In civil law systems, the judge typically serves as the fact finder. Juries are less frequently used in civil law systems; they are usually reserved for serious crimes, and some countries do not use them at all. Several civil law systems feature a mixture of judges and laypersons when juries are used. For instance, a panel could have three judges and nine laypersons who would decide the outcome of the case.

Alternatively, some countries (those following the German model) feature criminal trials with a panel of both professional and lay judges. These panels are unlike juries in the sense that they do not include randomly selected peers of the defendant, but they serve a fact-finding function that is similar to juries.

Unlike common law juries, civil law systems generally do not allow the parties to make peremptory challenges to eliminate jurors. However, the judge typically may replace jurors for bias or other valid cause.

Discovery

Discovery refers to the formal process whereby the parties to litigation collect evidence and learn the details of the opposing side's case. Criminal discovery practices vary considerably between adversarial jurisdictions (found in most common law systems) and inquisitorial jurisdictions (found in most civil law systems).

Adversarial Discovery Process

Recall that in adversarial jurisdictions, the parties involved in litigation primarily drive the discovery process, while the judge ensures that discovery procedures are followed correctly.

The adversarial process can be divided into the pretrial and trial stages. Most discovery between the parties is conducted in the pretrial stage. Both parties may request limited information from each other, and alleged failures to comply with evidentiary rules may be submitted to the judge, who may then order a party to comply. The prosecution, working with law enforcement, gathers all evidence on the government's behalf.

Some evidence, however, will not be available to a party until it is introduced as evidence during the trial by an opposing party.

Inquisitorial Discovery Process

The evidence-gathering process in inquisitorial criminal proceedings is quite different from adversarial proceedings. Criminal discovery in inquisitorial jurisdictions is driven by a judge. Some inquisitorial systems have two types of judges: the examining judge and the trial judge. *Examining judges* oversee the evidence-collection process in criminal proceedings, while *trial judges* preside over the trial. The trial judge presents evidence collected previously, questions witnesses, hears arguments, and makes rulings. In some jurisdictions, however, prosecutors share or replace the role of examining judges, while other jurisdictions have a single type of judge who is responsible for both overseeing investigations and performing trial functions.

The discovery process in inquisitorial jurisdictions occurs primarily in the first two of the three phases of criminal proceedings, which are the investigative phase, the examining phase, and the trial.

- In the investigative stage, the public prosecutor, judge, or both (depending on the jurisdiction's process) collect documentary and tangible evidence regarding the case. The investigating party then decides whether there is sufficient evidence to submit the case for prosecution.
- If there is sufficient evidence, the case moves on to the examining phase, which is mostly conducted in writing. The judge (an examining judge, if the jurisdiction uses them) completes a written record of the evidence and may also collect testimony and additional evidence. Some jurisdictions refer to this evidentiary record as the *trial dossier*. If the judge certifies that there is a valid case against the accused, the matter moves forward to trial.
- The trial commences with the exhibition of the examining record before the parties and the trial judge, jury, or panel. The parties argue their case before the trial judge (or jury, if applicable).

In inquisitorial trial proceedings, the evidentiary record or dossier is already available at the outset of the trial, whereas the entirety of each party's evidence is produced and recorded at trial in adversarial jurisdictions.

Disclosures

Criminal procedure for requiring parties to disclose information to each other also tends to vary in adversarial and inquisitorial jurisdictions.

DISCLOSURES IN ADVERSARIAL JURISDICTIONS

Generally speaking, discovery in adversarial jurisdictions is more limited than in inquisitorial systems, especially in criminal cases. Both the defense and the prosecution typically have far fewer rights to access information possessed by the other party than parties in noncriminal litigation. The prosecution is heavily limited in disclosures it may obtain, and the defendant typically has the right to refuse to testify. The prosecution generally must obtain evidence through search warrants or other means, rather than requesting the items from the defendant. However, the defense might still be required to turn over certain types of evidence that it intends to use at trial, such as the basis for any legal defenses raised, documents or tangible items, results of tests intended to be used at trial, statements of expert witnesses it plans to use at trial, and other items as required by the laws of the jurisdiction.

The defense is similarly limited in what it may request from the prosecution. The defendant typically does not have a right to the work product of the state, which includes reports, memoranda, and other internal documents made by the government attorney in preparing for and prosecuting the case. However, most jurisdictions also require prosecutors to turn over all exculpatory evidence that would tend to refute the guilt or mitigate the punishment of the defendant.

DISCLOSURES IN INQUISITORIAL JURISDICTIONS

The evidence available in inquisitorial jurisdictions is substantially less private than adversarial jurisdictions. The entire record, as submitted by the judge presiding over the examining stage of the litigation, is provided to the parties before the trial phase commences. The defense has full access to the dossier on the case. Therefore, there is rarely an element of surprise, as all parties have examined what evidence is expected to be presented.

The judge may obtain the defendant's testimony, but the defendant usually has the right to remain silent. Since the discovery process is mainly the responsibility of the court, the parties do not submit pretrial discovery requests to each other, although they can request that the judge obtain certain items of evidence.

How a Trial Is Conducted

Most trial processes share many traits, but each court system has its own rules for how a trial should be conducted. The most obvious contrasts occur in the context of common law versus civil law systems. In common law systems, the trial phase consists of both the presentation of evidence and the determination of guilt or innocence. Later, there is a separate sentencing hearing if the defendant is found guilty. In civil law systems, the evidence-gathering portion of the trial takes place separately from the decision of culpability and sentencing.

In many other regards, however, the processes are similar. A typical trial is held in a courtroom, with very few people present. There will be a judge, a prosecutor, an accused person (with or without a defense lawyer), a court clerk (to handle the paperwork and keep a record), a deputy (mainly for security), and possibly a few spectators. People who are going to be witnesses are usually kept outside once the trial begins, so they are not influenced by what others say in the witness box before them.

Once the judge is seated, everyone else may also sit, except when speaking to, or being spoken to by the judge. There will be microphones in front of the judge and the lawyers' tables, and in the witness box. In common law systems, a tape recording is made of everything that is said at the trial, so that a printed transcript can be made later if the verdict is appealed.

Once everyone is seated, the clerk will call the case, and the prosecutor will introduce themselves to the judge. The defense then does the same and confirms that it is ready to go ahead with the trial.

At the start of the trial, there will be introductory talks by the judge and by lawyers for both sides. The aim is to lay out the framework of the case and, if applicable, make sure the jury has an idea of what the main issues will be and to suggest to them how they should evaluate the evidence that will be given, either through witnesses or in the form of exhibits.

In common law systems, the prosecution calls its witnesses first. Each witness is brought in, swears an oath (or makes a solemn declaration) to tell the truth, and is questioned by the

prosecutor. Then the defense is given a chance to cross-examine the witness. Alternatively, in civil law trials, the judge questions each witness directly and presents evidence from the examination report created prior to the trial.

Once all evidence has been presented, the normal procedure is for the judge to allow the defense to summarize what the evidence has shown and to argue for the judge or jury to acquit. The prosecutor then makes their own final points, trying to convince the judge or jury to convict. The prosecutor is held to a particularly high standard during the closing arguments. Generally, they may not misstate the evidence, express a personal opinion as to the defendant's guilt or the credibility of witnesses, or otherwise make prejudicial or inflammatory remarks. The prosecutor is expected to stick to the facts and to the reasonable inferences that can be drawn from them.

Occasionally in common law trials, the judge may “direct” a verdict of not guilty on one or more charges. A judge will direct a verdict if no evidence was presented in relation to some aspect of the charge, or for some other reason that makes a guilty verdict not legally possible. If that happens, the jury will be told not to consider that charge. If there is a charge on which the judge has not directed a verdict, the jury will then retire to consider it; otherwise, they will be released.

Reaching a Verdict

Common Law Systems

In common law systems, a jury is usually the independent fact finder in serious criminal cases. There are often questions that come up in the jury room, about the evidence or the law, and the foreperson will relay these back to the judge via the sheriff. Usually, the judge will answer questions by having the jury come back into court.

In reaching a verdict in a criminal trial, the jury must be unanimous, meaning that every juror must agree with the verdict. A simple majority is not sufficient for a verdict of guilty. The requirement of unanimity is designed to prevent the conviction of innocent people—an aim that is vital to the preservation of the justice system.

If there is still disagreement after the jury makes a full discussion and considers the evidence, then the foreperson should inform the court that the jury cannot reach a verdict. The judge may call the jury back into the courtroom for more instructions, but it is improper for them to push the jury too hard for a verdict where there is genuine disagreement.

When the jury is unable to reach agreement (what is called a “hung” jury), the judge will generally discharge the jurors and declare a mistrial. If there is a mistrial, the defendant can be retried if the prosecution elects to do so.

Civil Law Systems

Ordinarily, a judge is the sole fact finder in a civil law system and renders the verdict after considering all the evidence presented. When a jury is present, they discuss and make decisions along with the judges, so there is no need for formal consultations.

Additionally, the unanimity requirement in common law systems is not present in most civil law jurisdictions. The minimum requirement is typically somewhere above a simple majority, such as 10 out of 12 jurors, but the requirement may vary among jurisdictions.

Sentencing

Following a verdict of guilty, the judge and/or jury, as applicable, must impose a sentence.

When a defendant is convicted of a crime, courts in common law systems typically hold a sentencing hearing to determine the manner in which the defendant will serve their sentence, but before the sentencing hearing, a government worker will prepare a *pre-sentence report* that will review the defendant’s character, background, associates, prior criminal record, and other factors relevant to setting an appropriate sentence. The report is designed to assist the sentencing judge in assessing punishment. Additionally, the pre-sentence report may contain a *victim impact statement*; that is, an assessment of the financial, social, psychological, and medical impact upon, and cost to, the victim of the crime.

While evidence of the defendant’s prior convictions is not typically admissible during the trial phase in common law jurisdictions, the defendant’s criminal record is relevant and admissible in sentencing (i.e., such evidence is admissible when determining the defendant’s punishment, not guilt). However, if a defendant testifies on their own behalf in a criminal trial, they are typically subject to cross-examination just like any other witness, and the prosecution can impeach their credibility by showing prior convictions.

Civil law systems typically do not provide for a separate hearing for sentencing. The decisions of guilt and punishment are made and announced together, and prior convictions are admissible evidence.

For information regarding how the sentencing process works in the United States, see the content on “The Sentencing Process” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Punishment

When a defendant is found guilty of a crime, there are a variety of sanctions available to the judge and, when they are charged with imposing sentences, the jury as well. Depending on the jurisdiction and the crime, available sanctions may include probation, imprisonment, fines, restitution, and forfeiture.

If the defendant is sentenced to imprisonment, the sentence may be made under rules that dictate a *determinate sentence* (e.g., 5 years) or an *indeterminate sentence* (e.g., 5–10 years). In some jurisdictions, defendants may be eligible for parole after serving a part of their sentence. *Parole* refers to the status of offenders after they have been released from prison and are placed under supervision in the community.

Probation is the suspension of an offender’s sentence in return for a promise of good behavior. Unlike parole, probation is typically a sentence imposed prior to (and instead of) imprisonment. Probation laws vary by jurisdiction, but the offender is generally placed under the control and guidance of a government agent (e.g., probation officer), who ensures that the conditions of probation are met. Under typical conditions of parole, offenders are required to:

- Maintain steady employment.
- Cooperate with the supervising government agent. This might involve, among other matters, showing up for appointments with the agent and notifying the agent of any address changes, employment changes, or similar developments.
- Meet all familial responsibilities.
- Obey all laws. Many jurisdictions will incarcerate a probationer as a violator if they believe that the probationer has committed another offense.

In some jurisdictions, *restitution* is a common condition of probation. That is, the court may, as a condition of probation, order the defendant to make restitution (i.e., pay money for incurred losses) to the victim or otherwise to cooperate in the victim’s efforts to recover money or property.

In most jurisdictions, courts can also order defendants to make restitution in cases that do not involve probation. For example, a defendant who is convicted of embezzling \$10,000 from their employer might be sentenced to 5 years in prison and also ordered to make restitution to the employer in the amount of \$10,000.

In some jurisdictions, defendants can be ordered to transfer specific property to the government as part of their sentence. This is called *criminal forfeiture*, and it generally involves property that was used to commit a crime. For example, if a defendant used their house to manufacture illegal drugs, the government might be able to seize the house.

For information regarding punishment options specific to the United States, see the content on “Punishment” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Appeal

In most jurisdictions, a convicted defendant has the right to appeal the trial court’s decision. An *appeal* is the procedure for obtaining review by a higher court to ensure that the trial was conducted in a lawful manner and that the judgments comply with the law. In an appeal, the appealing party petitions an appellate court to overturn or modify the lower court’s decision.

Generally, appellate courts will not accept an appeal unless the petition is filed in a timely manner. Most jurisdictions have time limits within which appeals must be filed (e.g., no later than thirty days after the trial court’s judgment).

In many jurisdictions, an appellate court will reverse a conviction only if it finds an error that likely affected the trial’s outcome and denied the defendant a fair trial. Thus, errors that likely had no impact on the trial’s outcome, or *harmless errors*, are not sufficient to justify a successful appeal.

Common law and civil law systems approach appeals in different ways. In most common law countries, appellate courts consider potential errors of law *de novo* (meaning they evaluate them independently of the trial court’s determinations), but they generally adopt the factual findings of the trial court. No jury is present, and there is typically no new evidence entered

into the record. Therefore, appeals in common law systems are typically limited to issues of law. Very rarely will an appellate court reverse a factual finding of the trial court in a common law jurisdiction, such as when there is an egregious and obvious mistake.

In most civil law systems, courts can review cases for both issues of fact and law. The appellate court can usually perform *de novo* reviews of both the factual and legal determinations by evaluating the compiled evidentiary record.

For information regarding the criminal appellate process in the United States, see the content on “The Appellate Process” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Corporate Criminal Liability

In many jurisdictions, corporations and similar business entities may be *vicariously liable* (the absolute liability of one party for the misconduct of another party) for criminal and civil violations. Most common law systems follow the doctrine of *respondeat superior* (“let the master answer”), which holds that a business entity is liable for the acts of their employees if those acts occur within the scope of employment and with some intent to benefit the corporation. Therefore, the employee needs to have committed each element of the crime for liability to be transferred to the corporation.

While civil law systems originally did not allow for the criminal liability of legal entities under the doctrine of *societas delinquere non potest* (“societies cannot offend”), some countries (such as France) have recently amended their laws to allow corporations to be criminally liable for the acts of employees. However, not all civil law countries allow for such liability (such as Germany), relying instead on administrative and civil penalties for business entities.

Of the jurisdictions that recognize corporate criminal liability, they either allow a corporation to be criminally liable for virtually every crime that an individual may be liable for, or they have an exclusive list or description of violations for which corporations may be liable.

Generally, vicarious liability is very broad and imposes liability on a corporation even if those in management had no knowledge or participation in the underlying events. Moreover, the acts of any employee, from the lowest clerk to the chief executive officer (CEO), can

impute liability upon a corporation, and a corporation may be liable for the acts of its employees that violate securities laws, banking laws, anti-bribery laws, and many others.

To establish criminal liability for some crimes, the government must prove that the defendant acted with a wrongful mental state (i.e., a “guilty” mind). This intent can be attributed to companies, despite the fact that they are artificial entities. When a corporation is being charged with a crime that requires proof of a mental state, the moving party must only show that the agent who committed the wrongdoing had the required state of mind. Thus, the required mental state is attributable to the corporation. For example, to impose liability against a company for fraud, the moving party must prove that an agent of the company made the alleged false statements with specific intent to defraud.

Liability of a Corporation’s Directors and Officers

The current legal environment in many jurisdictions imposes civil and criminal liabilities on a corporation’s directors and officers. Generally, director and officer liability stems from the certain duties imposed by law to their corporation. The duties, which are discussed in more detail below, are as follows:

- *Duty of loyalty.* Directors and officers must act solely in the best interest of the employer/principal, free of any self-dealing, conflicts of interest, or other abuse of the principal for personal advantage.
- *Duty of care.* Directors and officers must conduct business affairs prudently with the skill and attention normally exercised by people in similar positions.
- *Enumerated duties.* Some jurisdictions have numerous laws to regulate directors’ and officers’ actions and decisions regarding the management of their companies, including securities laws, antitrust laws, racketeering laws, tax laws, intellectual property and patent laws, and corporate laws.

Corporate Deferred Prosecution Agreements

Of the jurisdictions that allow for corporate criminal liability, some also use deferred prosecution agreements. Generally, *deferred prosecution agreements* occur when prosecutors file criminal charges against a company, but then they agree not to prosecute the claims as long as the company successfully complies with the deferral agreement’s terms. These requirements typically focus on getting the business to reform its policies and reduce the risk of illegal practices. Essentially, deferred prosecution agreements help companies avoid indictment, trial, and conviction while providing a jurisdiction’s justice system with another channel for resolving a corporate case that punishes malfeasance and effectuates changes in a company’s culture.

Similar to plea bargaining, deferred prosecution agreements are controversial, and many countries do not provide for such resolutions of criminal cases. However, the complexity and public cost of trying massive fraud cases has led to more jurisdictions adopting such strategies.

THE CIVIL JUSTICE SYSTEM

This section reviews the legal aspects of actions by private parties—including fraud examiners, auditors, accountants, security personnel, private investigators, and lawyers—to investigate and recover losses due to fraud. Many of these cases will be resolved in the civil justice system.

A *civil action* or civil suit arises when individuals or business entities (such as corporations or partnerships) disagree on a legal matter. A civil action usually involves a dispute over something (such as the terms of a contract) or a claim that one party has violated a legal duty owed to it by the other party. In a fraud case, the victim may be able to seek compensation from the fraudster in a civil action based on common law fraud, breach of fiduciary duty, or misrepresentation. The person who sues is the *plaintiff*, and the person being sued is the *defendant*.

Procedure in Civil Cases

The procedure in a civil case can be quite complex. Furthermore, the terminology describing steps in the process is not consistent in legal systems throughout the world. This discussion focuses on jurisdictions that follow the three phases of civil litigation: pleadings, discovery, and the trial itself.

For information regarding how civil litigation works in the United States, see the content on “Procedures in Civil Cases” in the “Supplemental Regional Information” section of this chapter on [fraudexaminersmanual.com](https://www.fraudexaminersmanual.com).

Beginning the Civil Action

Fraud examinations often begin before litigation occurs, but since fraud examiners should work with an eye toward potential litigation, it is helpful to understand what is necessary to begin this process. A civil action begins when the plaintiff files a pleading with the appropriate court, usually in the jurisdiction in which the defendant resides or where the claim arose. The pleading sets out the complaint against the defendant and the remedy that the plaintiff is seeking. Depending on the practice and procedure of the court in which the action is commenced, such a document may be called a *writ of summons*, a *statement of claim*, a *complaint*, a *declaration*, a *petition*, or an *application*.

The required contents of the plaintiff's pleadings vary somewhat between jurisdictions, but most jurisdictions require *fact pleadings*, meaning the plaintiff must identify:

- The grounds for legal relief
- A summary of the evidence
- The specific facts on which the party's claim relies
- Key items of expected evidence

Some jurisdictions have elevated pleading requirements and also require witness lists and the production of specific documents.

A minority of jurisdictions require simpler *notice pleadings* in which the facts in the pleading must merely put the defendant on notice of the alleged claims; notice pleadings do not need to include the specific facts underlying the case.

When a pleading is filed, a court officer issues the claim. This is done by affixing the seal of the court to the pleading and signing the document on behalf of the court. Copies, as issued, are then delivered to (or "served on") the defendant.

Once the originating document is delivered to the defendant, the defendant must, within a specified period, provide the court with a statement of defense in response to the originating document. If the defendant fails to do so, they risk losing the suit by default. That is, if the defendant does not respond within the specified period, the defendant forfeits the case, and the court issues a default judgment holding the defendant liable as it deems fit. When making a default judgment, the court assumes that because the defendant did not put up a defense, the allegations must be true.

The liability assigned in a default judgment usually is limited to the relief requested in the plaintiff's complaint because it would be unfair to hold the defaulting defendant to a higher liability than that of which they had notice in the complaint that was served on them.

In addition to allowing defenses against the plaintiff's claims, many jurisdictions allow the defendant to raise *counterclaims* (also known as *countersuits*), in which the defendant levels a claim against the plaintiff. The specifics of the counterclaim might be filed as part of the defendant's answer or as a separate document. If a defendant files a counterclaim, the counterclaim and the original complaint will be tried concurrently, with the final judgment stipulating a decision on each side's claims.

Preservation of Evidence

Most civil litigation concerning fraud involves many documents, tangible items, or digital information that might serve as evidence. Each jurisdiction has rules for how potential evidence should be handled.

Generally, common law jurisdictions impose a duty on parties in civil litigation to take affirmative steps to preserve relevant evidence, and this duty might arise prior to the commencement of litigation. For litigation occurring in common law courts, the duty to preserve relevant evidence typically arises when the litigation in question is reasonably anticipated. For instance, if a company receives a letter from a vendor that alleges a credible allegation of fraud and a threat to sue, the company's duty to preserve evidence has most likely arisen.

In contrast, civil law countries tend to have a more narrow scope of what evidence is required for litigation. Typically, the issue of when to take affirmative steps to preserve evidence is established by the court, meaning the court dictates what evidence must be preserved and produced by the parties or others with relevant information. Due to privacy requirements in many civil law jurisdictions, retaining personal information (a very broad class of information regarding individuals) for longer than necessary might be illegal without a court order. Some civil law jurisdictions allow a party to apply for a court order to preserve evidence prior to a lawsuit being filed. Even without such an order, a judge might draw a negative inference against a party that fails to preserve and produce relevant evidence.

The duty to preserve evidence can be a confusing concept, especially in the context of litigation between parties in different countries or parties with information stored in foreign countries. For instance, the United States and other countries require parties to issue *litigation holds* within their organization when litigation is anticipated, which freezes the regular destruction of documents and information. However, if the litigation hold is followed regarding information stored in countries with strong data privacy laws—particularly members of the European Union (EU)—there is the potential for a criminal violation of such laws. Therefore, fraud examiners should consult with legal counsel on how to preserve evidence gathered during an examination.

Gathering Evidence

After the parties submit pleadings to the court, the evidence-gathering process begins. The system for collecting evidence varies from country to country, especially along the lines of adversarial processes (generally common law systems) and inquisitorial processes (generally civil law systems).

Common Law Systems

After statements of claim and defense are filed in common law jurisdictions, each party is entitled to pretrial discovery. *Discovery* refers to the formal process whereby the parties collect evidence and learn the details of the opposing side's case, and pretrial discovery is intended to clarify the claim against the defendant, and to permit each side to examine the evidence that will be used in court by the other side.

In most common law jurisdictions, each party must file an *affidavit of documents*, or *affidavit of records*, which lists and describes all documents in its possession that are relevant to any matter at issue in the case. The party filing the affidavit must allow the other party to inspect or copy any such documents. If any of the documents are privileged, the privilege should be asserted in the affidavit of documents. If requested, the judge will examine the documents to determine if the privilege applies. Some of the more common privileges include:

- *Litigation privilege*: This privilege protects communications or documents prepared in anticipation of litigation.
- *Attorney-client or solicitor-client privilege*: This privilege protects information provided by the client to the solicitor which is necessary in order to obtain legal advice.
- *Settlement negotiations*: Pretrial settlement negotiations are also privileged.

Some jurisdictions also allow the parties to make a request for documents or records, in which they ask another party to turn over a specific document or other record.

A party may be examined or questioned by the other party either orally or by written questions. In Canada, this procedure is referred to as *examination for discovery*; in the United States, an oral examination for discovery is referred to as a *deposition* and a written examination is referred to as an *interrogatory*. However, other common law jurisdictions might not allow for pretrial oral discovery, although pretrial written discovery is still available.

An oral examination, or *deposition*, is sworn testimony given by a party or witness upon questioning by counsel for one of the parties before trial and outside of court, usually in a

lawyer's office. Opposing counsel and a stenographer, who administers the oath and transcribes the testimony, are also present. An oral examination may be used to obtain evidence about the party's own case or the opponent's, or it may be used to preserve testimony for trial.

Often, a party has the option of an oral or a written examination, but not both without court approval. In some jurisdictions, however, discovery by interrogatories can be conducted without forfeiting a party's right to an oral examination.

In contrast, a written examination for discovery, or interrogatory, is simply a list of questions that the party, usually through a lawyer, is required to answer in writing. Written examinations are less expensive than oral examinations, but they are usually not as productive. Some parties will try to provide as little information as possible but still give a "truthful" answer. Moreover, counsel often finds ways to avoid answering questions or to provide minimal information.

Generally, the collection of oral or written testimony in the pretrial stage does not remove the need for such testimony to be presented during trial. A witness in a pretrial oral examination would also need to testify at trial, barring some exception to the rules.

Civil Law Systems

One of the most significant differences between the adversarial process of most common law jurisdictions and the inquisitorial process of most civil law jurisdictions is the way in which evidence is collected. Again, adversarial processes are largely driven by the parties to a suit, whereas in inquisitorial processes, the judge is the driving force. In other words, instead of the parties seeking evidence from each other, the judge seeks evidence from the parties and other sources.

In the inquisitorial process commonly found in civil law jurisdictions, the evidence is gathered contemporaneously with the trial, as opposed to the common law method of having the parties gather evidence over time and enter it into the record all at once during the trial stage. Civil law legal systems tend to value documentary and written evidence over oral testimony. When witnesses give testimony, the judge orchestrates the questioning instead of the parties. The judge is also responsible for collecting documents and physical evidence.

Many civil law systems have *professional secrecy obligations*, which require members of certain professions to maintain the confidentiality of information obtained from clients in the course of

those services. This obligation is similar to the attorney-client privilege, and legal representatives of the parties generally may refuse to provide testimony or produce documents covered by the secrecy obligation.

While the parties' attorneys or advocates are still involved in the evidence-gathering process, they play a more advisory role, such as formulating questions for the judges to ask and making recommendations on how to interpret the evidence. The judge orchestrates the proceedings by calling witnesses and eliciting testimony, as well as collecting documents and physical evidence.

Rather than keep a verbatim record of witness testimony, the judge makes a synopsis of the evidence that will later be used in the decision-making portion of the trial. Typically, the trial record consists of the judge's summaries of evidence, as opposed to every document or item of evidence submitted. However, key documents or particularly important statements might be included. The parties also work to ensure that the judge accurately creates the trial record and argue to frame it in a way that represents their interests.

Civil Trials in Common Law Jurisdictions

The trial process in common law jurisdictions can most easily be divided into two phases: the pretrial stage and the trial stage. Beyond discovery that occurs in the pretrial stage, much of what occurs in the trial stage depends on the results of the pretrial process.

Pretrial Stage

Civil cases often involve pretrial motions in which the parties ask the court to rule on a number of issues that relate to how the trial will be conducted.

A common pretrial motion that occurs during, or at the conclusion of, the discovery process asks the court to decide the case without a trial, based on the evidence contained in the complaint and answer. In several common law jurisdictions, this motion is referred to as a *motion for summary judgment*. This motion will be granted if the court determines that the pleadings and proof clearly demonstrate that there is no genuine issue of material fact involved in the proceedings and that the moving party is entitled to judgment as a matter of law. Motions for summary judgment are generally not favored by the court, as they terminate the proceedings before trial and the moving party bears a heavy burden to demonstrate that there are indeed no circumstances, factually or legally, under which the opposing party could possibly be entitled to relief. If the granting of a motion for summary

judgment disposes of all the issues between the parties, the case ends, although the opposing party may appeal. If the motion is denied, the case proceeds to trial.

Other pretrial motions may involve:

- Requesting the court to rule that evidence is inadmissible and prohibiting opposing counsel from referring to or offering the evidence during trial
- Requesting the court to dismiss the charges based on a defect in the complaint
- Seeking a change of venue for the proceedings due to improper procedure, unfair prejudice, or similar reason

During the pretrial stage, parties may also seek provisional remedies. *Provisional remedies* are prejudgment court orders designed to preserve the status quo until the court issues a final judgment. That is, provisional remedies offer interim relief to the victim or preserve and protect the victim's right to a final remedy pending the final judgment.

In most jurisdictions, plaintiffs in fraud cases can seek a court order to prevent the defendant or a third party from disposing of, spending, damaging, transferring, or concealing assets or property while the lawsuit is pending. These court orders are generally known as *prejudgment attachments*. Depending on the jurisdiction, however, the order may be called a *freezing order*, a *precautionary attachment*, a *preventative injunction*, or a similar term. In some jurisdictions, courts also have the authority to seize assets or property temporarily while the lawsuit is pending.

Trial Stage

The purpose of a civil trial is to determine whether there is some basis upon which the plaintiff is entitled to a remedy from the defendant and, if so, what the appropriate remedy might be. To achieve this purpose, the jury (or in cases tried without a jury, the judge) must listen to both sides and determine the facts of the case. When juries are used for civil trials in common law jurisdictions, the requirements are typically less stringent than in criminal trials. For instance, it is common for the minimum number of jurors to be lower for civil cases. Additionally, in many jurisdictions, civil trials are less likely to require a unanimous jury verdict than criminal trials.

Generally, in a civil suit in a common law jurisdiction, the plaintiff must prove that it is more probable than not that the defendant is liable. This standard is sometimes referred to as the *preponderance of the evidence* in common law jurisdictions. The plaintiff does not have to prove liability beyond a reasonable doubt, as in a criminal case.

In the adversarial process present in most common law jurisdictions, the trial begins with the plaintiff presenting the evidence against the defendant. The plaintiff calls witnesses to testify as to facts, and present documents, photographs, or other kinds of evidence. The defendant may then cross-examine the plaintiff's witnesses to test their evidence. Once the plaintiff has presented their case, the defendant can present their own evidence, which may include calling witnesses, and the plaintiff can cross-examine the defendant's witnesses.

Expert testimony is another common facet of trials—especially for technical cases like white-collar crimes. In adversarial settings, civil parties may call expert witnesses to give their opinion on matters thought to be too technical for the judge or average juror to understand. Fraud examiners and accountants may be used as experts in cases to compute and testify to damages. In most trials, each side will produce a qualified expert who disagrees categorically with everything the expert for the other side says. Because the jury usually learns through cross-examination that each expert has been paid for preparation and trial time—and because jurors generally have a difficult time understanding and evaluating expert testimony—such testimony may have little effect on the outcome of the trial.

Throughout the trial, the judge must ensure that all of the evidence presented and, in adversarial proceedings, that all of the questions asked are relevant to the case. For example, in most situations, the judge will not allow *hearsay evidence*—testimony based on what a witness heard from another person that is offered to prove that the assertion made by the other person is true—because such evidence lacks reliability.

At the conclusion of the trial, both the plaintiff and the defendant present a summary of their arguments, and the judge or jury must then consider the evidence presented and make a decision that is based on what the evidence shows to be most probable.

Civil Trials in Civil Law Jurisdictions

Civil cases in civil law jurisdictions vary considerably from common law civil cases. The most obvious difference is that civil law trials are a continual series of meetings and written correspondences, rather than a single event, as in common law systems. Throughout the process, evidence is introduced and evaluated by the court, and motions are submitted and decided on by the judge. The division between pretrial and trial stages found in common law civil trials, therefore, does not apply in the typical civil law setting.

The standard of proof in civil law jurisdictions typically does not change in criminal and civil trials; it is often described as the *inner conviction of the judge*, sometimes called the *conviction intime* standard. This standard requires stronger evidence than the common law *preponderance of the evidence* standard used in civil trials but not as much as the common law *beyond a reasonable doubt* standard used in criminal trials.

The judge chooses an expert (usually only one per issue) to give testimony on a subject and make expert findings on behalf of the court. The idea is that court-appointed experts are less biased than those that are hired by the parties. Some civil law jurisdictions allow (or require) the parties to provide expert witnesses to provide input for the court's appointed expert. The court has the discretion to reject or accept the appointed expert's findings, but in practice the court usually accepts them.

Throughout the trial, the judge evaluates evidence and records it in the trial record. The record is generally a summary of the evidence, rather than a word-for-word transcript of the proceedings. At the final hearing, the judge rules on the admissibility and relevance of the evidence in the record and presents it. This final hearing usually resembles the trial stage in common law jurisdictions. After presenting the evidence in court, the judge, jury, or judge panel (depending on the jurisdiction and type of case) rules on the issues in the case.

Civil Appeals

Generally, both sides in a civil case may appeal from an adverse judgment, either as to liability or damages.

In common law systems, the appellate court is largely limited to reviewing the legal decision of the trial court, rather than the factual determination of the judge or jury. The appeals court may reverse and remand for a new trial on some or all of the issues, order that a certain portion of the awarded damages be remitted, or enter final judgment, if legal grounds are clear, in favor of either party.

In most civil law systems, the civil appellate court may review issues of both law and fact, meaning it may obtain additional witness testimony, gather new documentary evidence, obtain new expert opinions, and so forth. The appellate court may reverse, affirm, remand for additional proceedings, and (in some jurisdictions) modify the trial court's decision.

Decisions and Remedies in Civil Cases

If the defendant in a civil case is found to have done nothing wrong, the judge will dismiss the case, but if the defendant is found liable, the plaintiff is entitled to some sort of remedy. In general, the term *remedy* refers to any process, procedure, or consequence of a legal wrong by which a victim can be redressed for their loss. Thus, if the defendant is found liable in a civil case, the remedy to which the plaintiff is entitled must be considered.

Legal Remedies

The remedy to which the plaintiff is entitled, however, depends upon a number of factors, such as the relief sought, the facts, and the authority given to the court to grant specific relief. There are various types of civil remedies, but the following three are most common: monetary remedies (damages), declaratory remedies, and equitable remedies.

Damages are remedies for the victim's recovery of money from the defendant because of, and as compensation, reimbursement, or reparation for, the defendant's legal offense. Damages are the remedy most commonly available to the successful plaintiff, and the main purpose of damages is to compensate the plaintiff for the loss caused by the defendant.

The amount of damages is normally fixed by the judge or jury that decided the case, unless a statute proscribes a particular amount. In fixing damages, the judge or jury will take into account the out-of-pocket expenses incurred by the plaintiff and, where the law permits such recovery, an additional lump sum to compensate the plaintiff for the loss suffered and the loss that might be suffered in the future as a result of the wrongdoing of the defendant. Although the judge or jury may take into consideration the amount demanded by the plaintiff in the originating document, they are not required to award that amount: they are free to award substantially less than the amount claimed.

In some jurisdictions, a court may occasionally award *punitive* or *exemplary* damages in addition to those that would ordinarily be payable. Such damages are usually awarded when they are made available by statute or, in most jurisdictions, when the judge or jury feel that the conduct of the defendant was so reprehensible that an increased award is required to express the disapproval of the community. Punitive damages tend to be available in common law systems, although a few civil law countries allow them in very limited circumstances.

Declaratory remedies are those in which the court states or declares the rights of the parties. For example, when a court interprets a will or a contract, its decision is declaratory in nature. Similarly, the decision of a court as to the ownership of personal property or land is also declaratory.

Equitable remedies are remedies used when the legal remedy by itself would be inadequate compensation for the wrong suffered. That is, equitable remedies are used when the plaintiff has no adequate remedy at law (i.e., damages are inadequate). One of the primary equitable remedies is the *injunction*, which is a court order by which a party is required to perform, or is restrained from performing, a specific act.

Fidelity Insurance

Given the prevalence of fraud, and given the fact that it is difficult to fully recover losses from fraud, many businesses have fidelity insurance that covers fraud losses. Fidelity insurance (also known as *crime insurance* and *employee dishonesty insurance*) is an often overlooked method of recovery for losses due to internal fraud. *Fidelity insurance* is a type of insurance under which the insured entity is covered against losses caused by the dishonest or fraudulent acts of its employees.

Dishonest or fraudulent acts are typically defined as those acts committed with the intent to:

- Cause the insured to sustain a loss.
- Obtain a financial benefit for the employee, or for any third party intended by the employee, other than their proper compensation.

Fidelity insurance is likely to cover internal fraud or theft. Typically, fidelity insurance will provide coverage in cases of employee theft, forgery, fund transfer fraud, computer fraud, money order fraud, counterfeit currency fraud, credit card fraud, and so on.

It is often helpful for organizations to have fidelity insurance, since general liability insurance and many other policies will not cover damages from intentional acts like internal fraud.

As with any other insurance agreement, fidelity policies have deductibles (a reserved amount that is subtracted from the total loss claimed), policy limits (a limit to the amount the insurance company will indemnify the insured for a given loss), and certain exclusions.

To collect on a fidelity insurance policy, the insured must submit a sworn proof of loss claim within specified time limits, together with supporting evidence of liability and the amount of loss. Submitting a timely proof of loss is the responsibility of the insured; the carrier will not conduct nor assist in any investigation efforts to obtain proof of a loss, and the carrier will not reimburse the investigative or legal costs that the insured incurred in making a claim.

Most policies have express subrogation provisions providing that if the insurance company pays a claim, it acquires the rights of the insured to sue the wrongdoer. Policyholders are prohibited from interfering with these rights in any way at the risk of jeopardizing coverage, such as releasing the wrongdoer from liability. Therefore, no settlement agreements or releases should be executed with a dishonest employee or any confederate unless the insurance company consents.

Alternative Dispute Resolution

A growing trend in civil litigation is to allow or encourage parties to an action to resolve their disputes without the necessity of a trial. *Alternative dispute resolution* is the term used to refer to these processes. In fact, not many cases actually go to trial; most are settled out of court or go through some kind of alternative dispute resolution.

Alternative dispute resolution has certain advantages over litigation. It helps preserve existing business relations between the parties, it provides more flexible remedies, and often, but not always, it is less costly.

Alternative dispute resolution in fraud cases usually involves one of two types of methods: mediation or arbitration.

Mediation

Mediation is the process whereby an impartial third person assists the parties in reaching a resolution to the dispute. The mediator does not decide who should win but instead works with the parties to reach a mutually agreeable settlement. Any mediation agreement will be enforced as a binding contract.

Arbitration

Arbitration is the process whereby a dispute is submitted to an impartial third person (known as an *arbitrator*) who then decides the outcome of the case (i.e., which party should win).

The arbitrator acts as a judge or jury by deciding the case on its merits. Arbitration can be either binding or nonbinding. If the arbitration is binding, then the decision of the arbitrator is final, and the parties cannot later submit their dispute to a judge or jury for determination. Conversely, if the arbitration is nonbinding, the arbitrator's determination is not binding upon the parties.

Today, many contracts contain arbitration clauses providing that if a dispute arises between the parties to the contract, both parties agree to submit their claims to binding arbitration rather than filing suit. Additionally, parties might agree to have the laws of a particular jurisdiction apply during the arbitration, and these provisions are often enforceable.

BASIC PRINCIPLES OF EVIDENCE

In general, evidence consists of anything that can be used to prove something. In a legal sense, *evidence* refers to the testimony, documents, exhibits, and other tangible objects offered to prove or disprove the existence of an alleged fact during court proceedings.

In legal systems, the use of evidence is often regulated by an intricate set of principles that have been developed and refined over hundreds of years, designed to ensure that only relevant and probative evidence is admitted and that irrelevant, unreliable, and prejudicial evidence is excluded so that cases can be fairly and expeditiously decided.

Every aspect of a legal case—from filing the complaint to the presentation of witnesses and exhibits—is affected by rules of evidence. This body of law covers not just what counts as evidence, but how that evidence is gathered, handled, and presented.

In every jurisdiction, the law of evidence governs the admissibility of evidence in legal proceedings. The law of evidence, however, varies between countries and legal systems. Common law legal systems have separate rules of evidence that regulate the admission and evaluation of evidence by courts. For example, evidence in U.S. federal courts is governed by the Federal Rules of Evidence (FRE). These rules establish what can and cannot be introduced during a dispute. In the late 1960s, a U.S. Supreme Court panel began codifying centuries of common law into the FRE. What had previously been a far-flung set of precedents, buried in local jurisdictions and lengthy appellate court decisions, was gathered into a singular body of information. The FRE became law in 1975. Likewise, in Canada, the Canada Evidence Act regulates the rules of evidence in court proceedings under federal law. Civil law legal systems, however, do not have a separate code of evidence law.

The rules of evidence can be complex, and counsel should be contacted if an important question of evidence arises in the course of a fraud examination. Additionally, rules of evidence vary by jurisdiction, even within the same country. For example, in the United States, state courts have rules for the admissibility of evidence that might differ from federal rules. The following are some general principles regarding evidence; however, fraud examiners should always review the rules applicable in their jurisdiction.

Three Basic Forms of Evidence

Evidence can be anything perceptible by the five senses, which is invoked in the process of arguing a case. Documents, spoken recollections, data of various sorts, and physical objects are all potentially evidence. Put differently, evidence is simply anything that relates to proving or disproving a fact that is of consequence in a case. With the known universe available for court inspection, legal authorities have narrowed the field by setting up categories to evaluate evidentiary significance.

There are three basic forms of evidence: testimonial, real, and demonstrative. *Testimonial evidence* refers to the oral or written statements made by witnesses under oath. In general, there are two types of testimonial witnesses: lay witnesses and expert witnesses. A *lay witness* (or *fact witness*) is a nonexpert witness who must testify from personal knowledge about a matter at issue. An *expert witness* is a person who, by reason of education, training, skill, or experience, is qualified to render an opinion or otherwise testify in areas relevant to resolution of a legal dispute.

Real evidence refers to physical objects that played a part in the issues being litigated. The term includes both documentary evidence—such as canceled checks, invoices, ledgers, and letters—as well as other types of physical evidence. Therefore, a printer in a case involving questioned documents is clearly real evidence, as is a tape recording since members of the court can experience the sounds firsthand.

Demonstrative evidence is a tangible item that illustrates some material proposition (e.g., a map, a chart, or a summary). It differs from real evidence in that demonstrative evidence was not part of the underlying event; it was created specifically for the trial. Its purpose is to provide a visual aid for the fact finder. Nonetheless, demonstrative evidence is evidence and can be considered by the fact finder in reaching a verdict.

Direct Versus Circumstantial Evidence

There are two basic categories of admissible evidence: direct evidence and circumstantial evidence. *Direct evidence* is evidence that tends to prove or disprove a fact in issue directly, such as eyewitness testimony or a confession. *Circumstantial evidence* is evidence that tends to prove or disprove facts in issue indirectly, by inference. Many fraud cases are proved entirely by circumstantial evidence, or by a combination of circumstantial and direct evidence, but seldom by direct evidence alone. The most difficult element to prove in many

fraud cases—fraudulent intent—is usually proved circumstantially, and necessarily so, because direct proof of the defendant’s state of mind, absent a confession or the testimony of a co-conspirator, is impossible.

The distinction between direct and circumstantial evidence, however, is more significant in common law systems than in civil law systems; in trials held in civil law systems, the court weighs all relevant evidence, regardless of type, to reach its decision.

Admissibility of Evidence

Not all evidence is admissible. To be admissible, evidence must normally satisfy certain requirements. However, common law systems tend to have far more stringent restrictions on the admission of evidence than civil law systems. This is, in part, due to the extensive use of juries in common law systems. In common law systems, limitations on the admission of evidence are intended to protect jurors from irrelevant evidence and to ensure that the defendant receives a fair trial.

In common law systems using *adversarial processes*—those in which the litigating parties drive the discovery process—questions involving the admissibility of evidence occur when one party objects to another party’s offer of evidence. If a judge sustains an objection, the evidence is not admitted. If, however, the judge overrules the objection, the evidence is admitted and can be considered by the fact finder.

For country-specific information regarding the exclusion of illegally obtained evidence, see the content on “Illegally Obtained Evidence” in the “Supplemental Regional Information” section of this chapter on [fraudexaminersmanual.com](https://www.fraudexaminersmanual.com).

Relevant

The admissibility of evidence largely depends on the discretion of the presiding judge, but a basic requirement of admissibility in both common and civil law systems is that evidence must be relevant. To be admissible in common law systems, evidence must be relevant to material issues in dispute. In civil law systems, evidence is admitted if the presiding judge determines it is relevant.

For example, in the United States, a common law country, the general rule is that all relevant evidence is admissible. Rule 401 of the Federal Rules of Evidence (FRE) defines *relevant*

evidence as evidence having any tendency to make the existence of any fact that is of consequence to determination of the action more probable or less probable than it would be without the evidence.

Simply stated, evidence is *relevant* if it tends to make some fact at issue more or less likely than it would be without the evidence. The facts in issue, of course, vary according to the case, but generally can be said to be those that tend to prove the essential elements of the offense or claim, as well as related matters, such as motive, opportunity, identity of the parties, and credibility.

Whether a particular piece of evidence is relevant or not depends on what the evidence is offered to prove. An item of evidence might be relevant and admissible if offered to prove one thing, but not relevant and inadmissible if offered to prove something else. For example, evidence of other crimes, wrongs, or acts committed by the defendant would not be admissible if offered to prove that the defendant is generally a bad person and therefore is likely to be guilty of the crime charged. However, such evidence could be admissible if offered to prove motive, intent, identity, absence of mistake, or *modus operandi*, if such factors are at issue. If evidence of other wrongs or acts is admitted, the judge will instruct the jury that they may consider the evidence only as it relates to the narrow issue for which it was admitted and may not consider it for any other purpose.

Also, in common law systems using adversarial processes, the fact that an item of evidence is relevant does not automatically mean that it will be admitted. Relevant evidence might be excluded if it is unduly prejudicial, threatens to confuse or mislead the jury, threatens to cause unnecessary delay or waste of time, or is merely cumulative. Thus, evidence of drug addiction technically might be relevant to prove motive for embezzlement or fraud, but it will be excluded if the judge determines that its probative value is outweighed by the danger of prejudice to the defendant. Relevant evidence might also be excluded if it is subject to certain privileges as noted below. Evidence of other crimes and acts, as discussed above, that are otherwise relevant might also be excluded for the same reason.

Relevant evidence can be either inculpatory or exculpatory. *Inculpatory evidence* tends to show that an individual is guilty or at fault. *Exculpatory evidence* tends to clear an individual from fault or guilt. Evidence that is neither exculpatory nor inculpatory is likely irrelevant.

Authentic

Authentic evidence is evidence that accurately represents the fact or situation it is offered to prove or disprove. The authenticity of evidence is an important concept in civil law and common law systems.

Authenticity in Civil Law Systems

Civil law systems, in contrast to common law systems, do not impose a requirement of authenticity for the admission of evidence. However, authentication is relevant in civil law systems because it affects the evidential value or weight the fact finder should give to evidence. That is, in civil law systems, authenticity is a factor to be considered by the fact finder in deciding, in light of all the evidence presented at trial, just how much weight to give the evidence. If, for example, a relevant item of evidence is not authentic, it will not be reliable, and, therefore, it will not be helpful to the fact finder in ascertaining the truth. Consequently, the fact finder will give it less weight than authenticated evidence. Conversely, an item of evidence deemed relevant and authentic will be reliable, and, therefore, it can be used by the fact finder to ascertain the truth.

Authenticity in Common Law Systems

In common law systems using adversarial processes, evidence will not be admissible unless it is established as authentic. If a piece of real evidence cannot be authenticated, it will not be admitted, even if it is relevant.

Admissibility of Testimonial Evidence

Rules regarding the admissibility of testimonial evidence in civil law jurisdictions are typically more lenient than in common law jurisdictions. Generally, in civil law jurisdictions, testimonial evidence is admitted if the presiding judge decides it is relevant.

In contrast, to be admissible in common law countries, testimony generally must be relevant and based on:

- Fact, not speculation or opinion (unless the witness is testifying as an expert)
- Direct knowledge, not hearsay

Very generally, witnesses have direct knowledge if they:

- Performed the act or participated in it
- Saw the act being performed
- Heard about the act from the defendant (or in some circumstances, from a co-conspirator)

Special Rules Concerning the Admission of Evidence in Adversarial Proceedings

Common law systems that use adversarial processes have several rules that restrict the admission of evidence. These rules are not present in civil law systems that use inquisitorial proceedings.

In common law systems, special rules exclude certain forms of evidence that lack reliability.

The most common of these rules are:

- The rule of authentication
- The rule against character evidence
- The rule against opinion testimony
- The best-evidence rule
- The rule against hearsay

The Rule of Authentication

In common law systems using adversarial processes, exhibits are inadmissible unless they are relevant and established as authentic. *Exhibits* are the tangible objects presented as evidence. Therefore, both real evidence and demonstrative evidence are entered into the record as exhibits. Exhibits include documents such as contracts, letters, and receipts, as well as photographs, X-rays, baseball bats, knives, fountain pens, and computer files. In short, almost anything that is not testimony is an exhibit. Testimony is what people say. Exhibits are the “props.”

Questions concerning the admissibility of exhibits are determined by the trial judge in common law systems using adversarial processes.

But again, to be admissible at trial, evidence, other than testimonial evidence, must be properly authenticated; that is, the party offering the item must produce some evidence (e.g., testimony from a person with firsthand knowledge) to show it is, in fact, what the party says it is and to show it is in the same condition as when it was seized. If an exhibit cannot be authenticated, it will not be admitted even if it is plainly relevant.

The authentication requirement serves to ensure that evidence is what it purports to be and is genuine, not a forgery.

Although testimonial evidence does not have to be authenticated to be admissible, the courts in common law systems have a sort of credibility test for witnesses. Witnesses must demonstrate that the knowledge they communicate is believable and was gained through personal experience.

There are a number of techniques that can be used to authenticate evidence, but they vary depending on the type of evidence. Often, evidence is authenticated by the testimony of a witness who knows about the item's chain of custody, the testimony of a witness with knowledge that the item is what it is claimed to be, by reference to the item's distinctive characteristics, and so on. Additionally, certain documents are self-authenticating and may be received into evidence without independent proof of authenticity. For example, in the United States, business records are self-authenticating if they were generated or maintained in the usual course of business.

Authenticating Typical Exhibits

Below are some of the issues that might be encountered in proving that particular types of exhibits are authentic.

DEMONSTRATIVE EVIDENCE

Demonstrative evidence refers to a tangible item that illustrates some material proposition. It differs from real evidence in that demonstrative evidence is not part of the underlying event; it is created specifically for the trial. Its purpose is to provide a visual aid for the jury.

An exhibit used for purely “illustrative purposes” is a type of demonstrative evidence. Demonstrative evidence includes charts, graphs, and summaries that help to simplify complicated evidence for the jury. In complex fraud cases, such evidence is extremely useful, but it must be simple and easy to understand.

Demonstrative evidence is admissible if the court decides that it presents a fair and balanced summary or picture of the evidence and is not unduly prejudicial. If offered for its truth value (and not just to illustrate a point), demonstrative evidence must be authenticated to show that the evidence is in fact what it is claimed to be.

Also, demonstrative evidence must be made available to the other party, and the court may order that the information used to create the exhibit be produced in court.

DIAGRAMS

A *diagram* is a schematic or technical drawing that is used to help make something easier to understand. A diagram (on paper or some other tangible display) can be admitted as evidence with no more foundation than the assent of a witness (e.g., “Is this a fair representation of the suite where you work?”). It does not have to be true to scale or particularly detailed. A diagram

can be prepared before trial, during trial, or prepped outside the court and finished during questioning. If a party objects to the admission of a diagram, the offering party may need to establish that it is reliable. Diagrams can be used in tandem with photos or other representational evidence, or as assistance in demonstrations to the jury.

WRITINGS

In general, authentication of a writing consists of establishing who authored the document. Depending on the document and situation, this is done in one of several ways: (1) the author testifies and claims authorship; (2) a witness testifies to seeing the author write the document; (3) with handwritten letters, a witness verifies the author's penmanship; (4) with typed or machine-written documents, the witness verifies the author's signature; (5) a witness testifies that the contents of the document point decisively to the author. These and many other document issues may require the participation of a document expert.

BUSINESS RECORDS AND OTHER DOCUMENTS

Business records can encompass a broad range of documents, from all sorts of organizations, including corporations, small businesses, nonprofit operations, and community groups. Like other evidence, a party offering business records must provide testimony that the exhibit is the business record in question. For proper authentication, the party offering the evidence should be able to establish the following two things:

- The content of the document is complete and unaltered.
- The document originated from the named place of origination.

Certain documents, such as business records, are self-authenticating and may be received into evidence without independent proof of authenticity. For example, in the United States, business records are self-authenticating if a custodian or other qualified person certifies that the records meet the following requirements:

- The records were prepared reasonably near the time of the event they describe.
- The records were made by, or based on information transmitted from, a person with knowledge.
- The document was prepared as a usual part of doing business (i.e., it was not prepared specifically for litigation).

Business records and other documents are also vulnerable to hearsay objections. That is, offering the contents of business records to establish the truth of their contents can constitute hearsay. Thus, such materials can be barred as unreliable out-of-court statements

unless a trustworthy foundation is established. If, however, there is certification that complies with the self-authenticating rules listed previously, the records will not only be self-authenticating, but the records' contents will be admissible to prove the truth of the contents as an exception to the rule against hearsay.

GOVERNMENT DOCUMENTS

The requirements for government documents are the same as for other business records. The distinction between government and business records arose because of narrow interpretations of the law that separated nonprofit from for-profit enterprises. Today, most records, regardless of origin, are called business records.

PHONE RECORDS

To be admitted into evidence, phone records typically must meet the same authentication standards as business records.

DIGITAL RECORDS

Courts typically accept digital files and documents as evidence. In fact, courts themselves are using more digital resources because many aspects of litigation can now be conducted electronically.

Generally, to be admissible, digital records must meet the same authentication standards as hard copy records (i.e., to show that the item is what the proponent claims). Thus, to prove that a particular electronic record is authentic, those offering the evidence must demonstrate that the original document was not modified after its creation. But courts have recognized that the authentication of digital records may require greater scrutiny because such records can easily be altered after creation.

In fact, courts are still figuring out how to deal with digital evidence, and there is still disagreement regarding how to authenticate digital records. If digital evidence needs to be seized, it is vital that fraud examiners engage the services of a trained computer forensic technician. A properly trained technician should know the proper procedures to follow to ensure that the files can be authenticated.

Nevertheless, the most likely methods of authenticating digital records are:

- Testimony from a witness with personal knowledge (e.g., an authenticating witness attests to the process by which the digital records are created, acquired, maintained, and preserved)

- Circumstantial evidence of distinctive characteristics (e.g., a person's business habit is consistent with the document)
- Certified copies of business records (e.g., digital records are accompanied by a custodian's written certification)

Digital evidence comes in several forms, including email, texts, instant messages, website data, and digital photographs. And different forms of electronic evidence may require different authentication approaches. Therefore, it is helpful to examine a few common forms.

EMAIL

Unlike traditional business letters written on formal letterhead, emails are more prone to authenticity issues and may be more difficult to authenticate. Email authenticity issues usually arise because email systems are unreliable and inherently unsecure, making emails susceptible to alteration. Moreover, emails can lack reliability because the identities of senders can be corrupted through unauthorized access and use.

Even so, there are numerous ways email can be authenticated, including:

- Witness with personal knowledge (e.g., a witness testifies that they recognize a copy of an email that they received or drafted)
- Comparison with authenticated examples (e.g., if one email has been properly authenticated, a second email could be authenticated by comparing it with the first)
- Circumstantial evidence of distinctive characteristics (e.g., the presence of a party's name and email address or the presence of metadata)
- Trade inscriptions purporting to have been affixed in the course of business and indicating ownership, control, or origin (e.g., an automatic business signature at the end of the email)
- Certified copies of business records (e.g., email is accompanied by a written certification by its custodian)

TEXT AND INSTANT MESSAGES

As the use of text and instant messages continues to grow, parties are offering these types of records as evidence in an increasing number of cases. The most likely methods to authenticate text and instant messages are:

- Witness with personal knowledge (e.g., a witness testifies that they recognize a copy of messages that they received or drafted)

- Circumstantial evidence of distinctive characteristics (e.g., the use of the defendant's name in the text messages and the subject matter of the messages)

WEBSITE DATA

As with all evidence, the proponent of website evidence must be prepared to establish that the evidence is authentic. In some courts, authenticity can be established by the testimony of a witness. Like any other demonstrative exhibit, parties can authenticate a website with the testimony of a witness who verifies that the exhibit at issue accurately reflects what they observed after logging on to the site and reviewing what was there.

Alternately, the proponent may be able to authenticate a website by providing testimony from the webmaster or someone with personal knowledge to show that the data was posted by the person to whom the information is attributed. For example, if website data is attributed to the website owner, the webmaster can testify that particular content was entered on a site at a specific time. This is similar to authenticating writings by showing that the item was written by the person to whom it is attributed.

A growing number of people are using social networking sites like LinkedIn, Facebook, and Twitter. As a result, the legal use of information obtained from social media sites has increased. Many users don't give much thought to what they post online. And because most of the information that gets posted online becomes a permanent record somewhere, investigators, attorneys, and employers are increasingly mining these sites for information, photos, and videos that can become evidence in civil and criminal litigation.

The standard for authenticating evidence from social media sites is no different than for any other types of evidence—there must be sufficient evidence to support a finding that the evidence is what the proponent claims.

Because evidence posted on social media sites typically comes from third parties, who sometimes use pseudonyms, attributing this type of evidence to a certain person can be challenging.

Finally, some website data may be self-authenticated. To review, self-authenticating evidence may be received into evidence without independent proof of authenticity. The types of website evidence that may fall under this category include government material that appears on official government websites or business-related material that appears on an organization's website.

PHOTOGRAPHS

Concerning the admissibility of photographs, it is necessary to establish their fidelity to the object they claim to represent. This means that the offering party must prove that the picture is unaltered and shows what the proponent claims it shows. Generally it is enough to have a witness familiar with the object or space in a photo to corroborate it (e.g., “Yes, that’s the hallway running between our two buildings.”). The matter gets more complicated when a photo is controversial. This can require technical specifications for proper foundation.

In some unusual situations, a photo may reveal information that no witness can corroborate. There has been at least one instance where the background of a photo showed a stabbing that took place in a crowd. No one, not even the photographer, saw the stabbing at the time. In unusual situations where a photo communicates evidence not substantiated elsewhere, the foundation of the photograph will need more strength—including technical details on the camera, the film, who took the shot, why and where, and so on.

The exceptions make photos seem more legally fraught than they are. In fact, photos usually are admitted with little objection. Moreover, photos do not even have to be contemporary with the crime or grievance to which they pertain. If a photograph is established as accurate in its portrayal, it can be shot after the original act.

General Points About Exhibits

In adversarial processes, either side can enter exhibits into the record, given the proper foundation. Once admitted, the evidence is available for use by either side. It does not matter who entered the item into evidence; either side can use it during questioning.

It also does not matter when exhibits are admitted. They may be introduced into evidence during direct examination: opposing counsel is allowed to inspect the exhibit and then the witness confirms the exhibit.

Additionally, exhibits are marked for identification before they are offered into evidence. Marking an exhibit identifies it for the record so that it will be recognizable to anyone who subsequently reads the transcript of the proceedings. Exhibits generally are marked sequentially and identified according to the party who offered them (e.g., Plaintiff’s Exhibit 1).

Furthermore, when everyone agrees that an exhibit is authentic and admissible, it can be directly entered into the record, without foundational review, by *stipulation*—an agreement between the parties that relates to a matter in the trial proceedings.

Both sides to a lawsuit can stipulate to certain basic facts and narrow the line of dispute to a few issues or allegations. Stipulations generally are used only for objective facts that are easily proved or disproved. For instance, in an embezzlement case, both sides might stipulate the fact that the employee worked at the company, as well as the employee's dates of employment and title.

Objections to Exhibits

The fact that an item of evidence is relevant and authentic does not, however, automatically mean that it will be admitted. If the evidence violates some other rule of evidence—such as the rules against hearsay, prejudice, or relevance—it will likely be barred.

If, during trial, a party wishes to dispute the admissibility of an exhibit, the party will raise an objection and the judge will rule on it. If the judge overrules the objection, the evidence will be admitted, but if the judge sustains the objection, the evidence will be excluded. Also, in deciding on the admissibility of exhibits, judges can decide to admit the material just as it is, admit it with alterations (e.g., expurgating parts of a text or obscuring certain images), or deny the admission altogether.

In some instances, the judge's ruling on an objection requires a separate hearing to consider the issue.

Fraud trials can be bogged down with lengthy challenges due to the sometimes large volumes of documents offered as evidence.

The Rule Against Character Evidence

In civil and criminal trials in common law systems, there is strong policy against character evidence. *Character evidence* (sometimes called *propensity evidence*) is testimony or exhibits that purport to establish a "trait of character" or propensity to behave in a particular way, such as carefulness, honesty, violence, or cowardice.

There are several reasons why common law rules exclude character evidence. If used inappropriately, character evidence has the potential to be unreliable and unfair. Also, if

character evidence is admitted, the jury might draw conclusions about the general propensity of the individual who is the subject of the evidence. Similarly, juries might afford character evidence too much weight, or they might choose to punish a defendant for perceived bad character, rather than actual guilt. Additionally, character evidence is subject to interpretation—one person's idea of *antisocial* is another person's idea of *introspective* or *pensive*. Moreover, the introduction of character evidence might involve time-consuming ventures into matters that are collateral to the matters at issue.

Additionally, character is not an absolute indicator of behavior. That is, it is common to remark how out of character somebody's actions were in a given situation. So there is always a chance someone was acting out of character, making the behavioral propensity (if there was one) useless in the legal exchange.

Finally, testimony about character has the potential to be mistakenly founded, misled, or concocted. It is always possible to misjudge someone, especially if we only know the person in limited circumstances like work or a social club. Moreover, it is exceedingly easy to fabricate incidents about character and, for shrewd talkers, to manipulate perceptions of personality. To prove a fraud case, the party bringing the action must show that the defendant committed the act in question. There is too great a danger of prejudicing the jury if testimony about the defendant's allegedly poor character is allowed. A defendant's character flaws should have no bearing in determining whether the defendant committed the act in question.

In general, character evidence is not admissible in criminal cases, and it is only rarely admissible in civil ones. The general rule in criminal cases provides that evidence of a defendant's bad character is not admissible at trial. For example, under this rule, the government cannot offer evidence of a defendant's prior crimes or other bad acts to prove the defendant's bad character.

There are, however, some instances where character evidence may be admitted in criminal trials. Some of the exceptions for use of character evidence in criminal cases include:

- The accused may offer evidence of good character, in which case the prosecution may introduce evidence of the accused's bad character.
- Character evidence may be admissible to reflect on the credibility of a witness.

Again, evidence of other crimes, wrongs, or acts is usually not admissible to prove the character of a person. For example, Rule 404(b) of the U.S. Federal Rules of Evidence (FRE)

states that evidence of a person's earlier crimes, wrongs, or acts is not admissible to prove the person's character in order to show that the person acted in conformity with that character. That is, under such rules, such evidence is not admissible to prove that a defendant is generally a bad person and therefore is likely to have committed the crime charged. For example, if a defendant is charged with stealing money from their employer's safe, the prosecution would not normally be permitted to offer evidence that the defendant had previously stolen an item from their neighbor to show the defendant has a propensity to steal.

However, there are some uses of character evidence that may be admissible because they are offered for a purpose other than showing character. In criminal cases, character evidence generally may be used to:

- Show the accused's knowledge, intent, or motive for the crime.
- Prove the existence of a larger plan of which the charged crime is a part.
- Show the accused's preparation to commit the charged crime.
- Show the accused's ability and means of committing the crime (possession of a weapon, tool, or skill used in the commission of the act).
- Show the accused's opportunity to commit the crime.
- Show threats or expressions of ill will by the accused.
- Link the accused to physical evidence at the scene.
- Show the accused's conduct and comments during arrest.
- Show the accused's attempt to conceal their identity.
- Show the accused's attempt to destroy evidence.
- Present valid confessions.

Conversely, because civil law systems do not rely on juries as common law systems do, the laws of evidence in most civil law systems do not have rules designed to prevent improperly influencing an inexperienced fact finder. Therefore, most civil law systems do not prohibit the use of character evidence.

The Rule Against Opinion Testimony

During trial in adversarial proceedings, most evidence is introduced through the testimony of witnesses. Evidence on which the jury can make factual determinations must be introduced in the form of admissible testimony or documentary evidence by lay or fact (i.e., nonexpert) witnesses.

The rules of evidence, however, limit the testimony of *lay witnesses*—nonexpert witnesses who testify from personal knowledge about a matter at issue. Generally, lay witnesses are only allowed to testify about what they have actually experienced firsthand and their factual observations. Thus, lay witnesses provide a report on what they know and must keep their opinions and conclusions to themselves.

Despite the general rule, there are exceptions that allow some nonexpert witnesses' opinions into the record. Lay witnesses may give opinions if the statement is “rationally based” on their own perceptions, and if the opinion is helpful to a clear understanding of their testimony or the determination of a fact.

EXAMPLE

An employee at a securities firm blows the whistle on her superiors for a high-level stock fraud, and in response, the government initiates a secret investigation into the matter and ultimately brings criminal charges against the employee's superiors. At trial, defense suggests the investigation was an invasion of privacy. Prosecutors are justifying their secret eight-month investigation on the basis of the whistleblower's tip. The prosecution will offer into evidence the whistleblower's “opinion” that her superiors were engaged in fraud to show that the government was justified in conducting its investigation. Under these facts, the opinion is admissible. But the opinion testimony is not allowed to show that management is guilty of fraud; instead, it is admissible to show what prompted the investigation.

In general, lay witnesses in common law countries may give opinions if their statements pass a three-part test:

- The witness must have direct personal knowledge of the facts to which the opinion pertains.
- The opinion must be of the common, everyday sort (i.e., does not involve specialized knowledge or tests).
- The opinion is not part of a legal judgment, reserved for the jury or judge to decide.

Opinions from lay witnesses must be based on personal experience and have some bearing on the *facts* (as opposed to the *judgment*) of the case. This distinction is further refined in situations involving hearsay and personal judgment (discussed below).

In contrast to lay witnesses, expert witnesses may give opinion testimony because experts are hired to render a professional opinion. Experts are enlisted to testify because they possess

education, training, skill, or experience in drawing conclusions from certain types of data or information that lay witnesses do not possess. Expert testimony, however, may be excluded if it draws a legal conclusion. Therefore, expert opinions addressing guilt or innocence will likely be excluded in criminal cases.

The Best-Evidence Rule

Sometimes testimony may be excluded in common law systems because of the *best-evidence rule*, which prohibits a party from orally testifying about the contents of a document without producing the document itself or proving to the judge that there is a valid reason for being unable to do so. This rule, however, only applies when an original or copy is being used to prove the contents of a writing, and it does not demand that a party produce the very best evidence to prove a fact in dispute.

Also known as the *original-writing rule*, the best-evidence rule provides that when a witness testifies about the contents of a document, at least a fair copy of the original must be available for inspection. If there is no original, a copy of the proven authentic document will do, but the court must be assured that the copies are reliable and accurate. If the document is lost—no original, no copies—the judge will have to be convinced that there is good reason to forgo the exhibit and admit the testimony.

The original purpose of the rule was to prevent altered evidence from being admitted as evidence, but most modern commentators state that the primary purpose of the rule is to ensure that the most accurate written version of evidence is admitted at trial.

Fraud examiners can use copies in preparing their case reports, but at trial, the original must be produced if it is available. Thus, when public records are involved in a fraud examination, examiners should always obtain certified copies.

The best-evidence rule applies in the United States, but to accommodate electronic evidence, some common law countries, including England and Australia, abolished the best-evidence rule.

The Rule Against Hearsay

Many countries with common law systems restrict the admission of hearsay statements at trial. Simply put, hearsay refers to a statement that repeats what some other person said while outside of court. More specifically, *hearsay* is “a statement, other than one made ... at

the trial or hearing, offered in evidence to prove the truth of the matter asserted.” Basically, hearsay involves the following elements:

- A *statement* (anything intended to be an assertion; statements can be oral, written, or nonverbal conduct, such as nodding a head)
- *That is made outside the court’s supervision* (statements made at trial or during deposition are not hearsay because they are made during court proceedings, but a statement made at work or at a crime scene is outside the court’s supervision and could be hearsay if the other elements are also present)
- *That is offered to prove the truth of the matter asserted* (a party is offering a statement to prove the truth of the matter asserted if the party is trying to prove that the assertion made by the declarant [the person who made the out-of-court statement] is true)

Under the general rule, hearsay is not admissible in court, but this rule is subject to numerous exceptions. Excluding hearsay on one level means witnesses cannot say, “He said ... she said.” Each person testifies to that individual’s own experience. The general rule against hearsay is designed to ensure the credibility of testimony and to preserve each side’s right to cross-examine witnesses.

Each witness in the trial will be questioned about personal, firsthand encounters. Unless their statements satisfy one of the exceptions discussed below, witnesses will speak only about things they have experienced themselves. If possible, evidence should be presented in the courtroom so that the jury can determine the weight to give each piece of evidence.

The hearsay rule often creates admissibility issues for digital evidence because such evidence is often made out of court and offered to prove the truth of the matter asserted.

Exceptions to the Hearsay Rule

The general rule against hearsay is full of exceptions—ways to get information into the record—that accounts for the rule’s infamy in courtroom dramas and in real courtrooms. Some categories of statements may be exempt because they are not considered hearsay, and there are many circumstances in which evidence, although hearsay, is admissible.

Note that these are general types of exceptions, and each country that excludes hearsay has its own list. Fraud examiners should check the applicable laws for hearsay exceptions.

THE TRUTH OF THE STATEMENT IS NOT AT ISSUE

Although the general rule against hearsay provides that out-of-court statements offered to prove the truth of an assertion are not admissible, it does not apply to out-of-court statements that are offered for some other purpose. That is, the general rule against hearsay only applies if the statement is being offered to prove the truth of the matter contained in the statement. Therefore, if the statement is offered for some other purpose, it technically is not hearsay. An out-of-court statement can be admitted if it (1) is relevant to some aspect of the proceedings *and* (2) is not offered for the truth of its contents. Such statements are most often used to show a person's knowledge or state of mind at a particular time.

EXAMPLE

Patrick filed a civil suit against Dwyer alleging that Dwyer broke his jaw during an altercation. The suit goes to trial, and during the trial, it is established that the fight occurred at 8:30 p.m. and that it lasted about five minutes.

In his defense, Dwyer calls Walter to the stand, and Walter testifies that at 9:30 that night, Patrick called him and made the following clearly-enunciated statement: "Walter, I hereby forgive the money you owe me."

Walter's testimony relates to an out-of-court statement, but it is not hearsay because it is not offered to prove the truth of the matter asserted (i.e., that Patrick forgave the loan he made to Walter). Instead, the statement is being offered to prove that Patrick was speaking clearly at 9:30 p.m., which would mean that Patrick's jaw was unbroken after his altercation with Dwyer. Walter's testimony relates to his own firsthand perception of how Patrick's voice sounded. Therefore, this statement is not hearsay, and it is admissible to show that Patrick was speaking clearly at 9:30 p.m.

ADMISSIONS BY AN ADVERSE PARTY

Generally, the statement of an adverse party is not hearsay. Such statements, called *admissions*, can be very powerful evidence. More specifically, an *admission* is an out-of-court statement or conduct by a party to the lawsuit that tends to support the other side's position or diminish the declarant's own position. Thus, anything spoken or written by a party to a lawsuit can be entered into the record, provided that the statement can be corroborated and is relevant. Each side can use its adversary's out-of-court statements as evidence.

For example, during your investigation of the case prior to trial, you interviewed the defendant. During the interview, they tell you that they falsified invoices. Later they deny making the statement. If you take the stand and tell the jury that the defendant told you they falsified invoices, technically that statement is hearsay. But because the statement is an admission, it will be admitted under this exception to the rule.

An admission is not necessarily an outright confession. A witness may testify that a bank officer told them, “I have ways of getting loans approved that no one else knows about.” The statement alone does not prove loan fraud against the officer, but it does establish, by their own admission, their stated intent to subvert the security controls of the institution.

In cases involving corporations, large groups, or government agencies, any statement made by a member of the organization is potentially an admission. But to qualify as an admission, the person who made the statement has to be directly authorized to speak for the organization or perform a job related to the issue under discussion. For example, an agent employed by Jefferson Realtors who says, “You’ve been defrauded here” to an aggrieved client has made an admission on behalf of the company. A janitor at Jefferson Realtors, however, cannot make the same admission because janitorial duties are not related to the formation of contracts, and it is not likely that the janitor is authorized to make corporate declarations. Additionally, because an agent makes contracts on the company’s behalf, a statement made by an agent of Jefferson Realtors is an admission even if the agent is not the official spokesperson for Jefferson’s legal affairs.

FORMER TESTIMONY UNDER OATH

Testimony given by the declarant at another hearing is admissible if the party against whom the testimony is now offered had an opportunity and motive to examine the witness in circumstances similar to those of the present trial.

BUSINESS AND GOVERNMENT RECORDS

We commonly think of invoices, receipts, and official documents as the final legal word, but like statements made outside of court, business and government records are hearsay; they are prepared outside the courtroom. A special exception for these materials, however, makes them admissible if they are provided with a legal foundation. The admissibility of such records rests on two questions:

- Have they been prepared during “regularly conducted business activity”?
- Are they verifiably trustworthy?

If both questions can be answered in the affirmative, then the records are admissible. Thus, the business-records exception to the rule against hearsay provides that, although business records are hearsay (prepared outside the courtroom), such records are admissible under a hearsay exception if they are prepared during regularly conducted business activity and are verifiably trustworthy.

Materials prepared specifically for trial are not admissible as business records. Anything that casts doubt on the veracity of these documents can bar them. In situations where the charge involves altered documents, the materials are admitted to prove the charge of alteration—not for their truth-value—so the hearsay rule does not apply.

Computerized records have had no trouble being accepted as evidence. Generally, the hearsay exception for business records applies to such records (i.e., they are admissible as long as the records have been compiled as a regular facet of doing business).

STATEMENT AGAINST INTEREST

A statement against interest is a hearsay exception that is grounded on the theory that people do not ordinarily make harmful or damaging statements about themselves. A *statement against interest* is a statement that was, at the time of its making, contrary to the declarant's interests and would not have been made unless the declarant believed it was true. So, a statement against interest exception allows someone to testify to a statement by another person that reveals something damaging to the person who made the statement.

Generally, to be admissible under this exception, the statement must meet three requirements:

- The declarant must be unavailable to testify.
- The statement must have been against important interests of the declarant when made.
- Corroborating circumstances must clearly establish the trustworthiness of the statement.

In prosecuting a tax evasion charge, for example, prosecutors may present a financial statement used by the defendant to obtain a loan; this is a statement against interest because the document declares a higher net worth than the defendant now claims to have.

ABSENCE OF AN ENTRY IN BUSINESS RECORDS

Evidence that a matter is not included in the memoranda or reports kept in the regular course of business may be admissible to prove that a certain event did not occur if the

matter was one about which a memorandum or report regularly was made and preserved. However, this does not hold true if the source of information or the circumstances indicate a lack of trustworthiness.

RECORDED RECOLLECTIONS

A memorandum or record may be admissible if it concerns a matter that the witness once had knowledge of but now has forgotten; was made or adopted by the witness when the matter was fresh in memory; and is shown to be accurate. Such memoranda or records also may be shown to a witness who has temporarily forgotten the events to refresh the witness's recollection and allow the testimony to be more complete or accurate.

PRESENT SENSE IMPRESSIONS

Courts assume statements that are made during or immediately after significant events or conditions and that describe or explain the events or conditions are reliable, so present sense impressions are admissible. For example, a witness can report that they first suspected fraud at Securities Plus by noting that their superior said, "Oh my God! This can't be happening!" when they were informed that there would be an audit. In a similar example, Mr. Whistler notices Jenny Moore, a coworker, in John Smith's office and overhears her say, "Oh, here are some bid sheets in the trash can." If the government prosecutes Smith for bid rigging, which is demonstrated by the bid sheets, Mr. Whistler can testify about Moore's statement as a present sense impression because the words described the scene before her.

EXCITED UTTERANCES

There is also a hearsay exception for *excited utterances* (i.e., statements relating to a startling event or condition made while the declarant was under the stress of its excitement). Unlike statements of present sense impressions, excited utterances require an occurrence that is startling enough to produce excitement. In the Mr. Whistler scenario, for example, Moore's statements might qualify as an excited utterance if she discovered the bid sheets after months of searching for incriminating evidence and told Whistler, while jumping up and down in excitement, "This is the evidence I've been waiting for!" Here, the successful conclusion of the search was sufficiently exciting.

THEN-EXISTING MENTAL, EMOTIONAL, OR PHYSICAL CONDITION

Statements of the declarant's then-existing state of mind, emotion, or physical condition are also admissible as exceptions to the hearsay rule. Generally, evidence rules list state of

mind, emotion, sensation, or physical condition, pain, and bodily health as acceptable subject matters, along with extremely personalized thought processes such as intent, plan, motive, design, and mental feeling.

Defense attorneys at a fraud trial sometimes use arguments about what their client *intended*, or the *confusion* and *stress* the person was suffering. For instance, the defendant was seen shredding documents, and they were overheard to have said, “They’ll never prove anything now.” The statement may be admitted to show the defendant’s state of mind at the time they were shredding the documents. It also shows that the defendant acted with the intent to destroy the documents. Hearsay statements that help establish this intention are admissible as exceptions.

STATEMENTS FOR PURPOSES OF MEDICAL DIAGNOSIS OR TREATMENT

Anything first communicated during a medical examination is admissible as a hearsay exception. This includes medical history, symptoms, pain, and the general character of the medical condition. These statements do not even have to have been made by the patient. They can involve someone (parent or spouse) accompanying the patient.

PRINTED MATTER, LEARNED TREATISES, AND REFRESHER WRITINGS

Written materials that add to the court’s knowledge of an issue are excluded from the general rule against hearsay. This exception frequently applies to the testimony of expert witnesses who often use published material in their work.

Printed materials that support technical or professional assertions, such as commodity market reports, stock market quotes, mortality tables, cost of living indexes, etc., are admissible if they are “generally used and relied upon by the public or by persons in particular occupations.”

Often, rules of evidence create a hearsay exception for *learned treatises*, providing that an authoritative work is admissible to either support or attack the opinion of an expert witness if the work is established as a reliable authority. However, some courts limit the rule. In these jurisdictions, specialized “treatises, periodicals, or pamphlets” can be referenced only during cross-examination. In a world of proliferating and sometimes contradictory sources of information, just what counts as a learned treatise and what is a fringe group’s manifesto is not immediately clear.

Also, courts may permit testifying witnesses to refresh or revive their memory by referring to a writing or anything else if the witnesses will thereafter be able to testify without depending on the terms of the writing. For example, Whistler, who is serving as a witness at a fraud trial, wants to see some notes he wrote two years ago to make sure he got the numbers right in his testimony. He is allowed to consult the notes and continue with his testimony. The text of the notes used to refresh the witness's memory is also admissible, but only if the *opposing* attorney requests the admission.

OTHER EXCEPTIONS

There are other miscellaneous exceptions to the general rule against hearsay, and these include exceptions for things like *dying declarations* and *ancient documents*. For those instances not specified in any rule, there remains the judge's discretion: Anything the judge deems *trustworthy* for the purposes of its presentation is admissible. This is the cornerstone of the rule. Hearsay is excluded in the first place because it supposedly lacks trustworthiness. However, other kinds of hearsay that do not fall within any specific hearsay exceptions may be admissible if they meet the same standards of trustworthiness as required for the listed exceptions.

Hearsay in Civil Law Systems

Civil law systems generally do not have rules analogous to the common law rules against hearsay because judges play a more active role in determining the facts in inquisitorial systems. For example, in German courts, hearsay is admissible, and it is up to the court to determine whether or not the hearsay evidence is convincing. The common law rules against hearsay are founded on the concern that juries might give inappropriate weight to unreliable hearsay evidence, but because judges play a more active role in determining the facts in inquisitorial systems, the concerns that gave rise to the rules against hearsay in common law systems are not present in civil law systems. Accordingly, hearsay evidence is more freely admitted in civil law systems than in common law systems.

Chain of Custody

If evidence is subject to change over time or susceptible to alteration, the offering party might need to establish that the evidence has not been altered or changed from the time it was collected through its production in court. This is done by establishing a chain of custody. Thus, the chain of custody can be an important factor in establishing authenticity.

The *chain of custody* is both a process and a document that memorializes (1) who has had possession of an object and (2) what they have done with it; it is simply a means of establishing that there has not been a material change or alteration to a piece of evidence.

Thus, establishing the chain of custody for an item of evidence demonstrates its authenticity, and it shows that the item has not been altered or changed from the time it was collected through production in court.

In general, establishing the chain of custody consists of documenting each person who had control or custody of the evidence; how and when it was received; how it was maintained or stored while in each person's possession; what changes, if any, it underwent in that person's custody; and how it left that person's custody. The end result is a chain of testimony that accounts for the movement and location of physical evidence from the time it is obtained to the time it is proffered at trial. The goal is to show that access to the evidence was limited to those who testified in the chain of custody and thereby demonstrate that the evidence has not been materially altered.

Gaps in the chain of custody (e.g., when it is not clear what occurred with a set of records) or outright mishandling (e.g., a group of questioned documents was not properly sealed) can dishevel a case but not wreck it outright. Courts have found in some cases that even though there have been mistakes in the chain of custody, the mistake affects the *weight*, though not the *admissibility*, of evidence. That is to say, the evidence will still be allowed into the record, but it is accompanied by a forthright description of any improprieties that have occurred in the chain of custody. The jury and judge are supposed to consider the improprieties when they deliberate, weighing the case for guilt or innocence.

In fraud cases, the array of physical evidence, all the paper documents, audio and video recordings, and information-processing equipment, such as computers, demands close monitoring in the chain of custody.

The following are some general guidelines that will help examiners demonstrate the chain of custody. They will also help examiners in authenticating obtained evidence:

- If records are received via mail or courier-receipted delivery, keep copies of the postmarked envelope or the delivery receipts.
- If a cover letter is included, make sure to keep it.

- If the cover letter or transmittal letter includes a list of the documents, check the package immediately to ensure all documents are there. If something is missing, make a note in the file and notify the sender immediately.
- If you receive documents in person, create a memorandum stating the date and time the documents were received, who gave you the documents, where that individual obtained the documents, and a complete list of the documents received.
- If you obtained the documents yourself from the original source (e.g., from a desk or file cabinet), create a memorandum describing the date, time, *exact* location of where the documents were found, and a complete list of the documents obtained.
- Keep the originals of these memoranda or delivery receipts in the case file and keep copies with the documents (it will be much easier to identify where the documents came from if you have the information with the documents).

Additionally, because digital evidence can be easily altered or destroyed, a chain of custody must be maintained for all electronic evidence gathered and analyzed in an investigation. At a minimum, the following chain of custody procedures should be followed:

- Identify each item that contains relevant information.
- Document each item, who it was received from, who authorized its removal, the location of the item, and the date and time the item was received.
- Maintain a continuous record of the item's custody as it changes hands.

Impeachment

In common law systems using adversarial processes, evidence is usually introduced during direct examination of a witness. In adversarial processes, there is another side to testimony: cross-examination. (Inquisitorial processes do not allow cross-examinations). Under the evidence rules in adversarial systems, the adverse party is usually entitled to offer evidence to impeach the testimony or credibility of a witness. *Impeachment* is the practice of questioning a witness's knowledge or credibility.

It is important to note, however, that because cross-examination is absent from inquisitorial processes, impeachment is not an issue for civil law systems using inquisitorial processes.

There are numerous ways an attorney might impeach a witness, but the most common ways include efforts to show that the witness:

- Is influenced by bias or self-interest
- Has an impaired ability to observe
- Made prior inconsistent statements
- Has been convicted of a felony or equivalent crime
- Has a reputation for untruthfulness

Impeachment by *bias* shows that the witness has reason, or at least opportunity, to skew the evidence against one of the parties in the litigation. To impeach a witness for bias, opposing counsel will, during cross-examination, ask questions to bring up any pecuniary interest the witness has in the case, any connection the witness might have to any matter or litigant, and any other information that will make the witness appear to have some interest in favoring one party over another.

Another way to impeach witnesses is to show that their *ability to observe was impaired*. Matters of observance include the ability to see, hear, smell, or feel some item in question.

Nothing overturns a witness's statements like *inconsistency*. Opposing lawyers will always confront any witness on cross-examination with any apparent inconsistencies between the trial testimony and statements, testimony, or information given by the witness on other occasions.

In some common law systems, a witness's credibility may be challenged, though not automatically impeached, by showing that the person has been convicted of a felony crime. For example, under Rule 609 of the U.S. Federal Rules of Evidence (FRE), evidence that a witness has been convicted of a crime may be offered to attack the witness's character for truthfulness if the crime was punishable by death or imprisonment in excess of one year or if the crime, regardless of the punishment, involved dishonesty or a false statement. In short, Rule 609 offers a few basic rules for introducing evidence of prior crimes to impeach a witness. First, convictions for acts involving dishonesty, such as perjury, false statement, or criminal fraud, are admissible to impeach a witness's testimony. So, if a witness has been convicted of a misdemeanor not involving dishonesty or a false statement, the prior conviction cannot be used for impeachment. Second, evidence of felony convictions can be used to impeach a witness, but evidence of any prior conviction is presumably inadmissible if the conviction is more than ten years old. Finally, any witness may be impeached by proof of *reputation for untruthfulness*.

Generally, impeachment is complete when a witness admits the impeaching matter; if the witness does not admit it, then opposing counsel is usually required to prove the impeachment. If, however, the subject of the matter of the impeachment is *collateral*—those non-material matters that affect the credibility of a witness and do not tend to prove or disprove a substantive issue in the case—the impeaching counsel must accept the witness’s answer even if it is false. So, when a witness is asked about a collateral matter for the purposes of proving impeachment, the witness’s answer ends the inquiry, and opposing counsel cannot offer extrinsic evidence to prove collateral impeaching matters.

CFEs should keep in mind that the above methods of impeachment may be used not only on the defendant and defense witnesses, but also on witnesses for the prosecution. Inquiries should be made before trial to determine if a prosecution or defense witness is subject to impeachment, and, if so, appropriate steps should be taken.

Privileges and Protections

Introduction

There are evidentiary privileges and protections that prevent certain types of evidence from being discovered or produced during trial. Generally, if a privilege applies to information, the court and the parties seeking the information are denied access to it, and judges and juries must disregard any evidence they do actually hear if it is deemed privileged afterward.

The privileges and protections available and the requirements for each vary substantially by jurisdiction. Generally, countries with common law systems offer broader evidentiary protections than countries with civil law systems.

Civil law jurisdictions have doctrines that serve the same function as privileges and protections in common law jurisdictions—doctrines that exclude relevant evidence from being discovered or produced during trial—even if such doctrines are not classified as privileges. For example, many civil law systems have general professional privileges that prohibit the admission of communications made through the exercise of certain professional duties.

Some of the more common privileges and protections are discussed in the subsequent section.

Legal Professional Privileges

Legal professional privileges are rules of evidence that preclude disclosure of confidential communications between professional legal advisors (e.g., solicitor, barrister, or attorney) and their clients. These privileges are designed to encourage open and honest communications, and they go by many names. In the United States, the legal professional privilege is known as the *attorney-client privilege*; in the United Kingdom, it is known as the *legal advice privilege*; in Canada, it is known as the *solicitor-client privilege*; and in the European community, it is known as the *legal professional privilege*.

The requirements for the application of these privileges vary among jurisdictions, but, generally, the following elements must be present for communications to be protected:

- A communication between a legal professional and a client
- The communication was made to seek or give legal advice
- The parties intended the communications to be confidential (i.e., the communications must not be disclosed to third parties, such as vendors, customers, auditors, or governmental officials)

To be protected under a legal professional privilege, it is not necessary that the communication take place after a lawsuit has been filed.

Legal professional privileges, however, are not absolute; they are subject to waiver. Because these privileges only protect confidential communications, the protection they provide will be waived for communications disclosed to third parties who have little or nothing to do with the client's pursuit of legal representation because such disclosures demonstrate a lack of confidentiality.

Generally, waiver occurs when the client, who holds the privilege, voluntarily discloses (or consents to or encourages someone else disclosing) any significant part of the privileged communications. Although the client holds the privilege, the privilege can be waived by the client's attorney or a third party—someone who is neither the attorney nor the client.

The legal professional privilege can be waived in various ways, including:

- The client testifies about confidential communications.
- The attorney testifies about confidential communications at the client's command or request.

- The client puts confidential communications in question.
- The client, the attorney, or a third party carelessly or inadvertently discloses confidential communications to an outside party (which sometimes results in waiver).

Although legal professional privileges only apply to confidential communications between a legal representative and the legal representative's client, in most jurisdictions, the protection afforded by these privileges extends to communications with third-party consultants hired to help provide legal advice to the client (e.g., fraud examiners, accountants, bankers, or other experts). Thus, waiver does not occur when an attorney shares privileged information with an outside consultant hired in a role that concerns the client's pursuit of legal representation and when the communication is made for the purpose of effectuating legal representation for the client.

The U.S. Attorney-Client Privilege

The attorney-client privilege precludes disclosure of communications between an attorney and client, but only if all of the following conditions are met:

- The client retained the attorney to provide legal advice (i.e., there must be an attorney-client relationship).
- Thereafter, the client communicated with the attorney on a confidential basis.
- The privilege has not been waived.

The attorney-client privilege applies to individuals as well as corporations or other business entities. In the context of an investigation of a company, communications generally will be protected under the attorney-client privilege if the following elements are present:

- The communications were made by corporate employees to counsel.
- The communications were made at the direction of corporate superiors in order for the company to obtain legal advice from counsel.
- The employees were aware that the communications were being made in order for the company to obtain legal advice.
- The information needed was not available from upper management.
- The communications concerned matters within the scope of the employees' corporate duties.
- The communications were confidential when made and were kept confidential by the company.

To be protected under the attorney-client privileges, a communication must be made to obtain legal advice. Thus, a general counsel's participation in an investigation conducted by management does not automatically create an attorney-client privilege. The key element is that the attorney (whether in-house counsel or outside counsel) is conducting the investigation for the purpose of providing legal advice to the company. The privilege generally extends to information gathered by investigators acting at the direction of the attorney.

Also, to qualify for the privilege, there must be intent to keep the communications confidential (i.e., the communications must not be disclosed to third parties, such as vendors, customers, auditors, or governmental officials).

The attorney-client privilege prevents disclosure of the communications—the letters, memoranda, or contents of telephone calls—between the attorney and client, not of the underlying facts or documentary evidence in the case. A client may not refuse to produce documents or other relevant evidence merely because such evidence was previously given to the attorney.

Similarly, the attorney-client privilege does not prevent disclosure of communications that relate to business rather than legal advice. Corporate counsel is often consulted to give advice on matters related to business conduct rather than legal issues. Such communications would be discoverable.

Finally, the attorney-client privilege may not be asserted if the communication involved the attempted or actual commission of a present crime or fraud. The attorney does not have to be a participant in the fraud for the waiver to apply.

For additional information regarding waiver of the U.S. attorney-client privilege, see the content on “Privileges and Protections” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

The Legal Advice Privilege in the United Kingdom

Because the United Kingdom is also a common law jurisdiction, its legal advice privilege shares many aspects of the attorney-client privilege in the United States. The legal advice privilege prevents the disclosure of confidential communications between a lawyer and the lawyer's client that are in connection with giving legal advice.

The legal advice privilege applies to every communication between a lawyer and their client whether or not the communication was made in contemplation of litigation.

The Solicitor-Client Privilege in Canada

The solicitor-client privilege protects information a client provides to the client's solicitor that is necessary to obtain legal advice. For the solicitor-client privilege to apply, all of the following three requirements must be met:

- There is a communication between a legal professional and a client.
- The communication was made to seek or give legal advice.
- The parties intended the communications to be confidential.

Litigation Privileges

Many common law jurisdictions have a *litigation privilege* that protects materials prepared in anticipation of litigation.

The U.S. Attorney Work-Product Doctrine

In the United States, the litigation privilege is called the *attorney work-product doctrine*. The U.S. attorney work-product doctrine protects materials from discovery that are prepared in anticipation of litigation.

The attorney work-product doctrine is embodied in Rule 26(b)(3) of the Federal Rules of Civil Procedure (FRCP) and under comparable state rules. It protects documents and tangible things that are prepared in anticipation of litigation. The protection, however, is conditional in part: The opposing party may obtain access to otherwise protected investigative documents and things through pretrial discovery if it can show *substantial need* for the protected information and that the information cannot be obtained from another source. However, the attorney's mental impressions, opinions, and strategies concerning the litigation are absolutely privileged and cannot be discovered even with a showing of substantial need.

The protection offered by this doctrine extends to not only information and documents prepared by a party or the party's attorneys but also by third-party consultants and examiners hired by the attorneys. For instance, communications with the attorney and any work or analysis done by an expert with whom the attorney has consulted are protected as work product, although that protection will be waived if the expert is called to testify as an expert witness at trial.

Work-product protection applies only to documents and things *prepared in anticipation of litigation or for trial*. Thus, documents and tangible things prepared in the course of an in-house or other pre-litigation investigation, even if at the direction of an attorney, may not be privileged if they were not prepared in anticipation of litigation. Just because there is a possibility of future litigation does not mean that the investigation is in anticipation thereof. Litigation must be actually planned and the work for which protection is sought must have been undertaken for the specific purpose of preparing for that litigation. But if the work to be protected was done in anticipation of litigation, then it does not matter in most jurisdictions that a lawsuit has not yet been filed.

The work-product doctrine protects documents and things prepared in anticipation of litigation from compelled disclosure, but it does not render the facts themselves confidential, privileged, or non-discoverable. Thus, while reports, interview notes, and transcripts might not be discoverable under the doctrine, the facts learned may be discoverable. Similarly, the work-product doctrine does not prevent discovery of the identity of witnesses and the existence of interview notes, tapes, or transcripts.

Moreover, the extent to which interview notes, transcripts, and other factual reports prepared in anticipation of litigation are actually protected from discovery by a party opponent may vary between jurisdictions and may depend on the facts and circumstances of a given case.

Like the attorney-client privilege, work-product protection can be waived.

For additional information regarding waiver of the U.S. attorney work-product doctrine, see the content on “Privileges and Protections” in the “Supplemental Regional Information” section of this chapter on [fraudexaminersmanual.com](https://www.fraudexaminersmanual.com).

The Litigation Privilege

The litigation privilege, which is present in the United Kingdom, Canada, and many other common law jurisdictions, is roughly comparable to the U.S. attorney work-product doctrine. The litigation privilege prevents the disclosure of communications made, and documents prepared, for the purpose of litigation. The privilege, like the work-product doctrine in the United States, may extend to communications of, and documents created by, third-party agents (e.g., consultants or fraud examiners) in preparation for litigation.

The litigation privilege arises once litigation is reasonably anticipated. Accordingly, communication is only privileged under the litigation privilege if litigation was contemplated at the time the communication was created. Therefore, the privilege does not cover documents that came into existence before litigation was contemplated.

General Professional Privileges in Civil Law Jurisdictions

Many civil law systems have general professional privileges that prohibit the admission of communications made through the exercise of certain professional duties. That is, general professional privileges apply to certain kinds of communications made during the course of professional relationships. In France, for example, the Penal Code provides for penalties if professional confidences are broken.

Self-Evaluation Privilege

The *self-evaluation privilege* (also referred to as the *self-critical privilege*) may provide some protection for the work product of an investigation conducted by an organization. This privilege is based on the need to encourage voluntary internal reviews and compliance programs. It will protect the work product of an organization's investigation if the organization can demonstrate that it is attempting to police itself in an area of public interest, and it can show that disclosure of its work product would prejudice its efforts to police itself.

Normally, for this privilege to apply, the information must be prepared by the organization with the expectation that it would be kept confidential, and the information must have remained confidential.

The self-evaluation privilege may apply even in the absence of anticipated litigation, and it does not require the participation of a lawyer.

The privilege is a relatively new concept and is not recognized in all jurisdictions. It is much weaker than the legal professional and litigation privileges.

Marital Privilege

In many jurisdictions, the *marital privilege* (also called the *spousal privilege*) protects communications between spouses and is designed to encourage harmony within a marriage. The marital privilege, however, differs between countries.

In the United States, there are two forms of the marital privilege: (1) the confidential communications privilege, and (2) the adverse testimony privilege. The *confidential communications privilege* protects the contents of confidential communications between spouses during their marriage, and it enables either spouse to prevent the other from testifying about a confidential communication made during marriage. The *adverse testimony privilege* protects spouses from being compelled to testify against each other while they are married. Usually, the confidential communications privilege continues after the termination of the marriage; the adverse testimony privilege does not.

Many European jurisdictions, including Switzerland, the Netherlands, and Italy, have spousal communication privileges that prevent spouses from being forced to testify against each other.

Spousal communications, however, are not privileged in England and Wales, but Section 80 of the Police and Criminal Evidence Act 1984 (PACE) gives spouses or civil partners of criminal defendants protection against being compelled to testify by the prosecution, except in limited circumstances.

Parent-Child Privilege

Many European jurisdictions recognize a privilege that prevents parents and children from testifying against each other, but no such privilege is widely recognized in the United States.

Similarly, there is no privilege that permits a person not to testify against other family members, although, as a matter of policy, many law enforcement agencies will not compel testimony from immediate family members.

Law Enforcement Privilege to Withhold the Identity of an Informant

In some jurisdictions, law enforcement agencies may legitimately withhold the identity of an informant unless disclosure is necessary to ensure that the defendant receives a fair trial. In such circumstances, the prosecution has to decide whether to forego prosecution or disclose the identity of the informant. In the private sector, there generally is no equivalent privilege. CFEs or others who are investigating on behalf of a private client may be compelled by court order to disclose the identity of an informant or any other witness. This possibility should be disclosed to potential witnesses who may request confidentiality.

Accountant-Client Privilege

Some jurisdictions may have an *accountant-client privilege* that protects the communications between an accountant and client, although most common law jurisdictions do not recognize any such privilege. Even so, English law recognizes a limited accountant-client privilege, and in the United States, a few states have a weak accountant-client privilege that allows an accountant to resist production of a client's work papers or documents. No such privilege is recognized under U.S. federal law, and the state privileges may be overcome by a showing of need or by the service of a subpoena.

For additional information regarding the accountant-client privilege in the United States, see the content on "Accountant-Client Privilege" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

Other Privileges

There are a number of other privileges that are less likely to be asserted in fraud actions, including the *priest-penitent* and *physician-patient* privileges.

Judicial Treatment of Privileges from Foreign Jurisdictions

The rise of global markets and multijurisdictional transactions has resulted in an increase in disputes that span multiple jurisdictions, and as the above discussion on privileges demonstrates, the privileges that are available vary substantially by jurisdiction. There are no standardized rules of privilege for litigation in cross-border disputes, and, in some cases, there will be conflicting rules of privilege. For example, the litigants in a cross-border dispute might be required to disclose information in one jurisdiction that is protected by privilege in another jurisdiction. Accordingly, privilege law is a key source of uncertainty for litigants in cross-border disputes.

Generally, litigants involved in cross-border litigation should not expect to have the privilege laws from their own jurisdiction applied when engaged in litigation abroad. There are several reasons for this. First, courts are more inclined to apply their own privilege law because they are more familiar with local law than the laws of foreign jurisdictions. Second, characterizations and conceptualizations of privileges vary among different countries. For instance, common law jurisdictions typically view privileges as the right of the client, but civil law jurisdictions do not. In civil law jurisdictions, communications are protected by secrecy laws that require confidentiality.

TESTIFYING

Testimonial evidence is evidence presented in the form of statements made during a legal proceeding, such as a trial, an administrative hearing, or a deposition. All testimonial evidence has specific requirements governing its admissibility that depend on the type of witness and the manner in which the witness is testifying. The judge or administrator applies these requirements to determine who can testify and what they can testify about.

Witness testimony, however, differs in adversarial and inquisitorial jurisdictions. Again, adversarial jurisdictions (which are typically common law countries) are those that use judicial processes in which the parties to a proceeding propel the discovery process (the search for evidence), and inquisitorial jurisdictions are those that use judicial processes that place the primary responsibility of discovering evidence on the presiding judge. In adversarial systems, a large amount of litigation is conducted using oral evidence, with witnesses offering testimony, being examined in direct examination by their representatives, and, in turn, cross-examined by opposing counsel. Conversely, in inquisitorial systems, the examining judge interrogates witnesses and ultimately determines the value of witness testimony. Furthermore, adversarial systems substantiate testimonial evidence more than inquisitorial systems, and cross-examination of witnesses is virtually non-existent in inquisitorial systems.

CFEs, accountants, and auditors are often requested to provide testimony in criminal and civil prosecutions where their services can be used to support investigations of matters such as financial frauds, embezzlements, misapplication of funds, bankruptcy fraud, improper accounting practices, and tax fraud. Fraud examiners may also be used as defense witnesses or to support the defendant's counsel on matters that involve accounting or audit issues.

There are two basic kinds of testimony. The first is *lay testimony* (sometimes called *factual testimony*), where witnesses testify about what they have experienced firsthand and their factual observations. The second kind is *expert testimony*, where a person who, by reason of education, training, skill, or experience, is qualified to render an expert opinion regarding certain pertinent issues. Typically, a fraud examiner who worked on a case will be capable of providing lay testimony based on observations made during the investigation. When a trial involves issues that are complex or unfamiliar to most people, as is common in incidents of fraud, expert testimony is appropriate to help the fact finder understand these issues.

The type of testimony provided by the fraud examiner depends on both their role in the case and whether they are qualified to provide expert testimony. If a fraud examiner who participated in the investigation also qualifies as an expert regarding a relevant issue, they might provide both lay and expert testimony. Alternatively, the witness might solely be used either to present factual evidence or to provide a particular expert opinion based on the facts.

Many of the considerations for providing testimony are the same, regardless of whether it is factual or opinion-based. However, there are also some important distinctions, which are discussed throughout this chapter.

Considerations for Testifying as a Lay Witness

A *lay witness* (or *fact witness*) is anyone who provides nonexpert testimony in a legal proceeding. Before testimony begins, fraud examiners serving as fact witnesses will need to create a solid foundation. That is, to be an effective fact witness, fraud examiners must investigate, prepare, and disclose.

There are basic competency requirements for all witnesses. For fact witnesses, competency relates to the witness's capacity for observation, recollection, and communication. As will be discussed later in this chapter, there are heightened capacity requirements for those who are presented to give opinion evidence—either lay opinions or expert opinions.

Information Versus Evidence

Witnesses—particularly those involved in an investigative process—should familiarize themselves with the differences between information and evidence. Information consists of all facts, documents, observations, statements, or other indications of what happened. Evidence is information that is presented at trial, under the supervision of the judge, to prove or disprove an alleged fact at issue (i.e., to convince the judge or jury of the truth or falsity of the fact at issue).

The effective fraud examiner must not let concerns about the admissibility of investigative information or “leads” limit the scope or tenacity of the examination. Even if information is not in and of itself admissible, such information might lead to the discovery of admissible evidence.

Similarly, the effective witness is not hindered simply because the underlying information is inadmissible in court. Sometimes admissibility depends on the form of the information or prior disclosures; other times, it depends on whether specified procedures were followed. Therefore, all witnesses should work with their lawyers to make sure that all important information can be presented as evidence.

Sources of Lay Testimony

The rules of evidence, which govern the admissibility of evidence in court, prefer factual testimony based on firsthand knowledge (i.e., testimony on matters that the witness has perceived through one of the senses). There are several permissible sources for factual testimony:

- Observations
- Information collected during investigations
- Calculations and summaries
- Research
- Opinions (typically limited in scope)

Testimony derived from personal involvement in any of the sources enumerated in this list will generally be more effective and more easily admitted than all other types. Even if a witness is admitted as an expert, maximum exposure and reliance on direct rather than derivative information will make it more likely that the witness's statements will be admitted as evidence.

Use of Summaries

Whenever one party wishes to introduce an item of evidence, the other side is typically entitled to inspect such evidence. Nonetheless, when certain items of evidence are so voluminous that they cannot be conveniently examined in court, some jurisdictions allow the contents thereof to be presented in the form of a chart, summary, or calculation. When this occurs, the original documents (or duplicates) should be made available for examination or copying by other parties at a reasonable time and place, and the court may order that the underlying documentation be produced in court.

Opinions by Lay Witnesses

As a general matter, fact witnesses can only testify about the things they have personally observed and cannot give opinions or conclusions. However, some jurisdictions might allow some types of opinions from fact witnesses. For instance, under state and federal law in the

United States, a fact witness might be allowed to testify in the form of an opinion when such opinion is: (1) rationally based on the perception of the witness (i.e., one that an average person would form from those perceptions) and (2) helpful to a clear understanding of the witness's testimony or the determination of a fact in issue.

Lay witnesses are commonly allowed to testify as to:

- The appearance of persons or things
- Identity
- The manner of conduct
- Competency of a person
- Degrees of light or darkness
- Sound, size, weight, or distance
- A person's emotional state, including intent

EXAMPLE

Steven Dalton is called to testify as a lay witness in the fraud case against his boss, Frank James. As a lay, or fact, witness, Dalton can say that he found his boss frightening. For example, James often stomped up and down the office hallways yelling at subordinates. Dalton can also say that James kept the bottom right-hand drawer of his desk locked and that he became extremely irritated if anyone asked him what was in it. However, as a fact witness, some jurisdictions will not allow Dalton to offer opinions about James's psychological state or how he believes that James's desk contained information about a fraud scheme in which he thinks James was involved. In such jurisdictions, Dalton will have to limit his testimony to those things he actually saw, heard, and otherwise experienced.

EXAMPLE

Most courts would allow the owner of a business to testify as to the value or projected profits of their company without qualifying the owner as an accountant, appraiser, or similar expert. Such opinion testimony by a fact witness is not admitted because the witness possesses the broad range of experience, training, or specialized knowledge of an expert, but rather because they possess particularized knowledge—as to their specific company—by virtue of their position in that company.

Generally, lay witnesses are prohibited from providing expert opinions (i.e., opinions based on scientific, technical, or other specialized knowledge).

For additional information regarding the limitations of opinions by lay witnesses, see the content on “Opinions by Lay Witnesses” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Considerations for Testifying as an Expert

Litigation involving fraud is often complex, and the parties or the court might seek the help of experts. Experts can serve one of two roles in the trial process: testifying expert or consulting expert. *Testifying expert witnesses* give opinion testimony when specialized knowledge is needed to help the fact finder understand evidence or determine a fact in issue. Conversely, *consulting experts* typically do not testify at trial. Instead, they are hired to provide technical assistance to the attorney in preparing the case. In adversarial processes, both testifying and consulting experts have ongoing involvement with the litigation team for both sides. In inquisitorial processes, however, the court hires the expert to testify on technical issues.

Although experts serve one of two roles, they can perform various functions throughout the litigation process. Lawyers often count on testifying experts to help solidify the judge or jury’s understanding of the case. In his book, *Effective Expert Witnessing*, author Jack V. Matson lists the four main functions of all expert testimony and offers advice on fulfilling each assigned duty:

- *Establish the facts.* You must first develop a strategy to collect and examine the documentation in the case. The discovery process, which is a mechanism for full disclosure of all knowledge pertinent to the case, usually yields a vast amount of paper, which the expert then must examine to make a preliminary classification of relevance.
- *Interpret the facts.* Connect cause and effect relationships with the data and the facts for the technical basis of your case. Be mindful of correlation that seemingly links cause and effect but holds no theoretical justification.
- *Comment on the opposing expert’s facts and opinions.* If engaged in an adversarial proceeding, develop an understanding of the opposing experts by reviewing their educational background and experience. Read their publications. Check for weaknesses that your side might exploit. Oftentimes, trials become a battle of the experts, so go in with as much knowledge as you can gain. Dismantle the opposition’s expert report, which represents the other side’s best case, section by section. Your attorney needs to know the most intimate details about the facts and opinions contained in that report.

- *Define the professional standards in the particular area of your opponent's expertise.* One of the most critically important ways an expert is used in trial is to define the “standard of care” exercised by fellow professionals in the field. *Standard of care* has been traditionally defined based on the judgment normally exercised by professionals in compliance. Additionally, the professional must be informed or aware of current practices and promulgation. Obsolete practices are often considered by the court to be negligent practices. Thus, professionals must exercise reasonable, informed judgment when executing their duties. You, as the expert, will be called upon to define the professional standard.

Depending on the rules of the jurisdiction, the expert witness may be called by the court (i.e., the judge) or the parties. If called by the prosecution or plaintiff, fraud examiners might testify to their findings, and if called by the defense, they might testify regarding opinions expressed by the prosecution's or plaintiff's expert—to create doubt in the fact finder's mind about the credibility or consideration to be given to that expert.

Alternatively, an expert might be called upon to give an opinion different from that reached by an equally credible expert called by the court or on the other side. This might be due to different interpretations of the facts of the case. In some instances, given equally plausible alternatives, the case might be decided based on which expert witness was the most credible.

Additionally, effective expert witnesses frequently share certain characteristics. Credibility is one such feature. To become a “credible” expert witness, one must be a member in good standing of the profession and usually be recognized as an authority in that profession or some specialized aspect of practice within it.

Similarly, an expert witness in the area of accounting must have a thorough knowledge not only of generally accepted accounting principles, but also of current promulgations. The expert's expertise often might involve special knowledge of a specific industry. In this case, the expert should be attentive to developments and any important issues within that area.

The expert also must be analytical and be able to work with incomplete data. The expert, however, might not always be able to recognize when data are incomplete. As a result, the expert might make assumptions that will then be subject to interpretation or attack. If all data have not been made available to the expert, then a party might be able to offer alternate scenarios that are more plausible under the circumstances, thus discrediting the expert.

Accepting the Role of a Testifying Expert

Serving as a testifying expert is a difficult task, but it can be a rewarding experience. Before accepting a role that could potentially require testifying as an expert, the examiner must be capable of doing so and confident that the testimony will be helpful.

Ideal expert witnesses need to be respected experts in their fields and continue learning throughout their careers. For CFEs, that means completing Continuing Professional Education (CPE), regularly reading publications in the specific field, and actively seeking new developments. Fraud schemes and the investigation and prevention measures associated with them are always evolving, so the ideal expert will stay on top of these issues.

Additionally, a fraud examiner needs to confirm that the requested testifying role is within the scope of their skills. For example, a fraud examiner might have a long history in securities fraud, but that does not mean that they are qualified to testify in a case that will require appraising assets. Experts must reject work outside of their scope for the interests of the retaining parties and their own careers.

When an expert is asked by a party to provide expert testimony, it is usually easy to see what that party wants the expert's testimony to be—whatever will most help the party win. An expert must make sure that their analysis is objective and unable to be manipulated by the retaining party's will.

Asking the right questions of the retaining party in the beginning is necessary to avoid becoming an expert witness in a case in which the expert should not be involved. The types of questions necessary depend on the case, but in general, the expert should ask:

- Who are all of the parties and potential parties to the litigation?
- Who are the other attorneys for all of the parties?
- Who are the other experts in the case?
- What are the basic facts of the case?
- What is the scope of subject matter the party is requesting expertise for?
- Is the party seeking a consulting or testifying witness (discussed later in this chapter)?
- Are there any known or potential conflicts of interest?
- What court or administrative body will hear the case and what procedural rules should the expert know about?
- How will communications work (e.g., will the clients be contacted directly)?

Conflicts of Interest

When retained, experts must quickly determine if any conflicts of interest exist—or even appear to exist—in a particular case because a conflict might preclude participation. A *conflict of interest* exists when an expert's ability to objectively evaluate and present an issue for a client will be impaired by any current, prior, or future relationship with parties to the litigation. Prior or ongoing relationships might imply to others that the expert cannot provide undivided loyalty to the cause and the client. Whether a relationship causes a conflict of interest depends on the facts. Simply meeting a person does not necessarily cause a conflict, but a close personal or business relationship is more likely to give the perception of a conflict.

There are several actions an expert can take to determine if any conflicts of interest exist. For example, before an engagement an expert can ask for the names of all parties involved, and then review the names with their associates to disclose any connections, however remote.

Compensation (whether from the parties or from the court) for expert testimony services is standard, and it is not generally considered a conflict of interest. The amount of compensation can be brought up at trial, so the payment should not be above normal.

Penalties for consulting or acting as an expert in a conflict of interest include expert disqualification, attorney disqualification, and inadmissibility of expert testimony.

Divergences in Adversarial and Inquisitorial Jurisdictions

While most jurisdictions have procedures for admitting expert testimony in judicial proceedings, adversarial and inquisitorial jurisdictions tend to take different approaches. The biggest difference is the party retaining the expert.

Adversarial jurisdictions (which are typically common law countries such as the United States) usually allow the parties to litigation to retain experts to either consult or testify in proceedings, meaning the parties pay the experts directly. Each party might obtain its own expert, and it is common to have competing expert testimony in a proceeding. The parties are given an opportunity to both question their own expert in front of the judge or jury, as well as cross-examine the other party's expert to potentially reveal weaknesses in that expert's methods or analysis. The fact finder (i.e., the judge or jury) must evaluate these competing expert opinions.

In most inquisitorial jurisdictions (which are typically civil law countries), the court hires its own expert witnesses for technical issues that require guidance. This expert provides the court with information, and the judge has the discretion to determine whether to apply the expert's testimony when deciding issues. Unlike in adversarial jurisdictions, in inquisitorial jurisdictions, it is primarily the judge's responsibility to elicit the testimony from the expert. However, the parties' representatives can ask the expert questions, and in some cases can challenge the expert's qualifications or testimony. In some inquisitorial jurisdictions, the parties might also be permitted or required to provide experts for the court-appointed expert to question. Therefore, while not procedurally the same, expert witnesses in both adversarial and inquisitorial systems must be prepared to have their testimony withstand the scrutiny of the opposing party's legal counsel or the court-appointed expert.

While a jurisdiction's classification of being either adversarial or inquisitorial tends to determine its procedures for admitting expert testimony, this is not always what occurs. For example, Spain is a civil law country with an overall inquisitorial system, but it takes the adversarial approach of letting the parties obtain their own experts.

There are various other differences between adversarial and inquisitorial jurisdictions discussed throughout this chapter.

Pretrial Preparation in Adversarial Proceedings

Pretrial preparation remains key to becoming a successful expert witness, and success often depends on full inquiry and thorough investigation. In adversarial proceedings, the discovery process occurs in the pretrial stage, and an expert may provide assistance during this phase of litigation. An expert may help by composing discovery requests or answers. A financial expert is often expected to educate a lawyer on the types of documents typically available for certain cases.

Many times, financial crime experts must search through extremely large numbers of documents or computer files to determine whether evidence of fraudulent intent or behavior exists. The parties might provide the opposing party with a vast amount of paper or electronic documents to hide or trivialize vital documentation. Because an efficient search saves time and money, successful experts develop an early strategy to achieve their goals within a specific period.

When testifying as an expert, it is often useful to obtain a list of all other witnesses, including other testifying experts. This is important so that the expert is not surprised by the existence of other experts or reports. One can then determine if it is necessary to be present for the testimony of those witnesses and can obtain the necessary court approval. If other experts will be present, then it becomes incumbent upon the expert witness to examine the other experts' reports and assess whether they contain reasonable points that might affect the credibility of the expert witness's report.

Experts who are testifying need to be keenly aware that their communications with counsel or the judge will often be given to the parties. The best approach is to assume that each communication regarding the case will be heard or read by all parties to the litigation.

Expert Witness Report Requirements

A crucial aspect of preparing to testify as an expert witness is the expert report. The "Report Writing" chapter of the Investigation section of the *Fraud Examiners Manual* discusses the details of preparing the substance of the expert report.

Many jurisdictions require expert reports to contain specific disclosures. The required disclosures might include all or some of the following:

- A summary of the opinions the expert will express and the basis for the opinions
- The facts or data considered by the expert in forming the opinions
- Any exhibits that will be used to support the expert's opinions
- The expert's qualifications
- A list of publications authored by the expert
- A list of other cases in which the expert has testified as an expert
- The expert's compensation for their work on the case and testimony

Failure to comply with the relevant reporting requirements can result in the expert's work product, conclusions, and opinions being excluded from evidence. Experts should coordinate with counsel to ensure that their reports comply with all applicable legal standards.

A sample format for an expert witness report is included in Appendix E of the Investigation section of this manual.

For additional information on requirements for expert witness reports in specific jurisdictions, see the content on “Expert Witness Report Requirements” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Discoverability of Expert’s Reports

During litigation, parties have a chance to examine an expert’s opinions and underlying rationales. Caution is the byword for expert witnesses throughout the legal process. Reports and supporting documents used by experts might have to be disclosed to the opposing side in adversarial processes, and the parties in inquisitorial processes might also have a chance to review such documents. Therefore, experts should be cautious about what records they have. Fraud examiners should always consult with the party or court retaining them concerning the information in the report and the documents used to prepare the report.

Keeping Good Files

The best way to protect the confidentiality of information is to keep good files. Dan Poynter, the author of *The Expert Witness Handbook*, reports that experts routinely “reduce their files to useful reports only” once they have been officially engaged as a witness for trial.¹ No one is recommending that files be *sanitized*, Poynter adds, just *updated*. The difference might be subject to abuse, but it is simple: Any materials that serve as the basis for an expert’s opinion must be in the file. Notes, documents, or tests that serve as background or represent unsuccessful lines of investigation do not have to be included and probably should not be. The lawyer trying the case doesn’t want an expert having to answer questions about dead ends or exploratory diversions; a shrewd cross-examiner can turn a hastily scribbled hypothetical into just enough “reasonable doubt” to raise concern regarding the accuracy of an expert’s testimony. So, in the best-case scenario, an expert presents to the court an opinion and its basis—nothing more, nothing less.

Qualifying to Testify as an Expert Witness

Before an individual can testify as an expert, the proposed witness must be qualified as an expert. But what constitutes expert status? Generally, the term *expert witness* refers to those whose education and professional credentials establish their knowledge of a particular set of practices.

¹ Dan Poynter, *The Expert Witness Handbook* (Santa Barbara: Para Publishing, 1997), page 82.

The process for qualifying as an expert varies by country, but there are some common approaches in adversarial and inquisitorial jurisdictions.

Qualifying to Testify as an Expert in Adversarial Jurisdictions

In adversarial jurisdictions, parties introduce expert witnesses, so they are tasked with proving that an expert witness is qualified to give such testimony. As with introducing exhibits in trial, counsel must create a foundation for the expert's testimony. This means showing that by formal education, advanced study, or experience, the witness is sufficiently knowledgeable on the subject they are testifying about. That is, a witness must be qualified to testify as an expert. Depending on the jurisdiction, the foundation may be established during the pretrial stage or during direct examination.

Generally, before allowing an expert to testify before a jury, the judge will make three determinations:

- Is the person qualified as an expert witness?
- Will the expertise of the witness assist the jury in understanding the evidence or determining a fact at issue? In other words, is the proposed testimony relevant to the facts of the case?
- Is the testimony reliable?

For additional information on the qualifications of an expert witness in specific adversarial jurisdictions, see the content on “Qualifying to Testify as an Expert in Adversarial Jurisdictions” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Qualification Requirement

Before admitting expert testimony, the judge must determine that the expert is a qualified practitioner. This element addresses whether the individual is qualified to assist the trier of fact.

The process of evaluating whether an expert is qualified mainly centers on the candidate's formal education and work experience—whether that includes thirty years in law enforcement or ten years in a large accounting firm. But there is no standard educational requirement for expert testimony; a witness with no formal education may be qualified based on either special training or experience. Some other factors that may be considered include the candidate's:

- Awards and honors
- Licensing or certification
- Technical training
- Published books and journal articles
- Positions in professional associations, societies, and organizations

In addition to being qualified as an expert, the expert's qualifications must be relevant to the particular issue(s) concerning the case.

But the important thing to remember is that a person can be qualified as an expert based on either special training or experience. A person does not have to be a CFE to testify as an expert on fraud prevention, detection, or investigation techniques if that person has sufficient practical experience in those techniques. The CFE designation is important because it serves as recognition of the special skills that those holding the designation have demonstrated to become a CFE. A professional designation does not, however, automatically qualify someone as an expert for purposes of testifying in court.

Although designations are important, it is most helpful to have prior experience as an expert with litigation or criminal matters. This is primarily because of what is learned during the experience of testifying.

Further, it is often helpful to have been accepted as an expert in other cases, thereby easing current acceptance. A danger exists, however, if a witness serves as an expert on behalf of litigants in many cases because they could appear to be a "professional witness."

To establish the candidate's expertise, the counsel introducing the expert witness will often read the expert's qualifications or ask specific questions to establish the witness's credentials. Smart defense lawyers are not likely to challenge the credentials of experts, assuming they meet at least minimum standards of professional competence. To do so may give these experts an opportunity to fully highlight their professional credentials and perhaps make a greater impression on the jury or judge, thus substantiating their testimony. Although expert qualifications are not contested very often, it does happen.

Relevant and Reliable Requirement

After determining that a witness is a qualified expert, the trial judge must determine that the testimony being offered by the expert is relevant to the facts of the case and reliable. These two questions focus on what opinions the expert will actually testify to in court.

Relevant testimony will assist the jury in understanding the evidence or determining a fact at issue. To be relevant, the proposed testimony must be sufficiently related to the facts of the case so that it will aid the jury in resolving a factual dispute. That is, the testimony must have a tendency to make the existence of any fact more probable than it would be without the evidence. Testimony is not relevant if the jury can make its own determination without expert testimony.

To be reliable, the testimony must be based on sufficient facts and data, and it must be the product of reliable methodology that has been reliably applied to the facts of the case. This ensures that an expert's opinions are not mere speculation. Accordingly, fraud examiners should be sure to substantiate the rationale for their assumptions and determine whether the assumptions are supported by the facts.

When preparing an expert report or testimony, fraud examiners should remain mindful of the principles set forth above. Fraud examiners should document their conclusions, how they reached those conclusions, what evidence they based the conclusions on, and what professional techniques or knowledge they used. Additionally, it is a good idea for expert witnesses to keep a list of professional books or journals that advocate or sanction whatever principles they used in drawing their conclusions.

Qualifying to Testify as an Expert in Inquisitorial Jurisdictions

The primary experts in inquisitorial jurisdictions are usually appointed and presented by the judge, rather than the parties. Like in adversarial jurisdictions, the judge makes the final determination of whether an expert is qualified. However, most inquisitorial jurisdictions have more standardized requirements.

Many jurisdictions (through the courts, chambers of commerce, or other organizations) maintain lists of experts in certain fields from which the courts may choose for a particular case. These experts are generally qualified if they meet national standards, such as being certified in a specific field (e.g., an accounting certification); however, the judge will take the issues involved in the case into consideration and make the final decision. Some jurisdictions

allow judges to look outside of the lists for experts. Due to the maintenance of expert lists and the relatively low perceived bias of experts in inquisitorial jurisdictions, it is acceptable for expert witnesses to offer their services in court more often than in adversarial jurisdictions.

After being initially selected by the judge, expert witnesses are usually required to submit a report to the court and are subject to questioning by the parties to the litigation. The parties' representatives may ask questions concerning the expert's qualifications, potential biases, and report, but they are generally more limited in the scope of questioning than parties in adversarial proceedings. As the judge has already reviewed the witness and there are generally more specific requirements in inquisitorial systems, there is a lower perceived need to allow parties to challenge the expert.

Preparing to Testify

The majority of cases filed will not go to trial; most civil cases are resolved through a *settlement agreement* (a voluntary agreement resolving part or all of a dispute), and, in common law countries, most criminal cases result in a *plea bargain* (a negotiation whereby a criminal defendant agrees to plead guilty to a lesser charge). Therefore, most witnesses' experience in testifying comes through having their depositions taken.

Depositions

In many countries, depositions are available as a means of gathering testimonial evidence. A *deposition* is sworn testimony given by a party or witness upon questioning by counsel for one of the parties before trial and outside of court. A deposition serves as a powerful discovery device that may be used to compel anyone associated with the case to give oral testimony under oath. Although the subject cannot decline to testify in a deposition, they may be allowed to specify a convenient time and place for the deposition. In addition, a deposition may be recorded by a court reporter, camera, or a voice recorder.

For skilled investigators, depositions provide an opportunity to hear the other side's case aloud, but the opposition may set ulterior goals as well, including:

- Learn new information or confirm existing facts.
- Appraise the subject's ability as a witness.
- Lock the subject into a hard-to-defend position.
- Create a written record for future impeachment.

Before testifying at a deposition or at trial, the witness should ensure that required graphic displays are ready and available and that the witness has a complete understanding of the report and other relevant issues. Many witnesses have been discredited in depositions or at trial because they could not explain details of a report, such as how a particular calculation was made. The witness should ensure that they agree with counsel as to the sequence of evidence and the strategy for presenting it.

At pre-testimony meetings, it is appropriate to discuss the expert's qualifications (if applicable) to ensure that they are current, to discuss the strengths and weaknesses of the case, and to discuss and agree on what parts of the fraud examiner's reports, if any, are to be entered as exhibits.

Additionally, witnesses should pore over the written transcription of the deposition afterward to ensure accuracy, immediately correcting any omissions or errors, whether made by the witness or the stenographer. In the case of expert testimony, experts should notify their retaining party if their opinion changes after a deposition. If the expert is present at the deposition of an opposing expert, the expert may be asked to summarize their impressions afterward and note any uncertainties that call for further inquiry.

Appearance and Composure

The appearance of the witness can cause people to scrutinize the witness's credibility, so it is recommended that witnesses wear conservative business attire, be well groomed, and be neatly dressed.

It is also important that the witness maintain a professional demeanor. In the witness box, the witness should maintain a poised, alert appearance, stand firmly, and be ready to take the oath. The witness should not smile gratuitously at the judge, jury, or the lawyers. Also, it is important that the witness keep control of their hands to avoid fidgeting. The witness should maintain eye contact with the questioner as much as possible; they should not stare off into space, at the floor, or at the ceiling.

Because the judge will be taking notes during the testimony, witnesses should speak slowly to ensure that the judge does not fall behind.

The witness should direct their answers to the questioner, and their voice should be strong, clear, and audible. Thus, before answering each question, the witness should pause before answering and carefully consider the answer; they should also respond in a slow and deliberate manner.

Dos and Don'ts

There are other considerations in being a credible witness. Some tips are:

- Exude a confident attitude.
- Maintain professional pride and integrity throughout.
- Tell the truth; be honest and avoid bias.
- Use simple rather than complex terms, and refrain from using professional jargon where possible.
- Explain complex concepts in a layperson's terms.
- Be friendly and polite to all parties present.
- Be alert.
- Correct any misstatements as soon as they are detected.
- Listen carefully and answer the specific questions—do not digress from the topic or provide more information than the question requires.
- Do not be argumentative with the questioner.
- Do not try to be humorous or witty.
- Be calm and deliberate in responding to questions—think before you speak.
- Plan your testimony in advance and know your material thoroughly.
- Use graphs, charts, and other visual aids if they help to clarify a point.
- Do not read from notes if you can avoid it (the opposition lawyer will probably demand to see such notes, and the witness will then look like they rehearsed their testimony).
- Prepare your material completely. If you have documents to introduce, have them organized so that you can quickly retrieve them when asked to do so.
- Do not equivocate or stammer; recover your composure when a tough or complex question is posed.
- Ask for a question to be repeated or clarified if not fully comprehended.
- If an answer is not known, say so; do not guess.
- Do not invent and do not inflate.
- In cross-examination, do not respond too quickly because counsel might wish to object to the question.
- Do not be evasive.

Several other things should also be avoided. These range from conspicuous activities like drinking five cups of coffee immediately before testifying to small physical mannerisms that might affect your appearance. These mannerisms, which might be as simple as rubbing one's hands together continually, looking down at one's hands, fidgeting on the stand, or jingling coins in a pocket, could become irritating to the judge or jury.

In depositions and at trial, the judge or the opposition might extensively question a witness about their report, credentials, methodology, and conclusions pertaining to the case. If a witness is being questioned critically, then the witness often answers tersely, giving only a straight "yes" or "no." For inquiries that require more, witnesses should respond directly and precisely and refrain from volunteering any information.

Direct Examination

Direct examination is the initial questioning of a witness by the party that called the witness (in adversarial jurisdictions) or the judge (in inquisitorial jurisdictions). Most of the time, direct examination is a nonconfrontational questioning aimed at exposing the facts and issues of the case. It is usually not as treacherous as cross-examination—where opposing parties challenge the witness's testimony—but still requires a good strategy for answering questions, knowledge of the case, and self-awareness.

Direct Examination for Lay Witnesses

When a fraud examiner testifies as a fact witness, the direct examination generally proceeds from setting a background—who the witness is and the person's relation to the case—to establishing the witness's personal knowledge of the relevant material. Nonexpert witnesses must have some firsthand mental or sensory impression on which to base testimony. They generally can't discuss things they've only heard about or surmised. Conversations may be admissible, but only if details can be fully established, such as who participated, where and when the conversation took place, and so on. To be allowed, a conversation has to show relevance to the proceedings. Note, however, that inquisitorial jurisdictions tend to be less restrictive as to what testimony is allowed than adversarial jurisdictions.

As with an interview, the questions put to a witness can be broadly categorized as open or closed. Open questions ask for a detailed response: "What was it about the ledgers that made you call them 'irregular' in your report?" The witness offers a summary of the irregularities in their own words. A closed question, conversely, asks for a direct answer: "Did you remark

that the ledgers were in an ‘irregular’ state?” Closed questions are usually answered with yes or no, unless they’re aimed at extracting some particular piece of information. For example, the attorney might ask, “What was the word you used to describe the state of the ledgers?” The witness then replies, “I called them ‘irregular.’” A combination of open and closed questions is often used during direct examination.

For additional information on the limitations of direct examination for lay witnesses in specific jurisdictions, see the content on “Direct Examination for Lay Witnesses” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Direct Examination for Expert Witnesses

Expert witnesses, like lay witnesses, are subject to direct examination, but the direct examination of an expert witness will differ somewhat from that of lay witnesses.

Adversarial Versus Inquisitorial Direct Examinations

Recall that most expert witnesses in adversarial proceedings are chosen by the parties to the litigation (although adversarial courts may also appoint independent experts), while judges in inquisitorial courts typically appoint their own experts to evaluate technical matters. These relationships largely impact the dynamic of providing expert testimony in direct examinations.

In adversarial systems, the expert and the retaining party are “allies” in the sense that legal counsel will attempt to depict the expert’s testimony in the most compelling manner during direct examination and will try to correct any issues in the expert’s testimony that the opposing party raises. Additionally, the party retaining the expert might try to prepare the expert for the types of questions that will likely be asked. However, it is important that the expert never allow their opinion or best judgment to be supplanted by that of the retaining party. The expert must maintain objectivity, despite the obvious shared interest.

Most inquisitorial systems have a different dynamic, where the primary experts are appointed by the court. Expert witnesses in inquisitorial jurisdictions are subject to various examinations by the judge and the parties and might have to conduct their own examinations of witnesses. Usually, all of the expert’s activities related to the case are controlled by the judge, who determines the scope of the expert’s testimony and analysis, the expert’s authority to access certain items of evidence, whom the expert can interview, and several other functions. The judge may also question the expert’s credibility and qualifications and ultimately decides the extent of consideration that should be given to the expert’s testimony. Because some

jurisdictions allow parties to submit testimony or evidence from their own experts in addition to the court-appointed expert, the latter might need to interview the parties' experts. The expert should carefully follow the judge's instructions, especially since the instructions are usually made available to the parties of the proceeding.

The expert's findings are often requested in written form, but the expert might also have to answer oral questions from the judge and the parties' legal counsel.

In some ways, the expert's job in an inquisitorial system is easier than in adversarial systems because there is less assumption that the expert is biased toward one of the parties. However, the expert might have broader investigative responsibilities, depending on the judge's orders.

The same rules of integrity and professionalism for experts apply equally in both adversarial and inquisitorial proceedings.

Expert Reports

Experts typically create written reports regarding their analysis of the case. In adversarial processes, these reports are written in the pretrial stage and presented during direct examination by the party who retained the expert.

In inquisitorial processes, written reports are generally the only form of expert testimony presented, but the expert might also provide oral testimony. If there is oral testimony, the judge performs the direct examination. Because experts are hired for their opinions, they are not subject to the usual restrictions about statements of judgment very often. Experts also have other leeway not given to ordinary witnesses. They may rely on documents or exchanges that would otherwise be inadmissible as hearsay. This allows them to use articles, academic papers, professional texts, and consultations in rendering their opinions of the case. These materials are typically admissible as long as they were used by the experts in developing their opinions.

Question and Presentation Style

Expert witnesses present their findings in various ways, such as narrative questions, hypotheticals, specialized materials, and special exhibits. Experts are commonly asked to answer *narrative questions*, which are broad, open-ended questions that allow experts to state their opinions in their own words with minimal prompting. Fraud cases can require complex summarizing for the facts to make any sense. Average jurors and some judges have never considered how someone could manipulate store inventories to drive up the company's stock

price and then make a profit on the phony surge. The expert witness in cases dealing with such issues will often begin testimony by recounting the narrative background of a case, the tests and experiments that were performed during the investigation, and a summary of the findings based on the witness's professional expertise.

For example, during a direct examination, the judge or counsel for the party presenting the expert witness might ask open questions, such as, "Could you please tell us about the background of this case?" or "What procedures did you perform in your examination?"

Compound (two-part) and hostile questions do not generally occur in this process. Additionally, leading questions are generally not allowed during direct examination (e.g., "The results were negative, weren't they?").

Expert witnesses also are typically allowed to demonstrate their findings by using *hypotheticals*, which are fictional situations, analogous to the act in question, that clarify and highlight particular aspects of the dispute. But to be effective, hypotheticals must be constructed exquisitely. Appeals courts have been adamant that the facts of the case being tried have to be reflected directly in the hypothetical situation; there must be no exaggeration or obscuring in the presentation.

Publications and Exhibits

Experts sometimes use specialized materials in reaching and communicating their opinions, but generally, such materials must be used and relied on by people in the expert's relevant field. Also, these materials may be produced as part of the trial.

Finally, experts may use special exhibits to demonstrate facts about the case or some aspect of their opinion. These exhibits may include charts, diagrams, annotated documents, or photos. If the exhibit is offered to prove a fact, it must satisfy the rules applicable to any other piece of evidence in the case. In demonstrating a professional opinion, the role of the exhibit must be clear and its applicability to the present case justified, if necessary.

General Direct Testimony Considerations

The purpose of direct examination is to extract the evidence to prove or disprove issues in the case. Most likely, this will only be a reiteration of what previously has been discussed between the witness and counsel (in adversarial proceedings) or the judge (in inquisitorial

proceedings) outside the courtroom. It is still very important, however, for the witness to reacquaint themselves beforehand by reference to all relevant facts and data considered for the case.

Direct examination is the most organized aspect of the trial; it is the stage in which the witness's credibility must be established with the judge or jury.

According to the concept of the primary memory, people remember best what they hear first and last during a presentation. This is often a useful idea to employ in giving or structuring evidence. Another noteworthy point is that the fact finder in a proceeding often has a limited attention span in a long trial; thus, it is often useful to use a “grab/give/conclude” method of presenting evidence.

To a witness, the interpretation of questions and the ability to listen are crucial skills. Even though the witness might already have gone through a mock direct examination, it is critical that each question be carefully evaluated again—the witness should reflect upon the questions asked and not anticipate them (they might have been changed, anyway, since the time of rehearsal).

The answers to all questions should be clear and concise, and, where complex terms are used, they should be clarified. Similarly, expert witnesses should explain complex concepts in a layperson's terms and avoid professional jargon because the fact finders might not be familiar with esoteric or technical terminology.

Witnesses should avoid, or limit, the use of notes (if allowed) as much as possible, and they should strive to maintain eye contact.

If an expert witness is to give an opinion, they should state the opinion with conviction.

Certain standards for fraud examiners that apply when they testify are found in the ACFE Code of Professional Ethics (see the Fraud Prevention and Deterrence section of the *Fraud Examiners Manual*). Specifically, fraud examiners are prohibited from expressing opinions as to the guilt or innocence of any person or party. This is not to say that the witness cannot testify to the badges, hallmarks, or characteristics of fraud found in the case. It also does not mean that the fraud examiner cannot testify that, based on the evidence, they believe that the

accused might have committed the offense. However, the ultimate guilt or innocence of any person or party is the sole responsibility of the fact finder (i.e., judge, jury, arbitrator). The fraud examiner typically will not be permitted to testify to the ultimate fact questions.

Cross-Examination

Cross-examination refers to the questioning of one side's witness by the opposing side, and it is truly the highlight of the adversarial court system. Cross-examination, however, is uncommon in inquisitorial systems, although some civil law jurisdictions allow counsel for the parties to question witnesses in limited circumstances.

Cross-examination is geared to allow opposing counsel or another questioning party either to clarify or make points at the witness's expense. It generally is the most difficult part of the trial process for any witness. Questions during cross-examination might concern anything that might refute or embarrass the witness. During adversarial cross-examination, the witness's credibility will constantly be scrutinized. Inquisitorial cross-examination tends to be less confrontational, but even so, it is still important for witnesses to maintain poise and credibility in such situations.

Adversarial Cross-Examination

The goals of the opposing counsel during cross-examination are threefold. First, opposing counsel will seek to diminish the importance of the testimony presented by the witness. Second, opposing counsel will seek to have the witness testify in support of the opposing position by providing a series of assumptions. Third, opposing counsel will attack the witness's report or expert opinion (as applicable) to show the inadequacies, thereby discrediting the opinion, the report, and the witness.

The opposing counsel can attack or question anything that has been said or entered into court. This includes notes, working papers, affidavits, reports, and preliminary trial or discovery transcripts. Often, cross-examination creates an atmosphere of confrontation and contradiction.

When being cross-examined, the witness must not take attacks or attempts to discredit personally. Throughout the process, it is important for the witness to maintain pride and professional integrity.

Opposing counsel wants to reduce or limit the impact of the witness's evidence—it is natural for a witness to feel a certain amount of apprehension, and this might aid in keeping the witness alert. Often, the witness becomes aware as to the pace and reaction of the jury or judge to the evidence being presented. Slight changes in style and presentation could be made accordingly.

In adversarial proceedings, the opposing counsel usually has a plan of cross-examination in mind, and a witness should be able to anticipate this direction to avoid becoming entrapped. A danger of this, of course, is that the witness will spend as much time planning ahead as answering the questions and might not be giving appropriate attention to the immediate questions. Further, in attempting to anticipate a question, the witness might misunderstand what is actually asked.

Generally, a witness should not volunteer or freely give information.

Also, when providing an answer during cross-examination, it might be difficult to avoid getting trapped in various assumptions, what-if scenarios, and generalities presented by counsel. Opposing counsel might also pose overly complex questions in an attempt to convolute the witness's responses. If this occurs, or if asked a long or imprecise question, the witness should ask for a question to be rephrased in smaller components.

It is critical to never underestimate the expertise of the opposing counsel. Often, opposing counsel will be underplaying its understanding of the issues to ease the witness into a sense of security. This can lead the witness into a difficult situation. Opposing counsel's general rule is to cross-examine only if it would benefit the case. So, opposing counsel usually knows the answers to the questions it poses.

In asking questions of the witness, opposing counsel generally either will ask short questions in plain words or will ask leading questions. A common tactic is to make a question seem like a yes or no question, even though it might require an explanation. It is important for the witness to answer succinctly when possible to avoid appearing argumentative.

The opposing counsel generally will evaluate answers and then take a specific approach that furthers the argument. Generally, the witness will not be allowed to explain or elaborate on the question, as that would allow the witness to alter a carefully orchestrated cross-examination. Opposing counsel will continually question or evaluate how the last question and answer could be used against the witness.

Furthermore, opposing counsel will often prepare for cross-examination by researching the witness. For example, it is likely that counsel will read all of the witness's earlier testimony and publications. Opposing counsel also might speak to other lawyers as to the witness's capabilities in court if the lawyers have had experience with the witness. If weaknesses are discovered, the questioning probably will be directed toward those weaknesses.

Opposing counsel also might attempt to take psychological control of a witness by:

- Using physical presence to intimidate
- Making nonstop eye contact
- Challenging the witness's space
- Asking questions at a fast pace to confuse the witness
- Not allowing the witness to explain or deviate from the exact question

Physical domination is often used by opposing counsel. Opposing counsel will quickly discover the response pattern of the witness and might take an aggressive stance to lead the witness to the point where they are unsure.

It is not the witness's job to argue with or challenge the person conducting questioning. The witness should simply try to get through the cross-examination in the most professional way possible. If the questioning party uses blatantly unfair practices, the judge or jury will take note, and such practices might hurt the opposing side's case. In no circumstances should the witness argue. In adversarial proceedings, the counsel who called the witness is tasked with objecting to improper questioning, so the witness should continue answering questions until an objection is made, and then follow the court's directions. In inquisitorial proceedings, the judge should intervene if questioning is improper.

Inquisitorial Cross-Examination

Cross-examination is unusual in inquisitorial systems. Given that most lay and expert witnesses in inquisitorial jurisdictions are called by the judge, the closest thing to cross-examination in inquisitorial systems occurs when the parties object to or examine the witness. In some jurisdictions, the parties typically do not ask questions directly, but they may submit suggestions for inquiries to the judge. If parties are allowed to directly question witnesses, the questioning is usually less aggressive than in adversarial systems. Even so, the witness should be just as cautious in inquisitorial systems to preserve their credibility.

There are several considerations for experts in inquisitorial systems. Since the primary expert or experts are obtained by the court itself, they are generally seen as inherently less biased than experts in adversarial proceedings. Additionally, the selection of the expert is an extension of the court's authority and discretion. Therefore, for a party's legal counsel to attack the expert's credibility in an adversarial way would be strategically unwise in most circumstances.

However, parties are usually allowed to raise limited objections to an expert witness if they believe the expert is biased. For example, the expert might have a relationship with one of the parties to the litigation. The parties are often allowed to question the expert's analysis or methods used. While this process is less confrontational than in adversarial systems, a poor performance can lead to the court rejecting the expert's testimony.

Additionally, fraud examiners might be asked to serve as experts for the parties to litigation. In this case, the judge or the court-appointed expert may question a party's expert. Party experts will have a perception of potential bias, so the questioning might involve similar tactics as those that occur in adversarial cross-examination.

Strategies to Discredit Witnesses

The questioning party might employ various methods to discredit a witness or to diminish the importance of a witness's testimony. These methods could be used alone or in conjunction with one another and are not an all-encompassing list. A party with adverse interests in cross-examination will quickly discover the witness's weak areas and employ any possible techniques to achieve its goal.

Note that some of these strategies are unavailable to opposing counsel or other questioning parties due to restrictions on the scope of questioning (this is especially true in inquisitorial jurisdictions).

Also, in some inquisitorial jurisdictions, lawyers cannot impeach a witness whom they know to be telling the truth because such impeachment arguably interferes with the court's pursuit of truth.

Myopic Vision

Myopic vision, a tactic primarily used against expert witnesses, entails getting the expert witness to admit to excessive time being spent on a specific matter, and then selecting an area to

highlight in which the witness is unsure or has not done much work. This area might not be central to the issues in the case or to the conclusions reached. Then, the questioning party will make a large issue of it and suggest that the witness's vision is myopic in that the work was limited in extent or scope and, as such, substandard. At the same time, the questioning party might reference the expert's fees to show that the party retaining the expert spent large sums to have this "obviously incomplete" work done.

Safety

The questioning party might seek to ease the witness into a feeling of false security by not attacking them at first, but then—after the witness feels safe—finding a small hole in the testimony that can be enlarged quickly. This approach is often characterized by being friendly and conciliatory, by which the fact finder is made sympathetic to the questioning party's cause. The questioning party also might attempt to achieve a certain amount of association with the witness that will make the witness want to help the questioning party to bring out information. Doing so may result in the witness giving information that otherwise would not have been given. With this additional information, it might be possible to find a vulnerability or hole in the evidence and open it further.

Contradiction

In this type of attack, the questioning party seeks to impeach the witness by showing that the witness's testimony is contradictory or inconsistent. The questioning party might use leading questions to force the witness into a hard or contradictory position. Alternately, the questioning party can show that an expert's testimony contradicts documents or quotes from other articles written by experts in the field. If these documents or articles are in contradiction to the expert witness, then an admission can be obtained from the expert as to that contradiction. If a contradiction exists, the expert might be drawn into an argument as to who is the most appropriate or experienced person. A questioning party can also show that an expert witness has contradicted themselves or their own article, and often, such attacks occur because the expert does not have a strong memory of the matter, or because of confusion resulting from the attack.

New Information

The questioning party may introduce new information of which the witness might not be aware. This normally is done to confuse the witness in the hope that the witness might contradict themselves or show that an expert witness's existing testimony, assessment, report, or opinions are no longer valuable.

Support Opposing Side's Theory

This method is used against expert witnesses. In this approach, the questioning party recognizes an expert witness's qualifications and evidence, but they provide a different theory that relies on an alternative interpretation of the facts and try to get the expert to agree with the alternate theory. By obtaining the expert's agreement, the questioning party, in effect, makes the expert a witness for the other side. This technique is useful to obtain concessions from the witness that would damage their conclusions and, ultimately, their credibility.

Bias

The questioning party may seek to show that the witness is biased. *Bias* refers to partiality that prevents a witness from objectively considering an issue or situation. Often, this method draws the retaining party and the witness together to show possible collusion as to the evidence being presented, and hence, to demonstrate bias. Collusion and bias can be shown if the questioning party can determine that the retaining party had instructed the witness as to what to say or by limiting the witness's scope and thus their conclusions.

Attempts to show bias also can focus on the question of whether or not the witness was told by their client what to do and look for. With this approach, opposing counsel might attempt to show that the witness overlooked important documentation in an effort to assist their client.

Confrontation

The questioning party may seek to use confrontation to put the witness into a situation where they lose emotional control and show anger. If a witness explodes when confronted by the questioning party, the witness's credibility normally disappears.

Sounding Board

The questioning party may seek to use the witness as a sounding board to reacquaint the judge or jury with the favorable aspects of the questioning party's theory. This technique often uses the "Is it not true?" and "Would you agree with me?" approach. Often, the questions cover basic premises of the case that both parties agree to. Constant, nonstop agreement is used to intimidate the witness. If the witness agrees with various questions raised by the questioning party, the judge or jury might interpret the agreement to mean that the witness generally concurs with the questioning party's position.

Witnesses should be cautious not to be urged into agreeing with what the questioning party says after a barrage of "easy" questions. The questioning party might eventually try to trick

the witness into agreeing with something that contradicts former testimony. At the same time, the witness should not resist agreeing with accurate assessments because doing so makes them look combative and biased. It is important for witnesses to provide a thoughtful response to each question.

Willing to Say Anything for a Price

Under this method, which is used against expert witnesses, the questioning party portrays the witness as an individual who is willing to form their opinion in favor of the side that paid them. The attack might indicate a lack of complete work and be correlated to the fee charged. This method is often related to *bias* and *myopic vision*. The questioning party might suggest that the witness, their report, or their opinion are, in fact, biased. This technique often builds to a conclusion in which the questioning party decides that the expert's work was superficial and unprofessional, yet the expert received a great deal of money for this and other services provided to the client. These techniques seek to suggest that the testimony was purchased or that the witness was paid to overlook facts contradictory to the conclusions reached.

Terms of Engagement

This method is used against expert witnesses, and in this approach, the questioning party attacks the terms used to engage the witness. This technique normally is employed by obtaining the original engagement letter and examining the terms of engagement. With such information, the questioning party can show that the expert witness intended to look only at various items in support of their client and disregarded alternative theories, generally to the detriment of the opposition. As such, the witness could be portrayed as partial.

Discrediting the Witness

The questioning party may seek to discredit the witness by proving that they are unworthy to be a credible witness to the court. This can often be accomplished by showing that the witness is currently or has previously been grossly biased, prejudiced, or corrupt; been convicted of criminal activities; been shown to engage in immoral activities; made inconsistent statements; acquired a reputation for a lack of veracity; or exaggerated their qualifications.

Discrediting also could consist of looking at the quality of the witness's educational background to reveal any other unusual activities that might bias the witness or exclude them from the court as an expert.

Personal Attacks

The questioning party may also make personal attacks against the witness to damage their credibility. The following are common areas of attack:

- The witness is unqualified.
- The witness displayed unprofessional behavior during the examination (e.g., asking personal or inappropriate questions during interviews).
- The witness had a conflict of interest.
- The witness was harassing (e.g., phone calls at home, threatening voice mails).

Failure to Follow the Standards of the Profession

Additionally, the questioning party may attempt to discredit expert witnesses by trying to show that they failed to follow the standards, best practices, or professional conduct rules set forth by their profession, such as the ACFE for fraud examiners or other professional bodies for accountants, attorneys, etc.

For fraud examiners, it is extremely important to be familiar with the tools and techniques set forth in the *Fraud Examiners Manual*. There have been cases where enterprising defense attorneys have obtained copies of the *Manual* and quizzed the fraud examiner about whether or not the methods set forth in the *Manual* were followed. Likewise, attorneys will often question fraud examiners about the ACFE Code of Professional Ethics, particularly regarding the prohibition against stating an opinion on guilt or innocence (which is discussed below).

It is important to understand that the *Fraud Examiners Manual* does not set forth standards. The *Manual* provides the fraud examiner with information, suggestions, and methods for conducting a fraud examination. An ACFE member is always required to follow the ACFE Code of Professional Ethics, but they are not required to follow what is set forth in the *Fraud Examiners Manual*.

However, if a fraud examiner deviates from the normal investigative methods set forth in the *Manual*, they should have an explanation as to why it was appropriate and explain that the *Manual* is only provided as guidance.

Expressing an Opinion on Guilt

As previously discussed, testifying expert witnesses give opinion testimony, which is based upon their specialized knowledge and experience about case issues, but experts may only give

opinion testimony in areas that will aid the fact finders in reaching their verdict. Additionally, in some jurisdictions, experts may give opinion testimony on ultimate issues (i.e., the basic conclusions upon which the outcome of a case depends), but they cannot offer legal conclusions or educate the jury on the principles of law. However, there are some jurisdictions that do not allow expert opinions at all, and in such jurisdictions, experts are restricted to providing technical information.

Moreover, article five of the ACFE Code of Professional Ethics prohibits opinions regarding the guilt or innocence of any person or party. Determining whether a person is guilty or innocent of a crime is not a decision for fraud examiners; it is a decision that is reserved for a judge or jury. Article five states:

An ACFE member, in conducting examinations, will obtain evidence or other documentation to establish a reasonable basis for any opinion rendered. No opinion shall be expressed regarding the guilt or innocence of any person or party.

This rule is a rule of prudence. Clearly, it is prudent for a fraud examiner to refrain from usurping the role of the judge or jury. In a courtroom, no good attorney would ask a fraud examiner for such a conclusion, and no alert judge would allow such testimony.

The fraud examiner's job is to present the evidence in their report. Such evidence might constitute a convincing case pointing to the guilt or innocence of a person. However, a distinction should be made between a report that essentially says, "Here is the evidence," and one that says "This person is guilty (or innocent)." Nevertheless, there is a minute distinction between recommending action—forwarding the evidence to a law enforcement agency or filing a complaint or lawsuit—and giving an opinion on guilt or innocence. Fraud examiners might make such recommendations because they think the evidence is strong enough to support a case. They might even have a conclusion about whether the suspect committed a crime. The rule does not prohibit the fraud examiner, under the proper circumstances, from accusing the person under investigation. However, the ultimate decision of whether a person is "guilty" or "innocent" is for a judge or jury to determine. The fraud examiner is free to report the facts and the conclusions that can be drawn from those facts, but the decision as to whether or not a person is guilty of a crime is a decision for the judge or jury.

Witness Immunity for Experts

In many jurisdictions, expert witnesses have some level of immunity from lawsuits due to their service as experts. The immunity often applies to trial testimony, deposition testimony, and report preparation. There are three commonly cited public policy rationales for granting this immunity: (1) the immunity rule prevents self-censorship of the witness; (2) without immunity, witnesses may be inclined to distort their testimony in fear of a retaliatory lawsuit; and (3) the cross-examination process ensures truthful and reliable testimony.

In other jurisdictions, expert witnesses can be sued for negligence if they breach their professional duty to act within the standard of care. The bases for denying immunity to experts are generally founded on the following rationales: (1) potential liability encourages total and honest testimony; (2) experts should be held to the standard of their profession; and (3) the judicial system does not adequately ensure truthful and reliable testimony from experts.

Since jurisdictions have different laws regarding witness immunity, fraud examiners should be familiar with the relevant laws in every jurisdiction in which they intend to serve as an expert witness.

For additional information on how witness immunity is applied in specific jurisdictions, see the content on “Witness Immunity for Experts” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Summary

In his book *Succeeding As an Expert Witness*, Harold A. Feder suggests that experts do the following while working on a particular case:

- Keep an open mind.
- Do not approach a case with predetermined conclusions as to causation, culpability, fault, or damage.
- Remember that attorneys and clients might present slanted facts, either accidentally or purposefully.
- Carefully follow one’s own well-established investigative steps; develop forms, procedures, and processes that will ensure evidence is not overlooked.

One of the best things experts can do is to stay current about new developments in their field. It takes a concerted effort to remain knowledgeable about changes and advances in any industry, as well as the latest forensic investigation methods. To be a successful expert witness in any area of accounting, for instance, one must have a thorough knowledge of not only generally accepted accounting principles, but also current promulgation. For cases involving credit card fraud, one must have a basic understanding of their nation's electronic banking system. While active practice in one's field of expertise—in other words, experience—remains their single most valuable source of knowledge, other sources abound.

Actions that maintain and improve one's current credentials and make them a better expert witness include:

- Pursuing continuing education and training opportunities
- Reading trade journals and publications
- Joining and participating in professional societies and associations
- Teaching, lecturing, and holding seminars
- Attending specialized seminars and workshops
- Writing for trade journals and publications
- Taking advanced computer courses

Experts can practice their oral delivery skills, and hence improve their credibility, by actively pursuing public speaking engagements and opportunities.

Similarly, to feel more comfortable on the legal stage, an expert witness might wish to visit their local courtroom to observe another financial expert giving testimony in similar cases.

PLANNING AND CONDUCTING A FRAUD EXAMINATION

Fraud examinations—which could include the investigation of fraud allegations or an inquiry into an organization’s anti-fraud policies and controls—represent perhaps the most important part of a fraud examiner’s wide and varied body of knowledge. Myriad factors can impact a fraud examination, complicating the process for the fraud examiner and the investigation team. However, careful and thorough planning will mitigate these challenges and ensure that those involved are prepared to carry out a responsible and thorough engagement that achieves its goals without jeopardizing results. Taking the time to properly plan a fraud examination greatly increases the chances of its success.

Why Conduct a Fraud Examination?

There are many reasons why organizations choose to conduct fraud examinations. In particular, a properly executed fraud examination can address a number of organizational objectives, including:

- Identifying improper conduct
- Identifying the persons responsible for improper conduct
- Stopping fraud
- Sending a message throughout the organization that fraud will not be tolerated
- Determining the extent of potential liabilities or losses that might exist
- Helping facilitate the recovery of losses
- Stopping future losses
- Mitigating other potential consequences
- Strengthening internal control weaknesses

In some instances, a fraud examination might be required by law. A duty to investigate can arise from statutes, regulations, contracts, or common law duties. For example, a corporation’s directors and officers owe a common law duty of care to their organization and shareholders; therefore, when suspicions of fraud arise, it might be necessary for them to commission an investigation to ensure that they have full knowledge of such issues affecting the company. Likewise, some laws hold employers accountable for investigating employee complaints involving certain matters, such as retaliation, discrimination, harassment, and similar issues.

Tips

Fraud can be discovered in several ways; it can be discovered via a tip or complaint or through an auditing procedure or monitoring. Fraud is even discoverable by chance. According to the ACFE 2020 *Report to the Nations*, approximately 43% of all internal investigations originate with a tip from an employee, customer, or vendor. Management review and internal audit initiate approximately 12% and 15% of internal investigations, respectively, while the remainder are discovered through other means.

Because tips are the most valuable resource for discovering internal fraud, companies should encourage them by implementing easily accessible and anonymous (where permitted by law) fraud reporting tools, such as a tip hotline or dedicated web page. Additionally, these reporting programs should be designed to accept tips from external sources such as customers and vendors.

Not all tips are valid, and while it is important to consider the motives of individuals willing to supply information of this kind, all tips must be approached as if they will provide useful information. In many instances, the tipster provides information that is of value in commencing an internal fraud examination.

What Fraud Examination Entails

The term *fraud examination* refers to a process of resolving allegations of fraud from inception to disposition, and it is the primary function of the anti-fraud professional. The fraud examination process encompasses a variety of tasks that might include:

- Obtaining evidence
- Reporting
- Testifying to findings
- Assisting in fraud detection and prevention

Obtaining Evidence

The value of a fraud examination rests on the credibility of the evidence obtained. Evidence of fraud usually takes the form of documents or statements by witnesses; therefore, fraud examiners must know how to properly and legally obtain documentary evidence and witness statements.

Reporting

Once evidence has been obtained and analyzed, and findings have been drawn from it, the fraud examiner must report the results to the designated individuals (e.g., management, the board, or the audit committee). A fraud examination report is a narration of the fraud examiner's specific activities, findings, and, if appropriate, recommendations.

Such communications are necessary so that management can determine the appropriate course of action.

The results of an examination can be communicated in various ways. The appropriate method of communication depends on the facts at issue, but most reports are communicated orally or in writing.

When communicating the results of a fraud examination, the fraud examiner is responsible for providing clear, accurate, and unbiased reports reflecting the fraud examination results. This need arises from the possibility that such results might end up being read or used by various groups of people, such as organization insiders, attorneys, defendants, plaintiffs, witnesses, juries, judges, and the media.

Testifying to Findings

Often, fraud examiners are called upon to provide testimony and report their findings at a deposition, trial, or other legal proceeding. When providing testimony, fraud examiners must be truthful. They should also communicate in a clear and succinct manner.

Assisting in Fraud Detection and Prevention

Fraud examiners are not solely responsible for the prevention of fraud; such responsibilities typically belong to management or other appropriate authorities. Nevertheless, fraud examiners are generally expected to actively pursue and recommend appropriate policies and procedures to detect and prevent fraud, especially when their examinations identify issues with fraud controls.

Because of their education, experience, and training, CFEs are uniquely qualified to assist organizations in the prevention and detection of fraud.

Fraud Examination and Forensic Accounting

Although fraud examination shares certain characteristics with forensic accounting, they are not the same discipline.

Forensic accounting is the use of professional accounting skills in matters involving potential or actual civil or criminal litigation. The word *forensic* is defined by *Black's Law Dictionary* as “used in or suitable to courts of law or public debate.” Therefore, *forensic accounting* is actually litigation support involving accounting.

Accordingly, many fraud examinations can be considered forensic accounting, but not all forensic accounting is fraud examination. For example, an individual hired to appraise property in a minority shareholder derivative suit would engage in forensic accounting even if the engagement does not involve fraud.

While fraud examinations can be conducted by either accountants or non-accountants, forensic accounting work can only be performed by accountants. In addition, while forensic accounting is litigation support work that involves accounting, fraud examinations only involve anti-fraud matters.

Forensic accounting can include many professional services. Typically, forensic accountants perform assignments involving:

- Bankruptcies, insolvencies, and reorganizations
- Workplace fraud investigations
- Calculations of economic losses
- Business valuations
- Professional negligence

Fraud Examination Methodology

Fraud examination is a methodology of resolving signs or allegations of fraud from inception to disposition. The fraud examination methodology establishes a uniform, legal process for resolving signs or allegations of fraud on a timely basis. It provides that fraud examinations should move in a linear order, from the general to the specific, gradually focusing on the perpetrator through an analysis of evidence.

Fraud examinations involve efforts to resolve allegations or signs of fraud when the full facts are unknown or unclear; therefore, fraud examinations seek to obtain facts and evidence to help establish what happened, identify the responsible party, and provide recommendations where applicable.

When conducting a fraud examination, the fraud examiner should assume litigation will follow, act on predication, approach cases from two perspectives, move from the general to the specific, and use the fraud theory approach.

Assume Litigation Will Follow

Each fraud examination should be conducted with the assumption that the case will end in litigation. This will ensure that the fraud examiner maintains compliance with the proper rules of evidence and remains well within the guidelines established by the legal systems.

Act on Predication

Fraud examinations must adhere to the law; therefore, fraud examiners should not conduct or continue fraud examinations without proper predication. *Predication* is the totality of circumstances that would lead a reasonable, professionally trained, and prudent individual to believe that a fraud has occurred, is occurring, or will occur. In other words, predication is the basis upon which a fraud examination, and each step taken during the examination, is commenced.

A fraud examiner acts on predication when there is a sufficient basis and legitimate reason to take each step in an examination.

Accordingly, fraud examiners should begin a fraud examination only when there are circumstances that suggest fraud has occurred, is occurring, or will occur, and they should not investigate beyond the available predication. If fraud examiners cannot articulate a factual basis or good reason for an investigative step, they should not do it. Therefore, fraud examiners should reevaluate the predication as the fraud examination proceeds. That is, as a fraud examination progresses and new information emerges, fraud examiners should continually reevaluate whether there is adequate predication to take each additional step in the examination.

If fraud examiners act without predication, they might expose themselves and their clients or employers to liability.

The requirement for predication, however, does not bar fraud examiners from accepting other forms of engagements in circumstances where predication is lacking. For example, if employees appear to be living beyond their means (i.e., living a more extravagant lifestyle than their income would seem to allow), there could be many reasons other than fraud to explain the disparity, such as an inheritance, a higher-earning spouse, or royalties received from mineral rights; however, in such circumstances, a fraud examiner can conduct a fraud risk assessment for consulting purposes even if there is not necessarily reason to believe a fraud has occurred, is occurring, or will occur.

Approach from Two Perspectives

Fraud examiners should approach investigations from two perspectives: (1) by seeking to prove that fraud has occurred and (2) by seeking to prove that fraud has not occurred. To prove that a fraud *has* occurred, the fraud examiner must seek to prove that fraud has *not* occurred. The reverse is also true. To prove fraud *has not occurred*, the fraud examiner must seek to prove that fraud *has* occurred. The reasoning behind this two-perspective approach is that both sides of fraud must be examined because in most legal systems, *proof of fraud must preclude any explanation other than guilt*. Additionally, approaching fraud examinations from two perspectives preserves the fraud examiner's objectivity and helps ensure that bias does not influence an examination's results.

Move from the General to the Specific

Fraud examinations commence when the full facts are unknown or unclear; therefore, they should proceed from the general to the specific. That is, fraud examinations should begin with general information that is known, starting at the periphery, and then move to the more specific details.

For example, consider the order of interviews in fraud examinations. In most examinations, fraud examiners should start interviewing at the periphery of all possible interview candidates and move toward the witnesses who appear more involved in the matters that are the subject of the examination. Thus, the usual order of interviews is as follows:

- Neutral third-party witnesses, starting with the least knowledgeable and moving to those who are more knowledgeable about the matters at issue
- Parties suspected of complicity, starting with the least culpable and moving to the most culpable
- The primary suspect(s) of the examination

Use the Fraud Theory Approach

When conducting fraud examinations, fraud examiners should adhere to the fraud theory approach. The fraud theory approach is an investigative tool designed to help fraud examiners organize and direct examinations based on the information available at the time.

The fraud theory approach provides that, when conducting investigations into allegations or signs of fraud, fraud examiners should make a hypothesis (or theory) of what might have occurred based on the known facts. Once fraud examiners have created a hypothesis, they should test it through the acquisition of new information (or correcting and integrating known information) to determine whether the hypothesis is provable. If, after testing a hypothesis, fraud examiners determine that it is not provable, they should continually revise and test their theory based on the known facts until it is provable, they conclude that no fraud is present, or they find that the fraud cannot be proven.

Simply put, the fraud theory approach involves the following steps:

- Analyzing available data
- Creating a hypothesis
- Testing the hypothesis
- Refining and amending the hypothesis

The following internal fraud case study illustrates the concepts involved in the fraud examination process. Although the case study is based on an actual incident, the names and certain other facts have been changed for purposes of illustration.

LINDA REED COLLINS CASE STUDY

Linda Reed Collins is purchasing manager for Bailey Books Incorporated in St. Augustine, Florida. Bailey, with \$226 million in annual sales, is one of the country's leading producers of textbooks for the college and university market, as well as technical manuals for the medical and dental professions.

Bailey's headquarters consists of 126 employees, plus numerous sales personnel in the field. Because of the competitive nature of the textbook business, the company's profit margins are quite thin. Bailey's purchases average about \$75 million annually, consisting mostly of paper stock and covering used in the manufacturing process. The great majority of the manufacturing is done in Mexico through contracts with the Mexican government.

The purchasing function is principally handled by three purchasing agents. Linda Reed Collins is the purchasing manager and has two other buyers who report to her, plus another 18 clerical and support personnel.

Because Bailey Books is required by investors and lenders to have audited annual financial statements, Bailey employs a large regional certified public accountant (CPA) firm to conduct its annual audit and has a staff of five internal auditors.

All internal fraud matters within Bailey are referred to Loren D. Bridges, a CFE. Often, internal fraud issues at Bailey involve skimming by Bailey's cashiers, but Bridges also receives a constant stream of complaints alleging misconduct by Bailey Books' salespeople and distributors.

On January 28, Bridges received a telephone call in which the caller, who was male, wanted to keep his identity hidden. The caller, however, claimed to have been a "long-term" supplier of books, sundries, and magazines to Bailey. The caller said that ever since Linda Reed Collins took over as purchasing manager for Bailey several years ago, he has been systematically forced out of doing business with Bailey. Although Bridges queried the caller for additional information, the caller hung up the telephone.

Under the facts in this case study, there could be many legitimate reasons why a supplier to Bailey would feel unfairly treated. Linda Reed Collins could be engaged in fraud, as the caller claimed, or the caller could be someone who has a personal vendetta against Collins and wants to get her fired. That is, Bridges does not have enough information to know if the caller was forced out of doing business with Bailey or why this might have been the case. Because Bridges does not have all of the facts, he should investigate the matter using the fraud theory approach.

Analyzing Available Data

Under the fraud theory approach, Bridges should begin by analyzing the available data so he can create a preliminary hypothesis as to what has occurred.

Also, if those responsible determined that an audit of the entire purchasing function is warranted, the audit would be conducted at the time this determination is made. When conducting the audit, the internal auditors should keep in mind that there is a possibility that fraud might exist.

Creating a Hypothesis

Once Bridges has analyzed the available data, he should create a preliminary hypothesis as to what has occurred. The hypothesis should be a worst-case scenario. That is, based on the caller's statements, Bridges should determine the worst possible outcome. Under these facts, the worst possible outcome would be that one of Bailey's purchasing agents has been accepting kickbacks to steer business to a particular vendor.

Fraud examiners can create hypotheses for any specific allegation (e.g., a bribery or kickback scheme, embezzlement, conflict of interest, or financial statement fraud).

Testing the Hypothesis

Once Bridges has created a hypothesis, he should test it through the acquisition of new information or by correcting and integrating known information.

Testing a hypothesis involves creating a what-if scenario. For example, in the facts of the Linda Reed Collins case study, Bridges hypothesizes that, based on the anonymous tip, a vendor is bribing a purchasing agent to receive more business that previously went to other vendors. He would test this hypothesis by looking for some or all of the following facts:

- A vendor is receiving an unusually large amount of business.
- Purchases of high-priced, low-quality goods or services over an extended period.
- A purchasing agent has a personal relationship with a vendor.
- A purchasing agent with the ability to steer business toward a favored vendor.
- A purchasing agent's lifestyle suggests unexplained wealth or outside income.

Bridges could readily look for facts indicating a bribery scheme. He could readily establish whether a vendor is receiving an unreasonably large proportion of Bailey Book's business when compared to similar vendors. Bridges could ascertain whether Bailey Books was paying too much for a particular product, such as paper, by simply calling other vendors and determining competitive pricing. He could determine whether a vendor has a personal relationship with a purchasing agent by discreet observation or inquiry. Bridges could determine whether a particular purchasing agent had the ability to steer business toward a favored vendor by determining who is involved in the decision-making process. Also, he could learn about the agent's lifestyle by examining public documents such as real estate records and vehicle titles or by looking at the agent's social media accounts.

Refining and Amending the Hypothesis

If, after testing a hypothesis, the fraud examiner determines that it is not provable, the fraud examiner should continually revise and test it based on the known facts. For example, if Bridges tests his hypothesis that a vendor is bribing a purchasing agent of Bailey Books and learns that the facts do not fit the presence of a bribery scheme, he should revise his hypothesis and retest it. (Obviously, if a fraud examiner tests their hypothesis and determines that the facts do not fit the presence of a bribery scheme, it could be that no fraud is present or that the fraud cannot be proven.)

The following flowchart sets forth how the fraud examination process is used to resolve signs or allegations of fraud.

Develop a Fraud Response Plan

When evidence of misconduct arises, management must respond in an appropriate and timely manner. During the initial response, time is critical. To help ensure that an organization responds to suspicious fraud-related activity efficiently and effectively, management should have a response plan in place.

A *fraud response plan* outlines the actions that members of an organization will take when suspicions of fraud have arisen. Because every fraud is different, the response plan should not specify how every fraud examination should be conducted. Instead, it should help organizations manage their responses and create environments to minimize risk and maximize the potential for success.

Additionally, a response plan allows management to respond to suspected and detected incidents of fraud in a consistent and comprehensive manner. Having a response plan in place sends a message that management takes fraud seriously.

More specifically, the fraud response plan should guide the necessary action when potential fraud is reported or identified.

Also, a response plan should not be unduly complicated; for a response plan to work in high-pressure and time-sensitive situations, it must be simple to understand and administer.

While the appropriate response will vary based on the event, management should include a range of scenarios in the response plan, taking into consideration previous frauds within the organization and fraud risks specific to the industry or business sector in which it operates.

Organizations without a fraud response plan might not be able to respond to issues properly and will likely expend more resources and suffer greater harm than those that have such a plan in place. Conversely, having a response plan puts an organization in the best position to respond promptly and effectively.

This section explores the elements of a fraud response plan, which include:

- Reporting protocols
- A response team responsible for conducting an initial assessment
- Factors used to determine the course of action

- Litigation hold procedures
- Principles for documenting the response plan
- A template or form to report fraud incidents

Reporting Protocols

One of the first steps when developing a response plan is to establish reporting protocols for tips, matters, allegations, and other indicators of improper activity. Reporting protocols are necessary to ensure that designated individuals are notified immediately to enable a prompt response.

Reporting protocols should outline notification principles and escalation triggers, depending on the nature and severity of the allegations. That is, they should indicate how to communicate the incidents to the appropriate level of management. For example, a fraud response plan might instruct employees to report suspicions of fraud to their manager (if possible), a designated human resources (HR) or compliance officer, or the head of audit and enforcement.

Next, the issue should be reported to the party or parties responsible for conducting an initial assessment to determine how to respond and whether a full investigation is necessary.

Additionally, organizations should provide multiple channels for reporting concerns about fraud, including a whistleblower program that allows for anonymous reporting, where possible, and should at least implement a whistleblower protection policy.

A Response Team

No single person can effectively address every fraud-related issue. Therefore, the fraud response plan must identify key individuals who might be required to respond to a particular fraud. The response team members will vary depending on the facts and the potential severity of the suspected fraud, but the team might include:

- Legal counsel
- A representative of management
- A CFE
- The finance director
- A representative of internal audit
- Audit committee members

- A C-level executive
- IT personnel
- An HR representative

Factors Used to Determine the Course of Action

Again, the response team should determine the appropriate course of action when fraud is suspected. In general, if an allegation of fraud-related misconduct arises, management should conduct an investigation, but there are other courses of action it might decide to take. To help decide the best course of action, management should identify a list of factors it will use to make this decision. Identifying such factors will help the response team determine whether to escalate an incident into an investigation.

Each organization will have different criteria for deciding whether allegations or suspicions qualify for a formal investigation, but common considerations include:

- Credibility of the allegation
- Type of incident
- The subject of the allegation
- The business purpose of the activity at issue
- Seriousness or severity of the allegation
- Potential negative impact
- Likelihood that the incident will end up in court
- The ways in which prior, similar incidents were handled

Litigation Hold Procedures

If an organization does not already have litigation hold procedures in place following a credible allegation of fraud, management should institute them immediately. A *litigation hold* refers to the steps an organization takes to notify employees to suspend the destruction of potentially relevant records when the need to preserve information arises.

Litigation hold procedures are necessary to ensure that potentially responsive documents are not destroyed once evidence of misconduct arises. The failure to preserve relevant evidence could have several adverse consequences, including, but not limited to, the government's questioning of the integrity of any fraud investigation, monetary fines and sanctions, adverse inference jury instruction sanctions, or dismissal of claims or defenses.

To establish litigation hold procedures, management should:

- Identify the scope of litigation hold procedures (i.e., the locations that the litigation hold procedures will cover).
- Examine how information moves through the organization.
- Determine how to identify relevant documents.
- Develop a process to ensure such information is preserved.

Litigation hold procedures should apply to individual communications (e.g., email, chat messages, voice recordings), data on shared devices (e.g., network folders), system backup files, and archived data.

In general, litigation hold policies should be developed so the organization can:

- Promptly notify employees who might possess relevant documents.
- Issue a preliminary hold order to all individuals and employees who might possess relevant information.
- Promptly notify IT personnel and get their involvement if electronic data are at issue.
- Notify employees and IT personnel of their duty to preserve.
- Suspend any deletion protocols.
- Prohibit the destruction, loss, or alteration of any potentially relevant documents.
- Prohibit employees from destroying, hiding, or manipulating documents.
- Alert employees regarding the risk to the company and its employees if they fail to heed the litigation hold request.

Moreover, establishing litigation hold procedures will help those involved in an investigation identify the relevant sources of information quickly, and it will help them understand the technology options available for searching, analyzing, and reviewing data.

Even though litigation holds should apply to both electronic data and physical documents, electronic data contain certain attributes that make executing a timely litigation hold more difficult. Specifically, electronic data might only be available for a temporary period, as business practices are often designed to free up storage space by deleting this type of information. Electronic data can reside in numerous locations, and identifying relevant electronic data within today's large and complex data systems can be challenging and costly. A key objective of a litigation hold is to suspend any automatic document deletion programs or rules that might be in place.

If an organization operates internationally, it is more difficult to execute a timely hold. In such cases, management should consider retaining an outside expert to help with the data search and preservation.

Principles for Documenting the Investigation

Management should establish principles in the response plan for documenting information during each phase of a fraud investigation. The principles should be designed to record all information relevant to or created during each phase of a fraud investigation, including the initial response, that is used to support decision-making.

A Fraud Incident Report Log

Management should also develop a fraud incident report log of all suspicions of fraud, including those not investigated, to serve as a record of the organization's response efforts. Once a suspicion of fraud arises, the issue should be recorded and detailed in the log, and as the issue progresses, the log should be modified. Ultimately, it should contain details of actions taken and conclusions reached.

The report log should include information on the following items:

- How the organization became aware of the suspected fraud, including the name of any complaining party
- The date the issue was raised or reported
- The nature of the suspected fraud
- Department or divisions involved
- Suspect employees or parties
- Actions taken

Initial Response to Suspicions or Allegations of Fraud

When responding to suspected and detected incidents of fraud, time is critical. Management and fraud examiners must be prepared to address a number of issues in a short amount of time, sometimes under stressful conditions.

This section explores the first steps that management and fraud examiners should take when a fraud-related incident becomes known, and it provides a list of tips for managing and organizing the process of responding to suspected and detected incidents of fraud.

Initially, when a suspicion or allegation of fraud arises, management must respond quickly. Failure to do so could result in litigation, enhanced penalties, and enforcement actions by government regulators.

The appropriate response varies depending on the facts, such as the underlying evidence, who is implicated, how the evidence came about (e.g., internal sources, civil lawsuit, investigation by the government), and so on. When evidence of fraud arises, management generally should respond by engaging in the following actions:

- Activating the response team
- Engaging legal counsel, if necessary
- Contacting the insurance providers, if it makes sense to do so
- Addressing immediate concerns (e.g., preserving relevant documents and identifying who should be informed)
- Conducting an initial assessment to determine the appropriate response
- Documenting the initial response

Activating the Response Team

When evidence of fraud arises, management must activate the fraud response team—the group of people tasked with responding to incidents of fraud. When activated, the response team should seek to answer the following questions:

- Is a formal investigation necessary?
- If a formal investigation is necessary, who will lead it?
- Is there a need for immediate police involvement?
- Is there an immediate need for legal assistance or advice?
- Is there a need for external support (e.g., forensics specialists)?
- Is there a need for additional support (e.g., access to IT facilities or a secure room, support from administration)?
- Is there a need to devise a media strategy to deal with the issue?
- Is there a need to report the issue to an external third party?
- Should the audit committee be informed?

Engaging Legal Counsel

Because of the legal uncertainties associated with certain instances of fraud, management should consult with internal and possibly external local legal counsel before making any decisions or taking any action concerning the suspected conduct. Typically, the general counsel should be made aware of any significant fraud that might result in legal action.

Contacting the Insurance Providers

When evidence of fraud arises, it is generally impossible to know whether the incident will result in an insurance claim, but even so, many insurance policies require timely notice of potential claims. Therefore, an organization should consider putting its insurer on notice to preserve a potential insurance claim.

Addressing Immediate Concerns

Also, when evidence of fraud arises, management and the response team should address immediate concerns, which might include:

- Preserving relevant documents
- Identifying who should be informed

Preserving Relevant Documents

When evidence of fraud arises, management should seek to preserve all relevant documents, especially those that an employee might want to hide or destroy. In a fraud investigation context, the term *documents* typically refers to, but is not limited to, contracts, invoices, correspondence, memoranda, weekly reports, presentations, telephone messages, emails, reports, performance reviews, performance improvement plans, medical records, and other written or recorded material.

When evidence is misplaced, lost, or destroyed, it becomes more difficult to conduct an investigation. Thus, the response team and management must take action to preserve evidence as soon as the decision to investigate is made. There are a number of steps that management should take to preserve relevant documents. For one thing, management should work with legal counsel to issue a litigation hold to notify employees to suspend the destruction of potentially relevant records. Furthermore, management should temporarily suspend the organization's record retention policy to avoid evidence accidentally being destroyed.

Also, management could restrict access to emails or digital files that employees might want to conceal or destroy. Digital information can be found in virtually any type of media, and it is more fragile than tangible evidence. Therefore, employees can destroy this type of information if it is not protected properly. Often, when fraudsters become aware of an investigation, they try to destroy evidence in their computers or sabotage other evidence that could be used against them. Accordingly, it is generally a good idea to have IT personnel involved in this process each time the organization decides to conduct an investigation.

The failure to preserve documents could have several adverse consequences. First, it could cast doubt on the integrity of any fraud investigation. Second, documents destroyed when litigation is expected, or in progress, might result in obstruction charges or allegations of spoliation, which, if proven, could lead to the imposition of sanctions. *Spoliation* is broadly defined as “the intentional or negligent destruction or alteration of documents relevant to litigation.”

In today’s digital environment, digital spoliation is a major concern for organizations involved in litigation. When compared to the spoliation of tangible documents, digital spoliation carries additional risks. Management often lacks sufficient knowledge of the inventory of digital information, and electronic data might only be available for a brief time, as described earlier in this chapter in the “Litigation Hold Procedures” section.

Identifying Who Should Be Informed

Management and the response team should identify whom to inform. Depending on the facts, several departments should be interested in a potential fraud allegation, including legal, human resources (HR), internal audit, security, risk management, and loss prevention. When responding to an allegation of fraud, it is important to consider the interests of each of these departments to ensure that designated employees are notified immediately and to enable a prompt response. Information about incidences, however, should be shared only on a need-to-know basis.

HR personnel address issues involving unfair treatment, discrimination, harassment, substance abuse, or concerns about corporate policies. Therefore, the HR department should be informed of fraud that involves or affects any such areas.

Both the HR and legal departments should be involved to ensure that the right people receive information in a timely manner. Also, other departments, such as loss prevention and risk management, audit, and security might need to be involved. Although the development of information distribution rules requires the participation of several departments, it is best to have these rules set before investigation protocols are in place.

Another department that typically needs to be involved is the IT department. The IT department might need to be part of an investigation to safeguard data until the information can be analyzed. IT personnel can also help identify what data are available and where, and they might be able to function as forensic investigators if licensed to do so. If a member of

the IT department is suspected of being involved in a fraud, extra care should be taken to ensure that engaging the department does not tip off the suspect and allow the deletion or spoliation of digital evidence.

Again, management must restrict access to certain pieces of information on a need-to-know basis.

Conducting an Initial Assessment to Determine the Appropriate Response

Usually, when an allegation of fraud arises, there are not enough known and verified facts to begin a formal investigation; therefore, management and the response team should conduct an initial assessment to determine whether an investigation is needed and what steps, if any, are required to respond in an appropriate manner. This is perhaps the most critical question that management must answer when an allegation of fraud arises.

An initial assessment should be quick and, unless complications arise, completed within a few days. Ideally, action should be taken within three days of learning about an incident.

The initial assessment should be a limited fact-finding analysis focused on the specific allegation or incident. Unlike a formal investigation, it does not require an investigation plan or report. Thus, the initial assessment should seek to:

- Determine if fraud occurred.
- Identify the status of the fraud (e.g., When did it begin? Was it internal or external? Is it still occurring? If it is no longer occurring, when did it stop?).
- Identify potential claims and offenses.

To conduct an initial assessment and determine the appropriate response, the personnel specified in the response plan should take the following steps:

- Understand the context.
- Review any applicable policies and procedures.
- Investigate the allegations.

Understand the Context

Next, those responsible should gain an understanding of all the circumstances leading up to the current situation. Often, the context is necessary to determine the best approach to dealing with a tip or suspicion, and it can provide clues that are helpful in other areas. Efforts to understand the context should seek to obtain the initial facts and circumstances about:

- The manner in which the suspicions became known
- The date suspicions became known
- The areas to which the suspicions pertain
- The source of the information
- The allegations at issue

Review Any Applicable Policies and Procedures

Those involved in the initial assessment must also review any applicable internal controls and organizational policies, including any anti-fraud auditing and testing policies and procedures, to determine the best method and processes for continuing the investigation.

Investigate the Allegations

An initial assessment should be a limited, fact-finding analysis, and it should focus on investigating the specific allegation or incident. More specifically, to determine the appropriate response, the assessment should, if possible, seek to answer a number of questions regarding the allegation, including:

- Is the allegation credible?
- Who is the subject of the allegation, and what is their relationship to the company?
- When did the alleged misconduct occur, and how often did it occur?
- What was the business purpose of the activity related to the allegation?
- How serious is the allegation?
- What levels of employees, if any, are alleged to be involved in the misconduct (i.e., officers, directors, or managers)?
- What individuals might have pertinent information about the matter that would tend to support or refute the complainant's position, and what facts do these individuals purportedly know?
- Did any third parties receive any direct or indirect benefit from the misconduct, and if so, who are they?
- If a third party is involved, is the third party a government official?
- How was the matter recorded on the company's books and records, if applicable?
- Can it be determined whether the person in question acted with fraudulent intent?
- Is it possible that the issue might be larger than reported?
- Were there any whistleblowers, and if so, how should they be dealt with?
- What measures should the company take to document how the initial evidence of wrongdoing was handled?

- Is the government already involved, and if not, is it likely that the government will become involved?
- Is it likely that the matter will have a significant negative impact on shareholder value?

These questions are important because the response should be proportional to the potential scale of the fraud in terms of its value, frequency, potential damage, the individuals involved, the number of people involved, and so on.

In addition, the decision as to the appropriate response might be influenced by other factors. As with any business decision, the cost of conducting an investigation must be considered, and management might also consider whether, and to what extent, an investigation will interrupt business activity.

Generally, the investigation portion of the initial assessment involves:

- Contacting the source, if the investigation was triggered by a report or complaint
- Interviewing key individuals
- Reviewing key evidence

CONTACTING THE SOURCE

If the evidence came in through a tip from an identified source, those responsible should contact the source to find out additional information and confirm the source's willingness to help throughout the investigation. When contacting the source, the interviewer should encourage the complainant to provide a narrative description of the report. After the source provides the narrative, the interviewer should ask clarifying questions and then summarize the key points.

An interview with the source should seek to answer the following questions:

- What does the individual know?
- How did the individual get the information?
- Who were the key individuals involved?
- When did the alleged events occur (e.g., dates, times, and locations)?
- What are the details (e.g., who, what, when, where, why, and how much) of the allegations?
- What are the dates (or period) of the key events?
- What evidence exists to corroborate the alleged events, where is the evidence located, and how can the evidence be accessed?

- What witnesses can corroborate the alleged events?
- Which individuals might have pertinent information about the matter that would tend to support or refute the complainant's position, and what facts do these individuals purportedly know?
- What was the motivation behind the alleged events?
- Why were the alleged actions improper?
- If the scheme is ongoing, do the subjects know of the complainant's report?
- What is the complainant's motivation for making the report (e.g., What prompted you to report this?)?

When interviewing the source, the interviewer should seek to determine whether there is any reason to suspect the complainant's credibility. Also, if there are any weaknesses in the complainant's information, the interviewer should ask the complainant to explain what they expect the subject would say in defense of the allegations and ask the complainant to explain why such a response is not sufficient to dispose of the matter. Additionally, the interviewer should ask the source what they want or expect the organization to do about the complaint. The response to such an inquiry will help the team focus its efforts.

INTERVIEWING KEY INDIVIDUALS

Those responsible for the investigative portion of the initial assessment should interview key individuals for information about the suspicious conduct and the subject(s). Interviewing individuals with personal knowledge is critical.

Also, they should interview witnesses as early as possible because it limits the harm arising from loss of memory, witnesses becoming unavailable, and inadvertent loss or destruction of key evidence.

REVIEWING THE EVIDENCE

Another crucial part of the initial assessment includes the review of relevant documents and files, which might include personnel files, the organization's employee handbook, accounting records, vendor activity reports, budget reports, fixed asset records, expense reimbursements records, leasing documents, rental agreements, payroll records, purchasing requisitions, purchase contracts, inventory records, shipping and receiving reports, emails, telephone records, documents from external sources, and so on.

Obtaining and reviewing these documents will assist in understanding the chronology of events and might put the responsible parties on notice as to certain strengths or weaknesses of the investigation.

Documenting the Initial Response

To avoid any real or perceived minimization of the matter's significance and any attempts at willful ignorance (i.e., consciously avoiding important facts to avoid criminal liability), the actions and findings of the initial assessment should be documented. In addition, management must document its initial response and the reasons behind it. Thus, if management decides against conducting an investigation, it must document the reasons why.

Again, as soon as a suspicion of fraud arises, management should document the organization's initial response in an incident report log that serves as a record of the organization's response efforts. As the issue progresses, the log should be modified and, ultimately, it should contain details of actions taken and conclusions reached.

The incident report log should contain all information relevant to or created during the initial response that is used to support management's decision-making.

Planning and Conducting a Formal Investigation

Once it is determined that an allegation or issue will be investigated, those responsible must begin the formal investigation. Typically, the steps involved in this process include:

- Completing engagement letters or contracts
- Issuing advisory letters
- Assembling an investigation team
- Learning about the organization at issue
- Developing an investigation plan

Completing Engagement Letters or Contracts

CFEs are sometimes hired for specific engagements, and in such cases, it might be preferable to document the engagement in a formal written contract or a client engagement letter. (In some circumstances, an oral understanding might be sufficient.)

Engagement letters or retainer agreements are beneficial for various reasons. For one thing, they maximize a fraud examiner's protection in the event of a client dispute or

misunderstanding, making later disputes about the engagement's terms easier to resolve. For another thing, they help manage client expectations by making the assignment's objectives and the fraud examiner's authorizations and responsibilities clear. It is important to note, however, that although formal, written agreements might be preferable, they are not always practical.

Engagement letters should be written with certain standards in mind, and they should address a variety of items. Those items include, but are not limited to, the client's identity, the scope of the services, the timing of the work, deliverables, payment terms and fee structure, communication with the client, non-guarantee, governing law, jurisdiction, termination, and a limitation of liability through indemnity clause.

Examples of engagement letters can be found in Appendix A (located in the Investigation section of the *Fraud Examiners Manual*).

Engagement letters contain the following basic parts:

- Opening
- Body
- Terms
- Indemnity clause
- Close

Opening

The opening paragraph should state the purpose of the engagement. It should be specific as to whether the letter is an engagement or a proposal letter.

Body

In the body of the engagement letter, the fraud examiner typically describes the procedures and scope of an examination to the extent appropriate for the individual engagement. The amount of detail regarding the described procedures depends on the type of engagement; engagements that require the investigation of fraud allegations and a concluding opinion on the existence of fraud will typically feature a shorter body that focuses more on the allegations prompting the engagement rather than specific procedures the fraud examiner expects to perform.

At the onset, the fraud examiner might not know what procedures will be necessary to resolve the allegation, and in such circumstances, it is difficult to describe the anticipated procedures with any precision. Therefore, the body of the engagement letter might state that the services will include an investigation of a fraud allegation received over the hotline, by an anonymous tip, or by an audit anomaly. It might also confirm whether the fraud examiner has access to any personnel or documentation deemed necessary to execute the assignment.

An engagement letter for a review of an organization's anti-fraud policies and controls might feature a longer body that specifically describes procedures to be performed and limits the scope of the examination to the procedures mentioned.

Terms

The terms paragraph of an engagement letter should include the payment terms; fee structure; method of payment; a retainer, if needed; and how many hours of examination time the client initially agreed upon.

Additionally, this section should describe the billing procedures and a statement regarding payment methods.

Also, the terms should address out-of-pocket expenses. If travel is required, for example, the terms should discuss the anticipated cost of travel and the number of trips.

This section should include things such as:

- The fraud examiner(s) assigned to the case.
- The fraud examiner's hourly rate (if billing at a flat rate).
- If there is a retainer, the terms section should include a statement regarding the exhaustion of the retainer, what expenses will be reimbursed if there are unused retainer proceeds, and when and how such reimbursements will be refunded.
- A policy regarding past due invoices and late fees, including finance charges if applicable.
- Rates for any additional services or expenses that might be needed.

Indemnity Clause

In letters of engagement, there should be an indemnity clause to protect the fraud examiner if the subject, a witness, or a third party sues the client and includes the fraud examiner as a party to the suit. The clause should not be boilerplate; it should be tailored to fit the particular terms of the engagement.

The indemnity must be broad enough to cover the fraud examiner's legal expenses, provide for independent counsel, and protect the fraud examiner from liability in case of an adverse finding, but it should also provide for the cost of time and expenses of the fraud examiner at the fraud examiner's usual hourly rate.

It can be frustrating and expensive to spend days in court working on someone else's case with no retainer.

SAMPLE INDEMNITY CLAUSE

[Client company] agrees to indemnify and hold harmless [fraud examiner's company], its personnel, agents, subcontractors, and consultants from and against any and all claims, liabilities, cost, and expenses, including labor arbitration or related proceedings, (including without limitation, independent legal representation of [fraud examiner company]'s choice, attorney's fees, and the time of [fraud examiner's company] personnel, operatives, and consultants involved to defend or appear at any judicial or quasi-judicial proceedings), brought against, paid, or incurred by [fraud examiner's company] as a result of any of its services provided to [client company] in this project.

This includes, but is not limited to, any claims arising from violations of any laws relating to personal injury or property damage whatsoever suffered by [client company], its employees, or third parties. This provision shall survive the termination of this agreement.

Close

The closing section should conclude the letter. It should thank the addressee for the opportunity, and it should include the fraud examiner's contact information.

Also, the closing should include the date of agreement, client's signature, printed name, client's contact information, and the fraud examiner's signature. The fraud examiner should ask the addressee to sign one copy and return it in a self-addressed stamped envelope.

Issuing Advisory Letters

An individual or organization can use an advisory letter to convey information intended to inform or state an opinion about an issue relevant to a client or member-base. These letters include an auditor's formal opinion concerning a company's financial operations, an

attorney's opinion regarding a particular point of law, or a fraud examiner's general findings as to the presence of fraud—or lack thereof. Several examples of fraud examination advisory letters can be found in Appendix A.

Assembling an Investigation Team

Fraud examinations usually require a cooperative effort among different areas of expertise; therefore, if members of management decide to investigate suspicions of fraud, they must determine who should lead and be involved in the investigation.

To determine this, management must identify the needed skills. Typically, fraud investigations require skills across different areas of expertise and industry sectors. Auditors, fraud examiners, managers, attorneys, IT personnel, security personnel, and others are frequently associated with fraud investigations.

Selecting the right team members is essential for an effective fraud examination. Accordingly, when choosing the participants in an investigation team, it is critical to identify those who can legitimately assist in the investigation and who have a legitimate interest in its outcome. These persons should be included on the investigation team, and all other personnel should be excluded from the team.

Also, when organizing the team, it is important to consider all of the implications that might arise from an investigation. These implications include the business, legal, human resources (HR), and operational factors that arise when an investigation commences. Addressing these potential issues before the investigation begins ensures that significant factors (e.g., the team members' abilities, the leading executives, and the assurance of independent action and reporting) are considered.

Furthermore, the team should comprise professionals with the skills needed to help solve various types of incidents. To acquire the appropriate level and combination of skills, the team should include internal resources (if available) and external resources, if needed or appropriate.

Typically, team members should have:

- Accounting and audit knowledge
- Knowledge of the industry
- Knowledge of the organization

- Knowledge of the law and the rules of evidence in the jurisdiction(s) where the fraud occurred
- Knowledge of privacy issues in the jurisdiction(s) where the fraud occurred and where the investigation will occur
- An understanding of psychology and motivational factors
- Interviewing skills—in the relevant language(s)
- Communication skills
- Computer skills

A successful fraud examination, however, depends not only on the knowledge and skills of individual members, but also on the individual team members' characteristics that facilitate team interaction and functioning. These characteristics are especially critical for teams that require more coordination.

After identifying the necessary skills and characteristics, management must determine who possesses them and begin selecting the team. Each team varies, depending on the goals, circumstances, and people involved.

Common Types of Professionals

A typical fraud examination team might include the following types of professionals:

- CFEs
- Legal counsel
- Local international counsel
- Accountants or auditors (internal or external)
- Forensic accounting investigators
- Audit committee members
- Security personnel
- HR personnel
- A management representative
- IT personnel
- Digital forensic experts
- Data analytics specialists
- External consultants
- Industry specialists

CERTIFIED FRAUD EXAMINERS

CFEs are trained to conduct complex fraud cases from beginning to end. A CFE has training in all aspects of a fraud examination and can therefore be valuable in bringing together the financial examination and the more traditional investigative techniques.

LEGAL COUNSEL

It is crucial to have legal counsel involved in, and in most cases, leading fraud examinations, at least with regard to the legal aspects of the process are concerned (e.g., reporting results, preserving confidentiality, avoiding lawsuits, or terminating employees for wrongful misconduct). This is because a fraud examination can generate many legal questions, and the team must have legal counsel available to help answer these questions. Otherwise, the investigating organization risks exposing itself to greater danger than the threat it is investigating.

In addition, by having an attorney leading the investigation, or overseeing an investigation requested by the attorney, the company might be able to protect the confidentiality of its investigation under certain evidentiary privileges (e.g., the attorney-client privilege in the United States and the legal advice privilege in the United Kingdom) and similar forms of protection that shield certain types of evidence from being discovered or produced during trial.

LOCAL INTERNATIONAL COUNSEL

Management should obtain the help of local international counsel before beginning a fraud investigation involving work abroad.

Local international counsel is needed to help resolve a number of issues that occur when working in foreign jurisdictions. For example, local counsel can provide advice concerning applicable privileges. Likewise, consulting with local counsel can provide guidance as to whether local laws afford employees privacy rights that might interfere with the investigation.

ACCOUNTANTS OR AUDITORS (INTERNAL OR EXTERNAL)

As knowledge of accounting and auditing is necessary to most fraud examinations, a team might include accountants or auditors, whether internal or external. Auditors can support the investigation with information on company procedures and controls. Internal auditors are often used to review internal documentary evidence, evaluate tips or complaints, estimate losses, and provide assistance in technical areas of the company's operations. Additionally,

auditors can assess the probable level of complicity within the organization, and they can help design procedures to identify the perpetrators and help determine the extent of the fraud.

FORENSIC ACCOUNTING INVESTIGATORS

A forensic accountant can provide various services, including audits; accountant performance reviews; and examinations of financial documents for fraud, misconduct, or industry standard violations. Moreover, these experts can mine and analyze large amounts of data to identify potentially irregular transactions and high-risk relationships.

AUDIT COMMITTEE MEMBERS

As a result of the passage of the Sarbanes-Oxley Act (SOX) in the United States and similar legislation in many other countries, audit committees are taking a more active role in internal investigations. This has occurred, in part, because such legislation mandates that audit committees for publicly traded companies be directly responsible for two key components of an effective fraud prevention program—outside audits and internal reporting mechanisms. Accordingly, a company's audit committee might actively oversee a fraud examination or require that the investigation team report directly to it.

SECURITY PERSONNEL

Security department investigators are often assigned the investigation's fieldwork responsibilities, including interviewing outside witnesses and obtaining public records and other documents from third parties.

HUMAN RESOURCES PERSONNEL

The HR department should be consulted to ensure that the laws or internal policies governing the rights of employees in the workplace are not violated. Such involvement will lessen the possibility of a wrongful discharge suit or other civil action by employees. Also, involving HR personnel can help provide access to the organization's policies and any employee information that might be needed. Moreover, HR can help the team understand office procedures, and if necessary, place suspect employees on paid leave.

Although the team might need advice or assistance from an HR specialist, normally this person would not directly participate in the investigation.

MANAGEMENT REPRESENTATIVE

A representative of management or, in significant cases, the audit committee of the board of directors should be kept informed of the progress of the investigation and should be available to lend necessary assistance.

INFORMATION TECHNOLOGY PERSONNEL

If fraud occurs, it is likely that a computer was involved. If so, IT department personnel might need to be part of an investigation to help identify what data are available and where they are located, as well as to help safeguard the data until they can be analyzed.

DIGITAL FORENSIC EXPERTS

When developing a fraud examination plan, management should determine whether a digital forensic expert is needed.

In today's world of evolving technologies, more and more information is created, stored, and disseminated electronically. Due to the sensitivity of digital evidence, the team should include a digital forensic expert if an investigation involves more than a brief analysis of electronic evidence. Moreover, with the majority of communication being conducted electronically, emails and other digital communications can and will be used as evidence in almost any case.

Digital forensic experts can uncover a large amount of data that relates to the use of a computer or other electronic device, what is or has been stored on it, and the details about the device's users. Additionally, digital forensic experts might be able to recover evidence that a nonexpert cannot. For example, if the target of an investigation tries to delete electronic evidence, a digital forensic expert might, depending on when and how the files were deleted, be able to recover the deleted files. Similarly, a digital forensic expert might be able to bypass encrypted information.

Also, it is important to allow a trained examiner to conduct a proper seizure and examination of digital evidence to help ensure that the information can be used in a legal proceeding. Within the digital forensics field, there are several different types of experts. Given the diversity of computer-related fraud, no person can be an expert in all aspects of computer technology.

Moreover, in cases involving litigation, a digital forensic expert can help parties draft interrogatories and requests for production designed to solicit relevant data, and they can help prepare and participate in depositions involving record custodians.

DATA ANALYTICS SPECIALISTS

As the volume of electronic records continues to grow, it is increasingly necessary for investigation teams to include data analytics specialists. These specialists are adept at searching, collecting, extracting, cleansing, analyzing, and modeling data. Thus, data analytics specialists can help manage costs, especially in larger, more complex investigations.

EXTERNAL CONSULTANTS

When conducting a fraud examination, fraud examiners should determine whether a technical specialist or other subject-matter expert is needed.

Additionally, when the suspect employee is particularly powerful or popular, it might be useful to involve outside specialists who are relatively immune from company politics or threats of reprisals.

INDUSTRY SPECIALISTS

In some cases, it might be necessary to include an individual with extensive industry knowledge. Industry specialists can help develop the investigation plan, evaluate technical documents, and identify potential misstatements by interviewees.

Dos and Don'ts for Selecting Team Members

The dos for selecting team members include:

- Consider the team's size.
- Check for conflicts of interest between internal and external team members and parties relevant to the investigation.
- Ensure that there are no reporting issues (e.g., a team member feels pressure to report all details of the investigation to their direct manager, even though their manager does not have a need to know). Reporting issues can be prevented by establishing confidentiality rules in the beginning of the investigation.
- Select team members who fit the investigation's demands and objectives.
- Recruit team members with the skills needed to conduct the investigation.

- Recognize the unique knowledge, experience, and skills that each team member can contribute.
- Contemplate the ways that each potential member will fit into the team.
- Select people who will work well with other team members.

The don'ts for selecting team members include:

- Don't select team members based on friendship.
- Don't select team members to repay a favor.
- Don't select team members with negative attitudes.
- Don't overlook team members with untraditional knowledge that can contribute to the investigation (e.g., people with experience in a particular industry).
- Don't select members who might have personality conflicts with other members.
- Don't select members with a vested personal or corporate interest in the matter.
- Don't select members with a close personal or professional relationship with the subject or the complainant.
- Don't select members who lack restraint and a sense of discretion.

Identify the Investigation Leader

When evidence of fraud arises, management must designate someone to lead the investigation. A leader should have investigative experience and knowledge of legal and compliance requirements regarding the specific issues involved.

The investigation leader should be determined based upon the seriousness of the allegation. Management should consider whether to appoint an internal party (if available) or an external third party to lead and oversee the investigation.

The leader should be independent of the activity affected by the alleged fraud and have the means to recruit resources necessary to conduct the investigation, sufficient authority and access to gather any necessary information, and the ability to communicate with senior management.

Learning About the Organization at Issue

When tasked with conducting a fraud examination involving an organization, the team must become familiar, if it isn't already, with the organization, as well as its industry, competition, market share, financing structure, vendors (suppliers), customers, receipt (i.e., cash or on account) and disbursement methods, procurement methods, economic climate, recordkeeping

system, policies and procedures, employee organization chart, job responsibilities of key employees, and other matters that might be relevant to the fraud examination.

Understanding the entity will enable the team to assess the risks associated with the entity's particular operations.

Developing an Investigation Plan

Once it is determined that an allegation or issue will be investigated, and the investigation team has been assembled, the team should develop an investigation plan.

Each member of the team should be involved in the planning process. Letting each team member contribute to the planning process increases the likelihood that everyone will accept the plan and results in a team approach that draws on each member's expertise.

The team should start planning early and update the plan throughout the investigation. Planning is not a one-time event; it is an ongoing process that requires constant attention, and the team must refine their plan as the facts and client's (or employer's) needs change.

Each fraud investigation is different, and no single plan can cover every situation. The facts and circumstances of each case should shape how an investigation is structured, what procedures are performed, and how those procedures are carried out. Nevertheless, it helps to have a standard set of items from which to begin the planning process.

In short, when developing an investigation plan, those responsible should:

- Review what is known and gain a basic understanding of key issues.
- Define the goals of the investigation.
- Identify whom to keep informed.
- Determine the scope of the investigation.
- Establish the investigation's time frame.
- Assess the need for law enforcement assistance or notification.
- Define members' roles and assign tasks.
- Address operational issues.
- Outline the course of action.
- Adapt the necessary resources to conduct an investigation.
- Prepare the organization for the investigation.

Review What Is Known and Gain a Basic Understanding of Key Issues

The known information should serve as the basis for the investigation plan. So before writing the plan, the fraud examiner must review what is known and gain a basic understanding of issues that are key to planning the investigation.

Typical questions to answer before beginning a fraud examination include:

- What period is under review?
- What is the time frame?
- What are the deadlines?
- What is the nature of the suspected fraud?
- Where are the relevant locations?
- Who is the contact at the locations?
- Who are the persons of interest?
- Does the issue predate any of the key players?
- Have any related fraud examinations ever been conducted at the relevant location?
- What other entities, departments, or regions might be involved?
- How long has the issue existed?
- What is the culture of the industry or department at issue?
- What other sites might be involved?
- Does the organization perform background checks on employees as a precondition of employment?
- Did the suspected fraud occur in an industry or location that has a history or culture of fraud?
- Has the organization been in compliance with reporting and regulatory requirements?
- What is the profitability of the unit or organization at issue in the investigation?
- Does the organization's level of growth make sense in light of its industry and peers?
- Has there been a recent acquisition, and if so, is former management still in place?
- Does the organization have a fraud policy?
- What type of report (written or oral) does the client expect?
- What is the budget?

After obtaining a basic understanding of the key issues, the fraud examiner can begin developing the investigation plan.

Define the Goals of the Investigation

An investigation must have goals or a purpose, which should be identified at the outset so the team members can achieve them. Goals also help keep the investigation focused and on task, and they can serve as a motivator, as long as they are specific, well defined, and measurable. A specific goal is more likely to be achieved than a general goal. If goals are not well defined, the team cannot expect to reach them, and goals must be realistic within the availability of resources, knowledge, and time. Measurable goals will allow the team to determine attainability, estimate a timeline, and know when the goals have been achieved.

Although the basic goal for most fraud investigations is to determine whether fraud occurred, and if so, who perpetrated it, fraud investigations might be designed to achieve a number of different goals, such as to:

- Prevent further loss or exposure to risk.
- Determine whether there is any ongoing conduct of concern.
- Establish and secure evidence necessary for criminal or disciplinary action.
- Minimize and recover losses.
- Review the reasons for the incident, assess the measures taken to prevent a recurrence, and determine any action needed to strengthen future responses to fraud.
- Help promote an anti-fraud culture by making it clear to employees and others that management pursues all cases vigorously and takes appropriate legal or disciplinary action where it is justified.
- Protect the company's legal privileges.

Identify Whom to Keep Informed

At the outset of a fraud examination, the investigation team and management must identify whom should be kept informed about the investigation. In general, as few people as necessary should be kept informed.

Factors to consider when determining whom should be kept informed include the severity of the incident under investigation, the main suspect's role in the organization, and the tasks that will be required to conduct the investigation.

Determine the Scope of the Investigation

When planning an investigation, the stakeholders should identify the *scope* (the boundaries or extent of the investigation), which will vary depending on the facts and circumstances. An investigation, for example, might be limited to the subject matter, the department, or the geographic area at issue.

To determine the scope, those responsible should use the following guidelines:

- Consider the ultimate goals of the investigation.
- Develop a list of key issues raised in the initial assessment.
- Determine the level of discretion that is required.
- Determine whether there are any constraints (e.g., time, resource, authority, procedural, legal, or practical). Identifying such limitations helps ensure that the team can meet realistic objectives and develop alternative strategies.
- Consider the quality of the organization's anti-fraud program and policies.
- Consider the organization's actual culture of compliance.
- Determine the extent to which mid- and senior-level management is involved in the suspected misconduct.
- Determine whether the issue is widespread or isolated to a particular area.
- Ascertain whether the suspected misconduct was prohibited by the organization's compliance program.
- Consider broadening the scope if the allegations indicate a failure in the organization's compliance program.
- Consider what the government expects or requires.

Additionally, to determine the scope, the team and management should consider how the issue became known (i.e., what prompted the investigation). Fraud issues can stem from a number of different sources, and different sources prompt different responses. If, for example, the issue arose out of a government investigation, the company's investigation should closely examine the government's actions.

Establish the Investigation's Time Frame

When planning the investigation, the team must establish proper time parameters with start dates and due dates for tasks and deliverables. Also, the team should obtain the dates of upcoming earnings releases and audit committee meetings.

An established time frame helps the team provide a quick and appropriate response, which can help the subject organization avoid future legal disputes and minimize adverse impact on employee morale. Some circumstances might not allow for a quick response, such as situations requiring extensive investigations of multiple allegations; therefore, the time parameters set must be realistic, taking into consideration the time required to accomplish necessary tasks.

Time parameters, when realistic and appropriate, help the team members structure their plans, providing information to help develop concrete, short-range actions to reach the investigation's goals.

Assess the Need for Law Enforcement Assistance or Notification

The planning stage of the investigation should also include efforts to consider the need for law enforcement assistance or notification. That is, management must decide whether the matter at issue is serious enough to call in the police or other law enforcement entities. Whether to seek assistance from law enforcement can be a difficult decision for organizations to make. Some situations require that law enforcement be notified, depending on the nature of misconduct and the jurisdiction in which it occurs.

If, at the beginning of the investigation, management determines that it will make a formal referral to law enforcement or a prosecuting agency, then it must notify the authorities before the investigation commences to determine whether law enforcement personnel should participate in the examination.

Define Members' Roles and Assign Tasks

If the organization at the center of the investigation does not have a pre-established line of authority in its fraud policy or investigative protocols, the team members' authority levels, responsibilities for action, and reporting lines should be defined during the investigation planning process. For efficient and effective coordination, all team members must be clear about their roles and responsibilities and how they relate to the investigation's goals. Also, defining the members' roles and responsibilities gives them purpose and checkpoints for measuring success.

Conversely, failure to define roles and responsibilities can have an adverse impact on an investigation. Without clear roles, the team might waste time and money, gaps in the investigation process might appear, or the investigation might lead to incomplete or faulty results.

That said, delineating the team members' roles is difficult because fraud investigations often are conducted in an unstable and high-pressure atmosphere that disrupts communication. Nevertheless, it needs to be a priority for management and individuals on the team.

In general, team members should understand:

- Their expected roles and responsibilities
- The expected roles and responsibilities of other team members
- The degree and source of any outside scrutiny
- Timing issues
- Expected form and timing of interim deliverables or final product
- Specific facts of the matter at issue
- Limitations on who can be involved in the investigation or informed of its specifics

Management should designate a primary contact person with whom the team can communicate on all matters that arise during the investigation. It is essential that the team reports to someone who will take action pursuant to the investigation's findings.

Address Operational Issues

During the planning process, management must consider any operational issues, which might include:

- Gathering facts abroad
- Recordkeeping practices abroad
- Record content and format differences
- Language translation
- Cultural differences
- International data privacy issues
- Differing conceptions of privacy and discovery
- Immigration regulations
- Safety concerns, especially for global assignments

Among the issues listed, international data privacy laws are of particular concern. Many foreign countries—and those in the European Union (EU) in particular—restrict or prohibit processing and transferring personal data. For example, the EU’s General Data Protection Regulation (GDPR) requires notice and consent before collecting or processing personal data and, in most cases, limits the transmission of personal data to non-EU countries. For more information on the GDPR, see the “Individual Rights During Examinations” chapter in the Law section of the *Fraud Examiners Manual*.

Similarly, because recordkeeping practices in other countries differ, difficulties can arise when attempting to obtain information in foreign countries.

Outline the Course of Action (Case Plan)

Before the evidence-collection phase of a fraud examination begins, the investigation team should develop a case plan to make sure it addresses every relevant issue identified thus far. A case plan outlines the course of action the team members expect to take throughout the investigation, and establishing a case plan helps the team stay on track and focus on the key issues.

The case plan can encompass matters such as:

- The scope of the investigation
- The goals of the investigation
- Time parameters
- Resources needed
- Task assignments
- The overall approach to conducting the investigation

Also, the case plan should, among other things, outline how and in what order the team will proceed. Team members should organize an investigation by breaking it down into smaller, more manageable components. It is important, however, to avoid excessively breaking down an investigation because doing so can lead to micromanagement or inefficient work management.

There are many ways to organize an investigation's components, but often, investigations are organized in the following ways:

- *Chronologically*: A chronological investigation is divided into time-based phases that, when completed, are marked as milestones. The phases are the broad steps needed to complete the investigation, and each phase contains tasks that define the actions needed to reach each milestone. The tasks within each phase should be assigned based on who is best suited to perform them. Milestones indicate the investigation's overall progress. This structure is best suited for investigations where time sequence is essential in organizing tasks.
- *By functional area*: This approach organizes investigations by functional areas needed to accomplish the investigation's goals. Thus, this approach focuses on the type of activities and processes that must be done under each functional area.
- *By team member*: This method of organization involves organizing the investigation's work by each team member's area of expertise.
- *Hierarchically*: This approach organizes the team members' roles and tasks hierarchically, from major undertakings to minor undertakings. Thus, the components are organized based on their relationship to each other and assigned based on pre-established lines of authority or reporting.

Also, because the case plan should outline how and in what order the team will proceed, it should identify the information that is necessary to complete the investigation and include the investigative activities to be performed, such as:

- Documents and evidence that should be located, obtained, and examined
- A list of witnesses and subjects to interview and the preferred order of the interviews
- The date that a report of the investigation should be presented
- Matters that need supervisory review and approval

When developing the case plan, the team should consider:

- How to most efficiently achieve the goals of the investigation
- How to accomplish the goals of the investigation on a timely basis, with appropriate confidentiality and fairness to all parties
- How to ensure that the investigation's results are thorough, accurate, and documented appropriately
- How to ensure compliance with the law and the organization's policies and procedures

As circumstances change and new information emerges throughout the course of an investigation, the team and management should continually refine and modify the plan, so the plan must be adaptable, rather than rigid or inflexible.

Each stage of the investigation should be documented. Documenting the planning process demonstrates advance thought and preparation, and it will show thoroughness and help counter challenges that the investigation was inadequate or inappropriate.

It is helpful to prepare to-do lists or checklists for an investigation. For reference, a sample checklist is located in Appendix B. The sample checklist, however, is not intended to cover all aspects of the examination, but rather to provide the investigation team with planning assistance.

Adapt the Necessary Resources

As with any special investigation or operation that requires advance preparation, the planning process in a fraud investigation must include efforts to adapt the resources needed to deal with the variety of issues that might occur during the course of the investigation. A successful fraud investigation requires support from management, the right supplies, adequate funding, and any other identified resources.

That is, the investigation team needs to have the tools necessary to complete the investigation. This is especially true if the relevant operations are in developing economies, remote locations, or areas with a higher risk of security-related incidents.

The necessary resources might include:

- Outside specialists
- Case management software
- Digital forensics tools (e.g., EnCase or Forensics Toolkit)
- Access to a commercial database
- Security arrangements

Also, every team member should have the contact information of all others involved in the investigation.

Prepare the Organization for the Investigation

Before commencing a formal investigation (and especially before starting the evidence-collection process), it might be necessary to prepare the subject organization for the investigation. Preparing an organization for an investigation involves such things as:

- Prepare the managers of the employees who will be involved in the investigation, especially if they do not know about the issue. Let them know that the subject and witnesses might be busy at times during the investigation. The amount of information to share with a manager will depend on the circumstances.
- Notify key decision-makers when the investigation is about to begin.
- Notify the organization's in-house or outside counsel when the investigation is about to commence.

Generally, it is not good practice to alert all of an organization's employees that an investigation will be taking place, nor should the investigation's purpose be explained to all employees.

Structure the Investigation to Preserve Confidentiality

Fraud investigations must be structured to preserve confidentiality. If confidentiality issues are not given attention from the outset of the investigation, the details of the investigation might become public, compromising the entire investigation. Additionally, if the details of the investigation do not remain confidential, employees might be reluctant to report future incidents, and if the suspicions that prompted the investigation prove unsupported, the reputations of those suspected of misconduct might be irreparably damaged. Moreover, if an investigation stems from a complaint and the complaint becomes known, it is possible that the complainant could be retaliated against.

Accordingly, those responsible must structure the investigation to preserve confidentiality.

Among other things, the team members should:

- Avoid alerting the suspected fraudster(s).
- Request participants' confidentiality.
- Guard case information.
- Consider conducting the investigation under any applicable evidentiary privileges or protections.

Avoid Alerting the Suspected Fraudster(s)

When responding to a sign or allegation of fraud, those responsible must work to avoid alerting those suspected of fraud.

If the suspect is informed of the investigation, inadvertently or otherwise, a number of different adverse events might occur. For instance, the fraudster might attempt to destroy or alter evidence, making it more difficult to conduct the investigation. When investigation details are leaked, concealment and destruction of evidence typically occurs at a faster rate.

Additionally, a forewarned suspect might attempt to flee, cut off contact with associates, or try to place the blame on somebody else.

Since unintentionally notifying the fraudster is a key concern in any investigation, the confidentiality of an internal investigation is critical. To avoid alerting those suspected of misconduct, it is important to have information about the person who is being investigated and what that individual can access. Also, to maintain confidentiality, determine in advance who should receive information about the investigation and reevaluate who should receive information as the investigation proceeds.

The following are some basic measures that organizations and fraud examiners can take to avoid notifying suspected perpetrators who are under investigation:

- Know who is being investigated and what they can access.
- Limit the extent of any discussions.
- Inform only those who need to know.
- Inform employees of the consequences of a confidentiality breach.
- Work discreetly without disrupting the office's normal course of business so that employees do not know that an investigation is being performed.
- Work fast.
- Investigate during nonbusiness hours.

Moreover, it is important for fraud examiners to be knowledgeable about the subject organization's guidelines or policies. Do the applicable guidelines or policies have a need-to-know clause and an all-access clause? Such clauses allow the team to keep the details of the investigation confidential, and provide access to all the company systems so the fraud examiner can gather as much system evidence as possible without notifying any internal parties.

Finally, if the suspect is alerted, management should adjust the investigation and its timeline accordingly. This might mean interviewing the fraudster out of sequence from a normal investigation.

Request Participants' Confidentiality

To preserve the confidentiality of an investigation, management might (if legally permissible) remind participants to refrain from discussing investigation information with anyone or require participants to sign a confidentiality oath vowing not to divulge any information regarding the investigation.

Generally, an employer can ask employees to keep an investigation confidential when there are legitimate business justifications for making such requests. However, it is usually not wise for management to implement a blanket policy prohibiting employees from discussing employee investigations because doing so could violate certain employee rights. Some countries, such as the United States, guarantee private-sector employees the right to organize and engage in other concerted activities for the purpose of collective bargaining or other mutual aid or protection. If an employer in such a jurisdiction has a routine policy or practice of asking employees not to discuss matters that are under investigation, the policy or practice might violate the employees' right to organize and engage in other concerted activities.

To illustrate, consider the law in the United States. The National Labor Relations Act (NLRA) is the primary labor law in the United States, and it affects an employer's ability to ask employees not to discuss matters that are under investigation.

On June 16, 2015, the National Labor Relations Board (NLRB), the entity that enforces the NLRA, expanded its interpretation of what constitutes protected "concerted activity" under Section 7 of the NLRA. Section 7 guarantees most private-sector employees the right to organize and "engage in other concerted activities for the purpose of collective bargaining or other mutual aid or protection." In its decision, the NLRB ruled that an employer's routine policy or practice of asking employees not to discuss matters that are under investigation violates the NLRA, even where the employer did not threaten to take disciplinary action if employees breach confidentiality.

According to the NLRB, employee discussions may be restricted if the employer can show that it has “objectively reasonable grounds” for requiring confidentiality. The decision states that employers must proceed on a case-by-cases basis, determining whether confidentiality is necessary based on the circumstances of each case.

The NLRB provided the following suggestions for cases that would justify a legitimate business justification:

- Witnesses needed protection.
- Evidence was in danger of being destroyed.
- Testimony was in danger of being fabricated.
- There was a need to prevent a cover-up.

It is likely that the second, third, and fourth suggestions would apply to most fraud investigations, so fraud examiners in the United States could probably request that employees keep their investigations confidential. Still, it appears that before making a request for confidentiality, fraud examiners should document the need for confidentiality.

Based on the NLRB’s decision, U.S. employers should no longer have a blanket policy prohibiting employees from discussing employee investigations.

Guard Case Information

To help preserve confidentiality, the investigation team members should closely guard case information. The following are some recommended procedures for protecting case information:

- Store all confidential documents in locked file cabinets or rooms accessible only to those who have a need to know.
- Protect all electronic information via firewalls, encryption, and passwords.
- Clear desks of any case information before stepping away.
- Lock computers when leaving workstations.
- Mark all case information, whether tangible or electronic, as confidential.
- Avoid talking about the investigation in public or in any place where other employees can hear the communications.
- Avoid using email or other electronic means (e.g., text messages or instant messages) to transmit confidential case information.

Consider Implementing Any Applicable Evidentiary Privileges or Protections

To prevent third parties, including the subject of the investigation, from having access to the investigative materials, management should consider conducting the investigation under any applicable evidentiary privilege that provides the right to keep certain information from being disclosed without permission.

If an evidentiary privilege applies to information, the general rule is that the court and the party seeking the information will be denied access to it, and the triers of fact must disregard any evidence they do actually hear if it is deemed privileged afterward; however, legal jurisdictions vary on which communications are protected by such privileges.

Typically, the most relevant types of evidentiary privileges for keeping investigations confidential are legal professional privileges. These privileges protect the communications between professional legal advisors (e.g., solicitor, barrister, or attorney) and their clients, and in some situations, fraud investigations can be structured so that they are afforded protection under such privileges. Generally, to receive protection under a legal professional privilege, an investigation must be conducted at the direction of, or under the supervision of, a legal professional.

In most common law countries, the legal professional privilege is known as the attorney-client privilege, and it protects against involuntary disclosure of communications between clients and their attorneys. The general rule is that the attorney-client privilege only applies to confidential communications (verbal or written) between a client and their attorney made for the purpose of giving or receiving legal advice, but courts have extended the privilege to include client communications with nonlawyers (e.g., fraud examiners) who are working under the direct supervision, direction, and control of the lawyer. Specifics of the attorney-client privilege or its analogues might differ from jurisdiction to jurisdiction; local legal counsel should always be engaged to determine applicability of privilege in a fraud examination.

The attorney-client privilege, if properly implemented, typically provides some protection from discovery of internal reports by the subject of the investigation, the government, or third parties. The privilege might also assist in protecting the confidentiality of witnesses. It may not, however, protect the underlying evidence or documents that do not meet the criteria outlined above, and it generally cannot be claimed retroactively to cover work done before counsel was involved.

In addition to legal professional privileges, litigation privileges and other similar evidentiary protections, such as the U.S. attorney work-product doctrine, can protect the confidentiality of investigations. These protections shield materials that are prepared in anticipation of litigation.

The U.S. attorney work-product doctrine, for example, protects tangible materials from discovery that are prepared in anticipation of litigation. To apply this doctrine, litigation must actually be planned, and the work for which protection is sought must have been undertaken for the specific purpose of preparing for that litigation. Also, the protection offered by this doctrine extends to not only information and documents prepared by a party or the party's attorneys, but also to information and documents by third-party consultants and examiners hired by the attorneys. For instance, communications with the attorney and any work or analysis conducted by an expert with whom the attorney has consulted is protected as work product, although this protection will be waived if the expert is called to testify as an expert witness at trial.

For more information on evidentiary privileges and protections, see the Law section of the *Fraud Examiners Manual*.

COLLECTING EVIDENCE

The collection of evidence plays a fundamental role in any fraud examination by proving or disproving that fraud has occurred. Much of the investigative process includes collecting evidence through various means, which might involve obtaining the consent of subjects of an investigation, conducting interviews of suspects and witnesses, reviewing accounting records, searching offices, seizing computers, and surveilling individuals or locations, among other things. Methods and considerations related to the obtainment of evidence through interviews or from digital devices are covered in depth later in this section of the *Fraud Examiners Manual*; this chapter focuses on the collection and analysis of documentary evidence.

Types of Evidence

Most fraud examinations involve the collection of three main types of evidence. The three primary types of evidence that fraud examiners must consider and gather when conducting their investigations are:

- Testimonial evidence
- Digital evidence
- Documentary evidence

Testimonial evidence involves statements made by witnesses, neutral third parties, and suspects during interviews and/or when testifying at trial. Testimonial evidence is discussed in more detail in the “Interview Theory and Application” and “Interviewing Suspects and Signed Statements” chapters in this section of the *Fraud Examiners Manual*.

Digital evidence consists of information stored in electronic form on a wide array of computer and storage devices used by individuals and organizations in the course of business. The collection and analysis of digital evidence is covered in the “Digital Forensics” and “Data Analysis and Reporting Tools” chapters in this section of the *Fraud Examiners Manual*.

Documentary evidence consists of records that help prove or disprove the existence of fraud or another relevant fact of a case. These records might be created or maintained by the individuals or organizations to whom they pertain or by a third party, such as a vendor or financial institution. Among the most common types of documentary evidence in fraud examinations are canceled checks, memoranda, invoices, ledgers, letters, minutes of meetings, receipts, and financial records, such as bank statements.

The fraud examiner usually obtains a great deal of documentary evidence when conducting fraud investigations. It is critical that the fraud examiner understand the relevance of this evidence and how it should be preserved and presented. Fraud examiners should always remember that documents can either help or hurt a case, depending on which ones are presented and how they are presented. They should strive to make certain that all relevant documents are included and that all irrelevant documents are eliminated. Many fraud examiners pay too much attention to documents. It is important to remember that witnesses (those who testify at trial) are more important to a fraud case than documents. While documents are important in giving a witness and the case credibility, witnesses who spend too much time focusing on a document's details often confuse and bore the fact finders (i.e., the judge or jury members, depending on the jurisdiction's legal system).

General Rules for Collecting Documents

Basic procedures in handling evidence are required for documents to be accepted, or given much credence, by the court. Proof must be provided that the evidence is relevant, material, and authentic.

The relevance of documents cannot be easily determined early in a case. For that reason, all possibly relevant documents should be obtained. If they are not needed, they can always be returned. The following general rules are important in the collection of documents:

- Obtain original documents where feasible. Make working copies for review, and keep the originals segregated.
- Do not touch originals any more than necessary, as they could undergo forensic analysis at a later time.
- Maintain a dependable filing system for the documents. This is especially critical when large numbers of documents are obtained. Losing a key document is very problematic and can damage the case. Documents can be stamped sequentially for easy reference.

Obtaining Documentary Evidence

Documentary evidence can be obtained in a number of ways. The preferred method is to obtain evidence by consent, if both parties agree. In some cases, consent can be oral, but when information is obtained from possible adverse witnesses or the target of the

examination, it is recommended that the consent be in writing. Sample consent forms can be found in Appendix C. In many cases, however, investigators will not want to alert the suspect to their intentions; thus, other routes must be taken.

If the party that requests the information owns and controls the evidence (e.g., company documents in an employee's desk drawer at the office), then the investigator is usually able to obtain the documents as required.

Certain types of records can be obtained by consent only if the subject of the records consents in writing. Accessing a subject's bank records from financial institutions, for instance, generally requires written consent. If no consent is given and evidence is held by other parties or in uncontrolled locations, specific legal action might be required. Most often, the legal process used takes the form of a subpoena or other court order to produce the documents and records (including electronic records). Other forms of court orders can be used to obtain witness evidence and statements.

Generally, fraud examiners should not attempt to obtain documents by other means, as this can lead to charges of theft, trespass, and other sanctions. Further details are provided in the Law section of the *Fraud Examiners Manual*.

Categories of Evidence

There are two basic categories of admissible evidence: direct and circumstantial. *Direct evidence* shows *prima facie* (based on first impression) the facts at issue; it proves the facts directly. What constitutes direct evidence depends on the factors involved. For example, in a case involving possible kickbacks, direct evidence might be a check from the vendor to the suspect that does not correspond to a specific invoice or service.

Circumstantial evidence is evidence that tends to prove or disprove facts at issue indirectly, by inference. In the case of a kickback allegation, cash deposits of unknown origin deposited to the suspect's account around the time of the suspect transaction could be considered circumstantial evidence.

Organization of Evidence

Keeping track of the amount of paper generated is one of the biggest problems in fraud cases. It is essential that documents obtained be properly organized early in an examination, and that they be continually reorganized as the case progresses. Remember, it is usually

difficult to ascertain the relevance of the evidence early in the case. To maintain effective organization in complex cases, fraud examiners should use the following methods.

Segregate the Documents

In general, documents should be segregated by witness or transaction. In the former method, the fraud examiner takes a list of names, whether employee, associate, or witness, and begins assembling collected documents by individual. Alternatively, the fraud examiner might find it easier to organize the information by grouping evidence of the same or similar transactions together. During the evidence-gathering stage of an investigation, organizing the documents chronologically is not recommended because it makes searching for relevant information more difficult. It is generally better to organize them by transaction or by party. The fraud examination report often follows a chronological timeline to give a narrative of a fraud scheme, in which case displaying key documents chronologically is often best. But in the organization phase, there usually is too much clutter for chronological organization to be effective.

Make a Key Document File

Fraud examiners should make a *key document file*—a separate file that contains copies of certain important pieces of information for quick access—for easy access to the most relevant documents. Periodically review the key documents. Move the less important documents to backup files and keep only the most relevant documents in the main file.

Establish a Database

Establish a database early in the investigation and code all documents if there is a large amount of information to process. This database can be manual or computerized and accessed by keywords. The coding system should provide meaningful and comparable data; therefore, the database should, at a minimum, include the following fields of information: the date of the document, the individual from whom the document was obtained, the date obtained, a brief description, and the subject to whom the document pertains.

Maintain a Chronology

A chronology of events should be commenced early in the case. The purpose of maintaining a chronology is to establish the chain of events leading to the proof. The chronology might or might not be made a part of the formal report; at a minimum, it can be used for analysis of the case and placed in a working paper binder. Keep the chronology brief and include only information necessary to prove the case. The chronology should be revised as necessary, adding new information and deleting irrelevant details.

Keep a Checklist

Another indispensable aid is a checklist of investigation objectives. The checklist, which must be updated frequently, should be kept in a stenographer's pad or other permanent ring binder to allow a cumulative record. In a very complex case, the list can be broken into long- and short-term objectives: that which must be done eventually (e.g., prove elements of a particular count) and that which should be done tomorrow (e.g., conduct an interview or draft a subpoena). However organized, some sort of list must be kept; otherwise, important points will be forgotten in the lengthy case. A sample checklist is included in Appendix B.

Examining Fraudulent Documents

Forged, altered, fabricated, and other suspicious documents are regularly encountered in fraud cases. Most businesses, legal issues, or financial transactions produce a substantial amount of paper, including contracts, agreements, wills, order forms, invoices, and statements. These documents can be evidence in establishing that a fraud was committed, in determining the nature and scope of the fraud, and in identifying the parties responsible.

Fraud examiners are not expected to be document experts. They should, however, be aware of ways to spot counterfeit documents and have knowledge of the capabilities and limitations of forensic examinations. In addition, if fraud examiners suspect that significant documents are counterfeit, they should consider consulting with a forensic document expert. Forensic examinations conducted as a part of a fraud investigation can contribute to its success in several ways:

- Expert examination results can assist in developing and proving the fraud theory: who did what and when they did it.
- Expert examination results can corroborate or refute statements by witnesses or fraud suspects.
- Having the results of expert examinations before interviews can provide significant leverage for the fraud examiner during interviews with fraud suspects, even resulting in admissions of guilt from suspects who are confronted with the factual evidence.
- Forensic handwriting examinations and comparisons can result in the positive identification of the writer or signer of a document. Because writing is a conscious act, the identification might serve to prove that a particular act is intentional or willful. Proof of intent is usually necessary to prosecute a wrongdoer successfully.
- Forensic experts may testify at trial to explain evidence discovered through their analysis.

Early Consultation with an Expert Can Prove Valuable

An expert's assistance can be valuable early in an investigation, not just in preparation for a trial. Fraud examiners should consider consulting with experts early in their investigation or inquiry if they suspect that significant documents are counterfeit or have been forged, altered, or otherwise manipulated. The scope of an investigation can often be narrowed or directed by eliminating multiple suspects through handwriting examinations. The expert's findings might solidify the fraud examiner's theories of how the fraud was committed, or they can prevent wasted effort by proving theories incorrect at an earlier stage. See the end of this chapter for more information about finding help in document examinations.

Types of Forensic Document Examinations

There are many different types of forensic document examinations. However, most examinations concern signatures, handwriting, hand printing, or documents created by a typewriter or computer. Additionally, issues concerning photocopies and determining when a document was prepared frequently arise. Fraud examiners should be aware that many different types of forensic examinations are possible but that the following forensic examinations could be particularly beneficial when a fraud involves documents:

- Detecting forged signatures
- Identifying the writers of signatures, handwriting, and hand printing
- Detecting altered documents
- Detecting and restoring erasures and eradications
- Determining when a document was or was not prepared
- Detecting counterfeited documents and examining printed documents
- Detecting and restoring faint indented writings
- Comparing paper and inks
- Determining whether two sheets of paper came from the same tablet or pad of paper
- Examining paper folds and sequence of folds
- Comparing torn or cut paper edges
- Restoring charred and partially burned documents
- Identifying the machine that made a photocopy and whether two copies were made on the same machine
- Identifying the source of, or alterations to, notary seals, wax seals, and cachets
- Detecting the opening and resealing of sealed documents and examining adhesives
- Detecting inserted text in typewritten, printed, or handwritten documents

- Determining the sequence of handwritten text or signatures
- Identifying rubber stamp impressions
- Identifying mechanical check-writer and numbering-device impressions

Handling Documents as Physical Evidence

A document can be a piece of physical evidence and not just a source of information. As a piece of evidence, it should be handled carefully and stored properly in a sealed, initialed, and dated paper folder or envelope to avoid damage or contamination. If necessary, make a working copy and preserve the original document for submission to a forensic document examiner. Most forensic examinations require the original document, not a copy of it, because most photocopies do not reproduce original writings, typescript, or other features with sufficient clarity or detail to allow adequate examination.

All evidence received should be marked so that it can later be identified. The most common way to mark evidence is with the date and initials of the person obtaining it. If it is not practical to mark the document, or if marking it would damage the document, then it should be placed in an acid-free envelope that has been marked and sealed. To avoid creating indentations on the original document, do not write on the envelope after the document has been placed inside of it. When initialing a document for future identification, do it in a noncritical area and use an instrument that is different from the one originally used on the document. Other than making unobtrusive initials for identification, do not write or mark on original documents. Do not fold, staple, use paper clips, crumple, or do anything else that would change an item's original condition. Store photocopies and laser-printed documents in paper folders or envelopes, not transparent plastic envelopes; such envelopes can result in the copies sticking to the plastic and destroying some document features.

Chain of Custody

From the moment evidence is received, its chain of custody must be maintained for it to be accepted by the court. The *chain of custody* is both a process and a document that memorializes who has had possession of an object and what they have done with it. Essentially, the chain of custody is a recordkeeping procedure similar to physical inventory procedures.

Establishing the chain of custody for a document establishes authenticity (i.e., the document is in fact what the party offering the document says it is), but it also ensures that evidence has not been altered or changed from the time it was collected through production in court.

In general, to establish the chain of custody, fraud examiners must make a record of when they receive an item and when it leaves their care, custody, or control. This is best handled by creating a memorandum with the custodian of the records when the evidence is received. The memorandum should state:

- What items were received
- When they were received
- From whom they were received
- Where they are maintained

If the item is later turned over to someone else, a record of this should be made—preferably in memorandum form. All evidence received should be uniquely marked so that it can be identified later. The preferable way is to initial and date the item; however, this can pose problems in the case of original business records furnished voluntarily. For such records, a small check mark or other nondescript identifier can be used. If it is not practical to mark the original document, it should be placed in a sealed envelope, which should then be initialed and dated.

Preserving for Fingerprint Examinations

If fingerprint examinations are anticipated, use gloves to handle the documents (be careful if tweezers are used because they can leave indentations that might obscure faint indented writings or the identifiable indentations that are sometimes left by copiers and fax machines). If any individuals are known to have inadvertently handled the documents with bare hands, their names should be provided to the fingerprint specialist. It might be necessary to provide the expert with sets of inked fingerprints of these people for elimination purposes. (See the “Fingerprints” section for additional information.)

Charred or Partially Burned Documents

Charred or partially burned documents might contain valuable evidence if restored by experts, but they are very fragile and should be handled with extreme care. For proper preservation and storage, trained experts might use special polyester film sheets and envelopes, which are not readily available to fraud examiners. Fraud examiners can best preserve such evidence for submission to a forensic expert by using a sturdy crush-proof container into which they place layers of cotton (available in rolls at fabric and sewing materials shops). They should carefully slide a sheet of paper or thin cardboard under the burned fragments, lift them and place them on the layers of cotton, and then remove the paper used for lifting. Then, they should gently place additional layers of cotton over the

fragments until the container is filled, taking care not to compress the cotton. Fraud examiners should then seal the container, initial and date it, add an identifying contents label or exhibit number, and clearly write or stamp the word *fragile* on the container.

Recognizing Counterfeit Documents

Forensic document examiners apply scientific methods and use a variety of technical instruments in conducting examinations and comparisons of documents. Individual minute characteristics in handwriting and typewriting are examined and compared with genuine comparison standards. Detailed analyses are made of document features for proof of changes or modifications. Instruments used include sensitive measuring devices, low-power magnifying glasses, several types of microscopes, ultraviolet and infrared lighting, optical filters, micro and macro photography, computerized image-enhancement systems, sensitive instruments to detect faint indented writings, and numerous others. Various chemical analyses are also conducted.

Although not expected to be a documents expert, an observant fraud examiner might be able to recognize some of the following features of documents that could bring attention to their fraudulent nature:

- *Signature forgeries* might be recognized by irregularities noticeable in the written letters or by their differences in size from a genuine signature. A side-by-side comparison of a suspect signature with a genuine signature might reveal the differences. However, remember that advanced age, poor health, temporary injury, and the use of drugs and alcohol can result in similar discrepancies and might mislead the fraud examiner. Additionally, the quality of a signature can be dependent on the circumstance in which it was provided (e.g., a person's signature on a mortgage agreement might be more legible than the same person's scribbled signature on a credit card receipt). Genuine comparison samples should be obtained and a forensic document examiner should be consulted to make an expert determination. (See the "How to Obtain Handwriting Samples" section.)
- *Substituted pages* in multiple-page documents, such as contracts and wills, can often be spotted by holding each page in front of a bright light. Differences in the whiteness, density, thickness, opacity, and paper-fiber patterns of the substituted sheets might be apparent.
- Some *ink differences*, *alterations*, *erasures*, and *obliterations* are also revealed by holding the paper in front of a bright light or holding a light over the writings at different angles and observing differences in the color and reflectivity of the inks or disturbances to the paper surface.

- *Counterfeited printed documents*, such as checks, stock and bond certificates, business forms and stationery, birth certificates, drivers' licenses, and other identification documents, are sometimes readily disclosed through side-by-side comparisons with corresponding genuine documents. Be alert for the use of incorrect or different versions or form revisions of the documents. For forensic examinations, it is necessary to obtain and furnish genuine comparison samples of the printed documents to the document examiner. (See the "Counterfeit Printed Documents" section.)
- *Suspicious indented writings* might be revealed by reducing the light in the room and holding a bright beam of light (a narrow-beam flashlight or small high-intensity lamp) low and parallel to the page surface. (See the "Indented Writings" section.)

Identifying Writings

Each person's writings contain a unique and identifiable combination of acquired individual personal characteristics and shared "class" characteristics. In fact, individuals' writing skills vary considerably due to their differing physical and mental capabilities. These contrasts increase with age and physical development; the acquisition of skills; differing aesthetic values and education; and personal and professional usage of writing.

Forensic document examiners are trained and experienced in examining and comparing writings, as well as assessing this combination of individual and class characteristics in making expert determinations of identity or non-identity.

Class Characteristics

Fraud examiners should not be misled in developing suspects by mistaking similar class characteristics in different writing samples. Samples that *seem* to look alike are not necessarily from the same individual. The writings of some people might share superficial similarities in appearance and style and look the same to the layman when, in fact, they are very different. Forensic document examiners can correct this mistake.

Copybook Styles

Some of a writer's letter shapes, handwriting style, and other characteristics might be shared by other writers because they were taught the same original copybook system. In the United States, different states and different school districts within the states teach several different copybook systems. Internationally, different systems are also taught. Writers might retain remnants of the system they learned as children. For example, second-language writings of

people taught in a Cyrillic (Russian) alphabet style will be influenced by Cyrillic letter styles and might contain some similarities. Similarly, the hand printing and numeral styles taught to drafters, architects, and engineers might result in apparent similarities in the hand printing of people trained in those professions.

Imitator Styles

Some writers, especially adolescents, the young, and the easily influenced, might adopt or imitate the general handwriting style or some individual letter designs of a respected teacher or parent, or one shared by their peers. An example is the exaggerated rounded letter forms and circular “i” dots and periods that form the so-called bubble writings of some adolescents. This style is usually abandoned as the person matures.

Natural Variations, Disguise, Distortions, and Forgeries

Variations

No one signs their signature or writes *exactly* the same way twice because writing is a human act of coordinated mental and muscular activity, not the precise, repetitive action of a machine. However, individual writers have their own specific range of natural variation. Several examples of writing are necessary for a forensic document examiner to establish whether a questioned writing is, or is not, within the range of natural variation of a particular writer. If fraud examiners find two signatures that are exactly alike, then at least one is a forgery, probably a tracing.

Disguise

Disguise is the conscious, intentional effort to change or conceal one’s normal writings. Disguise is attempted in an effort to prepare writings that can later be disclaimed or that the writer hopes will be anonymous and cannot be traced to the source. The success of an attempt to disguise writings depends on the writer’s skill and knowledge of writings. Most attempts at disguise involve one or more of the following: change in slant, change in size, change in shapes of capital (uppercase) letters, changes in the shapes and sizes of loops in letters that contain them, use of peculiar letter designs, or block (squared) hand printing. Only rarely is the opposite, non-writing hand used. Fraud examiners should be aware that it is possible to successfully disguise writings to the point that they cannot be positively identified, even by experts. This is especially true when only limited amounts of writings are involved.

Distortions

Distortions are unintentional changes to a person's writings that are beyond the range of natural variation. Distortion can be caused by temporary impairment due to illness, injury to the writing hand or arm, substance abuse, extreme physical weakness, unusual writing environment, issues with the writing instrument, irregular or unusual writing surface, or unfamiliar writing materials. Distortions can also be permanent due to advanced age and cognitive decline. Fraud examiners should be aware that distortions in writings can, on occasion, be so severe that positive identifications of a person's writings might not be possible, even by experts.

Forgeries

A *forgery* can be defined as "any writing prepared with the intent to deceive or defraud." Most forgeries are signatures. Forgery can be done by *simulation*, by *tracing*, or by *freehand preparation*.

SIMULATED AND TRACED FORGERIES

A simulated or traced forgery is a writing, usually a signature, prepared by carefully copying or tracing a model example of another person's writings. Although identifiable as a forgery, a simulated or traced signature forgery often does not contain enough of the forger's normal handwriting characteristics to permit expert identification of the forger.

Remember, no one writes their signature *exactly* the same way twice. If two signatures look exactly alike, try superimposing the signature areas of the two documents by holding them in front of a bright light. If they match, then it is likely that one or both are traced forgeries. Be aware that, in some instances, it might be possible to locate the original document bearing the genuine signature that was traced. This regularly occurs in employee fraud and embezzlement cases in banks and other financial institutions where the account holder's signature card on file served as the source for the tracing. If the forged signature precisely superimposes over the genuine signature, then it is also likely that faint indentations might be present in the signature area of the original genuine document. Also, ink traces from the genuine signature might be transferred to the reverse side of the traced signature. Latent fingerprint treatment of the original source document might reveal the fingerprints of the suspect.

FREEHAND FORGERIES

A freehand forgery occurs when a writer signs the name of another person without knowing what the real person's signature looks like. The writers of freehand forgeries can often be identified by experts.

AUTOFORGERIES

An *autoforgery* is a true-name signature by an individual who intends to deny that signature at a later time. Generally, autoforgeries are prepared in a distorted or disguised fashion. This attempt at fraud has occurred in falsely reported traveler's check theft cases, in cases involving disputed home mortgage and other loan documents, credit card frauds, and others.

The Document Expert's Findings

A forensic document examiner *cannot* conduct a handwriting examination to determine with accuracy the writer's age, sex, race, physical or mental condition, personality, character, or which hand the writer used, no matter what claims are made.

There are three basic outcomes of forensic handwriting comparisons.

Non-Identification

The suspected person did not write the signature or other writings on the questioned document.

Identification

The suspected person did write the signature or other writings on the questioned document.

Inconclusive

No definite determinations were possible as to whether the suspected person did or did not write the signature or other writings on the questioned document. This outcome is often the result of insufficient or inadequate handwriting samples of the suspect or when a photocopy, rather than the original document, is submitted to the expert for examination.

Though inconclusive, some writings might contain common characteristics to indicate possible identity, or differences to indicate that the suspected person might not have prepared the writings. The expert might suggest additional leads for the fraud examiner that could resolve the inconclusive results of the comparisons.

How to Obtain Handwriting Samples

Positive results from forensic handwriting examinations and comparisons often depend on how well the fraud examiner has assembled adequate handwriting and signature samples from the suspects. The samples must be comparable to the writings on the evidence documents.

Hand printing cannot be compared with handwriting. Capital letters cannot be compared with lowercase letters. Also, the samples must contain the same letters and combinations of letters. For example: *John* cannot be compared with *Susan*, *hot* with *cold*, *black* with *white*, or *July* with *September*.

For comparison purposes, experts use two classes of writing standards: non-dictated writing and dictated writing.

Non-Dictated Writing Samples

Non-dictated writing samples include materials that are written by the individual during the everyday course of business. This type of writing tends to reveal the individual's normal writing habits.

For comparison purposes, try to obtain samples of a suspect or victim's signature or other writings that were not prepared by that person but can be authenticated. Courts will accept any writings that were witnessed by others. Other acceptable documents include those that were created in the normal course of business, such as canceled checks; signed or written documents in employee personnel records; applications for employment, licenses, or home utilities installations; and many others. The fraud examiner should use personal experiences and knowledge of the suspect's routine activities to locate sources for these types of samples.

When the evidence documents include suspected forged signatures, several genuine samples of the forgery victim's signature should be obtained for submission to the expert. If possible, include any documents bearing the victim's genuine signature that the suspect might have had access to and that might have served as a model for tracing or simulation.

Non-dictated writing samples should:

- Be as contemporaneous as possible to the date of the evidence documents; if the questioned writings were prepared in the 1970s, writings recently prepared by a suspect might not be adequate for comparisons. However, except for infirmity or extreme age, the writings of most adults usually do not change much except over long periods of time.
- Consist of the same signature or words containing many of the same letters and combinations of letters as the questioned writings on the evidence documents
- Consist of the same type of writings as on the evidence documents, such as hand-printed or handwritten capital letters or lowercase, or a combination of both

- Consist, if possible, of the same kinds of writings; a person's informal writings, such as hastily prepared signatures on credit card receipts, might be very different from more formal writings, such as a signature on a contract or other legal document

Dictated Writing Samples

Dictated writing samples are those that are written at the request, and usually in the presence, of the fraud examiner, typically in an interview setting. Fraud examiners should try to obtain dictated samples either voluntarily or by obtaining a legal order.

Obtaining Dictated Handwriting Samples by Court Order

When obtaining a legal order for samples, the fraud examiner or attorney should ensure that the order specifies that the samples should be provided in the writer's normal handwriting and in sufficient quantity, text, and form, at the interviewer's discretion, to permit a determination of identity or non-identity. A court order with these specifications will permit an inference of guilt or might allow pursuit of contempt of court charges if the suspect refuses to comply or attempts to prevent identification by intentionally disguising their writings, limiting the amount of writings, or failing to follow the interviewer's instructions and dictations.

Preparation for Taking Dictated Handwriting Samples

Because expert handwriting identifications can truly prove a case, adequate pre-interview preparation by the fraud examiner is essential. At the time of the interview session, the fraud examiner should have all the proper writing materials and the originals or copies of the evidence documents to serve as a guide for dictating the sample text.

Here are a few tips for conducting this type of interview:

- Do not rush through the interview.
- Take as much time as necessary.
- Take short comfort breaks if the suspect tires.
- Do not allow the suspect to see the evidence documents before or during the process of taking the samples.

Directions for Obtaining Dictated Handwriting Samples

Dictated writing samples should be obtained by using the same types of materials as the evidence document: writing instrument (ballpoint pen, fountain pen, or pencil), paper

(lined, unlined, size of sheet), and forms (check forms or business forms). For purposes of the samples, a fraud examiner can use a genuine form of the same or similar kind, make photocopies of it, and have the samples prepared on the blank copies.

To help the suspect relax, begin by having them write miscellaneous innocuous text, such as their name, the date, and a statement as to the voluntary nature of the samples being prepared. This statement will also assist later in getting the samples admitted in court.

Patently dictate to the suspect the same text or text containing the same letters and combinations of letters of the same type (hand printed, handwritten, capital, or lowercase) as the questioned writings on the evidence document. Do not assist the suspect in the spelling of words, punctuation, or grammar.

Obtain one sample at a time on separate sheets or forms. Once a sample is complete, remove it from the suspect's sight before the next sample is prepared. To ensure that the suspect's range of normal variation is displayed, several samples of each text should be obtained.

Be alert for any attempts to disguise normal writings, such as exaggerated slant, very rapid writing, very slow and awkward writing, unusually large or small writing, or peculiar letter formations. (See the "Natural Variations, Disguise, Distortions, and Forgeries" section.)

Typewriters and Computer Printers

Typewriters

Although typewriters are not as commonly used, documents prepared on traditional typebar or segment-shift typewriters, both manual and electric, often can be positively identified by experts who look for mechanical defects unique to each machine. Typewritten texts prepared on later-model typewriters equipped with interchangeable daisy wheel, ball, or basket-type elements are difficult, if not impossible, to identify.

Computer Printers

Relative to typewritten documents, the specific sources of documents made by computerized ink jet or laser printers are far more difficult to identify. In some cases, the only expert determinations concerning items made from these printers are that the same typeface (font) and size, letter spacing, and print process were used. Many brands of laser printers do print

small yellow dots on all documents that reveal the printer's serial number and the time and date that the document was printed. These marks can be seen under a microscope or by holding the document under a blue light, which causes the yellow dots to appear black. However, only some law enforcement agencies have the ability to fully decode these marks, which are primarily used to detect counterfeit currency.

In some instances, experts might be able to identify the product used to print a document. Product identification might be possible because some color printers embed their identification number in some printouts. Similarly, some printers can be identified by minor variants in the way they feed paper through the printing mechanisms.

Photocopies

A *photocopy* is a paper copy of a document or other visual image. Increasingly, photocopies are retained as "original" records of documents (particularly in outgoing correspondence files), and photocopies might be the only evidence of a document if the original cannot be located or, in some cases, cannot be released.

Fraud examiners and other investigators sometimes submit a copy of a document to a document examiner for examination because they do not want to part with the original. Document examiners, however, cannot uncover certain types of clues, such as indentations and erasures, from photocopies. As a result, document examiners might not be able to determine features and reach conclusions that could have been made from the original documents. Therefore, when possible, the fraud examiner should submit the original document to the document examiner. Original documents should be handled according to their importance, and transferring them often requires the observance of chain-of-custody procedures.

Identifying the Source of a Photocopy

Photocopies are admissible in court as original evidence for:

- Anonymous letters
- Unauthorized disclosure of information in the form of copies of letters, memoranda, files, and other records
- Copies made to conceal forgeries or to insert or manipulate text
- Spurious disinformation dissemination of counterfeit official documents

Locating the source of a copy can be crucial in some investigations. And in some cases, it is possible to determine what kind of copier was used to produce the copy in question. Some types of machines leave minute markings, indentations, and other features on the copy that can assist the expert in determining the brand and model of the machine used.

It is also possible to identify the particular machine used by examining the pattern of trash marks. *Trash marks* are uniquely identifiable markings on copies (e.g., specks, spots, streaks, or edge markings). Fraud examiners might be able to identify a particular machine by examining the trash marks left on copies and comparing the marks with the copies from a known machine. The fraud examiner should be aware, however, that some of these markings are permanent, while others are transient and temporary.

Permanent Trash Marks

Permanent trash marks are usually caused by accidental deep scratches and imperfections in the copier's glass surface or document cover, in the printing element surface, or in other machine parts that are not readily replaced or changed during servicing of the machine. These marks can be reproduced on copies until the machine is repaired or the part replaced.

Transient Trash Marks

Again, trash marks are uniquely identifiable markings on copies. Transient trash marks are usually caused by dirt, smudges, or small bits of foreign matter on or in machine surfaces that will appear until the machine is cleaned or serviced. These markings can prove not only that a particular machine was used to produce the copy, but that documents that share the same transient trash marks might have been produced at approximately the same time. This is one of several ways to determine when a document was prepared.

Taking Photocopier Samples

There are four steps that fraud examiners should follow when taking photocopier samples. First, make six "blank" copies by leaving the glass document surface empty and closing the lid. As the machine produces each copy, remove it, turn it over, and initial and number the reverse side of each one *in the same sequence* it was produced by the machine. These copies will reproduce all trash marks made by the machine, including the entire document cover, glass surface, and internal printing element surface. The fraud examiner should obtain six sample copies because different photocopier models have varying printing element surface sizes, usually ranging in size from one to three sheet impressions before repeating on the same area of the surface.

Second, place a ruler or other calibrated measuring device on the glass document surface of the photocopier, close the cover, and make six copies. These copies allow an expert to determine the standard amount of reduction or enlargement the machine makes when in the actual size or one-to-one mode. If the machine requires documents to be fed into it because it does not have a glass document surface, use any sample document available as an original and include that sample document along with the copies of it. On the reverse side of each copy, initial and number it in the same sequence that the copies were produced by the machine, as outlined in the first step.

Third, place a sample document containing both typewritten and handwritten text on the glass document surface in the standard position, close the document cover, and again print six copies, initialing and numbering as previously directed. Also, include the sample document with the copy samples.

Finally, place all of the sample copies and sample documents into a large sturdy paper or cardboard envelope or folder (do not use a plastic envelope). But before placing the documents in the envelope, note the make, model, and location of the machine. Initial, date, and seal the envelope, and submit it to the document examiner along with the questioned evidence documents.

Dating a Document

Occasionally, documents are backdated to make them appear as though they were created at an earlier date. More specifically, *backdating* is the process whereby an individual posts a date on a document that reflects a time earlier than the document's actual creation date for purposes of deception.

Sometimes, the question as to whether a document is genuine or a backdated fabrication arises during fraud inquiries. Forensic experts can use a variety of techniques to answer this type of question by examining the suspect documents. The fraud examiner should be aware of these types of analyses, have some knowledge of what can be done with these methods, and understand their limitations.

The “Alibi” Document

Alibi documents suddenly appear from out of nowhere, and they often appear late in the course of an investigation, inquiry, or trial. They are always favorable to the suspect and refute previously developed information or evidence that is damaging to the suspect. Often, alibi documents are fabricated.

The “Long-Lost” Will

The sudden appearance of a new will that post-dates and supersedes all other wills is all too common. Amazingly, these wills often leave large portions of the testator’s estate to the person who found them, and typically, only a photocopy of the will can be located. Many of these wills are proven to be fabricated with the cut-and-paste method. The fabricated and forged “Mormon Will” of billionaire Howard Hughes is a prime example of a long-lost will, although the document did not involve the use of photocopiers.

Valuable Historical and Collectible Documents

The production of counterfeit historical and collectible documents, artworks, and antiques has been a lucrative field for fraudsters for years. Major frauds involving losses of millions of dollars have involved diverse counterfeit documents. Some examples of frauds involving valuable historical and collectible documents include the fake “Hitler Diaries,” counterfeited baseball cards, forged autographs of historical figures and celebrities, counterfeited first-edition books, and many others.

Anachronisms in Historical Documents

Anachronisms are items located at a time when they could not have existed or occurred.

Generally, exposing anachronisms in fraudulent historical documents requires the expertise of investigators, historical experts, scientific laboratories, and forensic document examiners. For example, accurate handwriting comparisons are rarely possible in the absence of adequate contemporaneous genuine writings of the purported author. In such cases, the experts examine the materials used to produce the documents, such as paper, ink, printing, adhesives and seals, bindings, and covers.

Often, to add credibility to forged documents, fraudsters backdate them. To determine whether contemporary documents were backdated, experts usually rely on diligent investigation and forensic document examiners.

When adequate handwriting or signature samples are available, expert comparisons can expose forgeries. Otherwise, to disprove the purported date of the document, an analysis of the materials might prove that the document did not exist at the time the document was supposedly prepared. Expert examinations of contemporary documentary materials include the following methods:

- To determine the kind of ink and when the ink was first manufactured, experts conduct ink analyses and comparisons with a library of ink standards maintained by the U.S. Secret Service Laboratory in Washington, DC.
- To determine the kind of typewriter that was used and when the typewriter was first manufactured, experts examine the typewriting and compare the typewriting with collections of typewriter reference standards maintained by forensic laboratories.
- To determine who manufactured the paper and when it was first produced, experts examine the paper, especially watermarked paper, and conduct searches of reference materials.
- To determine what kind of machine was used and when those machines were first produced, experts examine photocopies and fax copies and compare them to the reference standards.
- To prove or disprove the date of the questioned copy, experts compare the questioned photocopies with photocopies known to have been produced on a particular machine on a particular date.

Fraud examiners should note that there are currently no methods for accurately determining how long ink, typewriting, or photocopier/printer toner has been on paper.

In some instances, historical and linguistic anachronisms might raise suspicion about a document's validity. A backdated document might contain a historical reference that has not occurred yet (e.g., a receipt listing a tax that had yet to go into effect at the time of the writing). In the case of purportedly older documents, a forger might use anachronistic words, idioms, or syntax. If a word or phrase seems out of place in a suspected forgery, it might be helpful to use an etymology resource (e.g., www.etymonline.com).

Indented Writings

Indented writing is the impression a writing instrument leaves on sheets of paper below the sheet that contains the original writing. Fraud examiners should be alert for the presence of incriminating indented writings or the absence of logical indentations, both of which can be valuable in proving fraud. In some situations, documents are routinely kept in multiple-page

sets, such as in legal forms, multiple-copy invoices, notebooks, tablets, pads, clipboards, and so on. In these situations, the writings on one sheet should correspond to indentations on the following sheet. The absence of corresponding indented writings on the following sheet, or the presence of indented writings on one sheet that do not correspond with the text of the writings on the preceding sheet, could provide proof that pages have been removed or substituted.

Developing Indented Writings

Fraud examiners should never attempt to develop indented writings by shading or scratching on the surface of a sheet of paper with a pencil. Although this method will reveal deep indentations, it will not reveal faint indentations and will prevent expert examinations from analyzing them. Moreover, shading or scratching with a pencil might prevent other types of technical examinations. Likewise, fraud examiners should not apply any sort of liquid to an original document with indented writings, as doing so can damage the document's ability to be analyzed.

Some indented writings can be seen by employing an oblique-lighting method. In this method, the fraud examiner takes the document into an area with subdued overhead lighting, places the document on a flat surface, and shines a bright beam of light—from a small-beam flashlight or small high-intensity lamp—across the document at a low oblique angle or parallel to the surface. Because shadows in the indentations will only show at right angles to the beam of light, it is necessary to move the light around and note the changing shadows as they form the text of the indentations.

Forensic document experts can perform advanced analysis to reveal messages in indented writings. They can use special lighting, photographic techniques, and sensitive instruments, such as the electrostatic detection apparatus (ESDA), to detect and permanently record extremely faint indented writings that cannot be seen by the oblique-lighting method.

Counterfeit Printed Documents

Many types of documents are counterfeited. Most documents that have monetary value, such as currency, bank checks, traveler's checks, money orders, bearer bonds, postage stamps, gift certificates, or lottery tickets, have all been counterfeited at one time or another. Identity documents (e.g., passports, birth certificates, driver's licenses, and government and commercial employee identity cards) are also often counterfeited. Other counterfeited documents include commercial product labels, business stationery and forms,

business logos, motor vehicle titles and registration forms, and safety inspection stickers. Despite efforts to prevent counterfeiting, almost every type of document with value can be, and probably has been, counterfeited.

Counterfeiting is a lucrative and illicit business, especially in some developing countries where the latest high-tech printers that produce large quantities of high-quality counterfeit documents and knockoffs in violation of international copyright and trademark laws are used.

Counterfeiting Methods

The days of old-style counterfeiters—skilled artisans who carefully etched counterfeit printing plates—are over. Today, most counterfeit documents are prepared by various photo-reproduction processes such as the photo-offset printing process (lithography) and flexography, which uses rubberized printing plates. These processes begin with the photographic reproduction of a genuine document. The photographic negatives are then carefully retouched to remove the filled-in text, serial numbers, and other distinguishing features that appeared on the genuine document. Printing plates are then made from the retouched negatives, and counterfeit copies are printed from the plates.

Rapidly advancing technology now allows individuals with no commercial printing experience to use sophisticated computerized scanners, graphic design software, multicolor computer printers, and full-color photocopy machines to produce relatively high-quality counterfeit documents.

Detecting Counterfeits

Many counterfeits can be detected by making a side-by-side comparison with a corresponding genuine document. But when conducting a side-by-side comparison, fraud examiners must be alert for different versions or form revisions. Look for subtle differences in ink colors and brilliance, different types of paper substrate (i.e., materials from which the paper is produced that affect the appearance, texture, thickness, or other physical qualities of the paper itself), different typestyles (fonts) and type sizes, and evidence that the text on the genuine document was retouched for the reproduction. Retouching will be most evident in areas where text, serial numbers, and the like are superimposed on a background design, especially if the documents are printed in black ink.

When furnished with genuine documents for comparisons with suspected counterfeits, forensic document examiners can also identify differences between the printing processes, ink

formulations, and paper substrates used. In some instances, experts have been able to reconstruct portions of the filled-in text or serial numbers that appeared on the genuine document but were removed in the retouching process. If the experts can reconstruct portions of the genuine document's text, they might be able to identify the original document. And if the original document is identified, fraud examiners can trace the history of the document's ownership to potentially identify and locate the counterfeiter. Moreover, if the original document is identified, it might be possible to identify the counterfeiter by obtaining fingerprints from the document.

Fingerprints

There are two basic types of fingerprints: latent and patent. *Latent* (invisible) prints are unique personal identifiers, and these prints are left on surfaces by the body oils, salts, and amino acids clinging to or exuded by friction ridges in the skin on fingers, palms of the hands, and soles of the feet. Latent prints might also be deposited on surfaces by hands, fingers, and bare feet through the transfer of oils and greases. *Patent* (visible) prints are visible to the human eye. They are sometimes deposited on surfaces by hands, fingers, and bare feet through the transfer of materials such as blood, paint, soot, and soil.

Latent prints absorbed into protected porous surfaces, such as paper in files or pages in books, can survive for decades. However, latent fingerprints on hard, nonporous surfaces can be destroyed or start to deteriorate rapidly if handled; not protected from the environment; or exposed to high temperatures, humidity, or water.

To avoid smudging and contamination, fraud examiners should wear protective gloves or carefully use tweezers when handling latent fingerprint evidence. However, tweezers should not be used on documents if indented writing or photocopier examinations are planned.

Fingerprints on Paper or Other Absorbent Porous Surfaces

Fraud examiners should never try to develop latent fingerprints that have been absorbed into paper or other porous materials by dusting with fingerprint powder or any other means. Such efforts will not only be unsuccessful, but they will prevent additional examinations. Instead, fraud examiners should preserve evidentiary documents that contain latent fingerprints by placing them into labeled protective containers, such as sealable, acid-free paper envelopes. Many types of paper and plastic containers can leach acids that damage originals over long periods of storage. While some plastic containers, such as those

made of polyethylene or polypropylene, do not leach acid, they might cause harmful condensation to develop on the document. If storing the documents, it is important to consider other environmental hazards, such as potential flooding or insects (silverfish, cockroaches, carpet beetles) that can cause damage.

Also, fraud examiners should label the item's container with their initials, the current date, where the document was obtained, and an identifying exhibit number (if any).

Experts use various methods to examine fingerprints on porous surfaces, including iodine fuming and brushing or silver nitrate solution or ninhydrin spraying, which reacts with the body chemicals and other substances in the latent prints that have soaked into the absorbent surface. Some of these methods will permanently discolor a document.

Fingerprints on Hard, Nonporous Surfaces

Fingerprints on items with hard, nonporous surfaces, such as plastic, metal, and glass, can be dusted for the presence of latent fingerprints. Special fingerprint dusting powders and lifting materials are available from law enforcement suppliers. The dry, powdered toner used in some photocopy machines has also been used to dust for fingerprints.

After dusting the surface and locating a suspected print or partial print, blow or gently brush off the excess powder. Remove the developed print with adhesive lifting tape and place the tape on an index card that contrasts in color with the dusting powder used. Mark the card with the fraud examiner's initials, the date, an identifying exhibit number, and where the print was found.

Some latent prints on nonporous surfaces, however, might not be developed by the dusting method. Therefore, if possible, the fraud examiner should retain the item instead of dusting it; place it in a protective container; initial, date, and label the container with an identifying exhibit number; and submit it to a fingerprint expert for processing. Fingerprint experts can obtain fingerprints using various methods. They might use cyanoacrylate (i.e., a quick-bonding glue) fuming or a laser to successfully develop and photograph the latent prints on some materials, such as black plastic bags.

Fingerprint Comparison Standards

The fingerprints of millions of people are on record in repositories of fingerprint cards maintained by law enforcement agencies throughout the world. These cards contain the inked

fingerprints of people for various reasons. For example, they contain the fingerprints of people who have been arrested, served in the military, applied for employment at various levels of government, volunteered their fingerprints to assist in personal identification in the event of their deaths, and so on. Many of these fingerprint databases have been computerized and are linked by networks. However, millions of people have never been fingerprinted.

If a suspect has never been fingerprinted or refuses to furnish inked print samples voluntarily, the fraud examiner might need to obtain a legal court order directing the suspect to furnish inked prints for identification purposes.

If an item of evidence has been handled by several people, it could still bear the guilty party's latent prints. In such cases, the fraud examiner should obtain the inked prints of everyone who might have handled the item.

Disposal of Evidence

Once an investigation or examination has concluded, fraud examiners might need to direct or participate in the disposal of evidence that was collected during an engagement. Organizational policies specifying procedures for proper disposal of evidence can provide guidance, but organizations might not have such policies in place. Additionally, circumstances related to an engagement might need to be considered, even if a policy on evidence disposal exists. Factors that could potentially affect evidence disposal following the conclusion of a fraud investigation or examination are:

- The personal information about suspects or witnesses that is documented in the evidence
- Jurisdictional regulations
- The likelihood of further litigation related to the engagement
- Organizational policies related to the disposal of sensitive information
- General document retention policies implemented by the organization
- Litigation holds related to the engagement

Any of these factors could require the evidence to be retained, disposed of, or returned to its owner in a specific manner. Before disposing of any evidence acquired during an investigation or other engagement, fraud examiners should ensure that they comply with any applicable requirements.

Sources for Expert Document Examinations

The following are potential sources for expert document examinations:

- Law enforcement laboratories
- Forensic document experts in private practice

Law Enforcement Laboratories

In cases where criminal prosecutions are likely, there are often forensic laboratories available through law enforcement agencies. However, access to these resources is typically limited and depends on the jurisdiction and the fraud examiner's relationship with the agency.

Forensic Document Experts in Private Practice

When an expert's services are needed, some jurisdictions offer lists of qualified forensic document examiners. For example, in the United States, fraud examiners can contact the American Board of Forensic Document Examiners (ABFDE) (<https://abfde.org>), and in the United Kingdom, fraud examiners can seek assistance from the British Academy of Forensic Sciences (BAFS) (www.bafs.org.uk). The Association of Forensic Document Examiners (AFDE) has members in select South American, Asian, and African countries (<https://afde.org/experts.html>).

INTERVIEW THEORY AND APPLICATION

An *interview* is a question-and-answer session designed to elicit information. It differs from an ordinary conversation in that an interview is structured, not free-form, and is designed for a purpose. An interview might consist of only one question or a series of questions.

Preparation

To effectively prepare for the interview phase of an investigation, the fraud examiner must first develop a plan. The fraud examiner should contemplate what the interview is intended to accomplish and state an objective. They should also review the case file to ensure that the plan is not devoid of important information that might have been overlooked.

Prior to the commencement of an interview, there should be a clear concept of what information might be gleaned from each of the potential witnesses, as well as the best strategy to go about obtaining it. Generally, the most vulnerable witnesses should be interviewed before the more reluctant witnesses. This will provide the fraud examiner with a broader base of information that can be used to formulate later questions.

When possible, the interview should be held in a venue where the subject will feel comfortable and secure, although it is not recommended that the interview take place in an environment that is particularly familiar to the subject, such as the interviewee's home or office. The most appropriate member of the investigative team should be selected to conduct the interview based on the interview's specifics.

Rather than devise an exhaustive list of questions to ask the subject, the fraud examiner should instead formulate a brief outline of main points to discuss during the interview. Additionally, an investigator should consider which evidentiary documents to bring into the interview, if any, as well as which documents they might request from the subject.

Many investigations span multiple jurisdictions or might be international in scope. Interviewing subjects in these investigations requires fraud examiners to consider the legal or administrative issues specific to all of the jurisdictions involved, as well as the cultural norms and practices that should be accommodated. For example, some jurisdictions might

restrict a fraud examiner's ability to interview an organization's employees or compel their cooperation, require that a legal representative be present for an interview, or limit the use of information obtained during an interview.

A fraud examiner's failure to observe and respect cultural norms and practices while conducting an interview—including greetings (e.g., shaking hands or bowing), personal space, eye contact, or body language—could negatively impact the interview process and thereby impede the overall investigation.

Consulting with local legal counsel or company representatives and researching cultural considerations during the planning process can help fraud examiners avoid missteps to ensure that interviews in unfamiliar jurisdictions are not compromised. Legal and administrative rights could dictate whether or how an interview can be conducted, and an understanding of cultural norms and practices will encourage interviewee cooperation and create a foundation for a more effective interview.

Characteristics of a Successful Interview

Successful interviews share common characteristics. The interview should be of sufficient length and depth to uncover relevant facts. Most interviewers tend to get too little, rather than too much, information.

A successful interview includes all pertinent information and excludes irrelevant information. From the outset, it should be determined what information is relevant, and that information should be sought. Extraneous or useless facts tend to complicate the gathering and analysis of the information.

The interview should be conducted as closely as possible to the event in question. With the passage of time, the memories of potential witnesses and respondents can become faulty, and critical details can be distorted or forgotten.

Additionally, a good interview is *objective* in scope. Therefore, interviews should be aimed at gathering information in a fair and impartial manner.

Characteristics of an Effective Interviewer

All effective interviewers share certain characteristics. Above all, they are amiable and possess strong interpersonal skills. Successful interviewers are the type of people with whom others are willing to share information. The effective interviewer does not interrupt the respondent with unnecessary questions. In most interviews, pertinent information results from volunteered information, as opposed to responses to a specific question. The effective interviewer displays interest in their subject and in what is being said.

Additionally, effective interviewers demonstrate fairness. The respondent must understand that the interviewer is attempting to obtain only the relevant facts and is not targeting them unfairly. This can best be done by phrasing questions in a non-accusatory manner.

Effective interviewers work informally. Little is accomplished when the interviewer is formal, ostentatious, or attempts to impress the respondent with their authority. Information gathering is best accomplished by approaching the interview in an informal and low-key fashion.

Moreover, an interviewer should lack bias. If the respondent perceives that the interviewer is biased or is attempting to confirm foregone conclusions, the respondent will be less likely to cooperate. Accordingly, the interviewer should make every effort to demonstrate impartiality.

Furthermore, effective interviewers project professionalism. Professionalism in the interview often involves a state of mind and a commitment to excellence. The interviewer should be on time, be professionally attired, and be fair in all dealings with the respondent.

Finally, effective interviewers present no threat. It is vital that the interviewer not appear to be a threat to the interviewee. If people perceive that they are the target of an inquiry, they will be less likely to cooperate.

Legal Considerations When Conducting an Interview

Interviews, and especially admission-seeking interviews, might expose the company and the fraud examiner to certain legal risks. Thus, before engaging in an interview, fraud examiners must understand the ramifications of their actions. This requires an understanding of certain legal issues and how they limit or affect the ways in which an interview might be conducted.

However, because employee rights vary from case to case and jurisdiction to jurisdiction, fraud examiners should always consult with legal counsel regarding the specific laws and regulations for their locality to ensure the interview complies.

Legal Authority to Conduct Interviews

In most instances, legal authority is not required to interview people or to inquire into matters. Most jurisdictions provide citizens the authority to inquire into virtually any subject area, as long as the rights of individuals are not transgressed in the process. Generally, no license is required to conduct interviews; however, if the interviewer represents themselves as an investigator, some jurisdictions require a license.

False Imprisonment

False imprisonment is the restraint by one person of the physical liberty of another without consent or legal justification. In the context of employee interviews, a claim of false imprisonment may be made if the interviewer locks the interview room, stands in front of the exit, or refuses to let the suspect leave.

Use of Deception in Interviews

The use of deception to gain information can sometimes be employed legally, but fraud examiners should consult with legal counsel regarding the applicable laws and regulations before engaging in such activity. In cases where deception is legal, the theory is that information can be obtained by nearly any means, with the exception of force or threats. The interviewer, however, may not employ any deception likely to cause an innocent person to confess. The use of deception is generally not justified regarding promises of leniency or confidentiality, nor is it usually justified to obtain a monetary or business advantage.

Recording Interviews

In some circumstances, recording an interview might be illegal. Some jurisdictions limit an employer's right to record employee interviews during an investigation. In fact, in some jurisdictions, audio recording an interview is permitted only with the consent of all parties to the communication. Thus, fraud examiners should always consult with legal counsel when deciding whether to record an interview.

If recording an interview without the respondent's consent is legal, consider recording the interview covertly. Covert recording offers an advantage in that it provides an accurate record

without disturbing the flow of the interview. If there is to be a covert recording and the subject asks if the interview is being recorded, do not lie. Explain that it is in the subject's best interest that an accurate recording be made and that the subject can have a copy when completed. Similar to how a fraud examiner should handle note-taking, electronic recordings of each interview in an investigation should be documented separately.

Elements of Conversations

Since an interview is essentially a structured conversation, it is helpful to understand the basic elements of communications. Whenever two or more human beings are conversing, several types of communication occur—either individually or in combination. Some common types of communication include: expression, persuasion, therapy, ritual, and information exchange.

Expression

A common function of conversation is self-expression. One or more of the conversationalists might need to express ideas, feelings, attitudes, or moods. The urge for spontaneous expression can be a vital asset in interviewing, and it should be encouraged in the respondent. The interviewer can direct the subject's urge for expression toward the information-gathering objectives; however, the interviewer should also take precautions to avoid giving in to their own urges for personal self-expression.

One of the most common errors made by novice interviewers is to attempt to impress the respondent with their knowledge of the interview subject. In doing so, interviewers risk making the respondent feel threatened, with the resultant tendency for respondents to be more guarded with their responses rather than express their feelings frankly. Experienced interviewers will have the discipline to control their own responses.

Persuasion

The concepts of persuasion and expression differ in that persuasion is essentially intended to induce a belief or action. There are times when persuasion can be used effectively in the interview. Often, the interviewer can use persuasion to convince the subject of the interview's legitimacy or that it is beneficial for the subject to fully cooperate.

Therapy

Making people feel good about themselves is often a function of conversation. In an ordinary conversation with a friend, a person often expresses ideas and feelings to remove emotional tension. This release is called *catharsis* and is encouraged, for example, in psychiatric interviews. There are many times when the information sought in an interview is closely related to the respondent's inner conflicts and tensions. For example, in the area of fraud, a person embezzling money from the company will typically feel guilty. A skillful interviewer will know the therapeutic implication of such a feeling when attempting to develop information.

Ritual

Some aspects of conversation are ritualistic; that is, they are merely a form of verbal behavior that has no real significance other than to provide security in interpersonal relations. Examples of rituals include "Good morning!" and "How are you today?" In interviewing, fraud examiners must learn to detect ritualistic answers by the respondent and avoid giving them. The interviewer must be aware of the danger of engaging in ritualistic conversation and then confusing the results with valid information.

Information Exchange

An exchange of information is the central purpose of the interview. The word *exchange* reminds us that the flow of information in an interview goes both ways. Too frequently, interviewers become so concerned with the information they wish to obtain that they do not properly exchange information with the respondent. Although details of what the interviewer says should be carefully measured to not divulge too much information, fraud examiners should not be cagey because it is a tactic that rarely works.

Two basic problems occur in the exchange of information. First, the information sought by the interviewer is not of equal importance to the respondent, making full cooperation more difficult to obtain. Second, there is often a communication barrier between people of dissimilar backgrounds. These barriers are common between people who do not know one another.

Inhibitors of Communication

To be an effective interviewer, one must understand that certain matters inhibit communication, while others facilitate it. It is the interviewer's task to minimize inhibitors and maximize facilitators. An *inhibitor* is any social-psychological barrier that impedes the flow of relevant information by making the respondent unable or unwilling to provide the

information to the interviewer. Eight inhibitors to communication are listed in this section. The first four tend to make respondents unwilling; the last four make respondents unable to give the information, even if they are willing.

Competing Demands for Time

The respondent might hesitate to begin an interview because of other time demands. When demands for time are present, the subject does not necessarily place a negative value on being interviewed, but they compare the value of being interviewed against doing something else. In such circumstances, the interviewer must convince the respondent that the interview is a good use of time.

Ego Threat

In some cases, the respondent might withhold information because of a perceived threat to their self-esteem. There are three broad categories of ego threats: repression, disapproval, and loss of status.

Repression

The strongest ego threat is repression. *Repression* is a defense mechanism that protects an individual from items that would cause anxiety by preventing the items from becoming conscious. Respondents might not only refuse to admit information to the interviewer, they might also refuse to admit the information inwardly. When this happens, the respondents are being honest when answering that they do not know or that they have forgotten. Embezzlers, for example, might repress memory of their act of embezzlement because it does not conform to their moral code.

Disapproval

A less intense but more common effect of ego threat is found when respondents possess information but are hesitant to admit it because they anticipate disapproval from the interviewer. If respondents are made to feel that the interviewer will not condemn them, they might welcome the opportunity to divulge information. A generally accepting and sympathetic attitude toward the respondent goes far toward eliciting candid responses.

Loss of Status

Sometimes respondents fear losing status if the information provided becomes public. This can sometimes be overcome by the interviewer's assurance that the information will be handled confidentially to the extent possible.

Etiquette

The etiquette barrier operates when an answer to the interviewer's question contains information perceived by the respondent as inappropriate. Answering candidly would be considered inappropriate or evidence of a lack of proper etiquette. For example, there are certain things that men typically feel obligated to not discuss in front of women and vice versa, things that students do not tell teachers, and things that doctors do not tell patients. The desire to avoid embarrassing, shocking, or threatening answers is distinct from the fear of exposing oneself. Often, the negative effects of the etiquette barrier can be avoided with the selection of an appropriate interviewer and setting for the interview.

Trauma

Trauma denotes an acutely unpleasant feeling associated with crisis experiences. The unpleasant feeling is often exposed when the respondent is reporting the traumatic experience. Trauma is common when talking to victims, but it can usually be overcome by approaching the issue with an empathetic demeanor.

Forgetfulness

A frequent inhibitor to communication is the respondent's inability to recall certain types of information. This is not a problem if the objectives of the interview deal only with current attitudes, beliefs, or expectations. The natural fading of the memory over time makes it easier for the ego-defense system to reconstruct one's own image of the past by omission, addition, or distortion.

The memory problem is a much more frequent obstacle than most interviewers expect. Even some of the most simple and obvious facts cannot be elicited because of the respondent's memory problems.

There are three factors that contribute to recollection of an event. First, the vividness of the person's recall is related to the event's original emotional impact, its meaningfulness at the time, and the degree to which the person's ego is involved. Second, the amount of time that has elapsed since the event contributes to the recollection of an event. Third, the nature of the interview situation, including the interviewer's techniques and tactics, also contributes to the recollection of an event.

Knowledge of these factors will help the interviewer anticipate problems that might occur. And there are certain techniques, discussed later, that will help the interviewer overcome many of these memory problems.

Chronological Confusion

Chronological confusion refers to the respondent's tendency to confuse the order of experiences, and it commonly occurs in interviews seeking case history information. Chronological confusion can occur in two ways:

- Two or more events are correctly recalled, but the respondent is unsure of the sequence.
- Only one event is recalled, and it is incorrectly assumed to have occurred at an earlier point.

Inferential Confusion

Inferential confusion denotes confusion and inaccuracies resulting from errors of inference.

These errors generally fall into two categories: induction or deduction. *Induction* occurs when the respondent is asked to convert tangible experiences into a higher level of generalization. *Deduction* occurs when the respondent is asked to give tangible examples of certain categories of experience.

Unconscious Behavior

Often, the interview process reveals information about a person's unconscious behavior. There are three types of unconscious behavior: customs or habits, circular reactions, and reactions to acute emotional crises. A *custom* or *habit* is a settled tendency or usual pattern of behavior; it is the behavior that an individual engages in regularly. A *circular reaction* is the immediate, unwitting response of one person to the subliminal, nonverbal clues of another. A response to an *acute emotional crisis* does not follow a habitual pattern or result from a reaction to others; it arises only in special circumstances when the interviewee is experiencing an emotional dilemma.

Facilitators of Communication

Facilitators of communication are those social-psychological forces that make conversations, including interviews, easier to accomplish. These facilitators require a basic understanding of what motivates people.

Fulfilling Expectations

One of the important forces in social interaction is the tendency of one person to communicate, verbally or nonverbally, their expectations to the other person. The second

person then tends to respond, consciously or unconsciously, to those expectations. This might be viewed as one manifestation of the more general human tendency to conform to the group and to the anticipations of higher-status people. It is in this conformity to group norms that security is sought.

In the interview setting, the interviewer communicates expectations to the respondent. The interviewer should be able to transmit both a general expectation of cooperation and a more specific expectation that the respondent will answer the questions truthfully. The interviewer must clearly distinguish between asking for information and expecting it. The former is mainly achieved with verbal communication, while the latter is accomplished through nonverbal behavior. The interviewer who expects the respondent to cooperate will likely be more successful than one who only asks questions.

Recognition

It is common for human beings to rely on the recognition and esteem of others. Social interaction often depends on an exchange of social goods. People will perform in exchange for recognition and other social rewards. The need for recognition can be fulfilled by attention from people outside the individual's social circle. The skillful and insightful interviewer takes advantage of every opportunity to give the respondent sincere recognition.

Altruistic Appeals

There seems to be a need for humans to identify with some higher value or cause beyond immediate self-interest. This might sometimes take the form of identification with the objectives of a larger group. Altruistic deeds usually increase self-esteem, whether or not the deeds have been made public. This distinguishes altruism from publicity. Altruism is of major importance in motivating many respondents. Interviewers who understand the respondent's value system can use strategy and techniques that appeal to altruism.

Sympathetic Understanding

Human beings might feel a need for the sympathetic response of others, so they will share their joys, fears, successes, and failures. This need for understanding differs from the need for recognition that requires success and increased status. Interviewers who reflect a sympathetic attitude and who know how to direct that attitude toward the interview's objectives will find that their interviews will be more successful than those who do not.

New Experience

Most people welcome new experiences. Sometimes the respondent is motivated by curiosity regarding the interviewer. Interviewers should consider this when deciding what to say about themselves. One must not assume that just because an interview is a new experience, it will satisfy the respondent's needs. Aspects of the respondent's perception of the new experience can be ego threatening. The respondent might be anxious about the impression left with the interviewer. The interviewer can often detect this apprehensiveness at the beginning of the contact. Once the interviewer dispels these fears, the respondent frequently finds the interview to be a new and interesting experience.

Catharsis

Catharsis is the process by which a person obtains a release from unpleasant emotional tensions by talking about the source of these tensions. Although people are familiar with the frequent necessity for catharsis in themselves, they do not always perceive the same need in others. The need for sympathetic understanding and the need for catharsis are related, but they are not the same thing. The interviewer who does not have time to listen to what they consider inconsequential or egocentric talk will often find the respondent unwilling to share important consequences.

Need for Meaning

Another general trait common to people is the need for meaning. Every society has a set of assumptions, values, explanations, and myths lending order to it. The concept of need for meaning is related to *cognitive dissonance* (i.e., an uncomfortable emotional state caused by holding conflicting ideas simultaneously). Psychological tension is created when an individual becomes aware of incongruence of facts, assumptions, and interpretations. This tension is painful, and its reduction is rewarding to the individual. In cases where the interview topic deals directly with the sources disturbing a person's system of meaning, there is a strong motivation for the respondent to talk it through if they are convinced of the interviewer's interest.

Extrinsic Rewards

Extrinsic rewards are rewards the interviewee receives that are not directly related to the interview experience, and they cause the respondent to see the interview as a means to an end. Extrinsic rewards for interviewees can include money, job advancement, and retention of privileges. What is irrelevant to the interviewer might be relevant to the respondent.

A sensitive interviewer will be able to recognize what extrinsic rewards the respondent receives, if any, from being interviewed. Fraud examiners should be careful to not promise any extrinsic rewards that are beyond their authority to grant.

Kinesic Interview and Interrogation

The kinesic interview or interrogation methodology has influenced many in the law enforcement community for decades. The methods used in kinesic interviews are different from those used in traditional interviews. In kinesic interviews, the interviewer is not necessarily looking for a confession from the subject. Instead, the interviewer is attempting to assess the subject and their responses to questioning by reading that individual's body language and other manifestations of deception. As will be discussed in further detail later in this chapter, the presence of a single manifestation does not necessarily prove deception; the interviewer should consider all behaviors together when making such assessments.

In the book *The Kinesic Interview Technique*, authors Frederick C. Link and D. Glenn Foster define the kinesic interview technique as:

[An interview technique] used for gaining information from an individual who is not willingly or intentionally disclosing it.

Link and Foster believe that the kinesic interview is based entirely on the concept of stress—an event or circumstance that forces an individual's mind or body out of psychological equilibrium. When stress occurs, humans, like any other living creature, have an emotional reaction. Link and Foster refer to this as the “fight or flight syndrome,” in which people either run from a stressful situation or brace to face it. Either way, they hypothesize, people's animalistic tendencies dictate that they must react to stress. When this concept is applied to the interview situation, the kinesic interview technique is applied to attempt to read the interview subject's reaction to stress.

The kinesic interview is conducted not just to observe what the subject says, but also how the subject says it; the subject's gestures, posturing, facial expressions, and voice inflection are just a few of the traits that an investigator looks at. This style of interviewing assumes that when most human beings experience stress or discomfort, often linked to deceit or concealment of facts, they will reveal this stress or discomfort through their body language.

An individual's reactions to stress are generally subconscious; in most cases, interviewees do not even realize that they are acting noticeably different. The actions or signs that an interviewer is looking for are called *meaningful behavior*—activities that might suggest that an interviewee is under stress.

Link and Foster identify three distinct categories into which meaningful behavior can be divided:

- Self-initiated verbal statements that the interviewee initiates without prompting
- Prompted verbal responses or statements made by the interviewee in response to structured questions asked by the interviewer
- Nonverbal behavior or body language, which includes body positioning movements, lack of movement, and observable physiological changes

Self-Initiated Verbal Signals

Interviewees make self-initiated verbal statements without any prompting by the interviewer. These statements can display changes in speech pattern, a use of overly respectful or friendly words directed at the interviewer, or indirect answers and statements. The subject's speech tempo will tend to increase, or the subject will hesitate or stammer frequently before giving any responses. These verbal clues might be a subconscious attempt by the interviewee to dodge the line of questioning or suppress their guilty feelings.

Generally, a dishonest person is much more likely to give more self-initiated verbal signs than a person who is telling the truth.

Prompted Verbal Responses

Prompted verbal responses can help an interrogator to differentiate an honest person from a deceitful one. By using a series of structured questions, interviewers can generally get a good indication of how truthful the subject is. These responses should be woven into a casual conversation so that the subject is not aware of the significance of the structured questions. Also, structured questions must not appear to be interrogational in manner.

Structured Questions

Fraud examiners have several types of loaded questions they can use to help determine the interviewee's guilt or innocence. Again, no single response or behavior should be considered proof of deception, guilt, or innocence, but instead viewed collectively with other responses or behaviors and documented facts of a case.

- *Punishment question:* The interviewer will casually discuss the punishment of the crime with the subject, asking, for example, “What do you think should happen to the criminal?” When posed with this sort of question, the innocent person, having nothing invested in the crime, will generally answer that the criminal should be severely punished, saying something like, “Lock them up and throw away the key.” However, if guilty of the crime, the interview subject will generally answer that the criminal should be treated fairly, saying for example, “The person who stole that money is very sick and probably needs mental help.” In essence, the guilty person is more likely to answer “Don’t hurt me.”
- *Physical evidence question:* This type of question is meant to jar the suspect into making a mistake. The interviewer will suggest that there is a piece of evidence that might link the interviewee to a crime, asking, “Is there any reason that your fingerprints might have been found near the crime scene?” This question does not assert that there is any evidence. The innocent person, knowing that they had nothing to do with the crime, will simply answer “no,” unconcerned about the possible evidence. The guilty party will often become concerned with this possible evidence and attempt to cover for it with another lie. However, interviewers should be circumspect when employing this tactic. For example, if the subject is guilty, but wore gloves while committing the crime, a question implying that their fingerprints were found at the crime scene might inadvertently undermine the remainder of the interview by informing the subject as to how little the interviewer actually knows about the methods used to perpetrate the fraud.
- *Crime existence question:* A variation on this question would be “Do you think that this crime was even committed?” The guilty party will likely see this as a possible way out and answer “no,” while the innocent person will likely answer “yes.”

Nonverbal Behavior/Body Language

The evaluation of an interview subject’s body language can provide the fraud examiner with numerous insights into the subject’s true intentions or reveal stress and discomfort. Quite often, while an interviewee says one thing, their body language tells a different story. The first step in this process is to evaluate the subject’s “normal” body language. While there are some general tendencies that suggest that a subject is experiencing stress, potentially due to being less than truthful, the interviewer must first evaluate the subject’s natural tendencies. For example, some people use their hands a lot when speaking, while others do not.

For most people, the head is the most expressive portion of the body. The interviewer can read several facial traits or expressions, including:

- *Eyes:* Breaks in eye contact can indicate that a subject is uncomfortable with a line of questioning or their response to questioning. To break eye contact, the subject might close their eyes, cover their eyes, or turn or lower their head. While any of these breaks in eye contact can suggest a subject's deceit, the interviewer must remain keenly aware that what is considered an appropriate amount of eye contact differs greatly among various cultures. In some cultures, direct or prolonged eye contact is purposefully avoided because it can be interpreted as disrespectful or threatening. Additionally, different personality types, mental health conditions, or intellectual capabilities might influence behaviors such as eye contact. Individuals suffering from anxiety-related disorders, for example, might not be comfortable making and maintaining eye contact, even when being truthful and cooperative.
- *Eyebrow movement:* When a subject uses their eyebrows to display disbelief or concern, the display might be a deceptive reaction to the interviewer's questioning.
- *Touching the face:* Many subjects, when under stress, repeatedly touch the tip of their nose or rub their chin. These movements are often nervous reactions to threatening situation.
- *Blushing:* A person whose face or cheeks become red is generally experiencing increased blood pressure, indicating pressure or stress.
- *Adam's apple:* Often, the subject's larynx will move up and down when they are concerned or nervous.
- *Carotid arteries:* Often, the veins in a person's neck will become exposed when they become nervous.

In addition, many interviewees will attempt to cover or defend themselves by crossing their arms or their legs. Generally, such movements are defensive postures.

Fraud examiners should consider the following factors when applying kinesic techniques:

- No single behavior, by itself, proves anything.
- Behaviors must be relatively consistent when the stimuli are repeated.
- The interviewer must establish what is normal or baseline behavior for each subject and then look for changes from the baseline. These observed changes in the subject's baseline behavior are diagnosed in clusters, not individually.
- Observing and interpreting behavior is hard work.
- The subjects will watch the interviewers while the interviewers watch them.
- Kinesic interviewing is not as reliable with some groups.

The Cognitive Interview Technique

Police and fraud investigators must often rely on the testimony of witnesses to bring the facts of a case together. The testimony of an important witness can determine the entire outcome of a fraud case, so it is essential that witnesses' words be as reliable and detailed as possible.

Unfortunately, witnesses are human, and humans are prone to make errors. Fraud investigators must understand that in a time of crisis, or even in a situation in which the witness was simply not paying close attention, the eyewitness can easily miss acute details. Often, witnesses have trouble recalling large portions of events because they did not know at the time that they should have been looking for specific details. Dr. R. Edward Geiselman and Dr. Ronald P. Fisher write in "Interviewing Victims and Witnesses of Crime," an article for the National Institute of Justice (NIJ), that "most victims and eyewitnesses . . . are so occupied with the event that they do not have the time to try to learn or memorize details about a suspect at the time of the crime."

Because of these problems, different techniques for filling out the witnesses' testimony have been developed to assist the investigator. One of the first techniques developed was the use of hypnosis on witnesses. The notion behind this approach was that an investigator could open the mind of a witness and pick into their subconscious for specific details. The merits of this technique are highly debatable and have been contested in courts of law.

But more recently, the cognitive interview technique was developed to serve a similar purpose of probing the subconscious. This approach has proven far more effective than questionable hypnosis techniques and has been deemed a reliable method in the court of law.

The cognitive interview technique was established, researched, and fine-tuned by Dr. Geiselman, a professor at the University of California, Los Angeles, and other professionals in the psychiatric profession. Geiselman and others have written numerous articles and governmental documents detailing the extensive research dealing with interviewing witnesses.

Geiselman believes that the cognitive interview should be split into two distinct phases: the narrative phase and the specific-detail phase. The narrative phase deals more with "what happened" during the event; the specific-detail phase seeks to track down who was involved and obtain specific details about the suspect. When the fraud examiner uses these phases in succession during an interview, it is likely that they will come away from the interview with an excellent witness account of an event.

The Narrative Phase

The first portion of the cognitive interview is the narrative phase, in which the witness tells the “whole story.” The investigator should first allow the witness to recount the situation, using several steps to guide the narrative portion. There are four primary steps in the narrative phase:

1. Reconstruct the circumstances of the event.
2. Instruct the witness to report everything and be complete.
3. Recall the events in different orders.
4. Change perspectives.

Reconstruct the Circumstances of the Event

In this first, important step, the interviewer should ask the witness to describe the context in which the incident occurred. The interviewer should ask the witness to describe everything, including the weather, time of day, and the look and feel of the environment in which the incident took place. What did the people and/or objects in the surroundings look like?

The objective of this step is to mentally return the witness to the scene so that they will vividly recall the unfolding events. Asking the witness to describe the emotional state they were in at the time of the occurrence often helps accomplish this first step.

Instruct the Eyewitness to Report Everything and Be Complete

In this stage, the interviewer should ask the eyewitness to recount every last detail as completely as possible. Geiselman says that a witness will often withhold information that they think might be irrelevant to the investigation. Therefore, the investigator should instruct the witness not to omit anything when giving their statement, no matter how trivial the information might seem. The small details that the witness remembers during the interview might not be directly beneficial to the investigation, but they will be important in helping the witness remember the events descriptively and thoroughly.

Recall the Events in Different Orders

Constructing the event in a different order will give the witness the freedom to recreate the event completely. When recounting the event in sequential order, the witness could very well forget minute details in an effort to describe what happened next. If the witness constructs the event from the single moment or thing that left the greatest impression on them, the interviewer might gain an insight into the witness’s perspective.

Change Perspective

The final step of the cognitive interview process is to get the witness to alter their perspective of the event. The investigator should ask them to reconstruct the scenario and assume a different position within the situation. For instance, ask the witness to pretend to be a different person within the event, and recount the event from that perspective. What was the other person thinking or feeling? This technique might seem a bit odd, but it might allow the witness to consider various elements of the event that they previously had not.

Specific Details

Once the narrative portion of the interview is completed, it is likely that the investigator will have questions about specific details. Geiselman and his contemporaries have developed five techniques to cultivate specific details and items of information from the witness. The five categories are:

- Physical appearance
- Names
- Numbers
- Speech characteristics
- Conversation

Physical Appearance

The investigator can often elicit additional information about the event by asking the witness to describe the suspect. A particularly effective technique is to ask the witness whether the suspect reminded the witness of anyone they know. Often, physical descriptions, such as the type of clothing a suspect was wearing or the particular way a suspect walked or looked, will not be presented during the narrative phase of the interview. This additional information, however, can be key to linking a suspect with a specific crime.

Names

Often, the name of the suspect or another person will be spoken during an event, but many times the event proves too traumatic or happens too quickly for a witness to recall. If a witness cannot remember any names spoken during the event, ask them to attempt to recall the first letter of the suspect's name (or any other names spoken) by going through the alphabet one letter at a time.

Numbers

Once the witness has possibly established the first letter of the suspect's name, the investigator should ask the witness how many syllables or letters were in the name. Establishing whether the name was long or short might effectively jar the witness's memory.

Speech Characteristics

The investigator can also ask the witness what types of speech characteristics the suspect has. Geiselman suggests asking the witness whether the suspect's speech reminds the witness of anyone else. The interviewer should also determine whether the suspect had any specific accent, an awkward or unusual voice, or used any words repeatedly during the event.

Conversation

The witness should be asked whether anything that the suspect or anyone else said during the event elicited an unusual response. Did the suspect or any other witnesses react in a strange manner to anything that was said?

The extensive research that Geiselman and his colleagues have done on the cognitive interview technique has shown that the technique improves the recall performance of witnesses when compared to standard interview techniques. The cognitive technique places emphasis on the witness's recollection of details to give investigators a more complete picture of what actually happened during a specific event.

PEACE Interviewing Method

The PEACE framework was developed by law enforcement and psychologists in the United Kingdom who were seeking to reduce the number of false confessions thought to be the result of more coercive techniques. The PEACE method is an effective means of conducting interviews with witnesses, victims, and suspects, although there might be differences in strategy for each. In this framework, PEACE stands for:

- Planning and preparation for interviews
- Engage and explain
- Account, clarification, compare, and contrast (formally challenge)
- Closure
- Evaluation

The Planning and Preparation Phase

The interviewer needs to decide the best order for conducting interviews to maximize their effectiveness. The interviewer should carefully manage the timing of interviews within an investigation and clearly define the objectives of each interview. First of all, the interviewer should decide whether an interview with a particular person is immediately necessary or if there are more important priorities to which they need to attend.

An interview's method and effectiveness depend on the amount and quality of the information the interviewer obtains in advance from other sources. For instance, if the interviewer wants a confession from the suspect, the interviewer must develop substantial evidence beforehand.

The investigator should consider interview requirements and strategy, as well as where the interview will be conducted. All of these decisions constitute the planning and preparation phase of the interview.

The Engage and Explain Phase

Once the interview itself begins, the investigator should strive to engage and explain. At the earliest opportunity, the investigator should establish a relationship with the interviewee and maintain it throughout. This is how interviewers engage with interviewees. Also, at the beginning of an interview, the investigator needs to explain the purpose of the interview, the individual's rights, the ground rules, and any relevant procedures.

The Account, Clarification, Compare, and Contrast Phase

The account, clarification, compare, and contrast phase is when the investigator obtains the interviewee's full account of events. The investigator might need to clarify or compare and contrast the interviewee's account because of inconsistencies in statements or with other evidence.

The Closure Phase

In the closure phase, the investigator needs to bring the interview to a conclusion by confirming what the interviewee has said and explaining what happens next.

The Evaluation Phase

After the interview, the interviewer should evaluate its significance within the framework of the entire investigation. In the evaluation phase, the investigator should ask themselves a number of questions:

- What information did I obtain?
- How does the interview match other available evidence?
- What action do I need to take?
- What further inquiries do I need to make?
- How did I perform and how can I develop my skills?

The investigator might need to revise their previous plan. Information obtained during the interview could demand an urgent reassessment of priorities. Sometimes there might seem to be precious little time for evaluation or planning and preparation, but that must not detract from the importance of spending time on these two phases.

Interview Mechanics

As with all other phases of a fraud examination, an interview will be most successful if the investigator is thoroughly prepared, which requires that the interviewer understands the mechanics of interviewing.

Note-Taking

The interviewer will frequently need to document interviews by taking notes or electronically recording the interview, if permissible. Interviews without notes or recordings are limited in value because they leave the results of the interview open to interpretation or dispute.

When taking notes, fraud examiners should follow a few basic rules. First, the interview notes for each interview should be recorded on a separate document. This can be especially helpful if documents from a particular interview are subpoenaed.

Take accurate, but not necessarily verbatim, notes during the interview. Do not try to write down all the information provided during an interview; only write down the pertinent facts. Taking too many notes will make the interview process cumbersome, and it might inhibit the respondent. If, however, a quote is particularly relevant, try to write it down verbatim. Enclose all direct quotes in quotation marks.

Do not slow down the interview process for note-taking. Instead, write down key words or phrases, and then go back over the details at the end of the interview. In general, it is better to err on the side of taking too few notes rather than too many.

An investigator might choose to electronically record an interview, if the practice is permissible. This allows the investigator to conduct the interview without disrupting the flow of the conversation to take notes. Additionally, recording the interview prevents the subject from observing which points the investigator finds most significant. It is important to keep in mind, however, that an electronic recording device can distract the subject and inhibit their responses. Therefore, fraud examiners should avoid drawing unnecessary attention to such devices and should consider covertly recording interviews when possible. As rules regarding the use of recording devices can vary, an investigator should always check a jurisdiction's laws before proceeding with an electronic recording, covertly or otherwise.

Maintain Eye Contact

The interviewer should maintain eye contact with the respondent as much as possible while taking notes. Eye contact personalizes all human communication, and it creates a more comfortable environment and facilitates the flow of information during the interview process. However, it is important to recognize that direct or prolonged eye contact is not customary in many cultures, including parts of Latin America, the Middle East, Africa, and East Asia. Maintaining sustained eye contact with interviewees from these cultures could be construed as disrespectful or as a challenge and negatively impact the interview. Furthermore, a subject's intellectual capabilities, mental health conditions, or personality type could make maintaining eye contact disadvantageous for the interviewer.

Opinions

Avoid making notes regarding your overall opinions or impressions of a witness. Fraud examiners should not offer opinions about the legal guilt or innocence of any person. Such notes can cause problems with credibility if they are later produced in court.

Do Not Convey Emotions

Avoid showing excitement or other emotions when taking notes. During interviews of targets and adverse witnesses, take notes in a manner that does not indicate the significance of the information; that is, never allow note-taking to convey your emotions.

Writing Down Questions

Whenever possible, do not prepare a list of predetermined questions to ask the subject. The interview should flow freely. The interviewer might, however, want to develop a list of key points to cover during the interview.

Also, do not provide the subject with a list of predetermined questions. Allowing the respondent to read a written list of questions can give them an opportunity to fabricate their answer.

Documenting Results

Explain the interview notes as soon as possible after concluding the interview—preferably immediately afterward. If this procedure is followed, the fraud examiner will not have to take copious notes during the interview.

Do Not Interview More Than One Person

One of the basic rules is to question only one person at a time. When two subjects are questioned simultaneously, the testimony of one respondent invariably influences the testimony of another. There are few absolute rules of interviewing, but this is one of them.

Setting

When possible, the fraud examiner should hold the interview in a physical location where the subject being interviewed feels comfortable and secure, as well as where there is no hint or indication that the subject's freedom is in any way restricted. If the subject is made to believe that they cannot leave at any time, adverse legal action could be taken.

Another basic rule is to conduct interviews under conditions of privacy. The interview is best conducted out of the sight and sound of friends, relatives, or fellow employees, as people are very reluctant to furnish information if others might be able to hear the conversation. Ideally, an interview should take place in an environment that can be controlled by the interviewer.

Question Typology

When conducting an interview, there are five general types of questions an interviewer can ask: introductory, informational, assessment, closing, and admission-seeking.

Because fraud examinations move in a linear order, starting with the general and working to the specific, the first interviews should be with those individuals who are least likely to be involved, working toward those individuals who are more likely to be involved. The first interviews are conducted for the purpose of gathering information; therefore, they should be nonconfrontational, nonthreatening, and should encourage open communication. In these routine interview situations, only three of the five types of questions will normally be asked: introductory, informational, and closing questions. If the interviewer has reasonable cause to believe the respondent is not being truthful, they can ask assessment questions. And finally, if the interviewer decides with reasonable cause that the respondent is responsible for misdeeds, they can pose admission-seeking questions.

Introductory Questions

Introductory questions are designed to meet four objectives: to provide an introduction, to establish rapport, to get the respondent to agree verbally to cooperate in the interview (i.e., establish the interview theme), and to observe the respondent's reactions to questions.

Informational Questions

Once the proper format for the interview is set, the interviewer then turns to the fact-gathering portion. Informational questions should be nonconfrontational and nonthreatening, and they should be asked for the purpose of gathering unbiased, factual information.

Typically, the interviewer will ask three types of questions during the fact-gathering portion of an interview: open, closed, and leading. These question types are discussed in more detail later in this chapter. Each type is used in a logical sequence to maximize the development of information. If the interviewer has reason to believe that the respondent is being untruthful, they can pose assessment questions. Otherwise, they should bring the interview to a logical close.

Closing Questions

Closing questions seek to close the interview positively. In routine interviews, closing questions serve the following purposes: reconfirm facts, gather additional facts, and conclude the interview in a manner that maintains goodwill.

Assessment Questions

If the interviewer has reason to believe the respondent is being deceptive, they should begin asking assessment questions. These are questions specifically designed to establish the respondent's credibility. When assessing credibility, the interviewer must observe the subject's verbal and nonverbal responses. By observing the respondent's verbal and nonverbal responses to these questions, the interviewer can assess the respondent's credibility with some degree of accuracy. That assessment will form the basis of the interviewer's decision about whether to pose admission-seeking questions and seek a legal admission of wrongdoing.

Admission-Seeking Questions

Again, admission-seeking questions are designed to obtain a legal admission of wrongdoing. The choice of when to conduct an admission-seeking interview of a suspect is critical. Admission-seeking interviews are reserved specifically for individuals whose culpability is reasonably certain. They should take place only when all other reasonable investigative steps have been completed and as much information as possible has been developed from other sources. In addition, the interviewer should be able to reasonably control the interview's place, time, and subject matter.

Admission-seeking questions serve at least three purposes: (1) to clear an innocent person, (2) to encourage the culpable person to confess, and (3) to convince the confessor to sign a written statement acknowledging the facts. But the interviewer must be careful to pose these questions in a way that does not violate the rights and privileges of the subject.

Introductory Questions

One of the most difficult aspects of an interview is getting started. Indeed, the introduction might be the hardest part. In many instances, the interviewer and the respondent have not met before, so the interviewer has a difficult task: meet the person, state a reason for the interview, establish necessary rapport, and get the information.

The introduction is accomplished through questions as opposed to statements. The questions allow the interviewer to assess feedback from the respondent. This is an important aspect of the introduction. If the respondent is reluctant to be interviewed, that fact will come out through the introductory questions.

Four Objectives

Introductory questions are designed to meet the following four objectives.

Provide the Introduction

The interviewer must introduce themselves before the interview commences. The interviewer generally should indicate their name and company, but they should avoid stating their title. In general, the more informal the interview, the more relaxed the respondent.

In some instances, the interviewer cannot avoid giving their title, and in such cases, the interviewer should use a title that will not conjure up emotions or possible fear in the respondent's mind.

Establish Rapport

Introductory questions should be designed to establish rapport. Merriam-Webster.com's Dictionary defines *rapport* as a "harmonious accord or relation that fosters cooperation, communication, or trust." In other words, the interviewer must establish some common ground with the respondent before they begin the fact-gathering portion of the interview. Interviewers usually establish rapport by spending a few minutes engaging the respondent in casual conversation. This aspect, however, should not be overdone, as most people are aware that the interviewer is there for a meaningful purpose.

Establish the Interview Theme

The interviewer must state the interview's purpose in some way prior to the commencement of serious questioning. Otherwise, the respondent might be confused, threatened, or overly cautious. Stating the purpose of the interview is known as establishing the interview theme.

Additionally, the purpose of the interview should be general and not specific. The specific interview purpose will be conveyed to the respondent later. The stated purpose of the interview should be one that is logical for the respondent to accept and easy for the interviewer to explain, but it might be related only indirectly to the actual purpose of the interview. Normally, the more general the theme, the better.

EXAMPLE

Interviewer:

"I am working on a matter and I need your help."

OR

"I am doing a review of procedures here at the company."

OR

"I am developing some information on our purchasing procedures."

The goal of the theme is to get the respondent to make a commitment to assist. Failure to get a commitment to assist from the respondent is one of the common mistakes that interviewers make. Obtaining a commitment to assist is a critical step in setting the tone for the interview. A commitment of assistance requires positive action on the part of the person being interviewed. Remaining silent or simply nodding the head in response to a request for assistance is generally not sufficient.

The interviewer should ask for the commitment before the interview commences, and they should encourage the respondent to voice that commitment aloud. If the interviewer makes a request for assistance and the respondent remains silent, the interviewer should repeat the question in a slightly different way until the respondent verbalizes commitment. In the following example, Hayden Barlow, the CFE, introduces himself to Emma Martin, who works in the purchasing department of Westbrook Furnishings Incorporated, and obtains a commitment to assist from Martin.

EXAMPLE

Interviewer:

"Ms. Martin, I'm Hayden Barlow. I'm doing a review of our purchasing function. Do you have a few minutes?"

Respondent:

"Yes."

Interviewer:

"I am gathering some information on certain company procedures. Maybe you can help me?"

Respondent:

No response.

Interviewer:

“Could I get you to help me, if you can?”

Respondent:

“Yes. What’s this about?”

Generally, the most effective interview theme is that help is being sought. Nearly all human beings get satisfaction from helping others. Thus, in most interviews, the interviewer should approach the respondent so that they do not feel threatened in any way and are made to feel important in helping out.

In the following examples, the interviewer is introducing himself to a fellow employee.

EXAMPLE

WRONG:**Interviewer:**

“Ms. Martin, I am Hayden Barlow, a Certified Fraud Examiner with Westbrook Furnishing’s fraud examination unit. I am investigating a case of suspected fraud, and you might know something about it. How long have you worked here at the company?”

RIGHT:**Interviewer:**

“Ms. Martin, I am Hayden Barlow. I work here at the company. Have we met before?”

Respondent:

“I don’t think so.”

Interviewer:

“I am working on an assignment and I need your help. Do you have a few minutes I can spend with you?”

Observe Reactions

The interviewer must be skilled in interpreting the respondent's reactions to questions. Social scientists say that more than half of the communication between individuals is unspoken. The interviewer must, therefore, observe systematically, though in a nondescript manner, the various responses the respondent gives throughout the conversation.

To observe the respondent's reactions, the fraud examiner should move from comfortable to sensitive questions. That is, the interview process should begin by posing comfortable questions while establishing rapport. Asking comfortable questions will help the interviewer find some common ground on which to connect with the respondent.

Sensitive questions should be avoided until well into the interview. Even then, such questions should be asked only after careful deliberation and planning. Moreover, all questions should be non-accusatory. Nothing closes up the lines of communication in an interview like an accusatory question. If the respondent starts to become uncomfortable with the questioning, the interviewer should move into a different area and approach the sensitive question later from a different vantage point.

Likewise, interviewers are encouraged to formulate their questions in a way that will not bring about a strong emotional reaction from the respondent, and emotive words of all types should be avoided during the introductory phase. Such words put people on the defensive, making them more reluctant to answer and cooperate.

EXAMPLE

Instead of:	Use:
Investigation	<i>Inquiry</i>
Audit	<i>Review</i>
Interview	<i>Ask a few questions</i>
Embezzle/steal/theft	<i>Shortage or paperwork problems</i>

Furthermore, some people will not volunteer information; they must be asked. The interviewer must not be reluctant to ask sensitive questions after the proper basis has been established. If the interviewer poses the question with confidence and with the attitude that an answer is expected, the respondent will be much more likely to furnish the requested information. If the interviewer is apologetic or lacks confidence in the question, the respondent is much less likely to answer.

Again, after the interviewer establishes rapport through normal conversation, they must observe the respondent's reactions. This will serve as a baseline for observing behavior when questions that are more sensitive are asked. If the respondent's verbal and nonverbal behaviors are inconsistent from one type of question to another, the interviewer should attempt to determine why.

To determine why the respondent's behaviors are inconsistent, the interviewer must be knowledgeable about nonverbal clues of behavior, which generally fall within one of the following categories: proxemics, chronemics, kinetics, or paralinguistics.

PROXEMICS

Proxemic communication is the use of interpersonal space to convey meaning. The relationship between the interviewer and respondent is both a cause and effect of proxemic behavior. If the distance between the interviewer and the respondent is great, there is more of a tendency for them to watch each other's eyes for clues to meaning.

It is important to position the respondent's chair and the interviewer's chair at an acceptable distance. The correct conversational distance varies from one culture to another. In the Middle East, the distance is quite short; in Latin America, equals of the same sex carry on a conversation at a much closer distance than in North America. Often, as the subject matter of the interview changes, the interviewer can note the changes in the respondent's proxemic behavior. If the person is free to back away, they might do so when the topic becomes unpleasant or sensitive.

CHRONEMICS

Chronemic communication refers to the use of time in interpersonal relationships to convey meaning, attitudes, and desires. If the respondent is late in keeping an appointment, for example, this might convey a lack of interest in the interview or an attempt to avoid the interview.

The most important chronemic technique used by interviewers is in the timing of questions. The interviewer can control the length of pauses and the rate of their speech. This is called *pacing*. The interviewer can also control the length of time after the respondent has finished a sentence before another question is posed. This is called the *silent probe*.

Pacing is one of the principal nonverbal methods of setting an appropriate mood. The tense interviewer often communicates anxiety by a rapid-fire rate of speech, which, in turn, might

increase anxiety in the respondent. To establish a more thoughtful, deliberative mood usually needed to stimulate free association, the interviewer must take the initiative in setting a more relaxed, deliberate pace.

KINETICS

Kinetic communication involves the use of body movement to convey meaning. Even though posture, hands, and feet all communicate, interviewers tend to focus attention on the face, and interviewers are more accurate in their judgments of others if they can see facial movements and expressions. When the interviewer concentrates on facial expressions, the primary interest is eye contact. Eye contact primarily communicates the desire to make or avoid communication. A person who feels shame normally will drop the eyes to avoid the glance of another. This is not only to avoid seeing disapproval, but to conceal personal shame and confusion.

PARALINGUISTICS

Paralinguistic communication involves the use of volume, pitch, and voice quality to convey meaning. One of the basic differences between written and verbal communication is that oral speech gives the full range of nonverbal accompaniment. For example, a “yes” response might not mean complete agreement; it depends on the way in which the “yes” is said.

The interviewer must learn to listen and observe changes in the nonverbal accompaniment and whether the verbal and nonverbal are harmoniously reinforcing or tend to give conflicting signals, as in cases where the respondent is trying to deceive the interviewer. Ten emotions have been studied by social scientists: anger, fear, happiness, jealousy, love, nervousness, pride, sadness, satisfaction, and sympathy. Some emotions, like anger and nervousness, can be more reliably identified than the others.

Methodology

Respondents must perceive that they have something in common with the interviewer and should feel good about the situation. This is best accomplished when respondents perceive the interviewer as being open and friendly. The following techniques promote this perception: make physical contact, establish a transitional statement, seek continual agreement, and avoid invading personal space.

Physical Contact

In some cultures, it is recommended to make physical contact with the person being interviewed by shaking hands. Making physical contact helps break down psychological barriers to communication. The interviewer should not invade the respondent's personal space, however, as this might make the person uncomfortable.

The interviewer uses body language to create the impression of trust during the interview by gesturing openly with the arms, clasping hands together, and leaning forward in a manner to indicate interest. Rapport can be established through verbal techniques, such as using soft words, agreeing with the respondent, and avoiding negative terms.

Establish a Transitional Statement

Once the interviewer has a commitment for assistance, they must describe the purpose of the interview in more detail. This is done with a transitional statement, which is used to provide a legitimate basis for the inquiry and to explain to respondents how they fit into the inquiry.

The interviewer usually can provide such information with a broad description. When interviewing employees in the same company, most of them already presume the legitimacy of the interviewer's request for assistance.

After describing the basic nature of the inquiry with the transitional statement, the interviewer should seek a second commitment for assistance.

EXAMPLE***Interviewer:***

"It's pretty routine, really. I'm gathering some information about the purchasing function and how it is supposed to work. It would be helpful to me if I could start by asking you to tell me about your job. Okay?"

When interviewing strangers, the interviewer might have to provide more particularity when describing how the respondent's assistance is needed. This can be accomplished by one or more of the following methods. In the example below, the interviewer is talking to an outside vendor.

EXAMPLE

Interviewer:

“It’s pretty routine, really. As I say, I work for Westbrook Furnishings and I’ve been assigned a project to gather some information about some of our procedures. And because you work for one of our vendors, I thought it might be helpful to talk to you. Okay?”

OR

“It’s pretty routine, really. I have been asked by the company to gather information on some of our procedures. I thought you might be able to help by answering a few questions. Okay?”

OR

“It’s pretty routine, really. I have been asked by the company to gather some information, and they suggested I might contact you. Okay?”

Seek Continual Agreement

Throughout the interview process—from the introduction to the close—the interviewer should seek continual agreement by attempting to phrase the questions so that they can be answered affirmatively with a “yes.” It is easier for people to reply in the affirmative than in the negative.

EXAMPLE

Interviewer:

“Okay?”

“Can you help me?”

“That’s okay, isn’t it?”

Do Not Invade Personal Space

During the introductory part of the interview, the interviewer generally should remain at a distance of 4–6 feet (i.e., 1.2–1.8 meters). Do not invade the respondent’s personal zone (closer than about three feet), as it might make the respondent uncomfortable. In some cultures, common practice might entail being closer than four feet or farther than six feet; in those situations, interviewers should follow any applicable cultural norms.

Informational Questions

Informational questions are nonconfrontational, nonthreatening, and are asked for information-gathering purposes. The great majority of the interviewer's questions fall into this category. These types of questions may be asked during any of the following types of interviews, among others:

- Interviews to gain an understanding of accounting control systems
- Interviews concerning documents
- Interviews to gather information regarding business operations or systems
- Pre-employment interviews

Informational questions seek to elicit unbiased, factual information. The interviewer will be alert to inconsistency in facts or behavior.

Question Sequences

As a general rule, questioning should proceed from the general to the specific; that is, it is best to seek general information before seeking detailed information. A variation to this approach is to “reach backward” with the questions, by beginning with known information and working toward unknown areas. An efficient method of doing this is to recount the known information and then frame the next question as a logical continuation of the facts previously related.

It is common, especially in accounting and fraud-related matters, for figures or numbers to be critical to an examination. Unfortunately, some witnesses are unable to recall specific amounts. The interviewer can jog the respondent's memory by comparing unknown items with known items.

EXAMPLE

Interviewer:

“Was the amount of money involved more than last year's figure?”

Questioning Techniques

Asking the right question is necessary to conduct an effective interview. By asking the right questions, the interviewer can improve a whole range of communication skills. Informational questions—as well as others—fall into several general categories.

Open Questions

Open questions are those worded in a way that makes it difficult for the respondent to answer “yes” or “no.” Also, the answer to an open question is not dependent on the question. The typical open question calls for a monologue response, and it can be answered in several different ways.

During the information phase of the interview, the interviewer should endeavor to primarily ask open questions. This is to stimulate conversation.

Some of the best open questions are subtle commands.

EXAMPLE

Interviewer:

“Please tell me about your job.”

“Please tell me about the operation of your department.”

“What do you think about this problem?”

“Please describe the procedures to me.”

Closed Questions

Closed questions are those that require a precise answer, such as “yes” or “no.” Closed questions also deal with specifics, such as amounts, dates, and times. As much as possible, closed questions should be avoided in the informational part of the interview. They are used extensively in closing questions.

EXAMPLE

Interviewer:

“Do you work here?”

“What day of the week did it happen?”

Leading Questions

Leading questions are questions that are framed in a way that evokes a specific reply from the respondent; they are questions that contain a suggested answer. Most commonly, leading

questions are used to confirm facts already known. This type of question gives the subject much less room to maneuver than an open or closed question because these questions direct the subject to answer in a particular way. Leading questions imply that the interviewer already knows the answer, asking the subject to confirm what is already known, and they can be particularly effective in interview situations.

EXAMPLE

Interviewer:

“So there have been no changes in the operation since last year?”

“Are you still employed by the Westbrook Furnishings Corporation?”

“You got promoted, right?”

“Don’t you get your income from various sources?”

Double-Negative Questions

Double-negative questions are questions that have two forms of negation within a single clause. Double-negative questions, or statements containing double negatives, are confusing and often suggest an answer opposite to the correct one. Therefore, they should not be used.

EXAMPLE

Interviewer:

“Didn’t you suspect that something wasn’t right?” (What does a negative answer mean here?)

Complex Questions

Complex questions are those that consist of a series of interrelated questions. Complex questions and statements are too complicated to be easily understood, cover more than one subject or topic, require more than one answer, or require a complicated answer. Therefore, fraud examiners should avoid asking complex questions.

EXAMPLE

Interviewer:

“What are your duties here, and how long have you been employed?”

Attitude Questions

The attitude of the interviewer can be conveyed by the structure of the question or statement, as well as by the manner in which the question is asked. When the interviewer wishes to establish a friendly mood, they can employ *attitude questions*.

EXAMPLE

Interviewer:

“How are you doing this morning, Ms. Martin?”

“Do you like sports?”

It is always a good idea, however, to ask a question to which the respondent will definitely answer “yes.”

Controlled Answer Techniques

Controlled answer techniques may be used to stimulate a desired answer or impression. These techniques direct the interview toward a specific point. For example, it might be possible to get a person to admit knowledge of a matter by phrasing the question: *“I understand you were present when the internal controls were developed; would you please describe how they were constructed?”* This phrasing provides a stronger incentive for the respondent to admit knowledge than does: *“Were you present when the internal controls were developed?”*

To stimulate the person to agree to talk or provide information, you might use a prompt such as the following: *“Because you are not involved in this matter, I am sure you would not mind discussing it with me.”* This provides a stronger incentive to cooperate than *“Do you have any objections to telling me what you know?”* Avoid negative construction such as *“I don’t guess you would mind answering a few questions?”*

Free Narratives

The *free narrative* is an orderly, continuous account of an event or incident, given with minimal or no prompting. It is used to get a quick synopsis of what is known about a matter. But when seeking to obtain a free narrative, be sure to designate specifically the occurrence that you wish to discuss.

Sometimes the respondent must be controlled to prevent unnecessary digression. Otherwise, avoid interrupting the respondent, and do not stop the narrative without good reason. The respondent will sometimes provide valuable clues when talking about things that are only partially related to the matter under inquiry.

Methodology

Once the introduction has been completed, the interviewer needs a transition into the body of the interview. This is usually accomplished by asking people an easy question about themselves or their duties.

EXAMPLE

Interviewer:

“As I said, I am informally gathering information about Westbrook’s operations. I hope you can help me. Can you give me an idea of what you do here?”

Begin with Background Questions

Assuming the respondent does not have a problem answering the transitional question, the interviewer should then ask a series of easy, open questions designed to get the respondent to talk about themselves.

EXAMPLE

Interviewer:

“What is your exact title?”

“What do your responsibilities involve?”

“How long have you been assigned here?”

“What do you like best about your job?”

“What do you like least about your job?”

“What would you eventually like to do for the company?”

“Overall, how do you like your current job?”

Observe Verbal and Nonverbal Behavior

During the period when the respondent is talking about themselves, the interviewer should discreetly observe verbal and nonverbal behavior.

Ask Nonleading (Open) Questions

Open questioning techniques are used almost exclusively in the informational phase of the interview. The questions must be inquisitorial and not accusatory. Remember, the most effective question is constructed as a subtle command.

EXAMPLE

Interviewer:

“Please tell me about _____. ”

“Please tell me about your current job procedures.”

“Please tell me what paperwork you are responsible for.”

“Please explain the chain of command in your department.”

“Please tell me what procedures are in effect to prevent errors in the paperwork.”

“Please explain what you understand to be the system of checks and balances (or internal controls) in your department.”

“Please explain where you see areas that need to be improved in the system of checks and balances in your department.”

Once the respondent has answered open questions, the interviewer can go back and review the facts in greater detail. If the answers are inconsistent, try to clarify them. But the interviewer should not challenge the honesty or integrity of the respondent at this point.

Approach Sensitive Questions Carefully

Words such as *routine questions* can be used to play down the significance of the inquiry. It is important for information-gathering purposes that the interviewer does not react excessively

to the respondent's statements. The interviewer should not express shock, disgust, or similar emotions during the interview. The following are examples of ways to discuss fraud within a company. The questions are posed in a hypothetical way to avoid being accusatory.

EXAMPLE

Interviewer:

"Part of my job is to prevent and uncover waste, fraud, and abuse. You understand that, don't you?"

"Please tell me where you think the company is wasting assets or money."

"Where do you think the company is vulnerable to someone here abusing their position?"

Suggestions

The following are suggestions to improve the quality of the interview during the information-gathering phase.

- Begin by asking questions that are not likely to cause the respondent to become defensive or hostile.
- Ask the questions in a manner that will develop the facts in the order of their occurrence, or in some other systematic order.
- Ask only one question at a time and frame the question so that only one answer is required.
- Ask straightforward and frank questions; generally avoid overly complex or deceptive approaches.
- Give the respondent ample time to answer; do not rush them.
- Try to help the respondent remember, but do not suggest answers; also, be careful not to imply any particular answer by facial expressions, gestures, methods of asking questions, or types of questions asked.
- Repeat or rephrase questions, if necessary, to get the desired facts.
- Be sure you understand the answers, and if they are not perfectly clear, have the respondent explain them at the time instead of asking for more explanation later.
- Give the respondent an opportunity to qualify their answers.
- Separate facts from inferences.
- Have the respondent give comparisons by percentages, fractions, estimates of time and distance, and other such comparisons to ascertain accuracy.
- Get all of the facts; almost every respondent can give you information beyond what was initially provided.

- After the respondent has given a narrative account, ask questions about every item that has been discussed.
- Upon conclusion of the direct questioning, ask the respondent to summarize the information given. Then summarize the facts as you understand them, and have the respondent verify that these facts are correct.

Dealing with Resistance

There is always the possibility that the respondent will refuse a request for interview. When the respondent and the interviewer have no connection, respondents are more likely to refuse an interview if contacted first by telephone. Fewer respondents will refuse interviews if contacted in-person. Of course, the more unpleasant the topic, the more likely the respondent is to refuse.

With inexperienced interviewers, there is a danger that the interviewer will perceive resistance when there is none. As a result, the interviewer might become defensive. It is incumbent upon the interviewer to overcome such feelings to complete the interview. The following are specific examples of the types of resistance that will be encountered and how to try to overcome them.

“I’m Too Busy”

When the interviewer contacts the respondent without a previous appointment, there is a possibility that the respondent will be too busy at the moment to cooperate. “I’m too busy” is also used as an excuse for the real source of the person’s resistance, which might be lethargy, ego threat, or a dislike of talking to strangers. These situations can be diffused by the interviewer stressing that:

- The interview will be short.
- The interviewer is already there.
- The project is important.
- The interview will not be difficult.
- The interviewer needs help.

“I Don’t Know Anything About It”

The interviewer will sometimes get this response immediately after stating the purpose of the interview. This resistance is typically diffused by accepting the statement and then responding with a question. For example, if a person says, “I don’t know anything,” the interviewer could respond by saying:

“I see. What do your duties involve, then?”

OR

“Well, that was one of the things I wanted to find out. Do you know about internal controls, then?”

“I Don’t Remember”

If, during an interview, the respondent replies, “I don’t remember,” or gives some similar reply, this type of response usually is not an expression of resistance. Instead, it is an expression of modesty, tentativeness, or caution. One of the best ways to respond to this type of response is to remain silent while the person is deliberating. They are saying, in effect, “Give me a moment to think.” If this is not successful, the best way to counter is to pose an alternate, narrower question. As with symptoms of resistance, the modesty is accepted and diffused, and an alternate question is posed.

EXAMPLE

Interviewer:

“Mr. McGuire, I understand you might not remember the entire transaction. Do you remember if it was more than \$10,000?”

OR

“It’s okay if you don’t remember the details. Do you remember how it made you react at the time?”

“What Do You Mean by That?”

When the respondent asks for clarification about a posed question, it might represent a symptom of mild resistance with which the respondent is attempting to shift the attention from themselves to the interviewer. It also might be a way for the respondent to stall for time while deliberating. Or it could be that the respondent is not sure what the interviewer’s question means. The interviewer should typically react to such a question by treating it as a request for clarification. The interviewer should not become defensive; to do so generally will escalate the respondent’s resistance.

Difficult People

The interviewer will invariably encounter a few difficult people. There are five common-sense steps to take with such people.

Don't React

Sometimes a respondent will be uncooperative for the interviewer for no apparent reason, though, in reality, there can be a multitude of reasons why the person refuses to cooperate. There are three natural reactions for an interviewer who is verbally assailed by the respondent: to strike back, to give in, or to terminate the interview. None of these tactics is satisfactory because none of these responses lead to a productive interview. Instead, the interviewer should consciously ensure that they do not react to anger with hostility.

Disarm the Person

A common mistake that interviewers make is to try to reason with an unreceptive person. When a respondent is not receptive, the interviewer must disarm the respondent. Surprise is the best tactic for disarming a hostile person. If the person is stalling, they expect the interviewer to apply pressure; if the person is on the attack, they expect the interviewer to resist. To disarm the person, listen, acknowledge the point, and agree wherever possible.

Change Tactics

In some situations, changing tactics to reduce hostility might be the only viable option. This means casting what the respondent says in a form that directs attention back to the problem and to the interests of both sides. This normally means asking the respondent what they would do to solve the problem.

Make It Easy to Say "Yes"

In trying to negotiate with difficult people, the usual tactic is for the interviewer to make a statement and attempt to get the respondent to agree with it, but there is a better option. A better choice is to agree with one of the respondent's statements and continue from there. It is better to break statements into smaller ones that would be difficult to disagree with. This technique will help the difficult person preserve their dignity.

Make It Hard to Say "No"

Another method interviewers can use to deal with difficult people is to make it hard for the respondent to say "no." One way of making it difficult to say "no" is to ask reality-based (what-if) questions. These types of questions are used to get the respondent to think about the consequences of not agreeing.

EXAMPLE

Interviewer:

“What do you think will happen if we don’t agree?”

“What do you think I will have to do from here?”

“What will you do?”

Volatile Interviews

A *volatile interview* is one that has the potential to bring about strong emotional reactions in the respondent. Typical volatile interviews involve close friends and relatives of a subject, co-conspirators, and similar individuals.

The personality characteristics of those involved in the volatile interview vary. There are, however, common personality characteristics associated with volatile interviews. Some individuals, by nature, are resentful of authority figures, such as fraud examiners and law enforcement officers.

A target’s friends, relatives, and romantic interests often make for a difficult interview. They perceive that the fraud examiner is deliberately targeting someone close to them.

Physical Symptoms

In volatile interviews, the individual typically reacts rather than thinks, and frequently, the individual is openly hostile to the interviewer. Individuals experiencing heightened emotions frequently have a dry mouth and tend to lick their lips and swallow more frequently than normal. Throat clearing is also an audible sign of emotion. Restlessness can be indicated by fidgeting, shifting in a chair, and foot-tapping. People under emotional stress typically perspire more than normal.

Under stress, a person’s complexion frequently changes. People might look flushed or appear to be pale. During stress, the heart beats more frequently, and a keen observer can see the carotid artery—the large artery on each side of the neck—of an anxious individual actually pulsate.

If an individual in a normal situation maintains eye contact, their efforts to avoid eye contact could indicate that they are under stress.

It is important to realize, however, that physical symptoms are not present in all emotional situations.

Other Considerations

There should be two interviewers involved in potentially volatile situations. Having two people present provides psychological strength for the interviewers. Additionally, the second person can serve as a witness in the event that an interview turns bad.

Surprise should be employed in any interview that is considered potentially volatile. In many instances, the potentially volatile respondent is unaware that they are going to be questioned, and they will therefore be unprepared. If the interview is not conducted by surprise, the interviewer runs the risk of the respondent not showing up, showing up with a witness, or being present with counsel.

In a potentially volatile interview, the interviewer should ask questions out of their natural sequence. This is necessary to keep the volatile respondent from knowing the exact nature of the inquiry and where it is leading. Although the interviewer will endeavor to obtain information regarding who, what, when, where, why, and how, the order of the questions will vary from that of other interviews. This technique is especially important in situations where the respondent might be attempting to protect themselves.

The hypothetical question is generally considered less threatening and is therefore ideally suited for the potentially volatile interview. *Hypothetical questions* pose fictional situations, analogous to an issue in question, that clarify and highlight particular aspects of the inquiry. For example, if the fraud examiner is interviewing Smith regarding the acts of Jones, the interviewer should not ask, “*Did Jones do it?*” Instead, they should ask, “*Is there any reason why Jones would have done it?*”

Overcoming Objections

Volatile witnesses will voice numerous objections to being interviewed. Some of the most common objections (along with suggested responses) are in the following example.

EXAMPLE

Respondent:

"I don't want to be involved."

Interviewer:

The interviewer should answer this question by pointing out that they would not be there, asking questions, if the respondent were not involved. The interviewer should point out that they are saving the respondent trouble by discussing the matter "informally" (do not say "off the record").

Respondent:

"Why should I talk to you?"

Interviewer:

The interviewer should answer by saying that they are trying to clear up a problem and that the respondent's assistance is important.

Respondent:

"You can't prove that!"

Interviewer:

The interviewer should tell the person that they are not trying to prove or disprove anything; they are simply gathering information.

Respondent:

"You can't make me talk!"

Interviewer:

The interviewer should tell the person that they are not attempting to make the person do anything; the interviewer is trying to resolve a problem and would appreciate the help.

Closing Questions

In routine, informational interviews, having the interview close positively is necessary. During interviews, the interviewer should ask closing questions for the following purposes: to reconfirm facts, to gather additional facts, and to conclude the interview.

Reconfirm Facts

It is not unusual for the interviewer to have misunderstood or misinterpreted the respondent's statements. Therefore, to ensure that the interviewer understood the information that the witness provided, they should review the key facts during the closing phase of the interview. However, the interviewer should not attempt to revisit all the information provided by the subject, only the facts that are most relevant.

EXAMPLE

Interviewer:

"Ms. Martin, I want to make sure I have my information straight. Let me take a minute and summarize what we've discussed."

Go over each of the key facts in summary form. When going over the facts, the interviewer should ask closed questions so that the witness can respond either "yes" or "no."

EXAMPLE

Interviewer:

"You have known Alice Cartwright for eight years, correct?"

"You knew Cartwright had some financial problems, is that right?"

"You suspected—but didn't know for sure—that Cartwright might have had an improper relationship with one of our vendors. Is that correct?"

On vital facts provided by the respondent, add *"Are you sure?"*

EXAMPLE

Interviewer:

"Ms. Martin, are you sure you suspected Ms. Cartwright falsified invoices?"

Gather Additional Facts

The closing questions phase should also seek to obtain facts previously unknown. This will provide the respondent further opportunity to say whatever they want about the present matter.

People being interviewed rarely volunteer additional information regarding other witnesses or evidence. The interviewer should, therefore, provide the respondent an opportunity to furnish further relevant facts or opinions.

If appropriate, the interviewer can ask if there are other documents or witnesses that would be helpful to the case. The interviewer, however, should not promise confidentiality; instead, they should say, *“I’ll keep your name as quiet as possible.”*

To obtain additional facts, ask the respondent if there is something else they would like to say. This gives the correct impression that the interviewer is interested in all relevant information, regardless of which side it favors. Try to involve the respondent in helping solve the case—*“If you were trying to resolve this issue, what would you do?”* This technique gives the respondent an opportunity to assist the interviewer, and it makes the respondent feel like a vital part of the interview.

In addition, asking the witness if there is anything else they would like to say gives them the opportunity to provide additional information that was not specifically asked for or suspected.

Similarly, asking the subject if they know of someone else whom you might talk to can be helpful and lead to other potential sources of information.

EXAMPLE***Interviewer:***

“Ms. Martin, there might be someone else I should talk to. Are there documents available that relate to this that we haven’t already discussed? If I keep your name as quiet as possible, are there any suggestions you can give me about whom else I might talk to about this?”

OR

“Are there any other documents or evidence I might look for?”

OR

“If you were in my shoes, what would you do next?”

Conclude the Interview

Maintaining goodwill with the subject to ensure future cooperation when concluding the interview is important. At the conclusion, the interviewer should ask the subject if they believe they have been treated fairly. This is particularly important at the conclusion of an admission-seeking interview or when the subject has been uncooperative. The interviewer generally should ask this type of question as if it were perfunctory.

EXAMPLE

Interviewer:

“Ms. Martin, this is just a standard question. Do you feel that I have treated you fairly in this interview?”

In addition, the interviewer should ask for permission to call the subject if they have any additional questions; this provides an opportunity for additional cooperation.

Finally, the interviewer should shake hands with respondents, if culturally appropriate, and thank them for their time and information.

EXAMPLE

Interviewer:

“Ms. Martin, I know you have given your time and effort to help me. I appreciate it. Good-bye.”

Assessment Questions

The closer you get to the admission-seeking interview, the greater the chance of facing deception. Witnesses might try to cover up what they know, and the target might lie to try to convince the interviewer that they are not guilty. When the interviewer believes that the respondent's answers might be deceptive, they should begin asking assessment questions.

Assessment questions seek to establish the respondent's credibility. They are used only when the interviewer considers previous statements by the respondent to be inconsistent because of possible deception.

Once the respondent has answered all questions about the event and the interviewer has reason to believe the respondent is being deceptive, the interviewer must establish a theme to

justify additional questions. This theme can ordinarily be put forth by saying, “*I have a few additional questions.*” But when presenting a theme, the interviewer should not indicate that the questions serve a purpose other than seeking information.

In short, the assessment phase will form the basis of the interviewer’s decision about whether to pose admission-seeking questions to obtain a legal admission of wrongdoing.

Assessment questions are designed primarily to get a verbal or nonverbal reaction from the respondent. The interviewer will then carefully assess that reaction.

In detecting deception during an interview, the interviewer must remember that the interviewee or target might already be under stress because of the situation. This does not mean they are lying. Darting eyes, shallow breathing, stuttering, or any of the other classic stress signs might be exhibited because the witness is afraid of the situation, not because they are fearful of being caught in a lie. For this reason, it is necessary for the fraud examiner to assess the normal behavior of the individual before assessing any clues to deception.

Assessing the norm is also called *calibrating the witness*.

Calibrating

Calibrating (or *norming*) is the process of observing behavior before critical questions are asked, as opposed to doing so during questioning. Calibrating should be a routine part of all interviews. People with truthful attitudes will answer questions one way; those with untruthful attitudes will generally answer them differently. Assessment questions ask the subject to agree with matters that go against the principles of most honest people. In other words, dishonest people are likely to agree with many of the statements, while honest people will not.

Suggestions for observing the verbal and physical behavior of the respondent include:

- Use your senses of touch, sight, and hearing to establish a norm.
- Do not stare or call attention to the person’s behavior symptoms.
- Be aware of the respondent’s entire body.
- Observe the timing and consistency of behavior.
- Note clusters of behaviors.

The best way to calibrate a witness is through the use of noncritical questions on background information, place of employment, and the like. If the witness displays general nervousness or

other verbal and nonverbal clues during this phase of questioning, subsequent indicators might not be reliable. The key is to observe changes in behavior when pertinent questions are asked.

Based on the respondent's reaction to the assessment questions, the interviewer then considers all the verbal and nonverbal responses together (not in isolation) to decide whether to proceed to the admission-seeking phase of the interview. Because it is easy to draw the wrong conclusions when evaluating signs of deception, no single behavior should be isolated, and no single conclusion should be drawn from it. Behaviors should be considered together.

Indicators of Deception

In most people, lying produces stress. The human body will attempt to relieve this stress (even in practiced liars) through verbal and nonverbal actions that provide clues.

Conclusions concerning behavior must be tempered by a number of factors. The physical environment in which the interview is conducted can affect behavior. If the respondent is comfortable, they might exhibit fewer behavioral quirks. If the respondent is biased toward the interviewer, or vice versa, this will also affect their behavior.

The more intelligent the respondent, the more reliable verbal and nonverbal clues will be. A higher level of intelligence breeds more consistency in responses from which deviations are more clearly recognizable. People of lower intelligence tend to be more erratic in their behavior, and thus meaningful deviations are more difficult to discern.

When attempting to detect deception through verbal and nonverbal actions, it is important to remember that signs of stress do not always mean that a subject is lying. While lying and deception do indeed cause stress, it is not necessarily true that all stress exhibited during an interview is caused by lying. An honest interview subject might feel stress simply by being asked pointed questions about uncomfortable subjects. It is important to consider the totality of evidence that an interview subject is being dishonest, rather than rely on individual behavioral indicators alone.

Behavioral clues are harder to read when the respondent is mentally unstable or is under the influence of alcohol or drugs. That is, people who are mentally unstable or are under the influence of drugs will be unsuitable to interview, and the behavioral clues of such individuals are unreliable. Similarly, behavioral symptoms of juveniles are generally unreliable.

Additionally, racial, ethnic, and economic factors should be carefully considered when observing a respondent's behavior. Some cultures, for example, discourage looking directly at someone. Other cultures use certain body language that might be misinterpreted.

Also, while pathological liars are inherently difficult to identify as such, their behavioral cues are likely to be unreliable.

There are two basic types of communication: verbal and nonverbal. Both types of communication can feature indicators of deception that interviewers should look out for.

Verbal Clues

Verbal clues refer to how an individual conveys information vocally, including tone, pitch, volume, and rate of speech; verbal clues are not only about word choice. Verbal clues are those relating to wordings, expressions, and responses to specific questions. Verbal responses include spoken words and gestures that serve as word substitutes, including nodding or shaking the head to indicate “yes” and “no.”

The following are some examples of verbal clues.

CHANGES IN SPEECH PATTERNS

Deceptive people often speed up or slow down their speech, or they speak louder. A deceptive person might experience a change in their voice pitch because the vocal cords constrict as a person becomes tense. Deceptive people also have a tendency to cough or clear their throats during times of deception.

REPETITION OF THE QUESTION

Repeating the question is a means for a deceptive respondent to gain more time to think of what to say. The respondent might repeat the question verbatim or might frame the answer with a request to repeat the question (e.g., “What was that again?” or similar language). Conversely, a truthful subject usually does not have to contemplate an answer.

COMMENTS REGARDING THE INTERVIEW

Deceptive people will often complain about the physical environment of the interview room, such as, “It’s cold in here.” They will also sometimes ask how much longer the interview will take.

SELECTIVE MEMORY

In some cases, the deceptive person will have a fine memory for insignificant events, but when it comes to the important facts, they will say something like, “I just can’t seem to remember.”

MAKING EXCUSES

Dishonest people will frequently make excuses about things that look bad for them, such as: “I’m always nervous; don’t pay any attention to that.”

EMPHASIS ON CERTAIN WORDS

On frequent occasions, dishonest people will add what they believe to be credibility to their lies by use of emphasis.

OATHS

Dishonest persons frequently use expressions such as “I swear to God,” “Honestly,” “Frankly,” or “To tell the truth” to add credibility to their lies.

CHARACTER TESTIMONY

A dishonest person will often request that the interviewer, “Check with my wife,” or “Talk to my minister.” This is frequently done to add credibility to a false statement.

ANSWERING WITH A QUESTION

Rather than deny the allegations outright, the dishonest person is more likely to answer with a question, such as: “Why would I do something like that?” As a variation, the deceptive person will sometimes question the interview procedure by asking, “Why are you tormenting me?”

OVERUSE OF RESPECT

Some deceptive people will go out of their way to be respectful and friendly. When accused of wrongdoing, it is improbable that a person will react in an overtly friendly and respectful manner.

EXAMPLE***Respondent:***

“I’m sorry, sir, I know you’re just doing your job. But I didn’t do it.”

INCREASINGLY WEAKER DENIALS

When an honest person is accused of something they did not do, that person is likely to become angry or forceful in making denials. The more the innocent person is accused, the more forceful the denial becomes. The dishonest person, in contrast, is likely to make a weak denial. Upon repeated accusations, the dishonest person's denials become weaker, to the point that the person becomes silent.

FAILURE TO DENY

Dishonest people are more likely than honest people to deny an event specifically. An honest person might offer a simple and clear "no," while the dishonest person will qualify the denial: "No, I did not steal \$43,500 from the company on June 27." Other qualified denial phrases include "To the best of my memory" and "As far as I recall," or similar language.

AVOIDANCE OF EMOTIVE WORDS

A dishonest person will often avoid emotionally provocative terms such as *steal*, *lie*, and *crime*. Instead, the dishonest person frequently prefers "soft" words such as *borrow*, and *it* (referring to the deed in question).

REFUSAL TO IMPLICATE OTHER SUSPECTS

Both the honest respondent and the dishonest respondent will have a natural reluctance to name others involved in misdeeds. However, the dishonest respondent will frequently refuse to implicate possible suspects, no matter how much pressure the interviewer applies. This is because the culpable person does not want the circle of suspicion to be narrowed.

TOLERANT ATTITUDES

Dishonest people typically have tolerant attitudes toward miscreant conduct. The interviewer in an internal theft case might ask, "What should happen to this person when they are caught?" The honest person will usually say, "They should be fired/prosecuted." The dishonest individual is much more likely to reply, "How should I know?" or "Maybe they are a good employee who got into problems. Perhaps they should be given a second chance."

RELUCTANCE TO TERMINATE INTERVIEW

Dishonest people will generally be more reluctant than honest ones to terminate the interview. The dishonest individual wants to convince the interviewer that they are not

responsible so that the investigation will not continue; this person might try to extend the interview if the interviewer does not appear to be convinced. The honest person, in contrast, generally has no such reluctance to terminate the interview.

FEIGNED UNCONCERN

The dishonest person will often try to appear casual and unconcerned, will frequently adopt an unnatural slouching posture, and might react to questions with nervous or false laughter or feeble attempts at humor. The honest person, conversely, will typically be very concerned about being suspected of wrongdoing and will treat the interviewer's questions seriously.

Nonverbal Clues

Nonverbal clues refer to clues that are illustrated by an individual's body language. Nonverbal clues to deception include various body movements and postures accompanying the verbal reply. Some common types of nonverbal clues are discussed below.

Again, none of the behaviors should be automatically considered proof of deception on their own, and interviewers should devote time at the beginning of an interview to calibrating each subject's nonverbal behavior before sensitive questions are asked to establish a baseline against which later nonverbal responses or behaviors can be compared.

FULL-BODY MOTIONS

When asked sensitive or emotive questions, the dishonest person will generally react differently than the honest person. The dishonest person will sometimes change their posture completely, as if moving away from the interviewer. In contrast, the honest person is more likely to lean forward toward the interviewer when questions are serious.

ANATOMICAL PHYSICAL RESPONSES

Anatomical physical responses are the body's involuntary reactions to fright or stress, such as increased heart rate, shallow or labored breathing, or excessive perspiration. These reactions are often displayed by dishonest people accused of wrongdoing.

ILLUSTRATORS

Illustrators are motions made primarily with the hands that demonstrate points when talking. During nonthreatening questions, the respondent's illustrators might occur at one rate, and during threatening questions, the respondent's use of illustrators might increase or decrease.

INTERRUPT THE FLOW OF SPEECH

Often, deceptive people will take some action to interrupt the flow of speech. Most actions that are designed to interrupt the flow of speech are stress related. Examples include:

- Closing the mouth tightly
- Pursing the lips
- Lip and tongue biting
- Licking the lips
- Chewing on objects
- Placing hands over the mouth

Genuine smiles usually involve the whole mouth; false ones are confined to the upper half. People involved in deception tend to smirk rather than to smile.

HANDS OVER THE MOUTH

Dishonest people will commonly cover the mouth with the hand or fingers when being deceptive. This reaction goes back to childhood, when many children cover their mouths when telling a lie. This nonverbal clue might reflect a subconscious effort to conceal the statement.

MANIPULATORS

Manipulators are motions like picking lint from clothing, playing with objects such as pencils, or holding one's hands while talking. Manipulators are displacement activities that reduce nervousness.

FLEEING POSITIONS

During the interview, dishonest people will often posture themselves in a *fleeing position*. In this position, the respondent's head and trunk might be facing the interviewer, but their feet and lower body might be pointing toward the door in an unconscious effort to flee from the interviewer.

CROSSING THE ARMS

Crossing one's arms over the middle zones of the body is a classic defensive reaction to difficult or uncomfortable questions. When a person places their hands across their body, it might be interpreted as a defensive gesture meant to conceal weakness. A variation of this behavior is crossing the feet under the chair and locking them. These crossing motions occur mostly when being deceptive. Some individuals, however, cross their arms or legs to reduce stress.

REACTION TO EVIDENCE

In an attempt to show concern, the guilty person might display a keen interest in implicating evidence. The dishonest person will often look at documents presented by the interviewer, attempt to be casual about observing them, and then shove them away, as if wanting nothing to do with the evidence.

Methodology of Assessment Questions

Assessment questions should proceed logically from the least to the most sensitive. The following questions illustrate the pattern that an interviewer might take in questioning a witness. In most examples, the question's basis is explained before the question is asked. The initial questions seek agreement. Also, the following questions assume the fraud examiner has some reason to believe the respondent, a company employee, has knowledge of a suspected fraud.

EXAMPLE***Interviewer:***

"The company is particularly concerned about fraud and abuse. There are some laws in effect that will cost the company millions if abuses go on and we don't try to find them. Do you know which law I am talking about?"

EXPLANATION

Most individuals will not know about the laws concerning corporate sentencing guidelines, and will, therefore, answer "no." The purpose of this question is to get the respondent to understand the serious nature of fraud and abuse.

EXAMPLE***Interviewer:***

"There are laws that can mean fines of more than \$200 million against companies that don't try to clean their own houses. \$200 million is a lot of money, so you can understand why the company's concerned, can't you?"

EXPLANATION

The majority of people will say "yes" to this question. In the event of a "no" answer, the interviewer should explain the issue fully and, thereafter, attempt to get the respondent's agreement. If that agreement is not forthcoming, the interviewer should assess why not.

EXAMPLE

Interviewer:

“Of course, these laws are not referring to a loyal employee who gets in a bind. They’re talking more about senior management. Have you ever read in the newspapers about what kind of people engage in company misdeeds?”

EXPLANATION

Most people are at least generally familiar with the problem of fraud and abuse. Agreement by the respondent is expected to this question.

EXAMPLE

Interviewer:

“Most of them aren’t criminals at all. A lot of times, they’re just trying to save their jobs or just trying to get by because the company is so cheap that it won’t pay people what they are worth. Do you know what I mean?”

EXPLANATION

Although the honest person and the dishonest person will both probably answer “yes” to this question, the honest individual is less likely to accept the premise that these people are not wrongdoers. Many honest people might reply, “Yes, I understand, but that doesn’t justify stealing.”

EXAMPLE

Interviewer:

“Why do you think someone around here might be justified in taking company property?”

EXPLANATION

Fraud perpetrators commonly attempt to rationalize their acts. Therefore, when compared to an honest person, a dishonest individual is more likely to attempt a rationalization, such as, “Everyone does it,” or “The company should treat people better if they don’t want them to steal.” The honest person, in contrast, is much more likely to say, “There is no justification for stealing from the company. It is dishonest.”

EXAMPLE

Interviewer:

“How do you think we should deal with someone who got in a bind and did something wrong in the eyes of the company?”

EXPLANATION

Similar to other questions in this series, the honest person wants to “throw the book” at the perpetrator, while the culpable individual typically will say, “How should I know? It’s not up to me,” or “If they were a good employee, maybe we should give them another chance.”

EXAMPLE

Interviewer:

“Do you think someone in your department might have taken something from the company because they thought they were justified?”

EXPLANATION

Most people—honest or dishonest—will answer “no” to this question. The culpable person, however, will more likely say “yes” without elaborating. The honest person, if answering “yes,” will most likely provide details.

EXAMPLE

Interviewer:

“Have you ever felt yourself—even though you didn’t go through with it—justified in taking advantage of your position?”

EXPLANATION

Again, most people, both honest and dishonest, will answer this question “no.” The dishonest person, however, is more likely to acknowledge having at least “thought” of doing it.

EXAMPLE

Interviewer:

“Who in your department do you feel would think they were justified in doing something against the company?”

EXPLANATION

The dishonest person will not likely furnish an answer to this question, saying instead that, “I guess anyone could have a justification if they wanted to.” Conversely, the honest individual is more likely to name names—albeit reluctantly.

EXAMPLE

Interviewer:

“Do you believe that most people will tell their manager if they believed a colleague was doing something wrong, like committing fraud against the company?”

EXPLANATION

The honest person has more of a sense of integrity and is much more likely to report a misdeed. The dishonest person is more likely to say “no.” When pressed for an explanation, the dishonest person will typically say, “No, nothing would be done about it, and they wouldn’t believe me anyhow.”

EXAMPLE

Interviewer:

“Is there any reason why someone who works with you would say they thought you might feel justified in doing something wrong?”

EXPLANATION

This is a hypothetical question designed to make the wrongdoer think that someone has named them as a suspect. The honest person will typically say “no.” The dishonest person is more likely to try to explain why someone would consider them a suspect by saying something like, “I know there are people around here who don’t like me.”

EXAMPLE

Interviewer:

“What would concern you most if you did something wrong and it was found out?”

EXPLANATION

The dishonest person is likely to say something like, “I wouldn’t want to go to jail.” The honest person, however, might reject the notion by saying, “I’m not concerned at all, because I haven’t done anything.” If the honest person does explain, it will usually be along the lines of disappointing friends or family; the dishonest person is more likely to mention punitive measures.

Typical Attitudes Displayed by Respondents	
TRUTHFUL	UNTRUTHFUL
Calm	Impatient
Relaxed	Tense
Cooperative	Defensive
Concerned	Outwardly unconcerned
Sincere	Overly friendly, polite
Inflexible	Defeated

INTERVIEWING SUSPECTS AND SIGNED STATEMENTS

Many investigations and fraud examinations depend on the information obtained through interviews with suspects. In fact, a successful suspect interview that concludes with an admission often brings the entire investigation to a resolution, allowing the fraud examiner to focus on compiling all of the information into a conclusive report to management. The importance of such admission-seeking interviews therefore cannot be understated; they deserve a well-prepared and disciplined approach from the fraud examiner to help elicit and capture an admission properly.

The terms innocent and guilty are occasionally used in this chapter. Please note that these terms are used informally to distinguish between an individual who had nothing to do with the fraud (i.e., “innocent”) versus someone who was involved with the fraud in some manner (i.e., “guilty”). The usage of these terms is not meant to denote legal guilt or innocence.

Admission-Seeking Questions

The choice of when to conduct an admission-seeking interview of a suspect is critical. Normally, the interviewer should ask accusatory or admission-seeking questions when all of the following are true:

- There is a reasonable probability that the respondent has committed the act in question.
- All other reasonable investigative steps have been completed and as much information as possible has been developed from other sources.
- The interviewer can reasonably control the interview’s place, time, and subject matter.

An assessment of culpability might be based on verbal and nonverbal responses to interview questions, as well as documents, physical evidence, and other interviews.

A transitional theme is necessary when proceeding from assessment questions to admission-seeking questions. In part, the theme should be designed to make the subject believe that they have been caught. Under the ideal circumstance, the interviewer should leave the room for a few minutes before proceeding to admission-seeking questions, saying that they have to “check on something.”

If incriminating documents exist, the interviewer can place copies of them inside a file folder and take them back to the interview. If no documents exist, the interviewer might consider taking a file folder filled with blank paper back to the interview.

EXAMPLE

When the interviewer returns to the room, the file folder is placed on the desk, and the interviewer asks, *“Is there something that you would like to tell me about _____?”*

OR

“Is there any reason why someone would say that you _____?”

The interviewer can hand the incriminating documents to the respondent and ask for comments. The interviewer should not introduce the evidence or explain it. When presented with the evidence, the subject might admit to incriminating conduct. If the subject does not make an admission, the interview must proceed. Once the interviewer is reasonably convinced of guilt, it might be appropriate to confront the respondent.

Purpose of Questions

Admission-seeking questions have at least three purposes. The first purpose is to distinguish innocent (non-culpable) individuals from potentially guilty ones. A culpable individual usually confesses during the admission-seeking phase of an interview, while an innocent person does not do so unless threats or coercion are used. In some instances, the only way to differentiate the culpable from the innocent is to seek an admission of guilt.

The second purpose is to obtain a valid confession. Under most jurisdictions’ law, confessions must be voluntary. The fraud examiner should seek to obtain an oral and written confession. In some jurisdictions, such as the United States, oral confessions are as legally binding as written ones; however, written statements generally have greater credibility. A written confession is tangible proof of an admission, whereas an oral confession is more abstract. A written confession also discourages subjects from later attempting to recant their verbal confessions, which might not have been witnessed or recorded.

The third purpose of admission-seeking questions is to convince the confessor to sign a written statement acknowledging the facts.

Preparation

The admission-seeking interview should be scheduled when the interviewer can control the situation. It normally should not be conducted in a venue that is overly familiar to the subject and is best conducted by surprise.

Preparing the Interview Room

When preparing a room for an admission-seeking interview, it is important that the interviewer consider how private the room is because the location should establish a sense of privacy. The door should be closed but not locked, there should be no physical barriers preventing the target from leaving, and the suspect should be made aware that they are free to leave. This is to avoid allegations of custodial interrogation.

Distractions should be kept to a minimum. Ideally, there should be no photographs or other objects in the room. Chairs should be placed about four to six feet apart, and the accused should not be permitted to sit behind any physical barriers, such as chairs, tables, or desks. This is to prevent a physical barrier from becoming a psychological barrier that might inhibit responses from the accused.

Note-Taking

When conducting an admission-seeking interview, note-taking should be kept to a minimum. In some cases, taking notes should be avoided. Because the admission-seeking interview's ultimate goal is to obtain a signed statement of guilt, it is not necessary to take extensive notes. Such notes can distract the suspect and reveal what points the fraud examiner believes to be important; thus, if the fraud examiner determines that note-taking is necessary, they should do so in a way that does not reveal the information's significance.

Presence of Outsiders

It is usually not necessary to inform the subject that they may have counsel present. Of course, this right cannot be denied if the subject wants to have an attorney present. If counsel is present, there should be an understanding that the attorney is an observer only; attorneys should not ask questions or object. Where allowed by law, no observers, other than the subject and up to two fraud examiners, should be permitted in the admission-seeking interview because, among other reasons, the presence of third parties could have liability consequences. Some jurisdictions, such as the United Kingdom, prevent fraud examiners from refusing to allow interviewees to be accompanied by another individual. Additionally, if

the accused is in a union, a union representative (or a union attorney) might have the right to attend. However, this might present legal problems in allowing a third party to hear any allegations made.

Because it is very difficult to obtain a confession with witnesses present, the fraud examiner should consider whether the case can be proven without the admission-seeking interview. (Please refer to the Law section of the *Fraud Examiners Manual* for more information.)

Individual Rights

In some situations, suspects have the right to not answer questions in an interview setting and/or the right to legal counsel during interviews. Some jurisdictions might require that suspects be advised of these rights. For example, in the United States, when a person is being interrogated by public authorities in a custodial setting, *Miranda* warnings serve the purpose of advising suspects of their rights. However, in most cases, if the interviewer is not employed by a public authority or working at the direction of a public authority, these warnings are not required. There are equivalents of the *Miranda* warnings in other jurisdictions, such as Canada and European Union (EU) countries, that might require interviewers to advise suspects of their rights before conducting admission-seeking interviews. Fraud examiners should always work with legal counsel ahead of interviews to determine which warnings or advisories might be necessary.

See the chapter on “Individual Rights During Examinations” in the Law section of the *Fraud Examiners Manual* for more information.

Theme Development

A transitional theme is necessary when proceeding from assessment questions to admission-seeking questions.

People rarely confess voluntarily unless they perceive that the benefits of confession outweigh the penalties. A good interviewer, through the application of sophisticated techniques, is able to convince the respondent that the confession is in their best interest.

Generally, people do not confess if they believe that there is doubt in the accuser’s mind regarding their guilt. Thus, the interviewer must convey absolute confidence in the admission-seeking interview—even if not fully convinced. The interviewer must make the

accusation in the form of an implied statement of fact. Accusatory questions do not ask, “*Did you do it?*” They ask, “*Why did you do it?*”

An innocent person generally does not accept the question’s premise. People confessing need adequate time to come to terms with their guilt; obtaining admissions and confessions takes patience. Therefore, admission-seeking interviews should be conducted only when there is sufficient privacy and time is not a factor. The interviewer must not express disgust, outrage, or moral condemnation about the confessor’s actions. To do so goes against the basic logic of obtaining confessions, which can be summed up as *maximize sympathy and minimize the perception of moral wrongdoing*.

The interviewer must offer a morally acceptable reason for the confessor’s behavior. The interviewer cannot convey an opinion that the accused is a “bad person.” Guilty people almost never confess under such conditions. To obtain a confession, the interviewer must be firm, but they must also project compassion, understanding, and sympathy. The interviewer must attempt to keep the confessor from voicing a denial. Once the accused denies the act, overcoming that position can be very difficult.

The threat of a lawsuit is always present when allegations of wrongdoing are made against certain employees. It is, therefore, important that fraud examiners understand exactly what actions are permitted so that they can avoid potential liability. It is generally legal to accuse innocent people of misdeeds they did not commit as long as:

- The accuser has reasonable suspicion or predication to believe the accused has committed an offense.
- The accusation is made under conditions of privacy.
- The accuser does not take any action likely to make an innocent person confess.
- The accusation is conducted under reasonable conditions.

Steps in the Admission-Seeking Interview

Make a Direct Accusation

The admission-seeking part of an interview begins with a direct accusation. The accusation should be made in the form of a statement, not a question.

Also, emotive words such as *steal*, *fraud*, and *crime* should be avoided during the accusatory process. The accusation should be phrased as though the accused’s guilt has already been established, trapping the accused with no way out.

EXAMPLE

WRONG:

"We have reason to believe that you ..."

OR

"We suspect that you might have ..."

RIGHT:

"Our investigation has clearly established that you:

- * made a false entry (avoid fraud)*
- * took company assets without permission (avoid using theft, embezzlement, or stealing)*
- * accepted money from a vendor (avoid bribe or kickback)*
- * have not told the complete truth (avoid lie or fraud)"*

OR

"We have been conducting an investigation into _____, and you are the only person we have not been able to eliminate as being responsible."

Observe the Accused's Reaction

When accused of wrongdoing, the typical guilty person reacts with silence. If the accused does deny culpability, those denials are usually weak. In some cases, the accused almost mumbles the denial. It is common for culpable individuals to avoid outright denials. Rather, they give reasons why they could not have committed the act in question.

Conversely, innocent people sometimes react with genuine shock at being accused. It is not at all unusual for an innocent person, wrongfully accused, to react with anger. In contrast to the guilty individual, the typical innocent person will strongly deny committing the act or acts in question.

Repeat the Accusation

If the accused does not strongly object after the accusation is made, the interviewer should repeat the accusation with the same degree of conviction and strength.

EXAMPLE

Interviewer:

“As I said, Carmen, our examination has concluded that you are the person responsible. It is not so much a question of what you did, but why you did it.”

Interrupt Denials

Both honest and dishonest people normally object to and deny a direct accusation. But when compared to an innocent person, a culpable person is more likely to avoid an outright denial (“I did not do it.”) and is more apt to provide the interviewer with explanations as to why they are not the responsible party.

EXAMPLE

Respondent:

“I wasn’t even there the day that entry was made.”

OR

“It could have been anybody.”

OR

“I don’t know what you’re talking about.”

Both the innocent and the guilty person will make an outright denial if forced to do so. Accordingly, the interviewer should not solicit a denial at this stage of the admission-seeking interview.

EXAMPLE

WRONG:**Interviewer:**

“Did you do this?”

OR

“Are you the responsible person?”

RIGHT:**Interviewer:**

“Why did you do this?”

Once the accused utters a denial, it becomes extremely difficult for them to change their response because doing so would be an admission that they lied. The interviewer must prevent an outright denial, thereby making it easier for the subject to confess at a later time. An innocent person is unlikely to allow the interviewer to prevail in stopping the denial.

Fraud examiners can use several techniques to stop or interrupt denials, including delays, repeated interruptions, and reasoning.

DELAYS

One of the most effective techniques to stop or interrupt a denial is through a delaying tactic. To employ this technique, the interviewer should attempt to delay the outright denial; however, they should not argue with the accused.

EXAMPLE

Interviewer:

“Ethan, I hear what you are saying, but let me finish first. Then you can talk.”

The innocent person usually will not let the interviewer continue to develop the theme.

REPEATED INTERRUPTIONS

Occasionally, it might be necessary to interrupt the accused’s attempted denial repeatedly. Because this stage is crucial, the interviewer should be prepared to increase the tone of the interruptions to the point of being prepared to say: *“Carmen, if you keep interrupting, I am going to have to terminate this conversation.”* This can come across as threatening because the accused wants to know the extent of incriminating evidence in the interviewer’s possession.

REASONING

If delays and repeated interruptions are unsuccessful, the interviewer can attempt to reason with the accused and employ some of the tactics normally used for diffusing alibis. Under these tactics, the accused is presented with implicating evidence. The interviewer, however, normally should not disclose all the facts of the case, but rather reveal small portions incrementally.

EXAMPLE

Interviewer:

"I know what you say, Ethan, but that does not reconcile with these invoices here in front of me. Look at the invoice in the amount of \$102,136. The facts clearly show you are responsible." (Do not ask the accused to explain the evidence at this point.)

OR

"Carmen, I have talked to many people before I sat down here with you. I am not asking you if you are responsible; I know you are. This is your opportunity to tell your side to someone who can understand." (Do not disclose the identity or number of witnesses who have been interviewed.)

Establish Rationalization

If the subject does not confess to the misconduct when faced with direct accusations, the interviewer should try to convince the respondent that confessing is the most advantageous option available. To do this, the interviewer must offer a morally acceptable reason that allows the accused to confess to a misdeed without feeling ashamed.

It is not necessary that the rationalization be related to the underlying causes of the misconduct. It is common and acceptable for the accused to explain away the moral consequences of the action by using any plausible explanation other than being a "bad person."

If the accused does not relate to one theme, the interviewer should move on to another until one seems to fit. Thereafter, the interviewer should fully develop the theme. Note that the theme development explains away the moral, but not the legal, consequences of the misdeed. The interviewer should not make any statements that might lead the accused to believe that cooperation will eliminate legal liability.

Rather than being confrontational, the questions posed in the examples constantly seek agreement from the accused. The interviewer must maintain control while still appearing compassionate and understanding. Again, no matter what conduct the accused has supposedly committed, the interviewer should not express shock, outrage, or condemnation.

Some themes commonly used to establish rationalization are provided below.

UNFAIR TREATMENT

Probably the most common explanation for criminal activity in general, and internal fraud in particular, is unfair treatment and the accused's attempt to achieve equity. Studies have shown that counter-productive employee behavior—including stealing—is motivated primarily by job dissatisfaction. Employees and others feel that taking retaliatory action is important to their self-esteem. The sensitive interviewer can take advantage of these feelings by suggesting that the accused is a victim.

EXAMPLE***Interviewer:***

"Ethan, I feel like I know what makes you tick. And I know it isn't like you to do something like this without a reason. You have worked hard here to get a good reputation. I don't think the company has paid you what you're really worth. And that's the way you feel, too, isn't it?"

OR

"Carmen, I've seen situations like this before. And I think the company brought this on itself. If you had been fairly treated, this wouldn't have happened; don't you agree?"

INADEQUATE RECOGNITION

Some employees might feel that their efforts have gone completely without notice by the company. As with similar themes, the interviewer should be empathetic.

EXAMPLE***Interviewer:***

"Ethan, I have found out a few things about you. It looks to me that you have given a lot more to this company than it has recognized. Isn't that right, Ethan?"

FINANCIAL PROBLEMS

Internal criminals, especially executives and upper management, frequently engage in fraud to conceal their true financial condition—either personal or business. Here are examples of how to develop a theme involving financial problems as a motive. In the following example, Ethan is an executive of a company and is suspected of fraud.

EXAMPLE

Interviewer:

“Carmen, I was astonished to find out some of your investments have taken such a beating. I don’t know how you managed to keep everything afloat as well as you did. You just did this to stay alive financially, didn’t you, Carmen?”

OR

“Ethan, I have found out what you’ve been paid around here and, frankly, I was surprised. I thought it might be a lot more. No wonder you had to get involved in this. You pretty much needed to do this to survive, didn’t you?”

ABERRATION OF CONDUCT

Many offenders believe their conduct constitutes an aberration in their lives and that it is not representative of their true character. The interviewer might establish this theme by applying the following examples.

EXAMPLE

Interviewer:

“Carmen, I know this is totally out of character for you. I know that this would never have happened if something wasn’t going on in your life. Isn’t that right, Carmen?”

OR

“Ethan, you’ve worked hard all your life to get a good reputation. I feel you wouldn’t normally have done something like this; it just doesn’t fit unless you felt like you were forced into it. You felt forced to do this, didn’t you, Ethan?”

FAMILY PROBLEMS

Some people commit fraud because of family problems—financial distress caused by divorce, an unfaithful spouse, or demanding children. Certain people might relate their worth to how much money they make and might believe that wealth signifies family respect. Others have been known to commit white-collar crime to satisfy the needs of their families. The skillful interviewer can use this motive as an advantage by applying one of the following approaches.

EXAMPLE***Interviewer:***

“Carmen, I know you have had some family problems. I know your recent divorce has been difficult for you. And I know how it is when these problems occur. You never would have done this if it hadn’t been for family problems; isn’t that right, Carmen?”

OR

“Ethan, someone in your position and with your ethics just doesn’t do things like this without a reason. And I think that reason has to do with trying to make the best possible life for your family. I know it would be difficult for me to admit to my family that we’re not as well off as we were last year. And that’s why you did this, isn’t it, Ethan?”

ACCUSER’S ACTIONS

Do not disclose the accuser’s identity if it is not already known. But in cases where the accuser’s identity is known to the accused, it can be helpful to blame the accuser for the problem. The accuser can be a colleague, manager, auditor, fraud examiner, or any similar person. Alternatively, the problem can be blamed on the company.

EXAMPLE***Interviewer:***

“Carmen, you know what these auditors are like. They are hired to turn over every stone. I wonder how they would look if we put them under a microscope. Compared to other things that are going on, what you’ve done isn’t that bad. Right, Carmen?”

OR

“Ethan, I really blame a large part of this on the company. If some of the things that went on around this company were known, it would make what you’ve done seem pretty small in comparison, wouldn’t it, Ethan?”

STRESS, DRUGS, AND ALCOHOL

Employees sometimes turn to drugs or alcohol to reduce stress. In some instances, the stress itself leads to aberrant behavior. The interviewer could establish a rationalization regarding stress, drugs, and alcohol similar to the following example.

EXAMPLE

Interviewer:

“Carmen, I know what you’ve done isn’t really you. Inside, you have been in a lot of turmoil. A lot of people drink too much when they have problems. I have been through periods like that myself. And when things build up inside, it sometimes makes all of us do something we shouldn’t. That’s what happened here, isn’t it, Carmen?”

OR

“Ethan, you’re one of the most respected men in this company. I know you have been under tremendous pressure to succeed. Too much pressure, really. There is only so much any of us can take. That’s behind what has happened here, isn’t it, Ethan?”

REVENGE

Revenge can be effectively developed as a motive. In developing this theme, the interviewer attempts to blame the offense on the accused’s feeling of wanting retribution against someone or something.

EXAMPLE

Interviewer:

“Carmen, what has happened is out of character for you. I think you were trying to get back at your supervisor for the time he passed you over for a raise. I would probably feel the same. That’s what happened, isn’t it, Carmen?”

OR

“Ethan, everyone around here knows that the board has not supported you in your efforts to turn this company around. I would understand if you said to yourself, ‘I’ll show them.’ Is that what happened, Ethan?”

DEPERSONALIZING THE VICTIM

In cases involving employee theft, an effective rationalization technique is to depersonalize the victim. The accused is better able to cope with the moral dilemma of their actions if the victim is a faceless corporation or agency.

EXAMPLE***Interviewer:***

“Carmen, it isn’t like you took something from a friend or neighbor. I can see how you could say, ‘Well, this would be okay to do as long as it was against the company and not my coworkers.’ Is that right, Carmen?”

OR

“Ethan, it’s not like what you’ve done has really hurt a person. Maybe you thought of it this way: ‘At most, I’ve cost each shareholder a few cents.’ Isn’t that the way it was, Ethan?”

MINOR MORAL INFRACTION

In many cases, the interviewer can reduce the accused’s perception of the moral seriousness of the matter. But the moral seriousness should not be confused with the legal seriousness. Fraud examiners and interviewers should be careful to avoid making statements that could be construed as relieving legal responsibility. For example, the fraud examiner should not state: “It is not a big problem, legally. It’s just a technical violation.” Instead, the interviewer should minimize the moral side’s importance. One effective way is through comparisons, such as those illustrated in the following examples.

EXAMPLE***Interviewer:***

“Carmen, this problem we have doesn’t mean you’re a mass murderer. When you compare what you’ve done to things other people do, this situation seems pretty insignificant, doesn’t it?”

OR

“Ethan, everything is relative. What you’ve done doesn’t even come close to some of the other things that have happened. You’re not Bernie Madoff, right Ethan?”

ALTRUISM

In many cases, the moral seriousness of the matter can be reduced by claiming the action was for the benefit of others. This is especially true if the accused views themselves as a caring person.

EXAMPLE

Interviewer:

“Carmen, I know you didn’t do this for yourself. I have looked into this matter carefully, and I think you did this to help your husband, didn’t you?”

OR

“Ethan, you have a big responsibility in this company. A lot of people depend on you for their jobs. I just know you did this because you thought you were doing the right thing for the company, didn’t you?”

GENUINE NEED

In a very small number of cases, fraud is predicated by genuine need. For example, the accused might be paying for the medical care of a sick relative or experiencing some other financial problem. In those cases, rationalization techniques similar to the following examples might be effective.

EXAMPLE

Interviewer:

“Carmen, I don’t know many people who have had so many bad things happen all at once. I can see where you thought this was pretty much a matter of life or death, right, Carmen?”

OR

“Ethan, you’re like everyone else: You have to put food on the table. But in your position, it is very difficult to ask for help. You genuinely needed to do this to survive, didn’t you, Ethan?”

Diffuse Alibis

Even when the interviewer presents the accused with an appropriate rationalization, it is likely that they will continue to deny culpability. When the interviewer is successful in stopping denials, the accused frequently presents one or more reasons why they could not have

committed the act in question. In these situations, the interviewer must quickly and decisively diffuse these alibis by convincing the accused of the weight of the evidence against them. Fraudsters usually have a keen interest in material that tends to implicate them.

Interviewers can often diffuse alibis by displaying physical evidence, discussing the testimony of witnesses, or discussing the subject's prior deceptions.

DISPLAY PHYSICAL EVIDENCE

It is common for most guilty people to overestimate the amount of physical evidence. The interviewer should try to reinforce this notion in the way the evidence is presented to the accused. The physical evidence—usually documents in fraud matters—should generally be displayed one piece at a time, in reverse order of importance. In this way, the accused does not immediately know the full extent of the evidence. When the accused no longer denies culpability, the interviewer should stop displaying evidence.

Each time a document or piece of evidence is presented to the accused, the interviewer should note its significance. During this phase, the accused is still trying to determine how to react to being caught. The interviewer should, therefore, expect that the accused will attempt to lie their way out of the situation. Like denials, the interviewer should stop the alibis and other falsehoods before they are fully articulated.

Once the alibis are diffused, the interviewer should return to the theme being developed.

EXAMPLE

Respondent:

"I couldn't have done this. I am not responsible for paying invoices."

Interviewer:

"Here is one of the invoices in question [display document]. We never received the merchandise." (Do not mention whether you have talked to the accounts payable department or whether you have subjected the invoice to any document analysis.)

"Look, Carmen, it is useless for you to try to deny the truth. We have lots of evidence. Let's just try to work this out, but you've got to help me, okay?" (Do not accuse the person of lying—this just prolongs the process.)

DISCUSS THE TESTIMONY OF WITNESSES

Another technique for diffusing alibis is to discuss the testimony of witnesses. The objective is to give enough information about what other people might say without providing too much. Ideally, the interviewer's statement will cause the accused to think that people are able to contradict the story that the accused is providing.

The interviewer is again cautioned about furnishing enough information to the accused so that they can identify the witnesses. This might place the witnesses in a difficult position, and the accused could contact the witnesses in an effort to influence testimony. The accused could also take reprisals against potential witnesses.

EXAMPLE***Respondent:***

"I couldn't possibly have done this. It would require the approval of a supervisor."

Interviewer:

"In normal situations it would. The problem is that your statement doesn't hold up. There are several people who will tell a completely different story. I can understand how you would want me to believe that. But you're only worsening the situation by making these statements. If you will help me on this, you'll also be helping yourself. Understand?"

DISCUSS THE ACCUSED'S PRIOR DECEPTIONS

The final technique is to discuss the accused's prior deceptions. The goal is to appeal to the accused's logic and not to scold or degrade. This technique is particularly useful in cases with a lack of physical evidence. As with other interview situations, the word *lying* should be avoided.

EXAMPLE***Respondent:***

"There is no way I could have done this. I didn't have the opportunity."

Interviewer:

"Ethan, here is the situation: You know what you've done, and so do I. I can understand it is difficult for you to admit. But if all the facts have to be presented, everyone will reach the same inescapable conclusion: You are responsible. If you continue to deny what you've done, you'll just make the situation worse. You understand that, don't you?"

Present an Alternative Question

After the interviewer diffuses the accused's alibis, the accused often becomes quiet and withdrawn. Some people in this situation might cry. If this occurs, the interviewer must be comforting. The interviewer should not discourage the accused from showing emotion. Generally, such reactions indicate that the accused is considering whether to confess.

At this point in the interview, the interviewer should present an alternative question. The alternative question forces the accused to make one of two choices, both of which imply guilt. One alternative provides the accused a morally acceptable reason for the misdeed; the other portrays the accused negatively. Regardless of which answer the accused chooses, they are acknowledging guilt.

EXAMPLE

Interviewer:

"Carmen, did you plan this deliberately, or did it just happen?"

OR

"Ethan, did you just want extra money, or did you do this because you had financial problems?"

OR

"Carmen, did you just get greedy, or did you do this because of the way the company has treated you?"

Obtain a Benchmark Admission

Again, the alternative question forces the accused to make one of two choices, both of which constitute a *benchmark admission* (i.e., an answer that implies guilt). Once the benchmark admission is made, the subject has made a subconscious decision to confess.

The questions for the benchmark admission should be constructed as closed, either-or questions. Alternative questions should not be asked in a way that requires an explanation; that will come later. The accused might also answer in the negative.

EXAMPLE

Respondent:

"I didn't do it deliberately."

OR

"I didn't do it just because I wanted extra money."

OR

"No, I'm not just greedy."

In cases where the accused answers the alternative question in the negative, the interviewer should continue trying to get a positive admission.

EXAMPLE

Interviewer:

"Then it just happened on the spur of the moment?"

OR

"Then you did it to take care of your financial problems?"

OR

"Then you did it because of the way you've been treated here?"

If the accused does not respond to the alternative question with the benchmark admission, the interviewer should repeat the questions or variations thereof until the subject makes the benchmark admission. It is important for the interviewer to get a response that is tantamount to a commitment to confess.

Reinforce Rationalization

Once the accused makes the benchmark admission, the interviewer should reinforce the confessor's decision by returning to the theme for their rationalization. This helps the confessor feel comfortable and lets them know that the interviewer is not judging them.

After reinforcing the subject's rationalization, the interviewer should make the transition into the verbal confession, where the interviewer obtains the details of the offense.

EXAMPLE

Interviewer:

“Ethan, I am glad to hear that you had a good reason to do this. That reinforces what I thought all along—that you were caught up in extraordinary circumstances. When was the first time you did it?”

Obtain a Verbal Confession

The interviewer should transition to the verbal confession when the accused provides the first detailed information about the offense. There are three general approaches to obtaining the verbal confession: chronologically, by transaction, or by event. The approach taken should be governed by the circumstances of the case.

Once a verbal confession is obtained, the interviewer must probe gently for additional details—preferably details that only the subject knows.

During the admission-seeking interview, it is best to first confirm the general details of the offense. For example, the interviewer will want the accused to provide estimates of the amounts involved, name other parties involved in the offense, and give the location of physical evidence. After obtaining these basic facts, the interviewer can return to the specifics, in chronological order.

Because of the psychology of confessions, most confessors lie about one or more aspects of the offense even though they confirm overall guilt. When this happens during the verbal confession, the interviewer should make a mental note of the discrepancy and proceed as if the falsehood had been accepted as truth.

Such discrepancies should be saved until the accused provides all other relevant facts. If the discrepancies are material to the offense, the interviewer should either resolve them at the end of the verbal confession or wait and correct them in the written confession. If not material, such information can be omitted from the written confession.

INFORMATION TO OBTAIN DURING THE VERBAL CONFESSION

The interviewer should obtain the following items of information during the verbal confession.

THE ACCUSED KNEW THE CONDUCT WAS WRONG

It is imperative that the interviewer obtain an admission that the accused knew the conduct in question was wrong early in the process. This information confirms the essential element of intent. *Intent* (i.e., the state of mind with which something is done) is required in all matters involving fraud. Not only must the confessor have committed the act, they must have known the conduct was wrong and intended to commit it. This information can be developed as illustrated in the following example.

EXAMPLE

Interviewer:

“Carmen, now that you have decided to help yourself, I can help you, too. I need to ask you some questions to get this cleared up. As I understand it, you did this, and you knew it was wrong, but you didn’t really mean to hurt the company; is that right?”

(Note that the question is phrased so that the confessor acknowledges intent, but “didn’t mean to hurt” anyone. Make sure the question is not phrased so that the confessor falsely says, “I didn’t mean to do it.”)

FACTS KNOWN ONLY TO CONFESSOR

Once the interviewer solves the intent question, the questioning turns to those facts known only to the confessor. These facts include—at a minimum—the accused’s estimates of the number of instances of wrongful conduct and the total amount of money involved. The interviewer should not phrase the questions in a way that allows the confessor to answer “yes” or “no.”

In fraud matters especially, it is common for the accused to underestimate the amount of funds involved, as well as the number of instances. This is probably because of the human mind’s natural tendency to suppress unpleasant matters. If the subject provides an estimate of these items, the interviewer should be skeptical of the figure’s accuracy. If the accused’s response is “I don’t know,” start high with the amounts and gradually come down.

EXAMPLE

Interviewer:

"Ethan, how many times do you think this happened?"

Respondent:

"I don't have any idea."

Interviewer:

"Was it as many as one hundred times?"

Respondent:

"No way!"

Interviewer:

"How about 75 times?"

Respondent:

"That's still too high. Probably not more than two or three times."

Interviewer:

"Are you pretty sure, Ethan?" (If the accused's estimates are too low, gently get them to acknowledge a higher figure, but do not challenge the accused by calling them a liar.)

Respondent:

"Maybe three times, but certainly not more than that."

MOTIVE FOR OFFENSE

Motive is the moving power that prompts a person to act. Motive, however, is not the same as intent, which refers to the state of mind of the accused when performing the act. Motive, unlike intent, is not an essential element, and criminal law generally treats a person's motive as irrelevant. Even so, motive is relevant for other purposes: It often guides the interviewer to the proper rationalization, it further incriminates the accused, and it is important for a successful prosecution. Therefore, it is best that the interviewer elicit the suspect's motive when obtaining a verbal confession. The motive might be the same as the theme the interviewer developed earlier—or it might not. The most common response is, "I don't know." The interviewer

should probe for additional information, but if the accused does not provide additional details, then the motive should be attributed to the theme developed earlier. The interviewer should establish a motive in a manner similar to the following example.

EXAMPLE

Interviewer:

“Carmen, we have discussed what might have led you to do this. But I need to hear it in your words. Why do you think you did this?”

WHEN OFFENSE COMMENCED

The approximate date and time that the offense started is important, and the interviewer can usually develop this by asking a question similar to the following.

EXAMPLE

Interviewer:

“Ethan, I am sure you remember the first time this happened.”

Respondent:

“Yes.”

Interviewer:

“Tell me about it.”

Respondent:

“Around the middle of January of last year.”

Interviewer:

“Ethan, I admire you for having the courage to talk about this. You’re doing the right thing. Tell me in detail about the first time.”

WHEN/IF THE OFFENSE WAS TERMINATED

In fraud matters, especially internal fraud, the offenses are usually continuous. That is, the fraudster seldom stops before they are discovered. If appropriate, the interviewer should seek the date the offense terminated. The question is typically phrased as follows:

EXAMPLE

Interviewer:

“Carmen, when was the last time you did this?”

DETERMINE IF OTHERS WERE INVOLVED

Although most fraudsters commit their crimes without the aid of an accomplice, the interviewer should determine whether others were involved. To obtain this information, the interviewer should not ask if anyone else assisted the fraudster; instead, they should phrase the question in a way similar to the following examples.

EXAMPLE

Interviewer:

“Ethan, who else knew about this besides you?”

By asking who else “knew,” the interviewer is not only asking for the names of possible conspirators, they are also asking about others who might have known what was going on and failed to report it. This question should be worded as “*Who else knew?*” rather than “Did someone else know?”

OBTAIN PHYSICAL EVIDENCE

Interviewers should obtain physical evidence from the confessor—regardless of how limited it might be. In many instances, fraudsters deposit illicit income directly into their bank accounts. The interviewer should typically ask the confessor to voluntarily surrender their banking records for review. It is recommended that either (1) a separate written authorization be obtained or (2) specific language be added to the confession noting the voluntary surrender of banking information. The first method is generally preferable.

If there are other relevant records that require the consent of the confessor to obtain, the interviewer should request permission to review them during the oral confession. In some instances, it might be advisable to delay this step until the interviewer obtains the written confession. The request for physical evidence from the confessor can be set up like the following examples.

EXAMPLE

Interviewer:

“Carmen, as part of wrapping up the details, I will need your banking records (or other physical evidence). You understand that, don’t you?”

Respondent:

“No, I don’t.”

Interviewer:

“Well, I just need to document the facts and clear up any remaining questions. You have decided to tell the complete story, including your side of it. I just want to make sure the facts are accurate and fair to you. We want to make sure you’re not blamed for something someone else did. And I want to report that you cooperated fully and wanted to do the right thing, okay?” (Avoid the use of the word *evidence* or references to higher tribunals, such as *courts* or *prosecutors*.)

Respondent:

“Okay.”

Interviewer:

“Where do you keep your bank accounts?” (If the interviewer knows of at least one bank where the confessor does business, the question should be phrased: *“Carmen, where do you do business besides Florida Marine National Bank?”*)

Respondent:

“Just Florida Marine.”

Interviewer:

“I’ll need to get your consent to get the records from the bank if we need them. Where do you keep the original records?” (Do not ask the accused’s permission to look at the records; rather, say that the records are needed. Let the accused object if there is a problem.)

DISPOSITION OF PROCEEDS

The interviewer should find out what happened to any illicit income derived from the misdeeds. It is typical for fraudsters to use illicit funds for frivolous or ostentatious purposes.

It is important, however, that the confessor sees their actions in a more positive light; the interviewer should avoid comments or questions relating to an extravagant lifestyle.

EXAMPLE

Interviewer:

“Ethan, what happened to the money?” (Let the accused explain; do not suggest an answer unless the confessor does not respond.)

LOCATION OF ASSETS

In appropriate situations, the interviewer should find out whether there are unspent or available assets that the confessor can use to reduce losses. The interviewer should ask the accused *“What’s left?”* rather than asking *“Is there anything left?”*

EXAMPLE

Interviewer:

“Carmen, what do you have left from all of this?”

Respondent:

“Not much. I used most of the money to cover my husband’s bills and financial problems. A little money and a boat that is paid for is all I have.”

Interviewer:

“Well, whatever it is, this whole thing will look a lot better if you volunteered to return what you could, don’t you agree?” (Remember, do not specifically promise the confessor leniency; it will typically invalidate the confession.)

SPECIFICS OF EACH OFFENSE

After obtaining the preliminary information, the interviewer should return to the specifics of each offense. Generally, to do this, the interviewer should start with the first instance and work through the events in a chronological and logical fashion.

Because these questions seek information, they should be openly phrased so that the answer is independent of the question. It is best to seek the independent recollections of the confessor first before displaying physical evidence. If the confessor cannot independently recall, documents can be used to refresh their recollection. It generally is best to resolve all

issues on each instance before proceeding to the next instance. In determining the specifics of the offense, the interviewer should usually ask:

- Who has knowledge of this transaction?
- What does this document mean?
- When did this transaction occur?
- Where did the proceeds of the transaction go?
- Why was the transaction done?
- How was the transaction covered up?

WRITTEN CONFESSIONS

The interviewer should reduce the verbal confession to a short and concise written statement that contains only enough detail to validate the confession. For more information on the points that every written confession should cover, see the discussion on signed statements that follows.

Interviewing is difficult, and few can master the process without considerable practice. The preceding techniques, when properly employed, can immeasurably aid in developing truthful, reliable, and legally valid information.

Signed Statements

The signed statement should reduce the verbal confession to a short, concise written statement. The interviewer should prepare the statement and have the confessor sign it before the confessor leaves the interview. There should be no attempt to make the statement longer than necessary, and it should rarely exceed two or three handwritten pages.

Contents of a Signed Statement

Every signed statement should include the following points.

Voluntariness of Confessions

In criminal law, a *confession* is an admission of guilt by the accused party. Generally, all confessions must be voluntary to avoid admissibility issues. For example, in the United States, involuntary confessions are inadmissible as evidence in court.

Accordingly, the signed statement should contain language expressly stating that the confessor is voluntarily making the confession. The voluntariness of a confession should be set forth specifically in the first paragraph of the signed statement, as well as the date of the interview.

Intent

As part of the elements of proof, most crimes require the fact that the confessor knew the conduct was wrong and intended to commit the act. Thus, the signed statement should contain language indicating the subject knowingly and intentionally committed the act and that the subject knew the act was wrong.

The interviewer can best accomplish this by using precise language in the statement that clearly describes the act (e.g., “*I wrongfully took assets from the company that weren’t mine*” versus “*I borrowed money from the company without telling anyone.*”).

As a general rule, the written confession should not include strong emotive words such as *lie* and *steal* because the confessor might balk at signing a statement containing such terms. Still, the wording must be precise. The following example includes suggested wordings:

EXAMPLE

Instead of:	Use:
Lie	<i>I knew the statement/action was untrue.</i>
Steal	<i>I wrongfully took the property of _____ for my own benefit.</i>
Embezzle	<i>I wrongfully took _____’s property, which had been entrusted to me, and used it for my own benefit.</i>
Fraud	<i>I knowingly told _____ an untrue statement and he/she/they relied on it.</i>

Approximate Dates of Offense

The signed statement should also include the approximate dates of the offense. Unless the exact dates of the offense are known, the word *approximately* must precede any dates of the offense. If the confessor is unsure about the dates, the statement should include language to that effect.

Approximate Amounts of Losses

The signed statement should also include the approximate amounts of losses, making sure they are labeled as such. It is satisfactory to state a range of losses (“probably not less than \$_____ or more than \$_____”).

Approximate Number of Instances

The statement should also include the approximate number of instances. This number is important because it helps establish intent by showing a repeated pattern of activity.

Willingness to Cooperate

The signed statement should also include language indicating the subject’s willingness to cooperate. This type of language is important because it makes it easier for the confessor to sign a statement that they perceive to portray them in a more positive way. The confessor can convert that natural tendency by emphasizing cooperation and willingness to make amends.

EXAMPLE

“I am willing to cooperate in helping undo what I have done. I promise that I will try to repay whatever damages I caused by my actions.”

The Confessor’s Moral Excuse

The signed statement should include the confessor’s moral excuse, but the fraud examiner should ensure that the wording of the excuse clause does not diminish legal responsibility.

EXAMPLE**WRONG:**

“I didn’t mean to do this.” (This implies a lack of intent.)

RIGHT:

“I wouldn’t have done this if it had not been for pressing financial problems. I didn’t mean to hurt anyone.”

Acknowledgement That the Confessor Read the Statement

The confessor must acknowledge that they read the statement, and they should initial all the pages of the statement. The interviewer should cross out any errors and insert the correct information; then, the confessor should initial the changes, which further proves that the confessor has carefully reviewed the statement.

Truthfulness of the Statement

The written statement should state specifically that it is true, which adds support to it. However, the language should also allow for mistakes.

EXAMPLE

“This statement is true and complete to the best of my current recollection.”

Key Points in Signed Statements

There is no legal requirement that a statement must be completely in the handwriting or wording of the declarant. A statement’s *wording* should be precise, and because the fraud examiner usually knows how to draft a valid statement, it is generally not a good idea to let a confessor draft the statement.

Declarants should read and sign the statement without undue delay. Thus, fraud examiners should not ask the confessor to sign the statement; instead, they should say “*Please sign here.*”

Although there is no legal requirement to have a witness present when the confessor signs a written statement, it is a good idea to have two people witness the signing of a statement. Likewise, there is no need to have the statement notarized.

There *should not be more than one written statement for each offense*. If facts are inadvertently omitted from the signed statement, the fraud examiner can add them later to the original statement as an addendum. For legal purposes, prepare separate statements for unrelated offenses. This rule applies because the target might be tried more than once—once for each offense.

Also, fraud examiners should preserve all notes taken during an interview, or any recordings, especially those concerning a confession. Having access to pertinent notes can aid in a cross-examination regarding the validity of a signed statement. Stenographic notes, if any, also should be preserved.

Once fraud examiners obtain a confession, they should substantiate it through additional investigation, if necessary.

Criteria-Based Statement Analysis

When collecting witness accounts or conducting interviews concerning a particular fraud case, fraud examiners must continually assess how honest the interviewee has been. Criteria-based statement analysis is a post-interview tool used to determine how truthful a subject has been. In contrast to the kinesic interview, which focuses on analyzing the subject's body language or nonverbal clues, statement analysis examines the subject's language.

Statement analysis is based on the notion that when humans speak, whether intentionally or unconsciously, they specifically select the language they use. In general, the verbal clues that a subject offers while speaking are at least as prominent as any nonverbal clues. The tense that an interviewee uses is often an indication that the interviewee knows more than they are letting on.

For instance, in a U.S. case, there was a mother who was convicted of murdering her two sons. The mother claimed that a carjacker forced her out of her car and drove away with her two children in the back seat. When the father spoke of his missing children, he spoke of them in present tense; when the mother mentioned them, she referred to her children in the past tense, indicating that she knew they had passed away. Upon interrogation, the mother confessed to driving her car into a lake with her children inside.

Parts of Speech

During a statement analysis, the main items of interest are the particular words used by the subject and any changes in their usage. Breaking down the subject's sentences carefully might reveal many undetected tendencies of the subject's speech. The instances in the interviewee's statement where the notable changes in word usage occur might warrant follow-up questioning or investigation.

Pronouns

Pronouns are words used in place of a noun. They are used to indicate association (we, they), cast blame (her fault, their decision), and—perhaps most relevant to statement analysis—to show possession (our, my, his, her).

The noun that is replaced by a pronoun is the antecedent. The proper identification of a pronoun's antecedent is crucial, although there are situations in which the antecedent is ambiguous or simply cannot be determined.

EXAMPLE

"During lunch, Serena and Dawn went into Liam's office. When they left, she was carrying a file full of documents."

In the above example, does the pronoun *she* refer to Serena or Dawn? Perhaps there is further context that might assist in making the determination, but without the ability to ask the subject for clarification, the antecedent remains uncertain.

When describing an incident or situation, a truthful subject will most likely use the pronoun "I." If the subject is guilty of an offense or involved in some fashion, that person will attempt to distance themselves from the situation by removing the "I" from their statement. Often, the "I" will be replaced by "we," as though the subject had little involvement in or was not responsible for the situation.

EXAMPLE

"I went to the grocery store with my girlfriend, but I didn't steal any of the items."

"We went to the grocery store, but we didn't steal anything."

The subject's subconscious reasoning for using "we" is to remove themselves from the situation as much as possible. By swapping "we" for "I" in the sentences, the perpetrator hopes to deflect attention or blame.

In a situation in which the subject uses "we" constantly, the subject is indicating to the interviewer that the subject has some sort of relationship with another party in the situation. If, for example, the subject continually refers to "my girlfriend and I" rather than "we," this might indicate a lack of personal involvement with the girlfriend. Fraud examiners can use this pronoun usage to determine whether the interviewee is involved in a fraudulent situation with other employees.

Possessive Pronouns

Possessive pronouns are pronouns that show ownership. When an interviewee gives false statements concerning an event, possessive pronouns are often avoided for the purpose of shifting blame to an exterior force.

EXAMPLE

“I got on my register at 10:30. I was working at my register when I was called away by my supervisor. When I returned to the register, the register was open and the cash was gone.”

In this statement, the subject referred to the register as “my register” up until the controversial act took place. At that point, “my register” becomes “the register,” indicating that the subject no longer wants to be associated with a corrupted register. This pronoun switch indicates that the subject is being less than truthful.

Additionally, when considering pronouns, it is prudent to note any changes in form, such as from *I* to *we*, or from *my* to *our*. This could indicate that the speaker is seeking to alleviate responsibility for the activity being discussed. Furthermore, a change from a naturally concise plural pronoun such as *we*, to an extended iteration, such as *my coworker and I*, might indicate missing information or a contentious event that resulted in depersonalizing the relationship.

Verbs

Verbs are words that describe an action, occurrence, or state of being. They are an important part of statement analysis; the tense that interviewees use when talking about past events will shed light on whether they are recalling the incident or making it up. When subjects are recalling a past event, they should use past-tense verbs.

EXAMPLE

“My wife and I left the house at 7:00, went to dinner, and then saw a movie. We returned to the house after the movie was over.”

Generally, subjects will use past tense verbs when recalling a past event, but if they begin being deceptive, they generally will change the verb tense. Typically, the verb tense changes at the moment the subject stops recalling a past event and starts improvising a false account.

EXAMPLE

“My wife and I left the house at 7:00, went to dinner, and then saw a movie. We return to the house and as we pull up to it, we see shattered glass on the driveway.”

Verb tense is also crucial concerning the whereabouts of another person (e.g., cases involving possible kidnapping). If the person interviewed continually refers to the missing person in the past tense, there is a good chance that the interviewee knows the missing person has been harmed. Again, the Susan Smith case is a clear example of how verb tense usage can lead to a confession.

Narrative Balance

Most interview subjects naturally balance their recount of an event, meaning they spend a fairly equal amount of time telling what happened before the event, what took place during the event, and what happened during the aftermath. To get a rough estimate of how balanced a subject's account is, fraud examiners should look at the amount of time or number of sentences a subject spends on each topic. If any of the portions of the account are exceptionally short, the subject is almost certainly lying. A truthful narrative or statement typically features 20–30% introduction, 40–60% climactic event, and 20–30% aftermath.

By performing this type of analysis, the fraud examiner can also determine what elements are absent from the story in a short amount of time.

In their work titled *Criteria-Based Statement Analysis*, German psychologists Max Stellar and Guenter Koehnken identify a number of separate criteria that fraud examiners can consider when attempting to analyze a just-completed interview.

General Characteristics

The following are general characteristics of an interview that fraud examiners should consider:

- *Logical structure:* The fraud examiner first examines the statement for inconsistencies in events, checking to ensure that the recounting of events is chronologically correct and does not contain contradictions.
- *Unstructured production:* The fraud examiner should examine the subject's unstructured production at the beginning of the interview by allowing the subject to recount the event without influence or questioning. Generally, an honest person will not tell an interviewer exactly what has taken place in complete chronological order, from start to finish. It is much more likely that the honest individual will recount the events in a disorganized

manner, and the scattered facts and details will eventually coalesce into a complete version. But when a subject can describe past events in complete detail, from beginning to end, it is likely that the subject rehearsed the story.

- *Quantity of details:* During an interview, an honest subject is more likely to recall more details than a dishonest subject. This is because most subjects who fabricate stories cannot bolster their accounts with many details.

Specific Content

Fraud examiners should be mindful of the following specific content:

- *Contextual embedding:* This is based on the premise that a truthful subject's statement will be tightly woven with incidental details, such as the subject's daily routine, habits, or family relationships. A deceptive subject is much less likely to associate an event with such seemingly insignificant details, choosing to focus only on covering up the major event that is being discussed.
- *Descriptions of interaction:* The truthful subject is likely to have some description of the actions and emotions involved with the described incident or people involved in the incident.
- *Reproduction of conversation:* Often, a subject will become animated when repeating any conversation related to an incident. When this occurs, the subject is generally telling the truth because it is difficult for a fraudster to improvise cohesive dialogue.
- *Unexpected complications during the incident:* Descriptions of incidents that disrupt the event, such as a sudden halt or interruption of the event, indicate that the subject is speaking truthfully.

Peculiarities of Content

Fraud examiners should consider the following peculiarities when analyzing an interview:

- *Unusual details:* The appearance of quirky but believable details lends credibility to the subject. Fabricated statements rarely contain these types of descriptions.
- *Superfluous details:* Subjects who provide details that are not essential or even related to the recalled event are often speaking truthfully. Deceitful subjects are often so preoccupied with lying that they will excise this type of information from the story.
- *Accurately reported details misunderstood:* When witnesses describe details that they do not understand or comprehend, but that the interviewer does understand, it is likely that the witnesses are telling the truth.

- *Related external associations:* This criterion focuses on points at which the subjects relate their particular experiences with some personal or external experiences. When the subjects make a relationship between the event and something that has occurred in their lives, they are likely being honest.
- *Accounts of subjective mental state:* The subjects who provide descriptions of feelings and emotions are likely being truthful. When subjects cannot provide such information during an interview, it is likely that they have not thoroughly thought through their deceptive story.
- *Attribution of perpetrator's mental state:* The honest subject will often recount the perceived mental state of the perpetrator, suggesting what the subject believes the perpetrator was thinking or feeling at the time of the event.
- *Spontaneous corrections:* Interview subjects might often correct themselves during the course of the interview, altering earlier details or events. When subjects do this, it is likely that they are being truthful. Deceptive subjects want to project honesty and do not want to correct themselves because, in their minds, doing so would give the appearance of deceit.
- *Admitting lack of memory:* This criterion is similar to spontaneous corrections. Honest interviewees will often acknowledge not remembering certain details. Dishonest subjects, however, generally will not admit a lack of knowledge about certain details because they want to be as complete as possible.
- *Raising doubts about one's own statements:* Deceitful interviewees will almost never raise any concerns about whether their statements are correct. If the subjects raise concerns about the accuracy of their statements, they are probably not being intentionally deceptive.
- *Self-deprecation:* If subjects provide any self-incriminating or personally unflattering details during the interview, it might indicate that they are credible. In contrast, those who attempt to fabricate a story are unlikely to depict themselves in a disagreeable manner and therefore will not make self-incriminating or unflattering statements.

COVERT OPERATIONS

A *covert operation* is an investigation technique designed to obtain evidence by use of agents whose true intentions are not communicated to the target. Covert operations must be undertaken carefully. With proper planning and precautions, such operations can prove very beneficial to an investigation. However, mistakes made during a covert operation can cause irreparable damage to an investigation and result in physical harm to the investigator. Moreover, the investigator might incur reputational, financial, and legal consequences.

When considering a covert operation, fraud examiners must take into account privacy laws, the potential cost of human and technological resources, any source or informant's motivations and expectations with regard to their participation, and the potential to alert suspects to the existence of an investigation. Therefore, fraud examiners should only resort to covert operations after conventional methods of evidence-gathering have been exhausted and proven unsuccessful.

The two main forms of covert operations are *undercover operations* and *surveillance operations*.

Undercover operations often use deception and disguise to obtain evidence directly from those involved in the illicit activity. Agents engaged in undercover operations actively attempt to elicit the desired information. In contrast, surveillance operations use observation to gather information about individuals suspected of misconduct. For example, a surveillance operation might involve observing a suspect from afar while they meet with a potential co-conspirator. Alternatively, the investigator might pose as the co-conspirator's agent and engage the suspect in conversation in an attempt to gather information; this would be an example of an undercover operation.

Many jurisdictions allow law enforcement to use disguise and deceit in undercover operations; however, covert operations must be based on sufficient probable cause. Such operations cannot be conducted as aimless searches for information, and they must not violate a person's reasonable expectation for privacy (if applicable in the jurisdiction). Furthermore, the justification for undertaking the covert operation must be legally sound and defensible.

Before conducting a covert operation, it is essential that the basis for the operation be committed to writing, preferably in a memorandum (see the “Report Writing” chapter). The memorandum should clearly state:

- The information upon which the covert operation will be based
- The information that is expected to be gained from the operation
- The identities of suspects, if known
- Operatives under the fraud examiner’s care, custody, or control (confidential sources’ identities should not be disclosed, but such sources should be referred to with a symbol)

A fraud examiner is undercover when they officially abandon their identity as a fraud examiner and adopt an identity designed to obtain information from people who do not realize the fraud examiner’s true identity. The assumed identity might involve adopting another name or it might require an elaborate cover, complete with a detailed backstory and supporting documentation. The aim should be to avoid being compromised, to minimize danger to the fraud examiner, and to ensure the operation’s success.

Information sought in a covert operation might include the location of markets for stolen goods, the subject’s methods of operation, detailed personal data on subjects, and any other relevant information. Information should be developed with care to avoid alerting the targets or their associates. Only those people who need to know should be informed of the undercover investigation.

Establishing an Identity

Some covert operations call for fraud examiners to fabricate cover stories to conceal their true identities. The story should help the fraud examiner gain the subject’s confidence, but it should rarely, if ever, be wholly fictitious. The fraud examiner should be from a city that they are familiar with that is not the subject’s home city. Arrangements should be made to have key people in the fictitious history corroborate the undercover fraud examiner’s claims.

Particular attention should be paid to items carried by the undercover fraud examiner, such as pocketbooks, watches, rings, tokens, suitcases, ticket stubs, miscellaneous papers, matches, letters, and sums of money. Documents and identity cards should show the appropriate amount of wear and tear. The fraud examiner should be able to explain how each item came into their possession.

There should be a natural contact between the undercover fraud examiner and the subject. The background story should contain elements that will bring the suspect and the fraud examiner together without any contrived effort. A mutual interest in hobbies, sports, and other leisure activities can provide an opportunity for getting acquainted. The fraud examiner should not pose as an authority on a subject unless they are totally qualified. Many times a fraud examiner's admitted lack of knowledge—but interest in—a given subject helps make the subject feel important and not threatened.

The following situations are those in which covert operations have traditionally worked well:

- There is reliable information about criminal activity or asset losses, but there is insufficient detail for prevention or apprehension.
- Losses are known to be occurring in an area, but there is no information as to how they are occurring or who is responsible.
- It is desirable to gather information concerning personal relationships or to identify the contacts made with or by certain people.
- It is desirable to compare actual practices with supposed or required practices.
- It is important to obtain information in an indirect manner from people believed to possess it.

Covert operations should be used when there is no other practical way to obtain necessary information.¹

Objectives

According to Paul O'Connell in an article for *Security Management*, one of the first steps in initiating an undercover operation is to identify the investigation's objectives.² The objectives must specifically identify what the operation is designed to discover, such as the identity of the fraudulent worker responsible for a specific crime.

The specific objectives of a covert operation depend on the type of investigation being conducted. For example, the objectives in the surveillance of a warehouse would not be the same as those in surveillance designed to determine if someone is receiving a kickback. However, all covert operations have similar general objectives:

¹ Walsh, Timothy J., and Richard J. Healy. *The Protection of Assets Manual*, 1985.

² E. Paul O'Connell, "Is a Ruse the Best Route?" *Security Management*, December 1995, 26–30.

- *To obtain evidence of a past, current, or future crime:* This evidence usually bears on the culpability of individuals. If an operative in a covert investigation is posing as a thief, for example, actual thieves might confess their involvement to the operative, unaware that their conversations were being recorded.
- *To identify those engaged in possible illegal activity:* If, for example, cash is missing, a covert investigation might disclose who is committing the offense. Thereafter, the covert operation might be discontinued and the evidence gathered by more traditional means.
- *To recover illegal gains:* If an accounts payable clerk has been stealing to purchase an automobile, locating the car might permit recovery through civil litigation.
- *To identify co-conspirators:* If an employee is in collusion with another employee or third party, a covert operation might lead to the second individual's identity.
- *To identify the modus operandi:* Again, in the case of missing goods, the perpetrator's identity might be known or suspected, but the internal control deficiencies permitting the theft might be unknown. A covert operation might discover the missing link.

Problems in Covert Operations

In addition to the legal problems a fraud examiner might encounter, a covert operation involves some of the most costly and risky work a fraud examiner can undertake. Such operations can consume great amounts of time and human resources, while exposing the fraud examiner to potential legal liabilities or physical harm. Covert operations should be used only with extreme care and as a last resort. If the information sought can be uncovered in any other way, the fraud examiner should refrain from conducting covert operations.

Legality of Recordings

Many jurisdictions have laws that impose restrictions on electronic audio or video recording that are generally based on individuals' right to privacy. The factors determining the legality of electronic audio or video recordings might include one or more of the following:

- *The consenting party:* Most jurisdictions require consent from at least one of the parties to a private conversation for a recording of that conversation to be permissible. Jurisdictions with higher standards of privacy might require the consent of multiple or, in some cases, all parties. Fraud examiners operating in jurisdictions that allow recordings in which there is only one consenting party will generally have more options available to them in terms of electronic recordings of video and/or audio in private or in public.

- *The setting*: Restrictions on recording might depend on whether the conversation or interaction to be recorded occurs in public or in private. For example, a fraud examiner might be allowed to record a conversation between two unsuspecting individuals on a busy street corner but not a conversation between two unsuspecting individuals in one of their residences. Alternatively, a conversation between two people in one of their residences might be permissible if one party consented to the recording. Additionally, the legality of electronically recording the interaction might depend on whether it occurs in person, over the phone, or on the internet.
- *A combination of audio and video*: In some jurisdictions, including the United States, fraud examiners might only be allowed to record audio *or* video of a public interaction between two or more unsuspecting parties but not audio *and* video.
- *The recording party*: The aforementioned considerations might not apply to individuals employed by, or operating in coordination with, law enforcement agencies who obtained a court order to record a conversation or interaction.

What is permissible varies by jurisdiction, even within countries. To ensure that no laws are violated, fraud examiners are strongly advised to consult with legal counsel or receive proper training that is specific to a particular jurisdiction before surreptitiously recording any audio or video.

Entrapment

Many jurisdictions recognize the legal defense of entrapment. *Entrapment* occurs when law enforcement officers or government agents induce a person to commit a crime that they are not previously disposed to commit. Entrapment also poses a legal problem in covert operations, particularly in undercover operations, because the defendant might not be found liable if it appears that they were improperly induced to commit the crime. Therefore, it is imperative that covert operations be properly predicated, and again, covert operations must not be used for aimless searches for information performed without notions of what might be uncovered—practices commonly referred to as *fishing expeditions*.

EXAMPLE

A storeowner was concerned because her inventory costs were unusually high in relation to sales. She hired a private investigator to pose as a contract driver and deliver and pick up merchandise to and from the store. The investigator proceeded to offer kickbacks to all employees in the shipping department if they would allow him to leave without signing for the

merchandise. One employee took the bait and was subsequently arrested for theft. The case was thrown out because of entrapment. The courts ruled that there was no reason to believe, simply because of a high sales cost, that merchandise was being stolen. Furthermore, the investigator had no suspect in mind; he was simply fishing.

Surveillance³

Surveillance is the planned observation of people, places, or objects. Obtaining information about places and objects is usually less important than gathering information about people.

There are two general types of surveillance: mobile and fixed. *Mobile surveillance*, also known as *tailing* or *shadowing*, can be conducted on foot or by vehicle and involves following people as they change locations. *Fixed surveillance*, sometimes referred to as a *stakeout* or *plant*, focuses on one location. Although the observers might change vantage points, the object of the surveillance stays in one place.

Surveillance, whether by foot or vehicle, is predominantly an exercise in common sense, skill, tact, and ingenuity on the observer's part. Carefully planned and properly executed surveillance can be of tremendous value in an investigation; conversely, lack of preparation, poor timing, and unsound surveillance practices can undermine an otherwise well-executed case.

Surveillance can be a valuable technique. It can be used to locate residences, businesses, or other places of interest to the investigation, and it can be used to locate places where criminal activity is conducted. It can also produce important evidence concerning the scope and nature of a person's activities.

Surveillance activities, however, must be carefully recorded. Detailed notes and logs, video recorders (often with special lenses and light sources), sound recordings, and miniature electronic listening devices must be used appropriately.

Two Methods of Surveillance

There are two basic methods of surveillance: loose surveillance and close surveillance. *Loose surveillance* is used when targets do not need to be kept under constant observation. Loose

³ Portions of the material in this section are based on the U.S. Navy publication *Master-at-Arms*, <http://militarynewbie.com/wp-content/uploads/2013/11/US-Navy-course-Master-at-Arms-NAVEDTRA-14137.pdf>.

surveillance should be discontinued if the subject becomes suspicious. *Close surveillance* is used when subjects need to be kept under continuous observation, even if it appears that the subjects have become suspicious.

Circumstances might require a fraud examiner to change from loose to close surveillance. It helps to develop a surveillance plan, but the fraud examiner must observe and interpret the circumstances to decide which tactic to employ. If the plan calls for loose surveillance until a specified act is complete, after which the subject is to be put under close surveillance or apprehended, the observer must determine when the specific incident has taken place.

Preparation

Again, before conducting surveillance, fraud examiners should develop a surveillance plan. The observer's attire should conform to the area or group being surveyed. Dress should be conservative, unless conservative dress is not appropriate for the area. Attire should not be loud or flashy so that if the subject notes the observer, it will be less likely that they will form any lasting impression. Minor changes in outer clothing or hand-carried items might alter the overall impression and help prevent recognition by the subject.

Two or more observers working together need complete agreement about the surveillance techniques and schedule. Discreet signals will help each observer understand any given situation.

Planning is essential, but the observers' adaptability and ingenuity are vital. Observers should be chosen for both aptitude and resourcefulness. They must have poise, patience, and endurance. Prior to the surveillance, the observer should prepare and document a cover story that will stand up under scrutiny. This cover story should provide the observer with a reasonable excuse for being in the area.

Electronic Equipment

Fraud examiners should consider using electronic surveillance equipment when conducting surveillance. For surveillance on foot, transmitting and receiving devices can easily be hidden on the person without arousing suspicion. Transmitters can be concealed in packages, briefcases, or on the person, although fraud examiners should check with local legal counsel in the jurisdiction before doing so. Light-gathering binoculars and metascope equipment for night surveillance should be used if necessary.

Social Media

If social media accounts or profiles for surveillance subjects can be identified, fraud examiners might be able to observe subjects' regular activities or habits through their social media postings. This information can be extremely valuable in the planning stage of surveillance, helping fraud examiners determine locations the subject frequents, vehicles the subject might use, or other relevant context. In addition to the social media profiles or accounts of subjects, fraud examiners should search for the social media pages related to a business or location that they anticipate could be involved in the surveillance.

Basic Precautions

When conducting surveillance, an observer should refrain from making abrupt, unnatural moves that could attract attention. Observers should also avoid disguises such as false beards, which are impractical, hard to maintain, and easily detectable. The observer should not look directly into the subject's eyes. Inexperienced observers must overcome the tendency to believe that they have been identified because the subject glances at them several times.

The geography of the area where surveillance is to take place should be studied carefully. The observer should know the location of cul-de-sacs, dead-end streets, or alleys to avoid being trapped or discovered. The investigator must recognize that knowing when to discontinue surveillance to avoid a confrontation with the subject is as important as any other skill required for effective surveillance. Investigators must be circumspect about taking conspicuous actions to maintain surveillance and recognize that losing the subject is not equivalent to failure.

A suspicious subject might suddenly reverse course, enter a street with no outlet, board and suddenly depart from public transportation, or engage in a variety of other evasive actions. The observer can counter these strategies by following approved surveillance techniques.

Techniques of Foot Surveillance

One-Person Surveillance

One-person surveillance is best for fixed surveillance. If a moving one-person surveillance must be used, the observer should follow the subject on the same side of the street and keep fairly close. Crowd and street conditions dictate the appropriate distance. When the subject turns a corner in an uncrowded area, the observer should continue crossing the intersecting street. By glancing up the street in the subject's direction, the observer can note the subject's position and actions.

If conducting surveillance in a crowded area, it might be necessary to decrease the surveillance distance. Unless the subject is standing just around the corner, surveillance can be continued from the same side of the street. Do not turn a corner immediately behind the subject. When conducting surveillance across the street from the subject, the best position (i.e., whether to be located behind, in front of, or abreast of the target) will depend on the situation. The observer should be abreast of the target when they turn a corner to observe any contact with individuals or entry into a building.

Two-Person Surveillance

In the two-person surveillance technique, which is also known as the *A-B* surveillance technique, there are two observers. A, the first observer, is stationed directly behind the target. A follows the target. B, the second observer, follows A either on the same side of the street or from across the street. When both observers operate from the same side of the street and the subject turns a corner, A continues moving forward and crosses the intersecting street. From a vantage point, A signals the correct moves to B. When B is operating across the street and the subject turns a corner to the right, B will cross the street behind the subject and take up the A position. This move should be prearranged. No signals should be necessary. All visual signals should be discreet and consistent with the environment. Should the subject turn to the left and cross the street toward B, B should drop back to avoid meeting the subject. B should keep A in sight to observe signals indicating their next move.

Three-Person Surveillance

In the three-person surveillance technique, which is also known as the *A-B-C* surveillance technique, there are three observers. The *A-B-C* technique of surveillance is intended to keep two sides of the subject covered. A follows the subject. B follows A and concentrates on keeping them, rather than the subject, in sight. The normal position for B is behind A. C normally operates across the street from the subject and slightly to their rear, enabling C to observe the subject without turning their head. Variations, such as having both B and C across the street or all three of the observers behind the subject on the same side of the street, might be necessary because of crowded conditions or traffic. In this technique, if the subject turns a corner, A continues in the original direction, crosses the intersecting street, and then signals instructions to the other observers from that vantage point. Either B or C can be given the A position, and A might take up the original C position and continue their observation of the subject from across the street.

In another variation of the three-person technique, both A and B might continue in the original direction and cross the street. A signals C to take up the A position. B then crosses the street again and assumes their former B position. A assumes the C position. In the third situation, when C notices that the subject is about to turn a corner, C signals what positions to assume to both A and B.

Other Techniques

There are other ways to lessen the chance of an observer being identified by the subject. One method is known as the *leap-frog method*. In this method, the observers change places with each other by either pre-arrangement or signal.

Another method is the *progressive surveillance method*. This method is used when extreme caution is necessary. With this technique, the subject is followed a certain distance and then the surveillance is discontinued and the time noted. The next day, another observer picks up the subject at the time and place where the surveillance was previously discontinued, and again follows the subject for a short distance. This continues for days until the surveillance is completed.

Techniques of Vehicle Surveillance

General

Vehicle surveillance demands preparations additional to those that are required for foot surveillance. The observer must use a dependable vehicle that is similar to the types of vehicles commonly found in the area where the surveillance will take place. For example, the observer might use a panel truck, automobile, or a large truck or trailer. The vehicle's license plate should be of the relevant jurisdiction where the surveillance will take place. Consideration should be given to gasoline, water, first-aid equipment, and navigational requirements.

Whenever possible, combining foot and vehicular surveillance can be advantageous. By using both methods, the observers will likely remain more alert. When a subject parks their vehicle and remains inside, an observer on foot can better monitor the subject's actions and those of passersby.

As in foot surveillance, vehicular surveillance requires inconspicuous actions. Observers should generally stay in the same lane as the target to avoid having to make turns from the wrong lane. If the situation allows, observers should change direction, perhaps going around

a block to break continuity before the suspect becomes suspicious. If the surveillance takes place at night, observers should limit the amount of light emanating from their vehicles to avoid unwanted attention.

One-Vehicle Surveillance

When conducting one-vehicle surveillance, the vehicle must follow the subject at a distance that allows the subject's actions to be monitored without risking detection. When a subject's car stops, one observer should follow their actions on foot. The subject normally will not expect to be tailed by a person on foot while they are using their car. When the subject turns a corner, the observers have two options. First, they can continue moving forward, cross the intersecting street, and then turn the vehicle around. Alternatively, they can continue moving forward, cross the intersecting street, and continue around the block.

Two-Vehicle Surveillance

This technique uses two vehicles to follow the subject at different distances on the same street, similar to the A-B foot-surveillance method. This technique can be varied by having one vehicle going in the same direction as the subject on a parallel street while receiving radio-transmitted directions from the observers directly behind the subject. This technique is more flexible because the two vehicles can change places from time to time.

Fixed Surveillance

Fixed surveillance, or a stakeout, is used when the subject remains stationary. In fixed surveillance, the observer can move around for closer observation. When one observer is detailed to watch a place with more than one exit, they might have to move about considerably. When preparing for a stakeout, the base of operations should be well planned. The base might be a store, apartment, house, automobile, or truck. A thorough—but cautious—area reconnaissance should be conducted. Necessary equipment should be readily available, such as binoculars, electronic investigative aids, cameras, and sound recording devices.

Aerial Surveillance

Aerial surveillance refers to the observation of a place, person, group, or ongoing activity from an aerial vehicle, and it includes satellite surveillance and surveillance with unmanned aerial vehicles (also known as drones).

Satellite Surveillance

Satellite data may be used for surveillance. With relative ease, a fraud examiner can obtain detailed satellite images from nearly anywhere in the world, although the fraud examiner should note when those images were produced, as older images might no longer be accurate.

Satellite imagery can be especially useful in surveillance if it is combined with more traditional types of photographic intelligence. This is especially true for large estates or industrial sites where aerial photography is prohibited. It also can be beneficial in a covert operation.

Satellite imagery can help to determine ways to penetrate a site, develop a map of the grounds, and identify important areas. In addition, satellite imagery can be used to investigate areas that are too remote, expensive, or dangerous to send operatives.

Obtaining satellite imagery is simple if the target's location is known. Satellite imagery is widely available online. Google Earth and Google Maps, for example, provide highly-detailed aerial or satellite images for most urban areas in developed countries, as well as industrialized parts of most countries. Additionally, Google Street View and some other services offer street-level images of urban areas, allowing ground-level viewing with 360-degree rotations. In some instances, the interior of a commercial property is mapped and made available by the proprietor, thus allowing investigators the ability to see inside of a building remotely. These images are updated only periodically, but they can be helpful in numerous ways. For instance, suppose a fraud examiner is trying to determine whether a suspect is living beyond their means. When they view the suspect's long-term address via one of these services, the fraud examiner sees a luxury home and several expensive cars in the driveway. These images thereby provide the fraud examiner with potential leads. Similarly, if a fraud examiner suspects that someone is operating a shell entity, using a ground-level view of the listed address might help to detect red flags (e.g., empty lot, lack of signage, lack of expected equipment).

There are some concerns about the legality involving the use of satellite-derived information. Satellite surveillance, for example, might violate privacy laws; however, privacy laws vary between jurisdictions, and they vary as to whether air and satellite surveillance is legal. Therefore, the fraud examiner should make sure to check the laws of the jurisdiction in which the surveillance is being conducted.

In the United States, for example, the Supreme Court has never taken a position on whether the Fourth Amendment, which guarantees the right of all citizens to be free from

unreasonable searches and seizures by government authorities, places limits on government use of satellite surveillance, but it has allowed government agents to conduct warrantless aerial surveillance from manned aircraft.

Aerial Surveillance with Unmanned Aircraft

Unmanned aircraft systems (UAS), or *drones*, are powerful surveillance tools and are becoming more popular. Drones can be used to observe people in public places, and they can be used to conduct aerial surveillance of locations that are difficult to access.

Drones can range in size and form, and they can be equipped with a wide range of surveillance technologies, such as high-powered cameras; radar technologies; night vision; and infrared, ultraviolet, and thermal imaging. Thus, drones can be used to collect, store, and transmit vast amounts of information.

Many jurisdictions have laws or regulations that restrict the use of drones based on the height at which they are flown, the times of day they are flown, proximity to restricted airspaces, such as the airspace surrounding airports, and more. Given drones' relatively recent increase in popularity and availability, regulations applying to them are subject to updates somewhat regularly. For current laws and regulations related to drones, fraud examiners can view UAV Coach's master list of drone laws at <https://uavcoach.com/drone-laws>.

Aerial Surveillance Law

Although aerial surveillance can provide valuable information, the use of such technology does raise important questions and concerns about privacy. Accordingly, before fraud examiners use aerial surveillance technologies, they must address the privacy implications of their use and ensure that such technologies are used in accordance with privacy laws and guidelines.

Unfortunately, aerial surveillance law varies among jurisdictions, and it is largely unsettled. The following are examples of how such law applies in various countries.

AERIAL SURVEILLANCE LAW IN THE UNITED STATES

Aerial surveillance law in the United States is unsettled. It is not clear as to what extent the Fourth Amendment, which guarantees the right of all citizens to be free from unreasonable searches and seizures by government authorities, places limits on government use of satellite

surveillance or drone surveillance. The U.S. Supreme Court has never taken a position on these issues, but it has allowed government agents to conduct warrantless aerial surveillance from manned aircraft.

In general, the Fourth Amendment does not prohibit the government from conducting warrantless aerial surveillance of a home or its curtilage—the area of land attached to a house—so long as the government is conducting the surveillance from public navigable airspace. The U.S. Supreme Court addressed aerial surveillance in a series of cases in the 1980s:

- In *California v. Ciraolo*, 106 S.Ct. 1809, 1810 (1986), the Supreme Court ruled that the government did not violate the Fourth Amendment when it engaged in the warrantless aerial observation of a person's backyard.
- In *Dow Chemical Company v. United States*, 106 S.Ct. 1819 (1986), the court enunciated standards regarding the legality of aerial photography. It expressed concern about satellite surveillance but did not establish any legal distinction between aerial photography and satellite surveillance.
- In *Florida v. Riley*, 488 U.S. 445 (1989), the Supreme Court ruled that government agents do not need a warrant to observe an individual's property while flying in publicly navigable airspace.

Although the Supreme Court has addressed the legality of warrantless aerial surveillance while flying in publicly navigable airspace, U.S. law is unclear about the operation of aerial surveillance vehicles below navigable airspace, which, as a general rule, includes airspace below five hundred feet.

Additionally, aerial surveillance in private places is more likely to violate privacy laws than such surveillance in public spaces because individuals' expectation of privacy is greater in private places than in public spaces.

Also, many states have added laws that impose further regulations on the use of drones, beyond those enacted by the U.S. Federal Aviation Administration (FAA).

AERIAL SURVEILLANCE LAW IN CANADA

The use of aerial surveillance might conflict with Canadian privacy law, in which an individual's privacy might be protected by, among other things, the Canadian Charter of Rights and Freedoms (Canadian Charter), common law, federal law (e.g., the Privacy Act and the Personal Information Protection and Electronic Documents Act [PIPEDA]), and

provincial law. But currently, privacy laws in Canada are primarily focused on protecting personal information that is collected by government and commercial businesses.

As in the United States, use of aerial surveillance in Canada is more likely to conflict with privacy laws when in private places than in public spaces. This is because people have a greater expectation of privacy in private places than they do in public spaces.

Drone use is restricted in Canada. Commercial drone use is subject to licensing approvals and safety parameters set by Transport Canada, which is responsible for regulating civil aviation in Canada, but such restrictions do not apply to drones that are flown for recreational purposes. Military drones, however, fall under the authority of the Department of National Defence (DND).

Additionally, Canada has restrictions on the use of drones over urban areas.

AERIAL SURVEILLANCE LAW IN GERMANY

The use of aerial surveillance in Germany implicates several laws. In particular, conducting aerial surveillance over private property that belongs to a third-party brings the personality rights of the third party into play. The personality rights, which include the right to privacy, are derived from the Basic Law for the Federal Republic of Germany.

Also, the restrictions that apply to the use of GPS tracking devices to conduct surveillance can be applied to the use of drones for surveillance.

Furthermore, the use of drones is regulated in Germany, but civilian drones that are used for recreation are subject to less stringent standards than those used for commercial purposes. The commercial use of drones requires a permit from the relevant federal state authority, and such authorization is granted only if the drone use will not violate data protection rights. For more information regarding unmanned aerial vehicle laws and regulations by country or U.S. state, fraud examiners can check the UAV Coach website.⁴

Night Surveillance Equipment

Night viewing devices allow users to observe events occurring in darkness. Basically, there are two types of night vision devices: *active* and *passive*. Active systems put out their own light

⁴ <https://uavcoach.com/drone-laws>.

source, an infrared beam, which is visible to the user through the systems' infrared scope. Active systems are advantageous because with active devices, users can see in total darkness. There are, however, disadvantages to active systems. Some disadvantages include limited range and the fact that the infrared beam is visible to anyone looking through an infrared scope or through a passive night viewing device.

Passive systems electronically amplify whatever existing light is in the environment, such as moonlight or sky glow, which is why such units are sometimes referred to as *starlight scopes*.

Night viewing devices can be attached to cameras to obtain evidence that can be used in court.

Sources and Informants

Sources and informants both serve the same purpose—to provide information to help develop a case. However, there are notable differences between confidential sources and confidential informants. The terms should not be used interchangeably.

A *confidential source* furnishes information as a result of occupation or profession and has no culpability in the alleged offense. For example, confidential sources might include attorneys, accountants, law enforcement personnel, or even barbers. A *confidential informant* has a direct or indirect involvement in the matter under investigation and might be culpable. The distinction between the two sources is their involvement in the offense. Informants can pose treacherous legal issues for the fraud examiner.

Tom Melsheimer, a former U.S. prosecutor, suggests that secretly photographed or recorded conversations provided by an informant are the most convincing type of evidence. This information is generally accepted as something that is sure to be successful for a criminal prosecutor, because there is little that a white-collar criminal can dispute when caught in the act of a fraud.⁵

⁵ Melsheimer, Thomas M. "Snitches." Texas Trial Lawyer, May 20, 1996, pages 12–18.

Types of Informants

In the book *Criminal Investigations*, authors Paul B. Weston and Kenneth M. Wells identify several different types of informants: the basic lead, the participant, the covert, and the accomplice/witness.⁶

Basic Lead Informants

This type of informant supplies information to the police about illicit activities that they have encountered. The reasons that the informant decides to supply information are varied; some informants simply want to “do their part” to stop an unscrupulous activity, while others are interested in harming the criminals against whom they are informing. For instance, many informants in the drug, prostitution, or illegal gambling areas are involved in those areas as well and intend to eliminate some of their competition. Whatever the reason, these informants’ only role in a covert investigation is to supply law enforcement with information.

Participant Informants

The participant informant is directly involved in gathering preliminary evidence in the investigation. The informant in this instance not only supplies an investigation with information but also takes an active role in obtaining further evidence. For example, a participant informant might help set up a sting operation, initiating contact with the criminal for purposes of arrest. A participant informant is just what the name suggests—a participant in the investigation of criminal activity.

Covert Informants

A covert informant also supplies information on criminal behavior to authorities. The difference between covert informants and other types of informants is that a covert informant is one who has been embedded in a situation or scenario for years and is called upon only sporadically for newly uncovered information (i.e., tip-offs) and leads. These types of informants are often referred to as *moles* because of the nature of their insulated situation as inside sources. Weston and Wells identify two instances in which covert informants are commonly used: In organized crime and hate-extremist group investigations, covert informants are often culled to get information about upcoming criminal activities by such groups.

⁶ Weston, Paul B., and Kenneth M. Wells. *Criminal Investigation*. Prentice Hall, 1970.

Accomplice/Witness Informants

The accomplice/witness informant is often called upon to provide information concerning criminal activity. Unlike other types of informants, the accomplice/witness informant seeks to avoid punishment or prosecution for an offense by providing investigators with helpful information. For example, the government might promise leniency if the accomplice/witness informant offers details about a co-conspirator. In most situations, fraud examiners should not promise witnesses anything in return for their participation or cooperation in an investigation unless they have been directly authorized to do so.

Objectives of Source and Informant Information

There are three essential objectives when using sources and informants. First, keep the informant's identity as confidential as possible. Second, independently verify the information provided by the source or informant. Third, develop witness and documentary evidence from independently verified information. For example, an informant might indicate that a particular suspect committed fraud. If the fraud examiner conducted an interview and got a confession out of the suspect, the information is no longer dependent on the informant's claim.

If the confidential source or informant has provided documents, names of potential witnesses, or other evidence, all reasonable steps must be taken to protect the identity of that source. Care should be taken to ensure that questioning of other witnesses regarding information provided by a confidential source or informant is done in a manner that does not reveal its origin. This can usually be accomplished by phrasing questions in a certain way. For example, Pilar Espinosa furnished confidential information about Liam Barrett, the co-owner of Barrett Brothers Construction Company. Upon confronting Barrett, the fraud examiner does not want Barrett to know that Espinosa has already been consulted.

EXAMPLE**WRONG:**

"Mr. Barrett, someone told me you were bribing building inspectors for special treatment."

RIGHT:

"Mr. Barrett, I have information indicating you are bribing building inspectors for special treatment."

In the above example, the investigator made the confrontation direct but did not reveal the origin of the information. If Barrett presses the fraud examiner to learn how such information was obtained, the fraud examiner should keep the information confidential. See the example that follows.

Mr. Barrett:

“Who did you get that information from?”

Examiner:

“Emails I have from your company’s records, plus other inquiries conducted in this matter.”

If necessary, in this example, the fraud examiner would display the evidence from witnesses and documents that would not reveal the source or informant’s identity. The information from the source or informant is basically useless unless the fraud examiner can verify its authenticity and independently corroborate it. Suppose a source furnishes the fraud examiner with copies of documents showing that Barrett Brothers Construction Company’s building code violations dropped by 80% since the bribery allegedly began. This kind of evidence would corroborate the source’s story. If a source told the fraud examiner that Barrett frequently had drinks with Eric Whitaker, the city’s chief building inspector, the fraud examiner would want to find out some way to verify this information.

Recall that the third objective when using sources is to develop the witness’s information and other evidence so that it makes a cohesive case.

Recruitment of Sources and Informants

Fraud examiners should remember the need to develop sources. Business and financial institution executives, law enforcement and other governmental personnel, medical and educational professionals, and internal and external auditors are good contacts for fraud examiners.

The fraud examiner should make contacts in the community well in advance of needing information; this is good public relations. If the fraud examiner receives an allegation and needs confidential information, they might obtain assistance from a source cultivated earlier.

Additionally, sources need to feel confident that they can share information without being compromised. In theory, the source will never have to testify; they have no firsthand knowledge. Firsthand information comes from a witness or document.

The fraud examiner might also meet sources when tracking leads during a specific investigation. They might interview a stockbroker from whom the target purchased stock who does not want their identity revealed. The fraud examiner should not encourage a person to provide confidential information, but rather try to get reports on the record. But if the fraud examiner promises confidentiality for a source's information, they must abide by that promise.

Active recruitment of informants is generally not desirable because doing so might appear unseemly to a jury. It is better to encourage an informant to come forward. It is desirable to develop an informant relationship, but such relationships must be handled carefully. The fraud examiner must clearly document the adequate predication for an informant's involvement.

Generally, the most serious questions concerning informants will focus on their culpability. There have been cases where the informant is guiltier than the target. A court might rule that the informant's information cannot be introduced.

Motives of Sources and Informants

Sources

In some instances (but not many), the source might want money or other consideration for furnishing information. The fraud examiner should not initially volunteer any compensation. It is better to have the source request it. This is to avoid any allegation of misconduct against the fraud examiner for paying for information.

Sources have their reasons for providing information. Often, they provide information because they have a sense of moral obligation or because they like and trust the fraud examiner and want to help. Unfortunately, sources might also provide information for far less altruistic reasons, such as having a grudge against the target or potential financial benefit.

Informants

Informants, especially incidental ones, commonly want something in return for their information. They often take the view that their involvement has personal risk, and they want to be compensated for their contribution. The informant is likely to be predisposed to sell information to the highest bidder.

Informants are motivated by different things. Often, an informant is motivated to pursue the target, not because of any sense of morality, but because the informant and the target are closely involved. One of the most common reasons informants supply information is because they are involved in the offense, and by furnishing information on the target, they can diffuse suspicion from their own activities. The informant might also feel that the criminal activity in which they are involved has become too extreme, so they might report the information hoping for leniency or a reduced sentence. In other situations—such as a drug dealing case—an informant might furnish information because the target is the competition. In many instances, the fraud examiner initially does not know the full truth about the informant or their intentions.

The fraud examiner must also be aware of the overzealous informant. Melsheimer cautions that many catalogued cases concerning the abuse of informants were the result of “involved informants who are private citizens, self-motivated to satisfy their law enforcement sponsors at virtually any cost.” To ingratiate themselves to investigators, these informants will often engage in unscrupulous activities to provide the information they think the investigators are looking for. Accordingly, before obtaining information from this type of informant, the fraud examiner must lay out the ground rules for the informant. Otherwise, the fraud examiner will risk suffering embarrassment (and punishment).

Legal Considerations

As noted, dealing with sources and informants is fraught with legal pitfalls. The fraud examiner should consider potential consequences in all interactions with sources and informants. The fraud examiner might be able to trust a source, but they can rarely trust an informant. Also, fraud examiners should always document their contacts with sources and informants in case problems arise.

Many jurisdictions guarantee the accused the right to confront their accuser. For example, the Sixth Amendment to the U.S. Constitution gives subjects in a criminal investigation the right to confront (cross-examine) the witnesses against them. This right to confront is an absolute

right of the accused; it guarantees persons accused of crimes the opportunity to face the government's witnesses in the case against them and challenge the witnesses' testimony. Similarly, Article 6 of the European Convention on Human Rights (ECHR), which protects the right to a fair trial, guarantees those accused of crimes the right to examine witnesses against them or have them examined. Likewise, in Canada, the right to make full answer and defense is a principle of fundamental justice, and this right encompasses a number of things, including the right for criminal defendants to examine witnesses against them.

The fraud examiner will usually not be able to testify to what a source or informant said because doing so would violate the general rule against hearsay evidence (i.e., in general, statements made out of court and not based on a witness's direct knowledge are not admissible). In general, a witness can testify only to what they know; they cannot testify about what someone else has said.

If the fraud examiner decides to pay an informant or source, they should make the payment in cash and obtain a receipt. If the source will not sign a receipt, the fraud examiner should not pay them. There have been numerous instances where a receipt was not obtained and the informant subsequently denied receiving funds or challenged the amount paid. If this happens, the fraud examiner will have to defend themselves without proof; indeed, some investigators have been accused of having embezzled the payments. Payments should only be made on a cash-on-delivery-of-information basis.

The fraud examiner should obtain the information and verify it before they turn over any money. If the fraud examiner fails to do this, they might become the victim of a scam.

Sometimes, an informant will claim entrapment as a criminal defense, especially when the informant is doing things at the behest of law enforcement. Remember, entrapment occurs when law enforcement officers or government agents induce a person to commit a crime that they are not previously disposed to commit. The entrapment defense asserts that the target is innocent and was unlawfully lured into a crime that they otherwise would not have committed. An entrapment defense can best be overcome by ensuring that the source or informant only gathers information and plays a limited role in the case.

In rare instances, informants themselves have attempted to harm investigators or worked with organized crime to harm investigators. They also might falsely claim that the investigators violated some law during the process, such as physical abuse or extortion.

Considering these risks, fraud examiners who use informants should not meet them alone. Preferably, face-to-face meetings should be conducted by two members of the investigation team and should take place in an environment they can control, such as their office.

Reporting Contacts

It is recommended that all contact with informants and sources be reported on a memorandum, although the confidential source or informant's identity should not be included in the report. Instead of including the source or informant's identity, the fraud examiner should use symbols to denote the source's identity. It is further recommended that sources be preceded with an *S*, followed by a unique identifier (i.e., source #1 would be "S-1"; source #2 would be "S-2"). The symbols for informants would then be "I-1" and "I-2."

Generally, disclosure of the identities of sources and informants should be on a strict need-to-know basis. For that reason, the person's identity should be maintained in a secure file with limited access, and it should be cross-indexed by the source's symbol number. The reliability of the source, if known, and whether the person is in a position to furnish relevant information should be noted in writing.

EXAMPLE

"A source of unknown reliability, but in a position to furnish relevant information (hereinafter referred to as S-1), advised as follows:"

OR

"An informant of known reliability and in a position to furnish relevant information (hereinafter referred to as I-2) advised as follows:"

Private (i.e., non-government) fraud examiners are not in a position to promise leniency to people involved in the commission of a crime or tort. To do so is serious misconduct and a violation of the ACFE Code of Professional Ethics. Promises of leniency can only come from the prosecutor or the courts. The fraud examiner may truthfully tell the informant that their cooperation will be made known to the authorities and that people who cooperate are generally treated better.

Promises of Confidentiality

Whether working in private or government sectors, fraud examiners are generally not in a position to offer unqualified confidentiality to informants. Therefore, any promises made to

an informant or source should be qualified with the caveat that no absolute assurances of confidentiality can be given. For example, a fraud examiner may say that they cannot guarantee that the source's identity will be kept secret but that they will do so if possible. In the case of a fraud examiner who is employed by a governmental agency, there might be an absolute duty not to hold sources and informants in confidence. In many law enforcement agencies, an investigator may not have informants or sources who are unknown to the agency. Investigative agencies also regularly share information on criminal investigations with prosecutors, including the identity of the source of information. The same regulations and considerations could govern business entities.

EXAMPLE

During an examination of Donna Kirkland, a division manager at QRS Technology, you contact Reece Sutter, one of Kirkland's coworkers. Sutter will talk to you only in confidence. You know QRS Technology's policies are to prosecute all criminal offenses. Sutter seems to be the key to making a case against Kirkland. You believe you can independently verify the allegations Sutter furnishes, but you will not be certain until you talk to him. It might be necessary to call on Sutter to testify against Kirkland in order to make the case.

WRONG:

"Mr. Sutter, I promise I will not tell anyone that you spoke to me."

RIGHT:

"Mr. Sutter, I promise I will not tell Ms. Kirkland that you spoke to me."

The second type of promise above is a conditional promise; the fraud examiner will not directly tell Kirkland, but that does not mean someone else will not. At some point, informants and sources often become witnesses. Under no circumstances should a fraud examiner promise a source or informant that their identity will not become known.

Ethical Considerations with Informants

Using covert or accomplice informants is not a light undertaking, and it can raise ethical issues. Depending on the type of crime involved, the situation can put people at risk—particularly the informant.

For instance, in a 2012 case, government investigators busted a money laundering operation with ties to the Zeta drug cartel in Mexico. Law enforcement officials turned several culpable informants within the organization, using threats of prosecution for failure to cooperate in

the investigation. These informants fed important information to authorities, helping to obtain search and arrest warrants. At one point, one of the informants pleaded to be released from his informing duties because he was afraid that he had aroused the suspicions of the criminals and was about to be killed. The agents insisted that he continue, and he reluctantly did so. Shortly after, his remains were found in his own burnt-out car.⁷

While informants like the one just mentioned are not being forced to act (they could opt for a probable conviction instead), fraud examiners who use informants need to carefully consider the potential consequences. The two biggest factors are the likelihood of detection and the likely response (e.g., loss of contact or death). A certain level of risk is inherent in the operation, and it can be difficult to differentiate an informant's reasonable complaint from a mere attempt to escape the cooperation requirement. However, informants who are harmed might refuse or be unable to continue cooperating, and ill treatment can reduce the credibility of the agency for future cooperation.

Use of Operatives

Operatives are subject to greater control than informants are. In a typical scenario, a source or informant advises that information exists or that a crime is currently being committed. The informant's motives might or might not be altruistic. For example, a warehouse worker approaches the fraud examiner and says that a coworker is stealing inventory. The warehouse worker (i.e., the informant) wants money for their assistance in apprehending the thief. The fraud examiner does not know if the informant is telling the truth or trying to divert attention from their own activities.

The informant suggests that they secretly record a conversation with the thief, getting the suspect to admit to the theft. If an informant conducts the investigation under the fraud examiner's direction, they then become an operative. To demonstrate a worst-case scenario involving an operative, consider the following example. Without the fraud examiner's knowledge or consent, the informant plants a recording device in the break room at the warehouse and records conversations to which they are not a party (assume that in the jurisdiction, this is a violation of the law regarding interception of communication). Although the recording was made without the fraud examiner's knowledge or consent, the investigation

⁷ Thompson, Ginger, "A Drug Family in the Winner's Circle," *The New York Times*, June 12, 2012, www.nytimes.com/2012/06/13/us/drug-money-from-mexico-makes-its-way-to-the-racetrack.html?_r=3&pagewanted=all#commentsContainer.

is nonetheless compromised. The informant might insist that they recorded the conversations at the fraud examiner's request, thereby forcing the fraud examiner to defend themselves.

Most operatives lack the training to conduct an investigation, and they cannot, in many instances, be trusted. If it appears critical that a source should be used as an operative, get the prosecutor's or attorney's approval before proceeding. It is vital that operatives be properly monitored and supervised. Obtain background information on the operative to determine their degree of culpability in the offense, if any. Ensure that the operative clearly understands the objectives of the covert operation and that they are regularly debriefed before and after critical meetings with the target. Be careful that the operative does not take any action without proper authorization.

SOURCES OF INFORMATION

Generally, the fraud examiner's initial efforts in any fraud examination are best spent identifying, collecting, and securing all possible relevant documents. Documents provide the foundation of the fraud examination case and help build the investigation's structure. Documents can be evidence in establishing that a fraud was committed, in determining the nature and scope of the fraud, and in identifying the parties responsible.

Internal sources—those generated and kept within the subject organization—are often the only resource for certain types of documents, such as accounting and business tax records, copies of canceled checks, or employee personnel files, unless the fraud examiner secures the subject's consent or a legal order to obtain those documents from other parties. In most fraud examinations, a large proportion of the documentary evidence will come from inside the organization at issue, but fraud examiners should remember that external sources can also help provide information necessary to conduct a successful examination. External sources can be particularly crucial in helping investigators locate missing assets; locate witnesses and suspects; determine ownership in vendors, competitors, and other related parties; research the suspects' assets and financial condition; and document the suspects' lifestyle and background information. All of this information will help an investigator build a case and will provide the basis for conducting interviews and obtaining confessions later in the investigation.

When external documents are needed, fraud examiners should consider accessing public and nonpublic records, commercial databases, the internet, social media sites, media records, third-party sources, and other valuable sources.

Fraud examiners must be certain they obtain information legally. Evidence obtained illegally may be excluded from use at trial, and it might give rise to liability. In U.S. criminal cases, for example, illegally obtained evidence falls under the exclusionary rule, which states that such evidence will be excluded from use at trial. And although the exclusionary rule does not apply in civil cases or to evidence obtained by private (or non-governmental) entities, obtaining evidence through illegal means could lead to civil liability or other sanctions.

Most countries, however, are not inclined to create an automatic exclusionary rule like the one found in U.S. law; instead, they leave it up to the trial judge to determine whether illegal conduct has reached the level of requiring that evidence be excluded from trial. For example, English law does not render relevant evidence inadmissible by the fact that it was obtained

illegally, but it does grant English courts the discretion to exclude evidence where the interests of justice so demand. Similarly, Australia employs a balancing test to determine whether illegally obtained evidence can be used at trial. The balancing test provides that courts consider factors such as the seriousness of the misconduct, the seriousness of the crime, and the power of the evidence.

For additional country-specific information that might not pertain to a global audience, see the “Supplemental Regional Information” section of this chapter located on fraudexaminersmanual.com.

Public Versus Nonpublic Records

There are many types of public and nonpublic records that can aid a fraud examiner’s efforts, and this discussion examines the difference between these types of records.

Public Records

Public records are documents that a governmental agency is required to keep by law or that are necessary to discharge the duties imposed by law. Each agency or governmental unit is responsible for many different functions that might require them to maintain unique information.

Public records, which can generally be accessed by the public and are thus available to anyone who wishes to use them, can be useful to fraud examiners for a number of reasons. They can supply invaluable background information on entities, employees, suspects, and witnesses. They can also be used to corroborate or refute witness statements, help investigators track the flow of stolen money or other assets, and aid in efforts to recover losses.

Of course, not all government records are open to the public, and the fact that a document is a public record does not mean it can be accessed without restriction. Sometimes a person must show a certain need to access a public record. Generally, such restrictions are in place to prevent certain personal information from being openly available. Some public records, like birth records, contain personal information that could be used to commit crimes like identity theft.

Also, public records are different from publicly available information. *Publicly available information* is information that has lawfully been published or broadcast to the public for consumption. Unlike public records, publicly available information is not kept by government organizations.

Public records can be obtained from a variety of sources. These records can be searched manually or online through governmental agency websites and online public databases. There also are many commercial search firms that will perform public records searches for a fee. Business and commercial indexes, such as Dun & Bradstreet (D&B) and Dow Jones Financial Information Services, can be searched for business credit and other information. However, the fraud examiner should be aware that accessing public records through a third-party service is regulated in many jurisdictions. There might be prohibitions against certain kinds of searches, while other searches can trigger a duty to inform the subject about the nature of the search. Additionally, results from third-party services are not guaranteed to be updated, accurate, or comprehensive; a fraud examiner should attempt to verify any information produced by third parties before relying on it.

To conduct a public records search, the fraud examiner must have information about the subject. The better informed the fraud examiner is about the subject they are investigating, the easier their search will be. The following items are essential for searching public records for information about an individual:

- The subject's correct name
- The subject's date of birth
- The subject's government identification number (e.g., Social Security number, social insurance number, National Insurance number, or national identification number)
- The subject's last known address

Other relevant items of information include:

- The subject's original surname if changed after marriage, any alternate given names, or known aliases
- The identities of the subject's close relatives and friends

At the outset of a search, the fraud examiner should compile everything known about the subject. When compiling such information, the fraud examiner should address certain issues, including:

- What is the subject's full name?
- Does the fraud examiner only know a last name? Is that name so common that a search will return thousands of possibilities? What are some ways of narrowing possible first names for the individual?
- What is the person's approximate age or date of birth?
- Where has the person lived?

- Does the person have a criminal background?
- Has the person been sued or sued someone?
- Has the person owned a business?
- Does the person have tax liens?
- Does the person have a professional license (e.g., contractor, accountant)?

Much of the basic information about an individual can be found in audit documents, business records, personnel records, court records, the internet, and conversations with people who know the subject.

Similarly, when conducting a public records search of a business, the fraud examiner should consider the following:

- Is the business incorporated?
- Where does the company do business?
- What type of business is it?
- Has the business sued or been sued?
- Does the business have real property?
- Does the company finance equipment?
- Does the company charge sales tax (if applicable in the jurisdiction)?
- Is the organization required to make filings that are available to the public?
- How long has the company been in business?

Once the fraud examiner has basic information about the subject, they can use it to search public records and gain intelligence. As the fraud examiner uncovers additional information about the subject, they should consider whether it can be used to conduct further searches.

Nonpublic Records

In addition to public records, nonpublic records—financial or otherwise—might be needed to prove fraud or to provide leads in a fraud examination. Nonpublic records include information about a person or business considered to be private and confidential.

Nonpublic records are not available to everyone, and because fraud examiners do not have an absolute right to see these personal records, obtaining access might be difficult or impossible.

Moreover, individuals generally will not willingly give their private records to a fraud examiner, and often, the authority of institutions to disclose nonpublic records is restricted by law.

Despite the limitations on obtaining such records, there are a few basic methods that fraud examiners can use to obtain bank records:

- Obtain consent from the individual to whom the records pertain.
- Obtain a subpoena or other legal processes, such as depositions, interrogations, and document requests, if a legal action is filed.
- Obtain a search warrant, although search warrants are only available to law enforcement.

For more information on gaining access to nonpublic records, see the detailed section on “Nonpublic Records” later in this chapter.

Laws Governing Access to Information

Despite the public’s broad right of access to public records, there are numerous laws that limit access to certain types of information, and a number of risks to privacy are raised by the collection of information. Therefore, fraud examiners must be certain that their efforts to obtain information are entirely legal.

The regulations that most commonly affect access to information are data privacy laws, although many jurisdictions have additional laws and regulations that might limit the public availability of information by the type of information or the industry that collects it.

European Union

The General Data Protection Regulation

The General Data Protection Regulation (GDPR), which took effect on May 25, 2018, is a regulation designed to protect the personal data of European Union (EU) residents and harmonize data protection laws throughout Europe. The GDPR applies to organizations that are based in the EU that collect or process the personal data of any person, regardless of where the person is located. The GDPR also applies to organizations that are not based in the EU if they collect or process the personal data of any person located in the EU for the purpose of:

- Offering goods or services to the person, regardless of whether payment is required
- Monitoring the person’s behavior

In other words, an organization does not have to be based in the EU for the GDPR to apply to it. For example, an organization based in the United States (a non-EU country) that has a

branch located in Germany (an EU country) will be required to comply with the GDPR when collecting personal information about, or monitoring the activities of, its employees at the German branch.

Generally speaking, the GDPR could limit the availability of personal information for fraud examiners, whether they or their organization is collecting that information or attempting to access personal information collected and disclosed by other organizations. Fraud examiners should work with legal counsel to establish organizational policies related to fraud investigations and ensure that they are compliant with GDPR requirements or any other applicable laws. For additional information on the GDPR, see the “Individual Rights During Examinations” chapter in the Law section of the *Fraud Examiners Manual*.

Canada

Canada has two primary federal laws that deal with privacy: the Privacy Act and the Personal Information Protection and Electronic Documents Act (PIPEDA). PIPEDA applies to fraud examiners, investigators, and security consultants in Canada who conduct fraud examinations for their employers or third-party clients. Also, because PIPEDA applies to activities tied to the employee-employer relationship, it likely covers surveillance activities by employers.

Every province and territory has privacy legislation governing the collection, use, and disclosure of personal information held by government agencies. Also, the federal government and several provinces have passed legislation that deals with the privacy of personal information held by entities in specific sectors (e.g., health care and financial). Fraud examiners operating in Canada must ensure that their investigative efforts comply with the requirements of PIPEDA, the Privacy Act, and any local or industry-specific regulations in terms of accessing, handling, or disclosing personal information.

United States

California Consumer Privacy Act

The California Consumer Privacy Act (CCPA) was signed into law in June 2018 and went into full effect on January 1, 2020. As they currently stand, the provisions of the regulation are very similar to the GDPR. As with the other two data privacy regulations, this could impact fraud examiners by making less information available to them from companies that collect the personal information of California residents. If fraud examiners have a legitimate purpose for acquiring the personal information, they should be able to collect and process

it as long as they don't mishandle it. Fraud examiners should check with legal counsel ahead of any engagements involving California residents to ensure that they are in compliance with the CCPA.

For additional information on laws that govern the availability of information in the United States, see the content on "Laws Governing Access to Information" in the "Supplemental Regional Information" section of this chapter on [fraudexaminersmanual.com](https://www.fraudexaminersmanual.com).

Local Records

The specific information available in public records varies considerably by jurisdiction, but local government agencies often maintain general records. Many of these local resources will be of use in fraud examinations. These records are often helpful for asset and person location, as well as for finding out who owns or is associated with a particular property, individual, or organization. The following are some local sources of records and the type of information they contain.

Building Inspector Records

The following information is generally available through a municipal or regional building inspector's office:

- Building permits showing the names of the applicants, the address of construction, the estimated costs, and the name of the builder or contractor
- Blueprints and plans showing construction details that are often submitted with applications for building permits
- Building inspectors' reports containing information regarding compliance with construction specifications

Building Permit Records

If a business, or an individual, constructs a new building or makes improvements to an existing building, there should be a building permit on file with the local building authority. In addition, before most businesses can open their doors, local agencies might require that they possess certain permits. In many cases, the person applying for permits will be the owner or someone traceable to the owner. The local fire department might require permits ensuring that the business complies with the fire code. The local health department typically requires permits for restaurants or other businesses that serve food. Planning and zoning departments enforce regulations regarding the types of businesses and their locations.

Health and Fire Department Records

Health and fire department records are another source of records often available at the local level. Many local health or fire departments conduct routine inspections of businesses for health and safety code or fire code violations. These inspection records might contain valuable information about the business, its operations, the employees, and the owners.

Birth and Death Records

Some local health records agencies maintain birth and death records. The content and availability of these records varies widely, but they might include the name of the individual, address, sex, age, race, birthplace, birthdate, death place, date and time of death, government identification number, close family members, occupational information, medical certificate, and coroner's certificate. If such records are not available locally, there might be a state/provincial or national health office that maintains them.

Public School Records

School systems sometimes maintain teachers' biographies, showing personal background, education, and former employment. They also might maintain student records, showing biographies (in some school districts), grades, and disciplinary actions, although records involving minors are much less likely to be publicly available.

Coroner's Register

A local coroner's register generally contains the name or a description of the deceased; the date of inquest, if any; property found on the deceased and its disposition; and the cause of death. In the United States, the coroner's register is usually located at the county level.

Voter Registration Records

Voter registration records are not public in all jurisdictions, but if they are available, they might contain useful information. Usually, much of the information contained in such records is withheld from the public for privacy purposes, but voter registration records might contain a person's date of birth, mailing address, and political affiliation.

Utility Records

Depending on the location, utilities might be managed by government agencies, private companies, or nonprofit organizations. Although the recent trend has been to restrict access to utility records, the fraud examiner should check with the relevant utility management organization in the subject's area to see what, if any, information is available. Utility records

might contain the customer's contact information, even if that number is unlisted. In addition, the fraud examiner should check the names of the subject's friends or relatives.

Marriage Records

Marriage license records and applications include information on previous marriages, maiden names, addresses, and dates of birth. These records are often maintained at the local level (such as the county clerk's office in the United States) where the license was issued.

Court Records

Court records are another common direct or indirect source of information for fraud examinations. Many jurisdictions allow fraud examiners to search court records, and there are also a variety of services that compile and search such records.

In most jurisdictions, many of the papers filed in civil suits are accessible as public records; however, full documentation of criminal and juvenile charges might not be as open to review. In addition, criminal conviction records are generally available to the public. For employee screening, make sure that conducting criminal background checks is legal in your jurisdiction for the type of position (check applicable law). Some jurisdictions allow employers to conduct criminal background checks but limit the scope to a certain period of time (e.g., the previous seven years) or types of records; fraud examiners must determine what is or is not allowed by law before carrying out any background checks, including a search for criminal records.

A great deal of litigation occurs each year, and many people might be subject to judicial action, voluntarily or not. These records, if available, can provide revealing data about a subject, including:

- The location of individuals
- Pending legal actions
- Closed cases
- Insight into marital status (family)
- Sources of funds (probate)
- Financial conditions (bankruptcy)
- Litigation history
- Outstanding judgments
- Criminal history (generally more limited than civil records)

For additional country-specific information regarding court records, see the content on “Court Records” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Court Levels

To perform court records searches, fraud examiners need to be familiar with the structure of the jurisdiction’s court system. Many jurisdictions implement a tiered court structure in which minor offenses and causes of action (e.g., small claims) are held in one set of courts and more serious offenses or issues are held in another set. Similarly, a jurisdiction might have courts that are divided based on local/municipal, state/provincial, and central/federal levels of government.

To illustrate, consider the structure of the U.S. court system. In the United States, local courts are generally divided into jurisdictions that encompass a single county in a single state. In each state, there are usually three levels: trial courts, appellate courts, and a supreme court. The primary trial-level federal courts are called *district courts*, with federal courts of appeals as the next level and the U.S. Supreme Court as the highest court in the country. Many countries have a similar model of fact-finding lower courts, with issues of appeal being reviewed by higher courts.

Court records are typically maintained by a clerk or administrative office of the court that heard the case. However, there might be an agency that maintains records from multiple court levels. Therefore, to conduct a thorough search of court records, fraud examiners might need to search at multiple court levels.

It is rare for there to be a central public database that maintains all court records at every level of a jurisdiction, and there are no parties that maintain a comprehensive database of court records on a global basis (despite what some records merchants might claim). However, for law enforcement purposes, some countries share available criminal records with authorities in other countries. For example, the European Criminal Records Information System (ECRIS) was established in 2012 to aid in the exchange of criminal records in the national registers of European Union (EU) countries.

Also, there are various other sources for obtaining court records, such as public records data vendors, but such vendors might have records that are not up to date, accurate, or complete.

Civil Court Records

Courts keep records of civil cases, which are noncriminal legal proceedings involving two or more parties, and many civil records are publicly available to search. Civil courts often maintain various types of records relating to civil cases, such as liens, name changes, and divorces. Civil court records generally include the complaint (identifying the plaintiffs, the defendants, and the cause of action), the answer to the complaint, and the judgment rendered. The availability of these records will vary from country to country, and there might be privacy laws that restrict reporting and transfer of such information.

Relevant civil records can be difficult to obtain because the fraud examiner might not know if or where a person was involved in a civil dispute. Civil disputes can be heard by a court where the subject resides, where another party to the suit resides, where the underlying events occurred, or at another proper venue per the parties' agreement.

The key to locating civil court records is knowing the correct spelling of the subject's name, where the person currently lives, and where they lived in the past.

Depending on the type of suit, civil court records will provide potentially valuable information. Various types of civil suits are discussed here.

Personal Injury Suit Records

Records for a personal injury suit, for example, will often contain an accident report, injury history, statements of the involved parties, and the financial settlement of the case. They can be helpful to identifying income streams (in the case of an injured party) or financial condition (in the case of a party that must pay an award). They can also potentially provide information about a subject's physical condition that would ordinarily be unavailable due to the Health Insurance Portability and Accountability Act (HIPAA).

Financial Suit Records

Financial lawsuits are those that involve financial law. The records of such suits might contain information on the defending litigant's debtors and creditors, business history, or ability to perform its obligations under a contract.

Divorce Records

Divorce court records might contain valuable information relating to bank accounts, employment, investment income, and other sources of income. Also, divorce records might

contain a statement of assets that includes information on bank account holdings, retirement funds, artwork, coin collections, and so on. Moreover, divorce records might contain the place and date of marriage; the filing date; the filing type; the locations, names, ages, and birthdates of the divorced parties; the names (and ages) of any children the divorced parties have; and the properties owned by the divorced parties. Also, the complaint filed to start the lawsuit might identify the attorneys in the action and contain the parties' signatures.

Divorce records, however, are not available publicly in every jurisdiction. In the United States, divorces are state court actions, and divorce records can be obtained from the county court in which the divorce decree was granted.

Criminal Court Records

Criminal records can be very valuable, but their availability varies considerably between jurisdictions. In many jurisdictions, most or all criminal records are not available to the general public. As a global trend, the typical approach is to allow individuals to access their own criminal records but require the subject's consent if another party (e.g., an employer) wants to access such records. There are, however, many exceptions to this model. For instance, in the United States and Canada, many criminal records are publicly available.

Criminal courts will maintain records of criminal filings and criminal convictions, but these types of records should not be confused with each other. Criminal filings are the records of criminal charges the government files against individuals, and therefore, there might be criminal filing records for an individual even if the person was not found guilty of a crime. Criminal conviction records, however, only include records of a final judgment of guilt for a criminal offense.

Criminal court records might provide information describing the offenses and charges filed. These records also might contain the complainant's signature; a transcript of the proceedings made or prepared by a court official; the names of the witnesses; the names of the prosecuting and defense attorneys; and the probation and release decisions, which might include a background investigation of the defendants.

Usually, the particular government recordkeeper will have a defined period for holding criminal records, and the length of time these records are kept often depends on the

severity of the offense. Likewise, some crimes might be expunged from the record. Therefore, the fact that a records search turns up no results does not necessarily mean that the subject has no criminal history.

In the United States, there is no national criminal records database available to the general public, but because most criminal charges are state court charges, records of state court criminal charges can be obtained from the county court in which the case was filed.

Probate Records

Some jurisdictions have separate probate courts to determine the dispersal of assets after a subject's death. The probate court conducts an investigation to verify any debts owed by an individual's estate and sees to the dispersal of assets after all debts are paid. Probate court records include documents filed to show the dispersal of assets after a subject's death.

The debts left in an individual's estate will give the investigator information on the following:

- Names of individuals with an interest in the deceased's estate
- The subject's financial position at the time of death

The dispersal of assets will reveal:

- The names and addresses of heirs to the deceased
- Some indication of the value of the property willed to them

Bankruptcy Records

Many jurisdictions provide bankruptcy records to the authorized parties or the general public. Bankruptcy proceedings generally occur in the jurisdiction in which the debtor resides. It is common for countries to have separate bankruptcy courts that handle most or all of such cases. The information available in bankruptcy records varies, but here are some common items:

- The bankruptcy filing document, which might include the subject's government identification number; street address and primary place of business; location of principal assets of business; type of business; name of legal representative; estimated amount of assets; estimated number of creditors, liabilities, and employees; financial data; and a list of corporate shareholders
- Claim documents by creditors listing the amounts that the debtor allegedly owes
- A final accounting that shows which claims were paid
- A descriptive list of the debtor's property at the time of filing (e.g., real estate, personal property, investments, accounts receivables)

- Filings that describe the debtor's income and expenditures
- The bankruptcy plan (some jurisdictions allow bankrupt parties to reorganize businesses or participate in a debt reduction plan, as opposed to liquidating all assets)
- Details from a fraud examination if the bankrupt party was suspected of bankruptcy fraud

When checking bankruptcy court records, the fraud examiner should remember to check not only the individual or business filing for bankruptcy, but also any related businesses, principals, employees, or relatives.

Property Records

Real property records are extremely important, and in many jurisdictions, property records are relatively easy to access and contain a vast amount of information. It is common for real property records to be found at the local level of government, but some jurisdictions might keep them at a centralized location. In the United States, records of real property transactions are usually maintained at the county level, but, depending on the state, the records might be at the state level.

Property records can identify unknown assets or reveal property transfers to relatives, friends, or other legal entities. Information contained in these records can include property address, owner name, purchase price at last transaction, legal description, value, mortgage information, lien holder, contractors who have worked on the property (if a mechanic's lien has been filed), and deed type.

Accordingly, fraud examiners can review real property records to identify the subject's main residence, land that adjoins the main residence, vacation homes, or other land.

Moreover, property records pertaining to leases and the sales or purchases of business assets might reveal an entity's income and expenses, if that information is available. Leases might also identify hidden relationships.

When an individual purchases real estate, they become a registrant in real property records, property tax records, and tax assessor records (if applicable).

Real Property Records

Most jurisdictions have a land registry office that maintains various information on real property and its owner(s). Both the level of government where these records are found and the information they contain will vary by jurisdiction, but the following information is often present:

- Documents pertaining to real estate transactions—including deeds, grants, real estate transfers and mortgages, releases of mortgages, powers of attorney, and leases that have been acknowledged or approved
- Mortgages on real property
- Security interests or liens on property
- Wills admitted to probate
- Official bonds
- Notices of mechanic's liens
- Transcripts of judgments that are made liens on real estate
- Notices of attachment on real estate
- Land cadastre (a registry of land surveys that specifically detail each plot of real estate in an area and may contain information about value, ownership rights, and other details)
- Papers in connection with bankruptcy
- Certified copies of decrees and judgments of courts of record
- Other documents permitted by law to be recorded
- Historical sale prices
- Residences and addresses of the buyer and seller
- Identity of the party financing the property, if applicable
- Improvements to a property

The increased awareness of identity theft has led to most jurisdictions taking measures to prevent the publication of a person's government identification number in public real estate records.

Property Tax Records

In addition, many jurisdictions assess property taxes and require parties that purchase real estate to register as a taxpayer with the jurisdiction's property tax records system. There might also be a tax assessor that keeps records on real property and owners of such property. These records can provide:

- An idea of the estimated value, for tax purposes, of the property listed
- The identity of the owner of a vacant piece of land or a piece of property

- The name of the last person to pay taxes on the property
- Legal descriptions of property
- Delinquency status of taxes
- Names of former property owners

When searching real property and tax records, the fraud examiner should always look for any additional names listed on the documents. Frequently, the name of the attorney or notary public who verified the documents is listed, providing another potential source of information.

Tax Assessor/Collector Records

In some jurisdictions, the county or state tax assessor's and collector's offices maintain maps of real property, including a property's dimensions, address, owner, taxable value, and improvements. Records maintained by a tax collector's office might include any of the following information:

- Names and addresses of payers of property taxes, even if the taxes were paid by individuals other than the apparent owners
- Legal descriptions of property
- Amounts of taxes paid on real and personal property
- Delinquency status of taxes
- Names of former property owners

Commercial Searches

Many commercial database vendors compile and provide access to real property records, and fraud examiners can use these databases to obtain real property information. However, the fraud examiner should make sure that the data vendor is actually active in the jurisdiction where the records are sought and should take steps to verify any information obtained from the vendor that is of consequence to the investigation. Many commercial database vendors have responsive customer service departments that fraud examiners can contact to inquire about specific records or jurisdictions. Additionally, some jurisdictions are known for keeping unreliable property records, which can make property records searches difficult or impossible.

Business (Corporate) Filings

Basic business organization—whether for businesses with a single owner or large corporations—is generally governed under the laws of the country in which the entity is

organized. Most jurisdictions require business entities to file various types of records that contain information that might be useful in a fraud examination, and generally, such filings are available to the public.

Organizational Filings

If an individual wants to conduct business in a name other than their own, the law requires that they file documents to claim ownership of that name. These documents can include an entity's organizational filing.

Companies are formed by submitting some type of organizational filing to the government of the jurisdiction in which the entity is incorporated. These filings might be referred to in various ways in different jurisdictions (e.g., articles of incorporation, corporate constitution, or corporate charter). Organizational filings are generally public records and usually include:

- Corporate name
- Ownership information
- Nominal stock value
- Names of initial shareholders
- Names of the directors and officers
- Registered agent(s)
- Location of the principal office
- Date of incorporation
- Standing/status

This information will permit the investigator to review a corporate structure, identify the registered agent(s) or other individuals linked to the organization, and trace incorporation dates. The records will often include limited partnership information as well. The examiner can also use these records to verify the jurisdiction in which a company is registered as a corporation.

Foreign Corporation Registration Records

Many jurisdictions, but not all, require corporations to register as foreign corporations if they wish to transact business in a jurisdiction that is different from the one they initially incorporated in. A corporation would register as a foreign corporation in the foreign jurisdiction (i.e., not in the initial jurisdiction in which it was incorporated). For example, if a corporation that was chartered in Country A wishes to transact business in Country B, then it must create a business organization filing in Country B.

Fictitious Business Names/Doing-Business-As Information

A fictitious name or doing-business-as (DBA) designation occurs when a business owner operates a company under a name that is different from its legal name. Most jurisdictions also require limited partnerships, trusts, and joint ventures to file DBA information at a local level. This information will provide insight into the true business venture behind the name.

Foreign corporation and DBA registration information is very similar to organizational or corporate filings, and this type of information can enable fraud examiners to trace a corporation's origins or prove ownership in sole proprietorships, partnerships, limited partnerships, joint ventures, and trusts.

Tax-Related Filings

Generally, tax records, including tax returns, are private. In most countries, including the United States, corporate tax returns are not public records. In fact, among countries in the Organisation for Economic Co-operation and Development (OECD), only Japan, Norway, Sweden, and Finland provide some form of public access to corporate tax returns.

Nevertheless, it might be possible to obtain tax information about businesses, especially publicly traded ones, without having access to their returns. In general, publicly traded companies must file regular statements with government securities agencies, and such records, which are often made public, can provide information on a company's tax filings.

Law enforcement officials might be able to gain access to corporate, business, and personal tax returns. These records might unwittingly reveal hidden assets or investments. Loans to or from officers, stockholders, or related entities should be examined closely. Also, mortgages, notes, and bonds shown as liabilities on a corporate return should be investigated.

In addition, some tax revenue departments require certain businesses to obtain licenses or permits, such as a sales tax permit. The licenses and the applications are often public record. If the business is delinquent in the payment of its taxes, the relevant tax investigator or collector might be able to provide inside information concerning the business.

Other Agency Records

The following section discusses several other government agencies or associations that perform similar functions that are useful for gathering information on businesses, other organizations, and individuals.

For information on agency records specific to the United States, see the content on “Other Agency Records” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Records of Secured Transactions

Commercial filings are records that can help fraud examiners identify personal property that an individual or business has financed. Banks, finance companies, and other lenders will generate records or recorded filings of financial transactions conducted with individuals and businesses, such as purchases of household furniture, appliances, boats and yachts, automobiles, aircraft, and business equipment. To secure repayment, the financing party retains an interest in the debtor’s property. This interest is referred to as a *security interest* or a *charge*, depending on the jurisdiction. To document this interest, the creditors might create a commercial filing, which will be publicly searchable in some jurisdictions. In jurisdictions where commercial filings are not public record, access might be restricted to those who have a court order compelling the records’ release or a relationship with the debtor or creditor.

These filings might help to identify:

- Name(s) of the debtor or joint debtors
- Current address of the debtor
- Name of the financial lender or creditor
- Type of collateral pledged as security
- Date of filing and continuations

Commercial filings and supporting documents can help fraud examiners uncover hidden ownership or relationships between parties by viewing the names of all listed debtors and their addresses. The fraud examiner might find information linking individuals to the companies they own or discover information about a company’s subsidiaries, branch offices, or parent company. Additionally, discovering financed assets can reveal information about a person or organization’s financial condition.

Commercial Filings in Common Law Jurisdictions

Many fraud examinations involve parties or assets in foreign jurisdictions, and commercial filing searches might be useful. However, the availability of such searches largely depends on whether the relevant jurisdiction is a common law or civil law country.

The majority of countries in which commercial filings are publicly searchable are common law systems. In these jurisdictions, a government agency typically maintains a register of commercial filings where defined items of personal property with security interests must be registered. The purpose of these filings is to put purchasers of personal property on notice if the property is subject to a security interest.

The method of searching these records varies by jurisdiction, but usually is done through the agency that maintains the records. Records are typically searched by the debtor's name or the organization's title. Here are examples of how searches are performed in a few countries with public commercial filings:

- Australia: The Personal Property Securities Register (PPSR), maintained by the Australian Financial Security Authority (AFSA), provides a database where details of security interests can be searched.
- Bermuda: A public *register of charges* is maintained by the Registrar of Companies (ROC) and available to search filings of charges against assets of a Bermudian company or the Bermuda assets of a foreign corporation.
- Canada: Each common law province and territory in Canada passed a version of legislation entitled the Personal Property Security Act (PPSA) to govern commercial filings, and commercial filings are searchable at the provincial or territorial level.
- United Kingdom: Certain businesses are required to register charges against their assets through the Registrar of Companies, maintained by the Companies House.
- United States: The Uniform Commercial Code (UCC) governs commercial filings. UCC filings are maintained and searchable at the state level by each secretary of state.

As with most public records, there might be a fee associated with accessing the records through the agency responsible for maintaining them and there are also commercial vendors who organize and provide searches of such records.

Searching Commercial Filings in Civil Law Jurisdictions

Civil law countries rarely have a public registration system for commercial filings. Security interests in civil law systems might involve filings, but they are typically not public

information. Commercial filings in these countries are typically private agreements between the creditor and debtor. When commercial filings are maintained, they usually are not in a centralized database, so searching on a broad scale is not feasible. Generally, access to commercial filings in civil law countries will be restricted to those with a relationship with the parties involved in a past or potential transaction.

Also, unlike the filings in most common law countries, the filings in civil law countries are usually against the asset and not the person or entity.

Regulatory Securities Records

Documents submitted by public companies and others who are required by law to file with securities regulators might contain valuable information. While jurisdictions treat the concept of securities differently, governments or self-regulatory bodies generally set rules for the issuing and trading of certain types of securities. Among the most common and important rules are disclosure requirements for companies with publicly traded securities. These rules are designed to make sure that investors are reasonably informed about stock that they purchase.

Beyond helping investors, these disclosures are typically made public, and they can provide a wealth of information about the filing company, including its type of business, history, organizational structure, auditor, balance sheets, and income statements.

Different securities regulators have varying disclosure requirements, but these records might include the following information:

- Corporate financial statements
- Identification of officers and directors
- Identification of significant owners (e.g., those with more than 10% of a business's stock)
- A description of the registrant's properties and businesses
- A description of the significant provisions of the security to be offered for sale and its relationship to the registrant's other capital securities
- Identification of events of interest to investors
- Identification of accountants and attorneys
- A history of the business

Fraud examiners should remember that if a public company does not report to its domestic securities regulator, it might still be registered with regulators of foreign exchanges. Even if

the company has minimal or no presence in the foreign jurisdiction, it might still be registered there to benefit from foreign investment. Therefore, searching multiple exchanges might be necessary for conducting a thorough securities records search.

In the United States, companies with publicly traded securities are required by law to file with the U.S. Securities and Exchange Commission (SEC). SEC filings are public, and they may be obtained from the Electronic Data Gathering, Analysis, and Retrieval (EDGAR) system. EDGAR collects SEC filings, and it performs automated collection, validation, indexing, acceptance, and forwarding of SEC filings.

Employee/Labor Department Records

A country's department of labor or equivalent agency typically maintains information concerning labor arbitrations, collective agreements, and other labor records, and many of these records might be public.

Professional Associations and Licensing Boards

Many government agencies or professional bodies maintain records identifying individuals holding special licenses or memberships. These can include:

- Medical practitioners, such as doctors, dentists, and nurses
- Social workers
- Attorneys
- Certified public accountants (CPA) or public/chartered accountants
- Real estate licensees
- Notaries
- Law enforcement personnel
- Firefighters
- Security guards
- Stockbrokers
- Teachers
- Insurance agents
- Private investigators
- Bail bond agents
- Travel agents
- Barbers and cosmetologists
- Contractors, engineers, electricians, and architects

Also, the regulatory or licensing agency might have the authority to suspend or revoke the licenses necessary for the business to operate.

Many professional organizations maintain their own listings of members or licensees. However, they might be reluctant to provide information beyond the person's name and current standing in the association.

Other Regulatory Agencies

At the regional or federal level, the following records might also be found:

- Auto licenses, auto transfers, and sales of vehicles
- Civil service applications
- Driver's licenses
- Health department records
- Inheritance and gift tax returns
- Name changes
- Occupancy and business licenses
- Parole officers' and probation departments' files
- Personal property tax returns
- School and voter registrations
- Regional income tax returns
- Welfare agency records

Nonpublic Records

Types of Nonpublic Records

As previously stated, *nonpublic records*—information about a person or business that is considered to be private and confidential—might be needed in some fraud examinations.

Some of the most valuable types of nonpublic records include:

- Banking records
- Tax records
- Credit records of individuals (but not business credit reports, as this information is generally not protected)
- Phone records
- Credit card account records
- Personal health care records

Banking Records

Bank records are perhaps the single most important external source of financial information available to a fraud examiner. However, they typically require consent or a legal order to obtain. In addition to their use as evidence for fraud, banking records might provide leads on a subject's sources of funds, expenditures, and personal affairs. These records help the fraud examiner construct a collection of evidence that can be used to prove the fraud.

Some of the types of banking records that should be reviewed, if available, are:

- Account opening documentation
- Monthly account statements
- Checks written on the account
- Loan files
- Safe deposit box records
- Currency transaction reports
- Bank collection department records
- Mortgage loan files

Tax Records

Tax records might provide indirect evidence of illicit payments, such as profits or losses from business ventures that a suspect has not informed fraud examiners of, or interest and dividends on hidden certificates of deposit and bank accounts. Such records might also show deductions and expenses, such as real estate taxes, which could lead to previously unknown funds or assets. Government investigators generally have broader access to these documents, while private parties will usually have to obtain the subject's consent or take legal action to obtain them.

Credit Records of Individuals

The ability to store large volumes of data digitally spawned an entire industry of parties who process and disseminate information about individuals and organizations. Practically all lines of business have specialized credit-reporting associations that can provide credit information on individuals and businesses, including trade information, designation of lenders and creditors, types of businesses, date accounts were opened, terms of payment agreed upon, highest credit, balance owed, and paying habits. Some credit reports also give the name of the bank the subject does business with and the size of the subject's accounts.

Credit reports and personal data are provided by third-party vendors that go by various names depending on the jurisdiction, such as “credit reporting agencies” or “data controllers.” These agencies are local, national, or global institutions that collect data from various sources on individual consumer creditworthiness or other information and report that data to their members or subscribers. In the United States, the third-party vendors that collect credit information are known as credit reporting agencies, and most consumer (i.e., individual) credit information is collected and maintained by three national credit reporting agencies: Equifax, Experian, and TransUnion. Generally, a subscription is required to obtain information from the three national credit reporting agencies, and because the big three agencies do not share data among themselves, there can be differences between the records from each credit bureau.

In the case of consumer (individual) credit records and personal data, a growing number of jurisdictions regulate both how such information is collected and stored, as well as who may access this information and for what purpose. In many cases, the consumer must be notified and must consent to the use of the report. Members of the European Union (EU) have especially strong data privacy requirements and require foreign parties who are requesting personal data about individuals within the EU to verify that the information will be properly managed.

The United States also regulates credit records, and the dissemination of credit information is governed by the Fair Credit Reporting Act (FCRA). The FCRA places restrictions on when a consumer credit report can be obtained and used. In many cases, the consumer must be notified or must consent to the use of the report for employment purposes.

In jurisdictions that regulate credit information and personal data, a fraud examiner will generally need a legally acceptable reason for accessing such information from third parties. However, simply suspecting an individual of fraud is generally not sufficient grounds for obtaining credit and personal data regarding the person from a reporting agency or data controller. The specific exceptions for allowing the processing and dissemination of credit and personal data vary, but some common circumstances include when:

- The individual has given consent.
- It is necessary for the extension of credit or to enter into a contract with the subject.
- It is necessary to protect the subject’s vital interest.
- It is necessary to comply with other legal requirements.

- An employer is conducting a background check for hiring or other employment purposes (consent is still required in many jurisdictions).
- It is necessary to serve the public interest.

Credit reporting agencies typically maintain the following information:

- Consumer information, such as address, age, family members, employers, income levels, length of employment, the extent of other obligations, and the like
- Account information, such as payment schedules, items purchased, defaults (if any), and buying habits
- Marketing information, such as customers broken down by age, sex, income levels, and other classifications
- Information on current and former employers

Information on a business organization's creditworthiness may also be obtained from credit reporting agencies. The responses for such searches might include payment trends from creditors, public records, banking information, and essential facts as to the type of business and ownership. But unlike consumer credit information, business credit information is generally not subject to legal protections.

Generally, credit-reporting agencies obtain their information from the following sources:

- Consumers, primarily from filling out application forms for credit
- Public records, which provide information on bankruptcies, court judgments, foreclosures, divorces, criminal convictions, and registered agreements
- Major credit grantors and collection agencies, which, as subscribers, regularly send their credit files electronically to the credit bureaus, resulting in files that include the account number, outstanding balance, and an indication of whether a payment was made on time

Many credit grantors and collection agencies only report payment information, and some creditors, like utility companies, only report delinquent activity.

Phone Records

Telephone records can provide valuable insight into fraud examinations. For example, telephone records might provide contacts with real estate brokers or sellers, identify charge calls from vacation spots or contacts with co-conspirators, or provide other leads to assets and expenditures.

Generally, a person's private phone lines, such as home phone and personal mobile devices, will be considered private. Therefore, to access the records for these lines, investigators will need consent from subjects, a warrant or subpoena, or another legal order.

Some phone records, however, might be accessible. For example, if a fraud examiner is conducting an internal investigation and the employer keeps business phone records, the fraud examiner might not have to obtain permission or a legal order to access these records. Whether the records are private will depend on the facts and the laws of the relevant jurisdiction. Often, the expectation of privacy regarding business phone records can be eliminated by having the employee sign a document upon being hired that acknowledges that phone calls, other electronic communications, and metadata may be recorded and reviewed by the employer. However, this may be prohibited in some jurisdictions, so employers should consult with legal counsel regarding the permissibility of such a policy.

Credit Card Account Records

Credit card account records can be helpful when conducting a fraud examination. Credit card receipts will track the subject's travels and expenditures. An extremely high balance on a credit card might indicate a motive for the crime or provide circumstantial evidence of hidden income. Even modest credit card charges might provide leads to identifying hidden assets (e.g., charges for boating supplies purchased at a marina might indicate a need for further investigation to determine whether the subject owns an expensive boat).

Personal Health Care Records

Health care records are valuable in several types of fraud cases, particularly those involving insurance or false claims regarding medical goods and services. They can also be relevant to a person's financial situation. However, unless the fraud examiner has the subject's consent or is in a special position to access health care records (e.g., as an employee of a medical provider), this information is often not available without a legal order.

Gaining Access to Nonpublic Records

Nonpublic records are not widely accessible and, therefore, might be difficult to obtain. Despite the limitations on obtaining personal records, fraud examiners might be able to obtain nonpublic records by using one or more of the following methods.

Requesting the Records

The simplest way to obtain relevant documents is to request them. This usually works for fraud examiners representing large organizations that are important customers to the party with the information. Vendors and other customers of the company conducting the investigation might cooperate voluntarily if they have nothing to hide (or think that incriminating evidence cannot be found) and are anxious to maintain good relations with the company. A subject can consent to produce the records or execute a written consent for the fraud examiner to obtain such records from banks, credit agencies, or the taxing authority.

Consent

It might be possible to obtain nonpublic records through consent from the entity to whom the records pertain. Although unlikely, a target might voluntarily produce certain records (e.g., if they are innocent, think they are innocent, or think the investigators will not find relevant evidence in such records) or execute a consent to obtain such records from banks, credit agencies, or the government.

Subpoena or Other Legal Processes

Subpoenas and other legal processes, such as depositions and document requests, are available if a civil or criminal action is filed. For example, a wronged organization may file a civil or administrative action or make a criminal referral so that records can be subpoenaed or obtained by a legal order (e.g., a search warrant). In a civil case, both private and public parties may obtain records such as bank account, brokerage account, travel, credit card, credit agency, and telephone toll records by subpoena or other legal order.

However, records obtained while executing a search warrant or similar legal order usually are available only to the government during the underlying investigation, and perhaps thereafter if they are not disclosed at trial. In addition, law enforcement agencies may also subpoena records but, depending on the jurisdiction, might not disclose the contents of such records with the victim or third parties.

In most jurisdictions, third-party organizations that maintain nonpublic records, such as banks and hospitals, are usually prohibited from revealing such records without express authorization from the subject or a legal order.

Demand as a Condition of Continued Business

Similarly, an organization may demand that a supplier, vendor, or agent turn over relevant documents as a condition of continued business. Taking this action is legal, in appropriate circumstances. Of course, management and counsel should be consulted before such demands are made, particularly if the other party has a contractual relationship with the demanding organization.

Exercise Audit Clause Rights

An audit clause allows parties to a contract the right to access another party's books. Thus, absent subpoena power, fraud examiners might be able to use audit clause rights to access contractor and subcontractor records and financial accounts.

Unfortunately, most audit clauses are too narrow to provide useful information. However, if properly constructed, an audit clause can be a powerful method by which on-book information can be obtained.

Improper Pretexting

Fraud examiners should not conduct a search of the sources of information without being familiar with the privacy laws of the relevant jurisdictions. Being familiar with privacy laws, however, can be difficult because jurisdictions approach privacy in different ways. There are some legal issues that fraud examiners should determine at the outset of a case.

One method that fraud examiners should be particularly cautious with is pretexting, which is a criminal offense in some circumstances. Broadly defined, *pretexting* is the act of impersonating someone else or making false or misleading statements to obtain, sell, or buy information about a person or organization. Under the broad definition, pretexting for non-fraudulent purposes is not always illegal, but it should be used with caution. For example, if a fraud examiner is trying to find a witness or a suspect, they might call the person's relative and pretend to be an old friend who is requesting the individual's phone number. This type of pretexting might be permissible. However, it is more often illegal to use pretexting to obtain certain types of information, such as financial records and phone history records.

Several jurisdictions have prohibited pretexting against financial institutions, even if no fraudulent intent is present. In the context of financial institutions, pretexting is the act of obtaining or attempting to obtain customer information from financial institutions using deceptive tactics. Some individuals used pretexting as a means to gather financial information

about a subject. Pretexters would contact a financial institution and pretend to be the customer, or another individual authorized to obtain financial information, and trick the financial institution into providing information about the subject.

Fraud examiners should not impersonate a member of law enforcement, nor should they impersonate an actual person (particularly the individual being investigated). To do so may lead to charges of identity theft. Before engaging in any type of pretexting activity, investigators should consult with legal counsel to determine whether the information sought is protected by the laws of the jurisdiction, as well as whether the planned impersonation method is legally acceptable.

Other Non-Government Sources

Associations and Lobby Groups

Associations and lobby groups have information about their member firms. Two of the best sources are the Better Business Bureau (BBB) and the Chamber of Commerce.

Better Business Bureau

A number of BBBs are located throughout the world. They are sponsored by local businesses and offer a variety of services, including background information on local businesses and organizations. The bureaus generally keep information about criminal rackets, cons, and their operators and can provide information about the business reputations of local groups.

Chamber of Commerce

A government's chambers of commerce generally have directories of local businesses, and they also have information regarding reputations of local businesses and operators. Chambers of commerce might be organized by community, city or town, region, state, or nation.

Abstract and Title Companies

Often, abstract and title companies maintain records of individual transactions, and they typically publish and distribute papers to attorneys, real estate brokers, insurance companies, and financial institutions. These papers contain information about transfers of property, locations, mortgage amounts, and release of mortgages.

Bonding Companies

Bonding companies provide bonding services, including surety bonds, license bonds, permit bonds, bid bonds, and so on. To become bonded, an entity will have to submit an application for a bond with a bonding company. The application for a bond contains the applicant's (person or firm) financial statement and data. The information contained in a bond application is essentially the same information that is required in loan applications (though in greater detail).

Credit Card Records

Credit card records often contain valuable information concerning the individual debtor, but laws and regulations must be checked before obtaining these records. Information on expenditures can be obtained from firms such as MasterCard, American Express, Diners Club, Discover, and Visa. This information usually requires a subpoena or court order.

Stockbrokers

Stockbrokers maintain client information in a manner similar to financial institutions, especially those who have margin accounts. They maintain records of transactions for all clients. These records are generally private, but can be obtained with a legal order, if relevant to litigation.

Western Union

Western Union is a non-bank money transfer provider, and it stores records for paid money orders in Minneapolis, Minnesota. These records contain the original telegram, by purchaser or sender, and bank drafts by Western Union. Western Union retains orders for less than \$1,000 for two years and orders of \$1,000 or more for six years. For private parties, these records will require a legal order to obtain.

Vehicle History Checks

In many countries, individuals can conduct vehicle history checks to find out various details about a vehicle's past. A vehicle history check might show the following information about a vehicle:

- When its inspection expires
- The date it was first registered
- Its color
- Its engine size
- Its year of manufacture

- Whether it has been reported as stolen
- The number of previous owners
- Whether it has any odometer discrepancies

International Air Transport Association

The International Air Transport Association (IATA) is an international industry trade group of leading airlines, and it has information on all international matters dealing with aviation security, including counterterrorism efforts worldwide. It also monitors and attempts to prevent fraud against airlines, such as ticket fraud.

International Foundation for Art Research

The International Foundation for Art Research (IFAR) is a nonprofit organization established in 1969 to help prevent the circulation of forged and misattributed works of art. IFAR offers an authentication service to help resolve controversies concerning the authenticity of works of art. IFAR also publishes quarterly journals on authentication research, art law, theft and recovery, and an extensive listing of recently reported stolen and missing art and antiques. More information on the IFAR is available at www.ifar.org.

International Association of Insurance Supervisors

The International Association of Insurance Supervisors (IAIS) is a voluntary organization of insurance regulators and supervisors from more than two hundred jurisdictions. The IAIS seeks to promote effective and consistent supervision of the insurance industry to foster safe and stable insurance markets and global financial stability.

Accessing Information Online

Fraud examiners now have a number of online investigative resources available through their personal computers. Not so long ago, fraud examiners had to travel to a physical location to search for public records. Fraud examiners today, however, have enough information available through different online sources to potentially conduct entire inquiries without leaving their computers.

A great deal of information can be accessed through the internet for little or no cost, and this discussion focuses on ways fraud examiners can use the internet to obtain information about assets, people, businesses, and fraud in general. Specifically, this discussion outlines a five-step approach to using the internet in fraud examinations and touches on finding information

online using search engines, databases, the deep web, the internet archives, and social media sites; using online sources to conduct specific types of searches; using newspaper/media databases to find information online; and using other nontraditional methods for finding information on the internet.

Five-Step Approach to Using the Internet in Fraud Examinations

The following is a five-step approach for using the internet in fraud examinations:

1. Compile everything known about the subject (e.g., name, age, national identification number, current address, past addresses, phone number, employer, family members, marital status, and hometown).
2. Conduct searches on major search engines.
3. Search social media sites.
4. Analyze data to identify leads to focus on in subsequent searches.
5. Investigate each lead using search engines and other online sources, separating out those that seem valuable, those that require more development, and those that should be eliminated.

Using Internet Search Engines to Find Information

The most basic way to find information on the internet is to execute searches using search engines or metasearch engines.

Search Engines

Search engines are programs that search websites and documents for specified key words and return a list of sites and documents where the key words were found. For instance, if a user searches for the key word *fraud*, the search engine will return a list of sites and documents related to fraud.

To provide such tools, search engines have automated programs, called *crawlers* or *spiders*, that systematically browse the internet and index its contents to facilitate fast and accurate information retrieval.

Although search engines are one of the most basic ways to find information on the internet, they can be erratic in the information they return; what is more, fraud examiners must verify all information they obtain through the internet.

There are several prominent search engines on the internet, and each functions in a different way. A few of the more popular engines are described here.

GOOGLE

Google is the most-used search engine in much of the world, including the United States, and it has advanced search capabilities. When a user conducts a Google search, the search engine's software generally ranks individual web pages according to how often the page is linked to by others, determining the page's relevance by the number of links and the identity of the linking page. It also uses information it gathers about the user, such as location, to predict what the user wants and prioritize the list of search results. Google is a good source for finding targeted information on a particular topic. Additionally, learning Google-specific search operators that enhance results will provide the investigator with an extremely powerful tool for online investigations.

BING

Bing (formerly Live Search, Windows Live Search, and MSN Search) is the current web search engine from Microsoft. It does not have as many web pages indexed as Google, but it offers many of the same features, in terms of specialized searches for images, news, video, maps, and more. Bing offers an easier way to track previous searches by allowing users the option to check their search history by clicking a button.

ASK.COM

Formerly AskJeeves, Ask.com is a good site for beginners and for general queries. The engine leads users through questions to help narrow the search, and also searches six other search sites. (For similar services, see the section on metasearch engines that follows.) Ask.com's ability to interpret natural language makes it easy to use, though constructing precise queries can be difficult for the same reason.

DUCKDUCKGO

DuckDuckGo is an internet search engine that uses information from crowdsourced websites to obtain its results. Unlike other search engines, DuckDuckGo does not record user information, does not generate search results based on a user's previous interests, and is not cluttered with ads.

Metasearch Engines

Metasearch engines are programs that send user requests to several search engines and display the results. Some of the more common metasearch engines are described here.

DOGPILE

Dogpile sends a query to a customizable list of search engines, directories, and specialty search sites (e.g., Google, Yahoo! Search, Bing, Ask.com) and then displays the results from each search engine individually. Once the results are retrieved, the innovative metasearch technology used by Dogpile goes to work removing duplicates and analyzing the results to help ensure that the best results top the list. The Comparison View feature lets users compare results from the leading engines with the click of a button.

SPUTTR

Sputtr uses metasearch technology to search the internet's top search engines and standalone websites, including Google, Yahoo! Search, Bing, Ask.com, Twitter, Facebook, YouTube, and others.

Advanced Search (Boolean) Operators

The best way to use a search engine is to use two, or possibly three, key words that best describe the topic; but often, such searches will return too many or irrelevant results, and in such situations, users can employ advanced search operators (or Boolean operators) to gain more control over the search results. *Advanced search operators* are query words or symbols used in search engine queries to instruct search engines to perform special actions when executing a search. Advanced search operators increase the precision of a search phrase. They help search engines better understand exactly what the user is looking for, and they improve searches and return relevant results faster. By using search operators, users can get more accurate search results and reduce the time it takes to find relevant sources.

Different search engines operate differently, and therefore, search engines use different search operators. To determine a search engine's advanced search capabilities, consult its service's FAQ or search help page.

This section examines the advanced search features of Google and Bing because they provide some of the most robust and useful tools for fraud examiners conducting online searches.

GOOGLE OPERATORS

The following chart lists Google search operators. Note, however, that the list includes operators that are not officially supported by Google and are not listed in Google's online help. In addition, Google might change how certain operators work, or it might do away with them completely.

Operators	Search Results	Example
OR (all uppercase)	Placing <i>OR</i> between two words returns pages containing either one, several, or all of the search terms.	[fraud OR Ponzi] returns pages in which either one or both of the words <i>fraud</i> or <i>Ponzi</i> appears.
AND (all uppercase)	Placing <i>AND</i> between two words returns pages containing both terms.	[budget AND report] finds pages with both <i>budget</i> and <i>report</i> .
" "	Placing quotation marks around a word or set of words returns pages containing the exact word or set of words.	["money laundering"] returns pages in which the exact phrase <i>money laundering</i> appears.
–	Placing the minus sign before a word returns pages that do not contain the term.	[fraud –Ponzi] returns pages in which the word <i>fraud</i> appears but excludes references to Ponzi.
()	Allows the grouping of words to create search strings with multiple Boolean operators, where each operation within parentheses is processed independently.	["(fraud OR con) schemes"] tells Google to find pages containing content related to fraud schemes or con schemes.
+	Designates two words that must appear together in either order.	[Ryan + Wilson] returns pages with the name <i>Ryan Wilson</i> or <i>Wilson, Ryan</i> .
site:	Using a key word and placing <i>site:</i> before a URL returns pages in which the URL contains the key word.	[fraud site:ACFE.com] returns pages on ACFE.com that contain fraud.
filetype:	Using a key word and <i>filetype:</i> followed by the file extension returns items of a particular file type that match the key word.	[fraud filetype:pdf] restricts the results to PDF files that include the term <i>fraud</i> .
link:	Using <i>link:</i> followed by a URL returns pages that link to the specified URL.	[link:ACFE.com] returns pages with links to ACFE.com.

intitle:	Using <i>intitle:</i> followed by specific term(s) returns sites containing the term(s) in their title.	[intitle: mortgage fraud] returns only documents that contain the words <i>mortgage</i> and <i>fraud</i> in the title.
info:	Using <i>info:</i> followed by a domain returns information about that particular domain.	[info: ACFE.com] returns Google's cache of ACFE.com, websites that are similar to ACFE.com, and websites that link to ACFE.com.
allintext:	Using <i>allintext:</i> followed by term(s) returns pages containing all the search terms in their text.	[allintext: fraud skimming materiality] returns only pages in which the words <i>fraud</i> , <i>skimming</i> , and <i>materiality</i> appear in the text of the page.
*	Using an asterisk (*) within a query allows Google to treat the asterisk as a placeholder for one or more unknown words.	["fraud * alert"] tells Google to find pages containing a phrase that starts with <i>fraud</i> , followed by one or more words, followed by <i>alert</i> .
AROUND(n)	Using <i>AROUND(n)</i> (where <i>n</i> is an integer) between two terms returns pages where the terms are within a certain number of words of each other.	[fraud AROUND(3) alert] limits the results to pages where <i>fraud</i> appears within three words of <i>alert</i> .

In addition, Google operators can be combined. For example, the query [site:hp.com filetype:pdf "5010 LaserJet" printer FAQ] will search for a PDF file of frequently asked questions regarding the 5010 LaserJet printer located on the Hewlett Packard website.

There are numerous other operators and search techniques that work with each Google search service. A good resource for lesser-known Google operators and search tips is www.googleguide.com.

BING OPERATORS

Although Bing and Google share some of the same search resources (e.g., quotation marks, minus sign, OR, AND, site:, filetype:, and intitle:), Bing has search operators that are unique to its search capabilities.

Operators	Search Results	Example
contains:	Searches for pages where there is a hyperlink to a file with the extension.	[swimming dolphin contains:wmv] finds wmv clips of dolphins swimming.
inanchor:	Returns pages that contain the specified terms in the link anchors of web pages.	[inanchor: useful fraud sites] searches for pages that are called <i>useful fraud sites</i> by others.
inbody:	Restricts results to those containing all the search terms specified in the body.	[inbody: securities fraud] returns only documents that contain the words <i>securities</i> and <i>fraud</i> in their body.
ip:	Finds websites hosted by a specific IP address.	[ip:198.46.34.22] finds websites hosted by the specified IP address.
prefer:	Adds emphasis to a search term to help focus the search results.	[fraud prefer:Ponzi] specifies the type of fraud that the user wants to find.
url:	Using a key word and placing <i>url:</i> before a URL returns pages in which the URL contains the key word.	[url:ACFE.com fraud] returns pages on ACFE.com that contain fraud.

Additional Tips When Using Internet Search Engines to Find Information

The following is a list of additional tips and guidelines for searching the internet for information:

- Use more than one search engine. Everyone has their favorite search engine, but relying on one search engine is not sufficient because every search engine collects and catalogs information differently.
- Be clear about what is being searched for. Define the search topic as clearly and succinctly as possible.
- Use unique, specific key words. Be specific when entering search terms.
- Use nouns for key words.
- Use format terms (e.g., transcript, document, report, statistics, pdf, policy, dictionary) in addition to subject words.

- Exclude articles (e.g., a, an, the) and pronouns (e.g., he, she, it, they) from search terms, unless they are part of a key phrase.
- Use correct spelling and include alternative spellings (e.g., *colour* OR *color*).
- Use filters to focus searches. Filters tell search engines to screen out specified types of pages or files.
- Check all the tips and features of any search engine to be used and make use of them.
- Increase the number of results displayed per page.
- Customize searches using advanced search operators, such as the minus (–) operator and quotation marks, to narrow the search results.
- Search for phrases. Search for a sequence of words in a specific order, using quotation marks around the phrase.
- Search for base words (drop suffixes) to avoid excluding relevant pages.
- Use metasearch engines if early searches are unsuccessful.
- Set a time limit for searching, and when that amount of time has elapsed, stop and try another method.
- Use a browser's find feature to find a word or phrase on a web page and help navigate search results.

Using Online Databases to Find Information

Any public records search should include searches of online databases.

Sources of Public Records

Public records can be obtained from a number of online databases. Typically, public records can be searched online through governmental agency websites, public record vendors' websites, and investigative service companies.

GOVERNMENT SOURCES

Many governments provide access to databases available through their websites, and these databases are numerous and varied. Government databases compile records from various levels, and most can be readily accessed from a home computer, although some might require a subscription to their services. The costs associated with these databases can be equally varied. There are several access options available, and a fraud examiner should be prepared to use any and all, separately or in combination. Remember, however, that it might be necessary to spend time examining the actual documents to get the whole picture.

In the United States, for example, various state and federal government agencies are repositories of public records and provide access to the records. The types of records maintained by government repositories include state government records, lobbyists' records, U.S. Securities and Exchange Commission (SEC) records, and federal government contract information. The problem for those performing public record searches, however, is that the records are spread among federal agencies, separate states, and different levels of government within states (i.e., local, county, and state levels).

PUBLIC RECORD VENDORS

Additionally, fraud examiners can search public records using public record vendors with proprietary databases. Unlike public databases available through governmental websites, public record vendors generally contain a broad range of information that can be searched from any location. Public record vendors usually contain such diverse information as court records, real estate records, lien records, corporate records, and telephone listing information.

Because public record vendors provide access to diverse information, fraud examiners can generally use them for many different types of searches. These databases can also uncover specific records from multiple jurisdictions in a short amount of time.

Although public record vendors generally do not provide any more information than can be accessed from other sources, they have two distinct advantages—search speed and constant access.

Generally, accessing information held by public record vendors is not free, and these companies use different pricing structures. Public record vendors might charge an initial access fee, monthly membership fees, or a one-time access fee, and some operate on a “pay as you go” principle that allows users to pay only for the searches they conduct. Therefore, it is important that fraud examiners shop around to get the best deal for their level of usage.

Furthermore, those performing public records searches should be fully informed about public record vendors. First of all, many of their records are incomplete because not all government bodies allow the vendors open access to certain records, such as criminal records. Therefore, turning up no convictions in a public data vendor search does not necessarily mean that the person has no criminal history. Additionally, the information on these sites can be inaccurate, out of date, or otherwise incomplete. Some public data vendor websites are just scam operations that will charge for bogus searches.

The bottom line regarding public data record sites is that the person conducting a search needs to confirm the site's legitimacy by reading reviews, articles, consulting peers, and so forth. Second, given that some records are not available, search conductors should attempt to collect public records from original sources when possible. Fraud examiners should verify any records that are returned by these sites by consulting original sources if the records are material to an investigation.

There are several companies that provide varying levels of public record information; some of these companies and the records they provide are discussed later.

INVESTIGATIVE SERVICE COMPANIES

There also are many investigative service providers that offer various services for public records searches, and for some practitioners, it might be economical to enlist the aid of service companies, information brokers, and professional online investigators. These companies will conduct research for fraud examiners, typically using online and physical sources. Although the cost of using the services of such companies will generally be higher than using a public records vendor, the entities might be the best choice for those who sporadically conduct public records searches. Sometimes, it might be best to hire an investigative service company to visit a government office to retrieve physical copies of records uncovered in abstract, or abridged, format through a public record vendor search.

Limitations of Online Public Database Searches

Despite the advantages of using online databases to find information, online databases have some downsides as well. For one thing, a public records database will tell the researcher whether a particular record, or some of the information contained in that record, exists, but generally, such databases will not provide a copy of the actual public record. For example, a fraud examiner can conduct a property record search to find out that John Doe owns the property at 7/25 Adelaide St., Brisbane City, QLD 4000 Australia; however, if the fraud examiner needs a copy of the actual deed, they will likely have to retrieve it from the appropriate government office.

There is a wealth of information now available through public record vendors, but accessing information online is never a full substitute for an examination of the public record itself. Such companies have to get their information from somewhere, and often, their records come directly from the government. But if the information in the government's record was incorrect, then it will be incorrect in the public record vendor's database as well.

Also, if a fraud examiner accesses certain types of personal information through an online service, they might be subject to laws that govern the collection, dissemination, and use of consumer credit information. For example, in the United States, the Fair Credit Reporting Act (FCRA) prohibits consumer reporting agencies from releasing personal information about an individual (e.g., information about the consumer's character, general reputation, personal characteristics, or mode of living) to third parties without authorization, and it limits disclosure of consumer credit information, such as a subject's credit history, to third parties.

Thus, before accessing such information, fraud examiners should always consult with legal counsel.

The following is a brief list of several limitations of conducting searches for public records using online databases, including:

- Online coverage of public records varies widely from jurisdiction to jurisdiction, and therefore, there are many degrees of accessibility to public records between jurisdictions.
- Online public records searches are limited in the area they cover. Therefore, when looking for information on a subject, fraud examiners often must search for public records in multiple jurisdictions.
- Often, online public records are brief abstracts of the original public record.
- The source of the information compiled in an online database must be reliable.
- Fraud examiners must validate information retrieved from online databases to determine if it is accurate and up to date.
- The public records compiled in an electronic format might cover only a limited period.
- Online searches can be erratic in the information they return.

Popular Public Record Database Vendors

There are a number of commercial database vendors that offer wide access to public records. Fraud examiners can shop various services to find the one that meets their needs in the most cost-effective manner. In some instances, it might be necessary to use more than one service to get accurate and complete information. These companies get their information from various sources and on various update schedules, so a search in any one database might return different results than a search done elsewhere.

Listed below is information about some of the more commonly used commercial database vendors.

DUN & BRADSTREET

Dun & Bradstreet (D&B) is a business information service provider. D&B is probably one of the most comprehensive and diverse sources available, with facts on more than 130 million companies in more than 190 countries. D&B is renowned for products like *Business Information Report* and *Industry Norms and Key Business Ratios*, both excellent tools. It is located at www.dnb.com.

KOMPASS

Kompass is a business-to-business (B2B) information system on companies and for companies, providing access to a database with information on millions of companies from numerous countries worldwide. Users can search Kompass to determine a company's executives, addresses, corporate structure, key personnel, turnover rate, description, product names, product services, trade names, brand names, and branch locations. Kompass is located at <https://us.kompass.com>.

HOOVER'S

Hoover's, a D&B company, is a one-stop reference for business information. Hoover's provides comprehensive, up-to-date business information for professionals who need intelligence on U.S. and global companies, industries, and professionals. Hoover's is located at www.dnb.com/products/marketing-sales/dnb-hoovers.html.

SKYMINDER

SkyMinder provides public information on global markets and on millions of companies in numerous countries. It is a web-based service that aggregates various company databases, such as those from D&B, Jordans, Thomson Financial, and Hoover's. SkyMinder also offers company credit and financial information on millions of companies worldwide. For more information, visit www.skyminder.com.

BUREAU VAN DIJK

Bureau van Dijk (BvDEP) provides a wide range of company information products, and it is one of Europe's leading publishers of electronic business information. For fraud examination purposes, the most relevant service is ORBIS, a global database with information on millions of companies worldwide. With descriptive information and company financials, ORBIS contains extensive detail on items such as news, market research, ratings, country reports, scanned reports, ownership, and mergers and acquisitions. For more information on BvDEP, visit www.bvdinfo.com/en-gb.

LEXISNEXIS

LexisNexis is one of the leading electronic data firms in the world. Users can obtain access to public records, media publications, and annotated court cases and records. For more information, visit www.lexisnexis.com.

DCS INFORMATION SYSTEMS

DCS Information Systems is an established source for investigative information. DCS provides online investigative solutions for businesses and government—from financial institutions to law enforcement or investigators. DCS provides information comprising public records and publicly available information. DCS Information Systems is located at www.dcsinfosys.com.

INSPERITY EMPLOYMENT SCREENING

Insperty Employment Screening, formerly US Datalink, is an employee background check service. Insperty is one of the only companies that use manual searches to obtain information. For example, Insperty uses its network of researchers to search local courts for the requested information, as opposed to using potentially out-of-date and inaccurate online databases that other online investigative databases use. Therefore, if a fraud examiner has the time to wait for an inquiry, Insperty might be the most reliable option. Insperty can be found at www.insperity.com/services/employment-screening.

CSC

CSC is a web-based due diligence service. It is a useful database for retrieving information about businesses. CSC can produce a business's financial statements, records pertaining to corporate status, business credit, and licensing information. Commercial filings, bankruptcy, judgments, and corporate good-standing searches are just a few of their services. CSC is located at www.cscfinancialonline.com/home.aspx.

EXPERIAN

Experian is one of the major providers of consumer credit information in the United States, and it provides services on consumer and business credit, direct marketing, and real estate information services. Experian is located at www.experian.com.

EQUIFAX

Equifax is also one of the big three credit reporting companies in the United States. It sells a variety of products, including consumer credit reports, insurance reports, business credit

reports, analytics, demographic data, and software. It also develops products for businesses aimed at stopping credit fraud and identity theft schemes. Equifax is located at www.equifax.com/personal.

TRANSUNION

TransUnion is another one of the big three credit report companies in the United States, and it offers credit information and services for consumers and businesses alike. More specifically, TransUnion is a global provider of business intelligence services with technology-based intelligence products, including innovative credit-decision and fraud-prevention tools, advanced target-marketing products, risk and profitability models, and portfolio management. TransUnion is located at www.transunion.com.

SEARCH SYSTEMS

Search Systems is a directory of sites that hosts searchable public record databases. Information available at the sites that it directs users to includes business information, corporate filings, property records, deeds, mortgages, criminal and civil court filings, inmates, offenders, births, deaths, marriages, unclaimed property, and professional licenses. For more information, visit <https://publicrecords.searchsystems.net>.

THOMSON REUTERS

Thomson Reuters provides numerous public records database and online research products, including Westlaw and CLEAR. These products contain information on individuals and companies compiled from numerous public sources, including telephone directories, publishers' mailing lists, change of address files, real estate filings, utility records, media reports, public demographic and consumer household data, voter registration records, driver's license data, federal and state death records, and credit header data. For more information, visit www.thomsonreuters.com.

TRACERS

Tracers Information Specialists offers several online investigative solutions, using public records collected from a variety of sources to provide products ranging from license and people searches to criminal and court records. For more information, visit www.tracersinfo.com.

Using the Deep Web to Find Information

The *deep web* (also known as the *invisible web*) refers to web content that is not indexed by standard search engines. There are a number of reasons why the deep web exists. For instance, there are websites where web crawling programs cannot enter. Web crawlers are scripts that create copies of visited web pages that are indexed by a search engine to provide faster searches. These deep web resources include websites without any links pointing to them, certain file formats that search engines cannot handle, websites that have been blocked from web crawler access, password-protected websites, and information stored in databases. Also, search engines limit the depth of their crawl on a website. Moreover, web crawlers cannot crawl as quickly as pages are added or updated.

Web search engines compile indices of only a relatively small portion of pages that are available on the web, and therefore, search engines only search a small portion of the web. In fact, estimates speculate that Google indexes less than 1% of the internet. Accordingly, the majority of online resources are actually deep web resources that users cannot access by using a standard search engine. Knowledge of the deep web can enable fraud examiners and organizations to more effectively investigate various types of fraud.

The Dark Web

Websites that are only accessible through specialized web browsers meant to anonymize the origins of user traffic make up the *dark web*. The most popular of these programs is Tor, although the Invisible Internet Project (I2P) has gained popularity in recent years. *Tor* is an acronym derived from “the onion router,” which is software that layers encrypted communications (like the layers of an onion) and offers increased anonymity to users. Tor hides where internet traffic originates, but it does not necessarily anonymize a user’s identity. Users’ communications are transmitted through various nodes in a distributed network of computers all around the world, making it exceedingly difficult to determine who is requesting particular data from a website. It prevents someone who is monitoring the user’s internet traffic from knowing what sites the person visits and also prevents the visited sites from learning the user’s location. Sites with a *.onion* address are designed to only be accessible by people using a Tor web browser.

The dark web is a neutral tool that can be used for both legitimate and illegitimate purposes. The privacy offered by dark web tools, such as Tor, has proven useful for intelligence agents, journalists, and dissidents operating in countries with heavily restricted access to the internet. However, there are also many services accessible by Tor that are criminal in nature. Perhaps

the most popular was the Silk Road, where users could purchase drugs and other contraband online. The Silk Road was shut down by authorities in 2013, but several other dark web marketplaces replaced it shortly after the bust (including a nearly identical site called Silk Road 2.0 that was shut down in 2014).

The Tor browser can be downloaded at www.torproject.org. Not all networks will allow access to the Tor browser; many employers block their employees from downloading it. Fraud examiners who need to access the dark web should check with their organization's IT personnel to obtain any necessary authorization to download and use the Tor browser. Furthermore, fraud examiners should solicit guidance from IT personnel on which security precautions will be necessary to protect the organization's network from risks associated with accessing the dark web, such as malware infection.

The services that require Tor tend to want to remain hidden from typical internet users, so they can be difficult to find unless a person knows what to look for. Additionally, the names and addresses of services change often. Users should also be cautious when exploring .onion sites, as many are scam sites, have malicious software, or feature disturbing content.

Using the Internet Archives to Find Information

Fraud examiners can also search the *internet archives*—archived versions of web pages that have since been updated or are no longer available online.

The most popular tool for searching the internet archives is the Wayback Machine, located at <https://archive.org>. The Wayback Machine allows users to see archived versions of web pages throughout time. It contains web pages archived from 1996 to the present.

Fraud examiners can use the Wayback Machine to find historical information, such as:

- A photo posted on a website that has been removed
- Content, views, writing, and opinions rescinded by an author
- A company's old job ads, statements, affiliations, or product lines

When fraud examiners are looking at archived sites, they should always search for what is not there—this is what is important. Also, when looking at archived sites, fraud examiners should look for any evidence of unusual activity and compile it for analysis.

Using Social Media Sites to Find Information

There is a growing trend of investigators mining social media for evidence. *Social media sites* use software to build online social networks, which enable people with shared interests to connect.

With social media, users can create an account, provide specific details about their lives—such as schools attended, past and present employers, hobbies, sports, family members, and interests—and become networked to other individuals who share similar backgrounds or interests. Whether activity on a user's page can be seen publicly depends on the social media site and the user's privacy settings. Some social media sites automatically make users' activity public unless users change their privacy settings.

The popularity of social media sites makes it easy for fraud examiners to find information about individuals who use such sites. Relevant social media evidence can include photographs, status updates, people's location at a certain time, and direct communications. For example, a person's online profile might provide valuable information, such as pictures of a new house that a subject cannot afford or postings detailing an aircraft previously unknown to the fraud examiner.

Fraud examiners might also find information about businesses on social networking sites. Relevant information on social media can include:

- Organization charts
- Price lists
- Hiring plans
- Expansion plans
- Customer names or lists
- Conflicts of interest
- Executive travel schedule and travel locations

In addition, fraud examiners can use social media to:

- Investigate complaints.
- Discover potential witnesses.
- Research the accused.
- Learn about the accusers.

While LinkedIn, Facebook, Twitter, and Instagram are the leaders of the social media industry, the landscape is constantly evolving, and new sites emerge regularly. It might not be enough to simply search the top social media sites for information. Accordingly, fraud examiners must keep current with emerging technologies and sites.

Social media sites can generally be searched the same as traditional websites, and although much of the information available can be found using traditional search engines, there is an ever-growing number of resources specifically designed to search social networks.

Searching Social Media Sites

An entirely separate category of search engines has been designed specifically to find information within social media. These search engines use social media to order, prioritize, or refine search results. Some popular social media search engines include Spokeo, PeekYou, and Pipl. This section discusses these search engines along with how to search photo-sharing sites.

SPOKEO

Spokeo is a social network aggregator site that gathers information about people by searching for their email addresses on various social networking sites. Essentially, it is designed to locate and track online profiles within social networks. This site allows users to search by a person's name, email address, or phone number. This can be helpful if a fraud examiner knows about the subject's profile in Facebook but is not aware that the subject is also a member of other sites.

PEEKYOU

PeekYou aggregates data from social sites but also incorporates results from news sources, homepages, and blog platforms to present a comprehensive online identity for a subject. The tool allows users to search for subjects by name, username/online alias, or phone number.

PIPL

Pipl also allows users to search by name, username/online alias, email, or phone number and claims that results include more than three billion people worldwide. The site no longer features a free version of the people search.

Privacy Issues When Collecting Evidence from Social Media

Social media sites might contain valuable information. Fraud examiners are free to search and extract information from a subject's page if it is open to the public, but there are limitations to the information fraud examiners can access on a social networking site due to privacy settings and anonymity.

Individuals, for instance, might have privacy rights that protect the information stored on their social media accounts. Users of social network sites can select their own privacy settings, and when a user has a social media profile with restrictive privacy settings, gaining access to the information can be difficult. For example, Facebook users can adjust their account's privacy settings to restrict the sharing of their profile information.

Many users set their privacy settings in a way that prevents anyone besides their friends, or users with whom they have connected on the site, from seeing their profile information, and this creates several issues of legal access and privacy rights. Accessing information that is set to private could result in claims under privacy laws. Thus, accessing information on social media sites that is restricted by privacy settings could result in liability for fraud examiners due to violation of users' privacy rights.

Privacy rights, however, vary between countries. Many European countries, for example, have laws that place limits on an employer's ability to regulate social media in the workplace. Spain, in particular, has some of the strictest legislation on personal data protection. Accordingly, fraud examiners must be careful about how they access information posted on a social media site.

Also, due to confidentiality, privacy, and security concerns, courts might not allow evidence obtained by someone who misrepresents themselves to gain access to join a subject's private social network. A good general rule for fraud examiners investigating social media is to only use publicly visible information. Attempting to gain access to privacy-restricted information on social media can result in legal liability for a fraud examiner in certain circumstances and therefore should be avoided. Chances are that inaccessible information might be obtained through other means, such as interviewing suspects and witnesses.

However, if a fraud examiner cannot access the information due to privacy restrictions, they might be able to petition the court to compel disclosure of the information. For example, courts can order parties to produce social media content as evidence. Similarly, a

court may order parties to disclose their passwords, but this is an extreme approach. Absent some legal process, accessing information on a site with tight privacy settings is difficult.

Generally, to avoid violating privacy rights when searching social media, fraud examiners should:

- Observe any applicable privacy laws.
- Restrict searches to publicly available information (i.e., information that has lawfully been published or broadcast to the public for consumption).
- Refrain from using any pretexting, password-cracking tools, social engineering, or unethical means to gain access to private material on social networking sites.

Using Legal Orders to Obtain Information from Social Media Sites

In some situations, it might be possible to obtain information from social networking sites via legal orders (i.e., subpoenas) to produce documents, witnesses, or other things. The ability to obtain evidence via legal orders varies among jurisdictions, however, and it might differ in criminal and civil matters. Furthermore, the extent to which social media companies are inclined to comply with requests for users' private information varies greatly between companies and potentially even within companies across jurisdictions in which they operate.

Often, Facebook and other service providers fight against subpoenas or other legal orders by invoking protections under local regulations aimed at protecting data privacy or electronic communications.

The Electronic Frontier Foundation (EFF), a nonprofit dedicated to digital civil liberties, obtained social networking sites' practices and policies regarding how they handle law enforcement requests for user information. The EFF then compared the guides and evaluated how they defended users' information. The results can be accessed at www.eff.org/wp/who-has-your-back-2019.

Social Media Data Collection Best Practices

Evidence from social media is subject to the same rules of evidence as tangible evidence and other forms of electronic evidence, but because the information stored in social media sites changes constantly and users can easily update, alter, and delete relevant information, fraud examiners face additional challenges when collecting social media evidence.

Accordingly, the challenges facing the admissibility of social media evidence demand that fraud examiners consider admissibility and authenticity issues when they collect information from social media sites.

Generally, documentary evidence, including digital evidence, will not be admitted in a legal proceeding, or it will not be given much weight, unless it is established as authentic (i.e., the evidence is what it purports to be and is in the same condition as when it was seized).

There are a number of techniques used to authenticate information from social media. Often, authenticity can be established through the testimony of a witness who verifies that the exhibit at issue accurately reflects what they observed on the site, and typically, the witness is the party who collected the evidence. Consequently, fraud examiners who collect evidence from social media often become a form of eyewitness, and for this reason, fraud examiners must capture, download, and preserve any useful information as soon as they discover it, and they must memorialize each step of the collection process, creating a record of what they see at any point in the investigation.

There are various methods fraud examiners can use to capture information on social media sites and memorialize the collection process, including the following:

- Take screen captures of relevant information.
- Print the content.
- Use screen-recording software to create a digital recording of a screen's output.
- Convert web pages into another format (e.g., PDF).
- Use a website capture tool that navigates to each link on a web page and captures all the content on each link, including embedded files and source code, contained in those links.

Although these methods can capture information on social media sites, most do not maintain a significant amount of the underlying information, or metadata, that is used to authenticate digital evidence.

Due to the limitations of traditional methods of capturing website information, companies have created specialized programs that can capture social media information while preserving metadata, which is not possible through image capture or printouts. They can preserve social media information in a searchable, native format and establish a defensible

chain of custody. For example, there are tools that allow users to capture key metadata unique to social media streams, preserving information not collected through image capture, printouts, or screen recording.

Using Online Sources to Conduct Specific Types of Searches

The following is a description of how online searches can be used to conduct certain types of searches, such as background checks, people searches, searches for hidden assets, legal records searches, and business filing searches.

Conducting Background Checks

Background checks generally involve two broad areas: performing due diligence to discover what public records reveal with respect to individuals and businesses with whom the investigating party might wish to do business and discovering information about prospective employees. In general, online public records databases are generally the best sources of background information.

Before conducting any background checks, consult with legal counsel.

For additional information regarding background checks in the United States, see the content on “Conducting Background Checks” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

DUE DILIGENCE

Management should ensure that it forms business relationships with reputable partners and agents. Such due diligence requires that the organization’s leaders conduct, or authorize and review, public record inquiries into businesses or individuals with whom they intend to do business. This type of public record inquiry involves such issues as verifying application information, debt burden, adverse financial information, credit capacity or worthiness, business relationships (the so-called family tree), litigation history, and criminal background.

Some useful searches for due diligence are listed here:

- Corporate/business entity searches can verify information, identify principals, and develop other business relationships.
- Bankruptcy filings, tax liens, and judgments searches respond to issues of adverse financial information and credit capacity/worthiness.

- Searches of loans or leases with secured assets can answer questions of debt burden. Searches of such records can be helpful to identify hidden ownership or partnership interests, and they can be helpful to locate address information on debtors.
- Civil court records provide answers to questions concerning litigation history, past business relationships, and the potential for debt burden either as a function of an adverse judgment or as a function of financing expensive litigation.
- Criminal court records identify the possibility of a criminal background.
- The use of consumer credit reports and business credit reports helps resolve questions concerning credit capacity and creditworthiness. In addition, business credit reports are useful in verifying information, understanding business relationships, and developing basic financial information about an organization.
- Searches of occupational safety and health records might be useful in developing adverse information or verifying information given by a prospective vendor, client, or strategic partner.
- Aircraft mechanics, airmen, medical license, controlled substances, and other professional licenses might serve to verify that basic professional and occupational standards are met by a prospective vendor, client, or strategic partner.
- Media reports can reveal reputational risks, prior or upcoming business developments, and any adverse publicity involving the company or individuals on its management team.

EMPLOYMENT BACKGROUND

Employers should conduct pre-employment background checks on the final candidates for open positions. Every position carries with it the risk of the employee committing fraud or some other crime while in the scope of employment. When performing background checks, remember the different types of resources and the best ways to access them. Some of the most useful and widely used sources of information are available online.

Some of the searches useful in developing background information on employment candidates are listed here (where permitted by law):

- Credit header searches are useful in confirming address and national identification number information.
- Civil court records can be searched to determine if candidates are or have been involved in legal actions.
- Criminal court records may be used to uncover past criminal problems.
- Fraud examiners can search tax court liens to determine if candidates have been sued by tax authorities.

- Aircraft mechanics, airmen, medical licenses, and other licenses are available to ensure that basic job requirements are met in the appropriate circumstance.
- Consumer credit reports may be used for employee selection, retention, and promotion.
- Bankruptcy filings, tax liens, and judgments may be used to identify adverse financial matters that can serve as potential motivators for fraud, defamation, and embezzlement.
- Where a prospective or current employee's position requires them to drive a personally owned vehicle or an employer-owned vehicle, such activity might expose the employer to liability for damages; therefore, driving records must be checked in such circumstances.
- A candidate's prior education and employment can be verified by conducting education and employment verification searches.

CRIMINAL BACKGROUND CHECKS

Criminal background searches involve checking criminal court records to see whether a person has a history of criminal misconduct. Criminal background checks are one of the most commonly used devices during employee screening and investigations. In employee screening, the purpose of these checks is to prevent the hiring of someone who, given a certain criminal history, would be unfit to serve the specific position applied for. In other investigations, criminal history can be useful in raising red flags and pointing out suspects.

The primary sources for criminal background records are court records and law enforcement agencies. Note that individual jurisdictions regulate access to each of these sources differently. Local laws might prohibit companies from asking prospective employees about their criminal history. In addition, they might limit how many years prior their criminal record inquiries can cover or limit the type of criminal charges upon which companies can base decisions to deny employment.

MANDATORY BACKGROUND CHECKS

In some situations, background checks are mandatory. When hiring for certain positions, employers must conduct background checks. Some of the professions that have mandatory criminal background check requirements include:

- Private investigators (in some jurisdictions)
- Securities brokers
- Financial industry personnel
- Security guards
- Insurance agents

Locating People Using Online Records

To locate people using online records, fraud examiners should adhere to three principles. First, when searching for an individual, the fraud examiner should obtain a past address of the subject, and search activities should begin with that information. Second, the fraud examiner should consider the cost effectiveness of the search activity and avoid ordering online searches that yield unnecessary or impractical information. Third, the fraud examiner should know the most powerful and useful types of searches, which are discussed here.

CREDIT BUREAU HEADER SEARCHES

Fraud examiners can use credit header data to locate individuals. A *credit header* is the information in a credit report that gives basic information about the person to whom the credit report applies. Although the information available via credit headers varies depending on the jurisdiction, it might include identifying information such as name, name variations, current and former addresses, telephone number, date of birth, and government identification number.

Nearly all individuals have been involved in some credit activity, either under their true names or an assumed (“also known as”) name, and if there are no credit records for an individual, it might be because they are very young or very old.

For common names, it might be necessary to search for the subject’s government identification number or date of birth to differentiate the subject from other people with the same name.

Options for searching credit bureau headers will vary from jurisdiction to jurisdiction but could involve using a past address, current address, government identification number, and/or birth date to search.

CURRENT OCCUPANT/NEW ADDRESS SEARCHES

A current occupant/new address search can be used to identify the occupant of an address, to confirm occupancy, to uncover a forwarding address, or to develop a list of neighbors who might know the suspect’s current whereabouts.

LAST NAME SEARCHES

Last name searches can be used if the subject’s past address is unknown. This search produces better results if the subject’s name is not common; however, if the subject’s last

name is common, differentiating information should be included in the search. Also, last name searches might return the identities of the subject's neighbors, who can be contacted for additional information about the suspect.

BANKRUPTCY FILINGS, TAX LIENS, AND COURT JUDGMENTS

Fraud examiners can use bankruptcy filings, tax liens, and court judgments to locate an individual because they might contain the national identification number of the person to whom they apply.

VOTER REGISTRATION RECORD SEARCHES

Voter registration records, which include the registrant's name, address, date of birth, signature, and government identification number, are available in some jurisdictions and might be used to locate individuals. Such records, however, might not be updated frequently. Also, fraud examiners should be familiar with any legal restrictions attached to the use of voter information, if that information is publicly available.

BUSINESS FILINGS SEARCHES

Fraud examiners can conduct business filings searches to locate individuals. Again, in many jurisdictions, individuals and corporations are required to file a doing-business-as (DBA) statement with the jurisdiction where they conduct their business. By searching such records for an individual or business name, the fraud examiner can gather information from fictitious business name filings, including owner name, business name, file date, and file number. Some jurisdictions provide business address information, and in these jurisdictions, the fraud examiner might also be able to conduct searches using the business address.

Locating Hidden Assets Using Online Records

When searching for hidden assets using the internet, the fraud examiner must attempt to put together the subject's lifestyle patterns. Online public records databases are useful in this capacity, and social media sources can also assist in a search for assets.

Discovering whether assets exist, where they exist, and whether they are recoverable can be accomplished with a search of government and proprietary records. These records can be further divided into those identifying *hard* assets and those regarding the potential for assets, credit capacity, or credit worthiness.

Generally, a search for an individual's assets should include research into, among other things, the types of information (if legally accessible) discussed here.

REAL PROPERTY RECORDS

Real property records are records of land. These records can identify unknown assets or reveal property transfers to relatives, friends, or other legal entities. Accordingly, fraud examiners might examine real property records to identify the subject's main residence, land that adjoins the main residence, vacation homes, former residences, or other land.

TAX LIENS

A *tax lien* is a legal hold or claim that a government entity places on a taxpayer's property (both real property and personal property) to secure the payment of taxes. Governments file tax liens against the assets of an individual with unpaid taxes. For example, in the United States, tax liens are filed with the county clerk's office in which the taxpayer lives, owns property, or owns a business, and they can state the type of unpaid tax, the tax period involved, the subject's Social Security number, the date the lien was assessed, and the balance due on the unpaid tax.

RECORDS OF SECURED TRANSACTIONS

Records of secured transactions in which the debtor(s) owes a stated value to a secured party or parties can provide valuable information. They can help identify personal property that an individual or business has financed. These records typically include the debtor's name and address, the name and address of the secured party, the filing date, the filing number, the filing type, and the type of collateral pledged as security. Moreover, these records might include documents such as tax liens, notices of secured interest in personal property, bank notes and drafts (including funds transfers between banks), letters of credit, and securities exchanges.

VEHICLE REGISTRATION RECORDS

Vehicle registration records can lead to unknown assets, the locations of other assets, and lienholder data, which can provide insight into the subject's banking connections.

PROFESSIONAL LICENSE RECORDS

Many agencies or bodies maintain records identifying individuals holding professional licenses or memberships. Although some applications for professional licenses contain no more than a name and address, some contain lengthy personal information, such as previous residential addresses, previous employers, education and training, and financial statements.

BANKRUPTCY RECORDS

Fraud examiners should, if legally possible, also conduct a bankruptcy (insolvency) records search, because such records can be used to gather background data on individuals and to determine a subject's assets, liabilities, and living expenses.

When checking bankruptcy records, the fraud examiner should check for the individual or business filing for bankruptcy, as well as for records involving any related businesses, principals, employees, or relatives.

CIVIL COURT RECORDS

Civil court records, especially those relating to a divorce, can be a noteworthy source of financial information. Divorce court records, for example, might contain information relating to bank accounts, employment, investment income, and other sources of income. Also, divorce records might contain a statement of assets that includes information on bank account holdings, retirement funds, artwork, coin collections, and so on. Moreover, divorce records might contain the filing date; the filing type; the locations, names, ages, and birthdates of the divorced parties; the names (and ages) of any children the divorced parties have; and the properties owned. Divorce records, however, are not available publicly in every jurisdiction.

Additionally, civil litigation records might contain valuable information. These records might identify a financial settlement a party was awarded as part of the litigation, and in some cases, civil litigation records might contain asset information of those involved in the litigation.

BUSINESS FILINGS AND DOING-BUSINESS-AS INFORMATION

Business filings, which refer to information an individual files to conduct business in a name other than their own, can provide valuable asset information. They might identify other businesses the subject owns or assets held by companies affiliated with the subject but not held directly in the subject's name. The address associated with the business filings could be a lead to follow for more information. Business filings might also reveal a business's real property, vehicles, equipment, and intellectual property registered in the subject's name.

BUSINESS RECORDS

Business records can also be valuable. If, for example, the subject owns a business, the ownership might make it easier for the subject to hide their assets. In such cases, it might be necessary to investigate the subject's business records thoroughly for possible concealment. Also, if the subject owns a business, the fraud examiner should look for wages paid to family

members or friends. It is possible that the subject paid wages to such individuals for work they did not perform with the understanding that the money belongs to the subject. Moreover, if a subject owns a business, they can write off investments as business expenses and inflate expenses to reduce income.

PHONE NUMBERS

Telephone records can provide valuable insight into asset investigations. For example, telephone records might provide contacts with real estate brokers or sellers, identify charge calls from vacation spots or contacts with co-conspirators, or provide other leads to assets and expenditures. Telephone records, however, will likely be private and require a subpoena or other court order to access.

VOTER REGISTRATION INFORMATION

Fraud examiners can use the information contained in voter registration records to determine the identity of a person who resides at a particular address. Moreover, if a fraud examiner has the name and address of a suspect but no other identifying information, voter registration records are good sources of additional information.

Finding Legal Records Online

Fraud examiners may generally review public court records pertaining to the subject individual or company. Court records are those papers, dockets, books, photographs, or other documentary materials made or received in a court and in connection with the court's dealings and the discharge of its responsibilities.

Many jurisdictions make court records available for public inspection, and they can provide information concerning the extent of litigation against a company or individual. Checking court records might reveal civil, criminal, or bankruptcy cases involving the subject.

The searches available to find legal records can be grouped in two broad categories: on-site court searches and index or broad coverage searches.

ON-SITE COURT RECORDS SEARCHES

On-site court records searches are performed by individuals who travel to county and municipal courthouses to search for records that match the search criteria that have been provided to them.

On-site court records searches are directed by court or jurisdiction. Accordingly, the fraud examiner must carefully consider the potential location of court records. Such considerations should take into account the locations of the suspect's current and past residences and their current and past businesses or employers. The results will include any litigation in which the individual was involved, including civil actions, criminal actions, divorces, and judgments. However, it will not return information concerning litigation that has been sealed by the court or information otherwise restricted, such as records concerning juvenile offenders in many jurisdictions.

The coverage for these searches varies according to the service used, and each court has varying rules regarding how the search is conducted, the times when searches may be conducted, the repository location, and the search methods. If the subscriber is interested in a particular type of record, such as a divorce record, it might be necessary to call the company's customer-support unit to adjust the search query.

INDEX/BROAD COVERAGE SEARCHES

Index/broad coverage searches are useful when a fraud examiner needs a search strategy broader than the by court/by jurisdiction method used with on-site court record searches or that makes use of an index of basic information in court records. The following are some key points of these types of searches:

- Searches of defendant suits might be limited. When searching a specific jurisdiction's database, the fraud examiner should review the service's help documents to determine the scope of the search abilities.
- Searches of criminal convictions are available in some jurisdictions.
- Searches of marriage/divorce indexes are available in some, but not all, jurisdictions.

Finding Business (Corporate) Filings Online

Again, in many jurisdictions, public companies, nonprofits, and some private companies must submit financial filings and forms to different government entities, and some of these records are available online.

For example, public companies in the United States must submit various filings (e.g., the annual report and the 10-K) to the SEC. These public filings provide a wealth of information about the filing company, including the nature of its business and its history, organizational structure, auditor, balance sheets, and income statements. SEC filings may be obtained from

the Electronic Data Gathering, Analysis, and Retrieval (EDGAR) system. EDGAR collects SEC filings, and it performs automated collection, validation, indexing, acceptance, and forwarding of SEC filings.

Using Newspaper/Media Databases to Find Information Online

Newspapers, periodicals, and journals can be excellent sources of information in a fraud investigation, particularly when searching for background information on an individual or a business. Many media outlets publish stories online for anyone to see, and such resources can be accessed through search engines or by going to the site directly.

Additionally, there are a number of commercial database vendors that offer wide access to newspapers and periodicals. These information database providers offer online access to the text of hundreds of newspapers worldwide, and although most providers are available for a fee, many can be accessed for free at most libraries.

Some popular news and media database vendors are described here.

Factiva

Factiva, from Dow Jones, is tailored for business and financial news searches. It maintains a catalog of thousands of the world's leading news and business sources from nearly two hundred countries and in 28 languages. For more information, visit <https://professional.dowjones.com/factiva>.

LexisNexis

LexisNexis is a legal and business information database that provides its subscribers with access to daily newspapers for either a flat fee or a per-use fee. LexisNexis maintains a large database of U.S. and international media sources, including daily newspapers, magazines, and television transcripts. In addition, LexisNexis offers a service in which the user can request immediate information on difficult-to-find topics. LexisNexis will research the topic and give the user the information as quickly as possible. For more information, visit www.lexisnexis.com.

Questia

Questia has an extensive archive containing millions of documents for online research that are primarily geared toward academic use. Searchable sources include books, newspapers, magazines, journals, and more. For more information, visit www.questia.com.

ProQuest

ProQuest is a data service that offers access to thousands of online journals and magazines covering a wide array of subjects. ProQuest's vast content pools are available to researchers through libraries of all types and include the world's largest digital newspaper archive; periodical databases comprising the output of thousands of titles, with many in full-text, full-image format; an extensive dissertation collection; and various other scholarly collections. For more information, visit www.proquest.com.

Using Nontraditional Methods for Finding Information on the Internet

Moving beyond the use of Google and other traditional methods of searching the internet is important for individuals conducting fraud examinations. This section will examine how to use the following websites to obtain information on the internet:

- eBay
- Whois
- Craigslist
- Zoominfo
- GuideStar
- NOZA

The websites addressed in this discussion are dependable resources that fraud examiners should be comfortable with using. When using some of these sites, fraud examiners should consider establishing an undercover email account to use when searching. The email account should be set up through a web-based service like Yahoo! or Gmail. Fraud examiners should not use any of the following information when creating the email account:

- Personal names
- Geographical region
- Favorite sports teams
- Hobbies

In addition, a discreet email account should have certain characteristics, such as a gender-neutral name. The handle should be composed of numbers and letters that appear to be for a purpose, giving it added credibility and authenticity.

EXAMPLE

LS-194-2183@yahoo.com

eBay

The online auction website eBay.com can be a valuable resource for fraud examiners. It maintains lengthy, detailed logs for each transaction, but this high-level information should be obtained with a court order. A fraud examiner can search for eBay users and obtain information from their eBay profiles. A fraud examiner can gain insight by examining any items the subject bought or sold and by reviewing any comments the subject has made, as well as the subject's Feedback Profile. In addition, if the subject has a seller profile on eBay, the fraud examiner can make the suspect one of their "Favorite Sellers," to receive alerts when the subject places new items for sale on eBay.

The Whois Protocol

Whois is a query and response protocol that is used to search databases that store domain registration records, including domain name, server addresses, technical contacts, and addresses. These databases can be queried at the following sites:

- www.arin.net is a Whois server that searches for the registrant and IP address range of a particular IP address.
- <https://viewdns.info> features a suite of tools that fraud examiners can use to discover information about IP addresses, domain name servers, individuals associated with websites and IP addresses, and more.
- <https://whatismyipaddress.com> provides a collection of tools for locating information about an IP address.
- www.traceroute.org—like whatismyipaddress.com—can be used to trace IP addresses.

Craigslist

Craigslist is a network of online communities featuring free classified advertisements with sections dedicated to jobs, housing, personals, items for sale, services, résumés, and so on.

The key to searching Craigslist is getting past the geographic restriction. For example, if the fraud examiner is looking for items in one location, they cannot search other areas at the same time. To expand the search, the fraud examiner must specify another area or use a tool, such as the one provided at www.searchtempest.com, which allows users to search multiple Craigslist sites at once.

Zoominfo

Zoominfo collates information from websites, and then software bots—also known as *intelligent agents*—capture and match the information to particular individuals or companies.

Zoominfo searches are conducted by company, person, or industry. Although Zoominfo searches can return a large amount of information, fraud examiners must understand that this information is generated from other websites and should be verified. Zoominfo search results look for résumés and include information like business experience, association connections, and education credentials.

GuideStar

GuideStar is a great starting point to find data about nonprofits. GuideStar gathers and publicizes information about thousands of nonprofit organizations. It obtains information from a variety of sources. To use this service, visit www.guidestar.org.

NOZA

Nozasearch.com is a web-based database of charitable giving designed as a research tool for nonprofit organizations. It gathers data about private foundations' activities that might be of interest to grant-seekers, philanthropic organizations, and individual donors.

Additional Information Sources

Additional information resources that can aid in investigations are outlined below. For a list of websites that should prove useful to fraud examiners and other anti-fraud professionals, go to ACFE.com/Useful-Websites.

Directories

Directories provide data on national, trade, business, and commercial associations. Some of the more frequently used directories are discussed here. For additional information regarding directories specific to the United States, see the content on “Directories” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Best's Insurance Reports

Best's Insurance Reports presents comprehensive statistical reports of the financial position, history, and operating results of thousands of property/casualty or life/health insurance companies operating in the United States, Canada, and around the world. The individual report on each institution includes a review of its history, management and operations, investments, operating results, and other statistical compilations.

City Directories

City directories usually contain the name, residence, occupation, and sometimes the place of employment of the city's influential people. Such directories can usually be found at public libraries, chambers of commerce, and secondhand bookstores.

Dun & Bradstreet Directories

Dun & Bradstreet (D&B) is a business and financial information services provider. D&B provides access to a variety of public records, including business registration information, secured financing transactions, unsecured credit transactions, lawsuits, liens, judgments, and bankruptcies.

Gale

Gale, part of Cengage Learning, is an educational publishing company. It is known for its online databases and multi-volume reference works. Some of its resources include: the *Gale Directory Library*, *Gale Directory of Databases*, *Directories in Print*, *Gale Directory of Publications and Broadcast Media*, *Encyclopedia of Associations*, and *Encyclopedia of Business Information Sources*.

THE GALE DIRECTORY LIBRARY

The *Gale Directory Library* provides online access to some of Gale's directories on companies, publishers, associations, and so on. It includes online access to *International Research Centers Directory*, *Gale Directory of Publications and Broadcast Media*, *Encyclopedia of Associations*, *Encyclopedia of Business Information Sources*, and more.

Users can use *Gale Directory Library* to find contacts, companies, individuals, or publications by searching with a name or key word.

Factiva

Factiva, from Dow Jones, is an information and research tool tailored for business and financial news searches that maintains a catalog of the world's leading news and business sources from many countries and in numerous languages.

The Global Banking Resource

The Global Banking Resource (TGBR) is a comprehensive database of financial institutions, and it provides data on financial institutions' contacts, correspondents, subsidiaries, affiliates, financial information, payment information, and much more.

The Index to Legal Periodicals

Published by H. W. Wilson, the *Index to Legal Periodicals* offers international coverage and access to English-language scholarly articles, symposia, jurisdictional surveys, court decisions, legislation, books, book reviews, and more. This source indexes more than 1,100 legal journals, law reviews, yearbooks, institutes, statutes, bar association publications, university publications, and governmental publications.

The Martindale-Hubbell Law Directory

The Martindale-Hubbell Law Directory contains biographical information on most lawyers and law firms practicing in the United States, Canada, and 160 other countries.

Mergent

Mergent is a business and financial information service provider partnered with Dun & Bradstreet (D&B). Mergent's reports can provide information about firms listed on the New York and American stock exchanges, as well as companies listed on regional American exchanges. Mergent also provides Mergent Online, which offers internet-based access to Mergent's database. Mergent publishes and maintains manuals and news reports about public companies in various business sectors, including financial, transportation, industrial, and public utilities.

The New York Times Article Archive

The *New York Times* Article Archive contains the complete back file of *The New York Times*. It contains more than 13 million articles in all, and it can be searched at www.nytimes.com/search.

The Reader's Guide to Periodical Literature

The *Reader's Guide to Periodical Literature* is a reference guide to articles published in periodicals and scholarly journals. The guide contains a full dictionary catalog of all articles by author, subject, and title, where possible. The entries refer to the volume, number of the periodical, starting and inclusive pages of the article, date of publication, and graphic material in the article, such as portraits. There is an online database version of the guide available as well.

Standard & Poor's Capital IQ

The Standard & Poor's (S&P) Capital IQ platform is a subscription-based service provided by S&P. It is a comprehensive source of business and investment information, offering online

access to S&P independent research, data, and commentary on stocks, bonds, funds, and industries. This service also includes export tools to enable researchers to download data into spreadsheet programs for further analysis.

U.S. Securities and Exchange Commission Filings

EDGAR

The Electronic Data Gathering, Analysis, and Retrieval (EDGAR) system collects documents submitted by companies and others who are required by law to file with the U.S. Securities and Exchange Commission (SEC). EDGAR performs automated collection, validation, indexing, acceptance, and forwarding of SEC filings. Its primary purpose is to increase the efficiency and fairness of the securities market to benefit investors, corporations, and the economy by accelerating the receipt, acceptance, dissemination, and analysis of time-sensitive corporate information filed with the SEC.

Not all documents that public companies file with the SEC, however, will be available on EDGAR. Even so, several important documents, such as Form 10-K or 10-KSB, are required to be filed on the EDGAR system. For more information, visit www.sec.gov/edgar.shtml.

Banks and Financial Institutions

In most jurisdictions, the relationship between banks and their customers is confidential, and there are numerous laws and regulations that protect consumers' personal financial information held by financial institutions. The following material explores information that can be obtained when proper legal measures have been taken.

For country-specific information regarding what information is available through banks and financial institutions, as well as other regulatory agencies and organizations, see the content on "Regulatory Agencies and Organizations" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

Types of Financial Records

As a general rule, financial information is private and can be obtained only by legal process or consent. If you are able to obtain financial records, the following financial information should be requested.

ACCOUNT HOLDER RECORDS

The relationship between banks and their customers is confidential. Generally, information from banks can be obtained only by subpoena or other legal process. Requested records and the information they provide could include:

- The master file of customers
- Safe deposit box records
- Account opening records

MASTER FILES OF CUSTOMERS

The master files of customers (e.g., depositors, debtors, and safe deposit box holders) that are maintained by most banks should detail where all of its important records are stored.

SAFE DEPOSIT BOX RECORDS

Safe deposit box records usually provide the name(s) of the person(s) renting the box, how often a person visited it, the dates they visited it, and the times they visited it. The times and frequency of visits can be valuable if they correspond to times and dates of deposits or withdrawals from other accounts.

Banks usually require the customer's consent, a search warrant, or a court order before an authorized bank official can open a safe deposit box.

ACCOUNT OPENING RECORDS

To open a financial account, an individual or business must provide certain information, and the records of such information can also be valuable. The account opening records for a personal account might contain handwriting samples and personal information about account holders, varying from one bank to another. But typically, the account opening records for a personal account contain the account holder's name, address, telephone number, tax identification number, amount of the account's opening deposit, and security data.

ACCOUNT STATEMENTS

Account statements, which are provided for all types of financial accounts, provide summaries of all the transactions on their corresponding accounts, and they contain information about the account holder and the financial institution in which the account is held (i.e., names and addresses). In short, account statements summarize the account holder's financial activity (e.g., cashed checks, withdrawals, and deposits) for a specific period (usually a month).

WIRE TRANSFER RECORDS

Records of wire transfers—electronic transfers of money from one bank to another—can contain valuable information. Typically, transfer records identify who sent the wire, when and where it was sent, and its amount.

FINANCIAL INTELLIGENCE UNIT DOCUMENTS AND REPORTS

Financial regulations and legislation obliges banks and other financial institutions to file reports detailing large cash transactions or suspicious activity with Financial Intelligence Units (FIUs), which are centers that collect information on suspicious or unusual financial activity.

Typically, reports filed with FIUs contain, among other things, the identity of the persons making the transactions and the amount of the transactions. In addition, they can provide valuable information that can be used to:

- Identify illegal activity.
- Detect the flow of illicit funds.
- Identify leads to assets purchased with ill-gotten gains.

International Financial Bodies**SOCIETY FOR WORLDWIDE INTERBANK FINANCIAL TELECOMMUNICATION**

International transfers by financial institutions are generally conducted through the Society for Worldwide Interbank Financial Telecommunication (SWIFT). Headquartered in Belgium, SWIFT was established in 1973.

Generally, SWIFT is not considered to be an electronic funds-transfer system such as Fedwire and the Clearing House Interbank Payments System (CHIPS) in the United States, but rather a specialized international cooperative communication service. As opposed to directly facilitating transactions, SWIFT sends payment orders to financial institutions, which then settle the transactions with correspondent accounts. A correspondent account is an arrangement in which one bank maintains a correspondent account at another bank for the purposes of settling transactions for itself or for its customers.

SWIFT acts as the gatekeeper to the records on these international financial transactions. However, access to this information can be difficult, given the high emphasis on privacy laws in the European Union (EU). Even law enforcement agencies are restricted in many situations.

Many countries, especially in Europe and the Middle East, use International Banking Account Numbers (IBANs), which is an international format for banking account numbers designed to avoid confusion in international transactions. SWIFT is the official registrar of IBANs. U.S. banks will be listed under an American Bankers Association (ABA) code.

International Law Enforcement Organizations

International Chamber of Commerce Commercial Crime Services

The International Chamber of Commerce (ICC) established the Commercial Crime Services (CCS) to act as a focal point for fraud prevention and to encourage cooperation between commerce and law enforcement agencies. The CCS maintains an extensive database on all aspects of commercial fraud. The CCS division operates Fraudnet, a global network of law firms that specialize in combatting business crime.

International Criminal Police Organization

The International Criminal Police Organization, better known by its radio designation as INTERPOL, is a network of National Central Bureaus (NCBs) in 194 member countries that share information with each other to assist law enforcement agencies in the detection and deterrence of international crime. Each bureau is an agency of the member country's government and serves as the liaison between that country's law enforcement agencies and the INTERPOL network.

To support ongoing investigations that require international assistance, INTERPOL provides information regarding:

- Location of suspects/fugitives/witnesses
- International wanted circulars
- Criminal history
- Terrorism prevention
- Stolen art
- Tracing of weapons and motor vehicles abroad
- License plate, driver's license records, and vehicle registration data

INTERPOL bureaus typically have case tracking systems that contain information about people, property, and organizations involved in international criminal activity. They can determine the history of an international connection in an investigation or the existence of any previous international criminal activity.

While INTERPOL is a network of law enforcement agencies, it also may work with private financial institutions during international investigations. Not every country participates in INTERPOL, and those that do have varying levels of international coordination. Therefore, fraud examiners might need to take a more direct approach to working with foreign law enforcement officials.

DATA ANALYSIS AND REPORTING TOOLS

Whether using the internet for an investigation or using software to analyze data, fraud examiners rely heavily on technology to aid them in an investigation. More data are stored electronically than ever before—financial data, marketing data, customer data, vendor listings, sales transactions, email correspondence, and more—and evidence of fraud could be located within those data. Unfortunately, fraudulent data often look like legitimate data when viewed in the raw. Taking a sample and testing it might not uncover fraudulent activity.

Fortunately, fraud examiners have the ability to sort through piles of information by using special software and data analysis techniques. These methods can identify future trends within a certain industry, and they can be configured to identify breaks in audit control programs and anomalies in accounting records.

Understanding the Need for Data Analysis

In general, fraud examiners perform two primary functions to explore and analyze large amounts of data: data mining and data analysis. *Data mining* is the science of searching large volumes of data for patterns. *Data analysis* refers to any statistical process used to analyze data and draw conclusions from the findings. These terms are often used interchangeably.

If properly used, data analysis processes and techniques are powerful resources. They can systematically identify red flags and perform predictive modeling, detecting a fraudulent situation long before many traditional fraud investigation techniques would be able to do so.

Big Data

A component of data is big data. According to the technology research firm Gartner, *big data* are “high volume, high velocity, and/or high variety information assets that require new forms of processing to enable enhanced decision making, insight discovery, and process optimization.” Simply put, big data are information of extreme size, diversity, and complexity.

In addition to thinking of big data as a single set of data, fraud investigators should think about the way data grow when different data sets are connected together that might not normally be connected. Big data represent the continuous expansion of data sets: the size, variety, and speed of generation of which makes it difficult to manage and analyze.

Big data can be instrumental to fact gathering during an investigation. Distilled down to its core, how do fraud examiners gather data in an investigation? They look at documents and financial or operational data, and they interview people. The challenge is that people often gravitate to the areas with which they are most comfortable. Attorneys will look at documents and email messages and then interview individuals. Forensic accounting professionals will look at the accounting and financial data (structured data). Some people are strong interviewers. The key is to consider all three data sources in unison. Big data help to make all sources of data work together to tell the complete picture.

Big data have gradually shifted into supporting real-time processing of data, and with the ever-increasing size of data sets, data analytics has never been more important or useful. Big data require the use of creative and well-planned analytics due to its size and complexity. One of the main advantages of using data analytics in a big data environment is that it allows the investigator to analyze an entire population of data rather than having to choose a sample and risk drawing conclusions in the event of a sampling error.

To conduct an effective data analysis, a fraud examiner must take a comprehensive approach. Any direction can (and should) be taken when applying analytical tests to available data. The more creative fraudsters get in hiding their schemes, the more creative the fraud examiner must become in analyzing data to detect these schemes. For this reason, it is essential that fraud investigators consider both structured and unstructured data when planning their engagements.

Structured Versus Unstructured Data

Data are either structured or unstructured. *Structured data* are the type of data found in a database, consisting of recognizable and predictable structures. Examples of structured data include sales records, payment or expense details, and financial reports.

Unstructured data, by contrast, are data not found in a traditional spreadsheet or database. Examples of unstructured data include vendor invoices, email and user documents, human resources files, social media activity, corporate document repositories, and news feeds.

When using data analysis to conduct a fraud examination, the fraud examiner might use structured data, unstructured data, or a combination of the two. For example, conducting an analysis on email correspondence (unstructured data) among employees might reveal suspicious activity in the purchasing department. Upon closer inspection of the inventory

records (structured data), the fraud examiner might uncover that an employee has been stealing inventory and covering their tracks in the records.

Data Mining

Data mining has roots in statistics, machine learning, data management and databases, pattern recognition, and artificial intelligence. All of these are concerned with certain aspects of data analysis, so they have much in common; yet they are each distinct, emphasizing unique problems and types of solutions.

Data mining has great potential to help organizations shift their energy and focus to the most important information in their databases. Data mining tools search databases for unclear patterns, finding predictive information that even experts might not recognize. Using data mining technologies, companies can evaluate vast amounts of information, spotting patterns in their marketing and business procedures.

Although data mining technologies provide key advantages to marketing and business activities, they can also manipulate financial data that were previously hidden within a company's database, enabling fraud examiners to detect potential fraud.

Not so long ago, computer programmers were required to oversee any data mining processes; however, this is no longer necessary. Current methods use computers and computer software. Data mining software provides an easy-to-use process that gives the fraud examiner the ability to get to data at a required level of detail.

Data mining combines several different techniques essential to detecting fraud, including the streamlining of raw data into understandable patterns.

Data mining can also help prevent fraud before it happens. There are many data mining tools and applications that can be used to develop anti-fraud models that score transactions in real-time.

The scoring is customized for each business, involving factors such as locale and frequency of the order, and payment history, among others. Once a transaction is assigned a high-risk score, the merchant can decide whether to accept the transaction, deny it, or investigate further.

Data mining is an effective way for fraud examiners to develop fraud targets for further investigation. It can mine databases for various fraud indicators, such as (1) specific types of transactions; (2) patterns within the data; or (3) a relationship between two data fields that should not have a relationship (e.g., the same address or telephone number for companies with different names). Targets are then examined to develop an investigative strategy involving site visits and face-to-face interviews. Data mining can also be refined based on interviews of targets.

One of the most sophisticated uses of data mining is known as *computer matching*, also called *data matching*. This approach involves the comparison of two discrete data sets to identify questionable overlaps.

Before applying data mining processes, it is important to identify the sources from which the data will be collected. Data might be stored in any of the following locations:

- Mainframe software
- Laptop installed software
- Security system software
- Hand-held devices issued to the company's employees (e.g., smart phones, thumb drives, or inventory scanning equipment)
- Company vehicle GPS systems
- Telephone systems
- Time card systems
- Key card access

Often, companies use data warehouses to manage data for analysis. *Data warehouses* are repositories of a company's electronic data designed to facilitate reporting and analysis. By storing data in a data warehouse, data users can query and analyze relevant data stored in a single location. Thus, a company with a data warehouse can perform various types of analytic operations (e.g., identifying red flags, transaction trends, patterns, or anomalies) to assist management with its decision-making responsibilities.

Although this section focuses on electronic data, fraud examiners should also identify manually generated data, such as:

- Visitor check-in logs
- Appointment logs or individual calendars

- Customer receipts for cash payments
- Return merchandise slips
- Any manually maintained lists

After fraud examiners have identified the data sources, they should identify how the information is stored by reviewing the database schema and technical documentation. Fraud examiners must be ready to encounter a number of challenges when attempting to identify how information is stored, from weak or nonexistent documentation to limited collaboration from the IT department.

Moreover, once collected, it is critical to ensure that the data are complete and appropriate for the analysis to be performed. Depending on how the data were collected and processed, it could require some manual work to make the data usable for analysis purposes; it might be necessary to modify certain field formats (e.g., date, time, or currency) to make the information usable.

The Data Analysis Process

Although the purpose of data analysis involves running targeted tests on data to identify anomalies, the ability of such tests to help detect fraud depends greatly on what the fraud examiner does before and after actually performing the data analysis techniques.

Consequently, to ensure the most accurate and meaningful results, a formal data analysis process should be applied that begins several steps before the tests are run and concludes with active and ongoing review of the data. While the specific process will vary based on the realities and needs of the organization, the following approach contains steps that should be considered and implemented, to the appropriate extent, in each data analysis engagement:

- Planning phase
 - Understand the data.
 - Define examination objectives.
 - Build a profile of potential frauds.
 - Determine whether predication exists.
- Preparation phase
 - Identify the relevant data.
 - Obtain the data.

- Verify the data.
 - Cleanse and normalize the data.
- Testing and interpretation phase
 - Analyze the data.
- Post-analysis phase
 - Respond to the analysis findings.
 - Monitor the data.

Planning Phase

As with most tasks, proper planning is essential in a data analysis engagement. Without sufficient time and attention devoted to planning early on, the fraud examiner risks analyzing the data inefficiently, lacking focus or direction for the engagement, encountering avoidable technical difficulties, and possibly overlooking key areas for exploration.

Understand the Data

As a first step—long before determining which tests to run—the fraud examiner must know what data are available to be analyzed and how those data are structured. This might mean reviewing the database schema and technical documentation and consulting with the data administrator to learn what fields and records exist and in which tables the information is stored. The fraud examiner will also need to know how the tables are linked together.

Helpful tools in getting a full view of the organization's data include a data inventory and a data map. Such documents can be used to identify and record information about the data source, file formats, business process owners, and key systems used as they relate to specific projects. This documentation provides a good starting point for documenting the engagement history and for managing the data analytics process.

Understanding the structure of the existing data will not only help ensure that the fraud examiner builds workable tests to be run on the data but might also help identify additional areas for exploration that might otherwise have been overlooked.

Define Examination Objectives and Scope

The amount of data housed by most organizations is extremely large; many companies process millions of transactions every day. Going through all of the data would be impossible. And, although data analysis techniques can greatly increase investigative efficiency, performing every possible analysis of the data would be prohibitively time consuming.

Consequently, at the outset, the fraud examiner must define the objectives and scope of the expected analysis. This includes considering:

- The purpose for the data analysis engagement
- The structure and size of the business
- The target area of examination, if restricted
- The resources (e.g., time or personnel) available for the engagement
- Whether any predication exists that a particular fraud is occurring
- Any existing thresholds or preferences for frauds to be considered material

Build a Profile of Potential Frauds

To maximize the potential success of detecting fraud through data analysis, the analysis performed should be based on an understanding of the entity's existing fraud risks. To do so, the fraud examiner must first build a profile of potential frauds by identifying the organization's risk areas, the types of frauds possible in those risk areas, and the resulting exposure to those frauds.

In organizations that have a formal fraud risk assessment process, this step should simply involve referring to the outcomes of that process and forming a fraud detection approach based on the risks identified. In organizations lacking such a process, however, this step can be quite time consuming, as it involves gaining a sufficient understanding of organizational operations to identify the full spectrum of fraud scenarios possible within the company.

Determine Whether Predication Exists

Data analytics is instrumental in helping a fraud examiner determine predication. *Predication* is the totality of circumstances that would lead a reasonable, professionally trained, and prudent individual to believe a fraud has occurred, is occurring, and/or will occur. Predication is the basis upon which a fraud investigation begins. Internal fraud investigations should not be conducted without proper predication.

Suppose someone has submitted a tip that gives the fraud examiner reason to believe a particular fraud has occurred. Prior to accusing someone of wrongdoing, the fraud examiner must perform some preliminary work, such as data analysis. This is done to determine predication, but such work should be carried out carefully to avoid defamation.

To illustrate, imagine a bull's-eye representing a particular fraud. The fraud examiner must stay on the outside of the bull's-eye during the predicate check. That means they should avoid

conducting any interviews or making accusatory statements and instead use data analytics techniques that do not infringe upon anyone's rights. Because the investigation of fraud deals with the individual rights of others, an investigation must be conducted only with adequate cause or predication.

Preparation Phase

The results of a data analysis test will only be as good as the data used for the analysis. Thus, before running tests on the data, the fraud examiner must make certain the data being analyzed are relevant and reliable for the objective of the engagement. The phrase "garbage in, garbage out" is applicable in the preparation phase.

Identify the Relevant Data

Using the profile of potential frauds as a guide, the fraud examiner must identify the target data for analysis. Specifically, for each specific fraud scenario assessed to be a high risk to the organization, the fraud examiner should determine which data fields and records would be affected by such a scheme.

The fraud examiner must then identify the logistics involved with obtaining this information, including:

- What specific data (i.e., fields, records) are available
- Who generates and maintains the data
- Where the data are stored
- Timing of the data extraction (e.g., date range, cutoff dates/times)
- How the fraud examiner will receive and store the data
 - Data format
 - Storage/transfer mechanism
- Control totals needed for verification
- How to validate the sources of data

Obtain the Data

The fraud examiner should prepare and submit a formal request for the desired data, outlining the specifics determined in the previous step. Depending on the objectives of the engagement and the operations of the organization, the fraud examiner might be given a file containing the data to work with, or they might be provided read-only access to the data within the organization's information system.

This step in the process can be particularly challenging. In some cases, obtaining the data involves working with overloaded or uncooperative data managers, IT departments, or other parties. Other potential obstacles at this stage include data that are housed in different systems or on different platforms, data that are maintained manually, and data that are paper based.

Verify the Data

Once the data have been received by the fraud examiner, they must be verified. The first step is simply to ensure that the data analysis software that will be used is able to open and read the data as provided. The fraud examiner should then validate that the data received contain all requested fields and records.

Once the success of the transfer process has been confirmed, the fraud examiner should perform the following tests to verify the integrity of data:

- Confirm control totals.
- Confirm that the period covered by the data is appropriate and as requested.
- Sort the file in ascending or descending order to test for leading or lagging errors.
- Check for gaps in applicable fields, including system-assigned identifying record number, to identify missing records.
- Confirm the format of data in format-specific fields, such as date fields and numeric fields.
- Check for blank fields where information should be entered.
- Check for duplicate fields or records.

The fraud examiner can also use tests for reasonableness or logical relationships to verify data integrity. Examples of such tests include:

- If transactions average X per day, verify that a monthly file includes approximately X times the number of business days.
- Divide average transaction size by the number of transactions in the file.
- Compare fields such as items ordered to items shipped to confirm that the amount shipped is equal to or less than the amount ordered.

Cleanse and Normalize the Data

Depending on how the data were collected and processed, as well as the results of the data verification process, the fraud examiner might need to cleanse and convert the data to a format suitable for analysis before executing any data analysis tests. For example, certain field formats (e.g., date, time, or currency) might need to be modified to make the information consistent and ready for testing.

The data must also be normalized so that all data being imported for analysis can be analyzed consistently. Common data fields from multiple systems must be identified, and data must be standardized. In normalizing the data for analysis, table layout, fields/records, data length, data format, and table relationships are all important considerations.

Additionally, the following inconsistencies in the data must be addressed:

- Known errors
- Special/unreadable characters in the data
- Other unusable entries

When possible, such situations should be addressed by fixing, isolating, or eliminating them. Any issues that cannot be cleaned up will require special consideration during the testing and interpretation phase.

Testing and Interpretation Phase

If the planning and preparation stages have been conducted effectively, the testing and interpretation phase should yield results that are helpful in uncovering red flags of fraud in the data. Any known issues in the data that cannot be fixed or isolated might require further review. These data might lead fraud examiners to areas they did not think to focus their attention. Such findings could prove to be useful information during the testing and interpretation phase.

Analyze the Data

When using data analysis to detect fraud, the fraud examiner should organize and analyze the data in a way designed to uncover patterns that are consistent with the specific fraud scenarios identified during the planning stage.

Grouping the data into homogenous groups can facilitate the fraud examiner's ability to spot outliers. The specific groupings should be based on the target fraud scenario and data being analyzed, but such categorization might include grouping data by:

- Geographical location
- Business division or unit
- Time period
- Dollar value
- Salesperson

Another useful step involves running some high-level tests, such as summarization or statistical analysis, to get an overview of the data and provide some context for any outliers identified during later testing.

From here, the fraud examiner should run tests to uncover possible indicators of fraud, including unusual trends, anomalies, and control breakdowns. The data analysis techniques used should be chosen based on the high-risk fraud scenarios being considered. Tests designed to detect specific fraud schemes will be covered later in this chapter.

In analyzing the results of the tests run, the following issues merit special consideration:

- The role of concealment
- Addressing false positives

The Role of Concealment

The fraud examiner must remember that the goal of the data analysis engagement is to identify fraudulent transactions—transactions that, by their very nature, involve deception and attempted concealment. The fraud examiner is looking for data that have been intentionally manipulated, rather than just erroneously recorded. Consequently, they should focus their analysis on data that are strategically missing or altered, such as lacking contact information, or transactions that narrowly circumvent organizational policies. Additionally, because fraudsters can be creative in concealing their schemes, fraud examiners must be creative in their searches, often combining several data analysis techniques and tests.

Addressing False Positives

A false positive is a transaction identified by a data analysis test as an anomaly within the data set even though it is not actually a fraudulent transaction. Such results can occur for a number of reasons, including:

- Data validity/integrity issues
- Data merging difficulties
- Legitimate data that fall outside the field norm (e.g., letters in a numbers-only field, such as a phone number)

The goal in running data analysis tests is to identify anomalies without generating too many false positive results. Sorting through and analyzing false positives takes time and resources that could be spent further investigating other potentially fraudulent transactions. However, proper planning and preparation should help minimize the occurrence of false positives in the test results.

Post-Analysis Phase

The data analysis tests will likely reveal many potential areas of exploration. After executing the desired tests, the fraud examiner will need to determine how to respond to the findings and how to watch for future anomalies.

Respond to the Analysis Findings

The findings of the data analysis engagement will rarely be sufficient on their own to conclude that fraud is or is not occurring. Any anomalies identified will require follow-up and further examination to determine the reason for the discrepancy in the data. Often, this will include investigatory procedures such as document examination and interviews. The specific resultant actions should be based on the fraud scenarios in question and the particular red flags identified in the data.

Additionally, the terms and objectives of the engagement will dictate whether a formal report should be issued and, if so, the form and audience of the resulting report. Such a report should typically be easy to understand, summarize the analysis findings, and provide insightful and applicable information for the relevant readers.

Monitor the Data

Based on the results of the analysis and the needs of the organization, the fraud examiner should work with management to determine whether any of the tests performed should be repeated on a periodic or continuous basis. In areas deemed to be at heightened risk for fraud, continuous monitoring can provide increased assurance of early detection of any fraud schemes and can even serve as a deterrent to misconduct.

Spectrum of Analysis

The spectrum of application for data analysis includes:

- *Ad-hoc testing*, which involves a one-use, point-in-time analysis conducted for a specific project or exploration, such as a fraud investigation.

- *Repetitive testing*, which is composed of repeatable, predefined, and automated procedures performed on similar data on a scheduled basis, is most beneficially used on business processes where the risk and likelihood of fraud are high.
- *Continuous testing*, which involves constant automated data monitoring efforts, often embedded directly into the production system, focused on those transactions or areas that pose particularly strong risks or for which preventive controls are not possible or deemed ineffective.

Based on key risk indicators, ad-hoc testing will help identify transactions to be investigated. If that testing reveals indicators of fraud, recurring testing or continuous analysis should be considered.

Using Data Analysis Software

Once data have been extracted, they must be analyzed. While data analysis is used mainly as an audit technique, it can be an important part of the fraud detection toolkit. Although the direct results from data analysis software cannot be used as trial evidence that a fraud was committed or that a specific individual was involved, they can serve to identify red flags associated with a wide variety of frauds. The results will thereby provide investigators with a trail to follow.

Advantages of Using Data Analysis Software

There are five significant advantages to using data analysis software. First, data analysis software allows the fraud examiner to centralize an investigation, relying less on others to gather data. Due to the amount of information data software is able to sort through, the fraud examiner no longer has to rely on different sources for information. In the past, when analyzing a company's books for possible discrepancies, the fraud examiner would have to ask for the assistance of several persons within the accounting department to locate the information. Now, however, software programs will do all the work, ensuring an above-the-board investigation without many variables.

Second, data analysis software allows the fraud examiner to ensure that an investigation is accurate and complete. In the past, an audit or fraud examination could only be complete to the extent that the investigator was able to sift through information. When looking at one month's worth of a company's transactions, a fraud examiner might be forced to research more than one million transactions. Given the amount of time an auditor generally has to

conduct a single examination, the depth of a manual audit can be suspect at best. By using a data analysis program, the fraud examiner can run several different analysis patterns in a matter of hours, enabling them to look at greater volumes of information from a number of different angles. These procedures lead to a more comprehensive examination.

Third, data analysis allows the fraud examiner to base predictions about the probability of a fraudulent situation on reliable statistical information. By using data analysis software, the fraud examiner can base any strong suspicions of fraudulent activities on hard numbers. Because the software will compare one month's expenditures with the same data for the rest of the months of the year, the fraud examiner can point conclusively to troubled areas. With hard data to support a fraud examiner's suspicions, a company is more likely to conduct further investigations into the wrongdoing.

Fourth, data analysis allows the fraud examiner to search entire data files for red flags of possible fraud. The number of checkpoints a fraud examiner can set up using a data analysis program is staggering. By cutting down the paperwork involved in an investigation, the fraud examiner is able to execute a number of different searches and analyses of the company's raw data.

Finally, data analysis can assist the fraud examiner in developing reference files for ongoing fraud detection and investigation work. By performing audits and examinations with data analysis software, the fraud examiner will begin to recognize trends and set up a list of precedents for individual accounting situations, such as a monthly statement reconciliation. In doing so, the fraud examiner can establish a norm with which to compare individual months or years. These precedents can also be used by the fraud examiner in general terms, and the knowledge can be applied to nearly any fraud investigation.

Core Data Analysis Software Functions

Computers can scan database information for several specific types of information, creating a red-flag system. To perform this, most software packages use a combination of different functions. These functions are:

- Sorting
- Record selection
- Joining files
- Multi-file processing
- Correlation analysis

- Verifying multiples of a number
- Compliance verification
- Duplicate searches
- Expressions and equations
- Filter and display criteria
- Fuzzy logic matching
- Gap tests
- Pivot tables
- Regression analysis
- Sort and index
- Statistical analysis
- Stratification
- Date functions
- Benford's Law analysis
- Graphing

Sorting

To sort means to arrange data in a meaningful order. Sorting is nothing new; most reports you read are sorted in some way. With sorted data, fraud examiners can quickly determine what is important or identify blank fields where information should be entered. An investigator can ask a program to sort information using different methods, such as alphabetically or numerically. For instance, when searching for a suspected fraudster's name out of thousands in a check disbursement file, software can quickly sort a list of payee names.

Sample Customer Sales Data

Date	Customer	Invoice	Amount
3/12/20X6	V45892	J54534	\$10,000
4/8/20X6	V45892	J54535	\$10,000
5/7/20X6	V78293	J70384	\$15,698
2/8/20X6	V90132	J37234	\$85,365
12/15/20X5	V10345	J12853	\$47,952
1/8/20X6	V78343	J26487	\$52,978

Data Sorted by Invoice Number

Date	Customer	Invoice	Amount
12/15/20X5	V10345	J12853	\$47,952
1/8/20X6	V78343	J26487	\$52,978
2/8/20X6	V90132	J37234	\$85,365
3/12/20X6	V45892	J54534	\$10,000
4/8/20X6	V45892	J54535	\$10,000
5/7/20X6	V78293	J70384	\$15,698

Data Sorted by Amount

Date	Customer	Invoice	Amount
3/12/20X6	V45892	J54534	\$10,000
4/8/20X6	V45892	J54535	\$10,000
5/7/20X6	V78293	J70384	\$15,698
12/15/20X5	V10345	J12853	\$47,952
1/8/20X6	V78343	J26487	\$52,978
2/8/20X6	V90132	J37234	\$85,365

Record Selection

Data analysis software can select specific records for analysis. Specific record selection is accomplished by making a request or query to find the occurrences of items or records in a field. This type of request will only return instances where the record did occur, effectively reducing large amounts of information into brief lists. Often, additional criteria placed on the record selection or query will reveal a more pertinent list of information. Most data analysis programs include simple macros to help locate specific records.

Joining Files

The Join function gathers the specified parts of different data files. Joining files combines fields from two sorted input files into a third file. Join is used to match data in a transaction

file with records in a master file, such as matching invoice data in an accounts receivable file to a master cluster. For example, a fraud examiner might need to compare two different files to find differing records between files. The following is an example of how joining two files can easily provide that information.

File 1

Customer	Account	Balance	Last Invoice
Jerry's Cleaners	555221	\$12,500	12/30/X6
Quality Garments	555658	\$9,283	11/15/X5
Beverly's Tailoring	554891	\$27,588	01/15/X6

File 2

Customer	Account	Balance	Last Invoice
Quality Garments	555658	\$9,283	11/15/X5
McCloud's Fabrics	556897	\$10,888	09/24/X6
Beverly's Tailoring	554891	\$27,588	01/15/X6

The *JOINED* Exception File

Customer	Account	Balance	Last Invoice
McCloud's Fabrics	556897	\$10,888	09/24/X6
Jerry's Cleaners	555221	\$12,500	12/30/X6

Multi-File Processing

Multi-file processing allows the user to relate several files by defining relationships between multiple files, without the use of the Join command. A common data relationship would be to relate an outstanding invoice master file to an accounts receivable file based on the customer number. The relationship can be further extended to include an invoice detail file based on invoice number. This relationship will allow the user to see which customers have outstanding invoices sorted by date.

Correlation Analysis

Fraud examiners can use a correlation analysis to determine the relationships among different variables in raw data. Fraud examiners can learn a lot about data files by learning the relationship between two variables. To illustrate, see the example that follows. In the example, there should be a strong correlation between the independent and dependent variables because there is a direct relationship between them. Hotel costs should increase as the number of days traveled increases. The gallons of paint used should increase as the number of houses painted increases. Any deviation from the expectation should be investigated more thoroughly.

Independent Variable	Dependent Variable
Number of days traveling	Hotel cost
Number of documents printed	Reams of paper used
Number of houses built	Paint used

To conduct a correlation analysis, there must be a pair-wise relationship between the two sets of data. In other words, each x variable has a corresponding and unique y variable. If the data are not intrinsically related (e.g., two fields on the same invoice), then there must be a strong logical relationship between the data (e.g., same general ledger account).

Correlation analysis allows a fraud examiner to evaluate the *strength* of the connection between two or more pieces of information on, for example, a balance sheet or an income statement. Suppose you find a strong correlation between consulting expenses and earnings over an adequate period of time. You would then use regression analysis to assess any fluctuations that had occurred in that relationship, compared to the historical norm for that organization or its industry. The goal is to find out whether (and if, so when and why) the relationship entered a new phase and to isolate any red flags that might warrant a fraud investigation.

The strength of the relationship between two variables is indicated by the correlation coefficient. The formula to calculate the correlation coefficient is the following:

$$r = \frac{n(\sum xy) - (\sum x)(\sum y)}{\sqrt{[n(\sum x^2 - (\sum x)^2)] [n(\sum y^2 - (\sum y)^2)]}}$$

In Excel, the CORREL(array1, array2) function returns the correlation coefficient.

The value of the r ranges between -1 and 1 . A positive r means that the variables vary in the same direction together (positive slope). A negative r means that the variables have an inverse relationship and that the graph is negatively sloping.

The strength of the relationship between the two variables is indicated by the absolute value of r . An r of 0 , for instance, means that there is no relationship between the two variables. A correlation coefficient ranging from 0.8 to 1 would indicate a strong relationship between the two variables. Note, however, that a strong correlation coefficient does not indicate there is a *causal* relationship between the variables; it merely implies correlation. It also does not indicate fraud, but rather the potential for fraud, or at least suspicious data.

Once two variables have been graphed against each other, the result will be a scatterplot. If the two variables have a strong correlation, you will be able to calculate, or at least eyeball, a best-fit line. A best-fit line can be used to predict the y variable given any x variable. The least squares method is the most common way to calculate the equation of the line. It minimizes the squared distance of the data points from the line.

The equation of a line is $y = mx + b$, where m is the slope and b is the y -intercept (i.e., the value of y when $x = 0$). Linear regression and correlations are closely related. The importance of regression lies in the ability to predict the value of y based on known values of x . Remember, the stronger the correlation coefficient, the more accurately the best-fit line will predict y for any given x .

Values that fall far outside of the expected range (graphically, points that are far away from the best-fit line) are known as *outliers*. In some cases, there are reasonable explanations for outliers. Sometimes, however, an outlier is an indication of fraud.

Verifying Multiples of a Number

With this function, a fraud examiner can determine whether regularly disbursed checks, such as reimbursement for mileage, are consistent within the regular rate. For instance, if the mileage checks do not measure up to the standard units of currency-per-mile rate, a red flag should automatically be raised.

Compliance Verification

Compliance verification determines whether company policies are met by employee transactions. If a company limits the amount of its reimbursements, analysis software can check to see that this limit is being observed. Many times, fraud examiners can find early indications of fraud by testing detail data for values above or below specified amounts. For example, when employees are out of town, do they abide by the company policy of not spending more than thirty dollars a day for meals? For starters, the fraud examiner can look at the expense reports and select those with meal expenses exceeding thirty dollars. With the information returned from this simple query, the fraud examiner has a starting point for suspecting fraud. Even though these variances are small (two and three dollars), the time taken to research small variances can be well invested. The search might lead to something big. After further investigation, the fraud examiner might learn that the employee did not have supporting documentation to submit because a vendor's sales representative paid for all the meals. If this is the case, you have two fraud suspects, the employee and the employee's boss who approved the report.

Duplicate Searches

Duplicate testing is used to identify transactions with duplicate values in specified fields. This technique can quickly review the file, or several files joined together, to highlight duplicate values of key fields. In many systems, the key fields should contain only unique values (no duplicate records).

For example, a fraud examiner would expect fields such as check numbers, invoice numbers, and government identification numbers (e.g., Social Security numbers) to contain only unique values within a data set; searching for duplicates within these fields can help the fraud examiner find anomalies that merit further examination.

Expressions and Equations

Fraud examiners can build expressions or equations based on their knowledge and expectations of what should be in the data (e.g., recomputing net payroll amounts based on gross pay, taxes, and other deductions; recalculating amounts charged on invoices based on unit price and quantity ordered). Comparing the actual data to these equations, then, can be used to verify actual amounts and test actual relationships.

Filter and Display Criteria

Fraud examiners can create filters or queries based on specific user-defined criteria that result in only those records that meet the criteria being displayed. Such filters can help identify transactions that are outside the expected norm for the data. Additionally, the results can be further filtered or analyzed using other data analysis techniques; such layered analysis can help the fraud examiner drill down to the most pertinent records for review.

Fuzzy Logic Matching

Employing fuzzy logic techniques can help identify records with similar or potentially duplicate—though not identical—values, such as First Street, First St., and 1st St. Using this approach is especially helpful in detecting fraudulent transactions where the perpetrator has taken some steps to manipulate values and conceal illegitimate data. However, it also typically produces an increased number of false positive results, so it should be used with appropriate caution and oversight.

Gap Tests

Gap testing is used to identify missing items in a sequence or series, such as missing checks or invoice numbers. It can also be used to find sequences where none are expected to exist (e.g., employee government identification numbers).

Pivot Tables

A *pivot table* is an interactive data summarization tool found in Excel. It is used to sort, count, total, or give the average of specified data in a spreadsheet. It is a helpful way to see the big picture of the data you are working with without having to enter in formulas. You can also perform the filter and sort functions within the pivot table.

Suppose you have a spreadsheet with sales data. A pivot table will allow you to determine how many sales occurred by month, by country, by product, by salesperson, and so on. The table will summarize these data in any way you like—for instance, in units or dollars sold. This allows the fraud examiner to make comparisons, detect patterns and relationships, discover trends, and possibly detect anomalies.

The following is an example of a pivot table made from sales data. Each row represents a salesperson, and the columns are broken out by country. The table results display the sales each salesperson made by country, and the final column is the total sales produced by each salesperson.

Sum of Amount	Country				
Salesperson	CAN	MEX	UK	USA	Grand Total
Carson	\$978	\$24,613			\$25,591
Grant	\$7,842		\$1,248		\$9,090
Hughes	\$6,777	\$1,203			\$7,980
Jamison		\$8,596		\$5,634	\$14,230
Jarrison		\$9,785	\$4,576	\$7,854	\$22,215
Miller		\$452	\$552	\$9,809	\$10,813
Parsons	\$9,846		\$2,458		\$12,304
Grand Total	\$25,443	\$44,649	\$8,834	\$23,297	\$102,223

Regression Analysis

Regression analysis is a sophisticated statistical technique that uses a series of records to create a model relationship between a dependent variable and one or more independent variables. For example, regression analysis could be used to model and predict the number of

widgets manufactured based on amounts of materials and labor used. A period in which production output is significantly lower than predicted based on this model would merit further examination.

Sort and Index

Sorting or indexing arranges the data in ascending or descending order based on the specified field(s). Depending on the values in the selected field, the data might be sorted alphabetically (e.g., names), numerically (e.g., amounts), or chronologically (e.g., dates).

Statistical Analysis

Calculating statistics—such as averages, standard deviations, highest or lowest values, and absolute values—can be a valuable early step in analyzing volumes of data to enable quick identification of unusual relationships that need further review. Additionally, comparing statistical results to industry standards, past performance, or expected relationships can provide further direction for an investigation.

Stratification

Stratification breaks the data into specific intervals, or *strata*, based on a specific field and counts the results that fall into each group. The following is an example of the results of stratifying a sample of invoices by dollar amount:

Invoice Amount	Count	% of Total	Total Amount
Less than \$1,000	87	10.5%	\$ 66,078.24
\$1,001–\$5,000	196	23.6%	\$ 782,089.00
\$5,001–\$10,000	359	43.2%	\$ 2,515,940.21
\$10,001–\$20,000	102	12.3%	\$ 1,427,527.74
\$20,001–\$50,000	68	8.2%	\$ 2,022,600.16
Over \$50,000	19	2.3%	\$ 1,298,874.96
Total:	831	100%	\$ 8,113,110.31

Date Functions

Various software programs allow users to check for differences in dates, such as invoice dates. By verifying that check disbursements are consistent, fraud examiners can ensure that no suspicious payments were arranged by an employee. Analysis programs will also allow for aging of data. Aging techniques involve analyzing data based on date. For example, a fraud examiner might look at the age of different invoices by putting them into buckets of 30, 60,

and 90 days and totaling the amounts for each bucket to look for patterns or outliers among the periods. The following is an example of accounts receivable aging.

Amounts Outstanding								
Invoice Number	Customer Name	Amount Receivable	Amount Owed	1–30 Days	31–60 Days	61–90 Days	90–120 Days	120+ Days
56987	McClintock Fabrics	\$1,250	\$250		\$250			
45365	ABC Incorporated	\$5,250	\$650	\$650				
78942	Riley's Pest Control	\$1,000	\$200			\$200		
25410	Bob's Lawn Service	\$250	\$50			\$50		
89463	Clean 4 You	\$750	\$300					\$300
97156	XYZ Corporation	\$6,250	\$1,000				\$1,000	

Benford's Law Analysis

In the 1920s, General Electric Co. physicist Frank Benford made an interesting observation while examining his logarithm book. Logarithm books were used by scientists and mathematicians to multiply large numbers before computers or calculators were available. He noticed that the first few pages of his logarithm book were more worn than the other pages. Since the first few pages of a logarithm book list multi-digit logs beginning with the digits 1, 2, and 3, he theorized that scientists spend more time dealing with logs that begin with 1, 2, or 3. He also found that with each succeeding first digit, the amount of time it was used decreased.

This observation led to a remarkable mathematical discovery: In a population of naturally occurring multi-digit numbers, the multi-digit numbers beginning with 1, 2, or 3 must appear more frequently than multi-digit numbers beginning with the digits 4 through 9. Furthermore, the first digit of the numbers will be distributed in a predictable, but unexpected, way. Instead of the frequencies of the first digit being equal (a 1 out of 9 chance for each of the digits 1 through 9), the first digit of a multi-digit number typically follows a different pattern. Predictable patterns also occur in the second and third digits of multi-digit numbers.

Benford's Law distinguishes between natural and non-natural numbers, and it is important to understand the difference between the two types because Benford's Law cannot be applied to data sets with non-natural numbers. *Natural numbers* are those numbers that are not ordered in a

particular numbering scheme and are not human-generated or generated from a random number system. For example, most vendor invoice totals or listings of payment amounts will be populated by currency values that are natural numbers. Conversely, *non-natural numbers* (e.g., employee identification numbers and telephone numbers) are designed systematically to convey information that restricts the natural nature of the number. Any number that is arbitrarily determined, such as the price of inventory held for sale, is considered a non-natural number.

Benford's Law provides that the distribution of the digits in multi-digit natural numbers is not random; instead, it follows a predictable pattern. The following table shows the expected occurrence for the distribution of the first digit in natural numbers, according to this law:

First Digit	Probability
1	30.1%
2	17.6%
3	12.5%
4	9.7%
5	7.9%
6	6.7%
7	5.8%
8	5.1%
9	4.6%
Total	100.0%

When natural numbers are present, Benford's Law maintains that certain digits show up more than others do. A 1 appears as the first non-zero digit roughly 30% of the time; 2 is the leading digit almost 18% of the time; and 9 leads off only 4.6% of the time. Moreover, 0 is most likely to be the second digit, appearing 12% of the time.

The goal of a Benford's Law analysis is to identify fictitious numbers. Many fraudsters fail to consider the Benford's Law pattern when creating false documentation or transactions to cover their tracks. Consequently, testing data sets for the occurrence or non-occurrence of the predictable digit distribution can help identify included numbers that are not legitimate.

To which data sets might Benford's Law be applied as a fraud detection tool? Mark J. Nigrini, Ph.D., is an expert on this topic. In his 2012 book, *Benford's Law: Applications for Forensic Accounting, Auditing, and Fraud Detection*, Nigrini identifies the following criteria that a data set should possess in order for Benford's Law to be valid:

- The data set should describe the sizes of similar phenomena (e.g., the monetary amount of purchase transactions).
- There should be no built-in minimum or maximum values in the data set.
- The data set should not consist of assigned numbers (e.g., account numbers, transaction numbers, purchase order numbers, or check numbers).
- The data set should have more small items than large ones (e.g., a business normally has a greater number of small transactions than larger ones).

The most common application of Benford's Law to fraud detection involves analyzing the dollar amounts of a data set consisting of business transactions. Note that Benford's Law is scale invariant under multiplication; that is, if a Benford set is multiplied by a nonzero constant (e.g., a foreign currency exchange rate), the new list of numbers will also be a Benford set.

In analyzing populations of financial transactions, Benford's Law can help uncover a wide variety of anomalies that might indicate asset misappropriations, such as:

- Shell company (fictitious vendor) schemes, in which the perpetrator makes up amounts to be used for the fraudulent invoices submitted by the supposed vendor
- Cashiers who ring fictitious refunds on cash registers
- Bid-splitting and other schemes involving limit circumvention, in which the fraudulent transactions often begin with a digit that is just below the threshold (e.g., if transactions above \$10,000 are subject to increased scrutiny, one might observe a higher-than-usual number of transactions in which the first digit of the amount begins with a 9 or an 8)

Benford's Law can also be useful in the detection of financial statement fraud. In their paper, "Data Mining Journal Entries for Fraud Detection: A Pilot Study," Roger Debreceeny and Glen Gray studied the journal entries of 29 entities and found a high correlation between Benford's Law and the first digits of the amounts in journal entries.¹ Only a handful of anomalies were found, suggesting further investigation would be necessary to determine whether fraud was involved. (Note: Debreceeny and Gray do not indicate what types of entities were included in their data, nor do they provide details of the anomalies that were identified, and these anomalies were not subject to further investigation.) Accordingly, Benford's Law may have useful applications in detecting financial statement fraud.

¹ Roger S. Debreceeny and Glen L. Gray, "Data Mining Journal Entries for Fraud Detection: A Pilot Study," 2009.

One possible application of Benford's Law to journal entries and financial statement fraud is the potential for discovery of multiple journal entries just below a limit threshold that would be subject to greater scrutiny, such as by the internal or external auditors. Similar to detecting limit circumvention associated with asset misappropriations, Benford's Law might also be used to detect numerous journal entries used to perpetrate financial statement fraud, such as recording many entries, each involving fictitious revenue.

Graphing

Data analysis programs can provide numerous types of graphs to give fraud examiners a quick glimpse of the data. For example, the following graph demonstrates that an inquiry should be made as to why November expenses are \$10,000 more than the monthly norm.

Advanced Data Analytics

Rapid technological advancements in data analytics are changing the business landscape and the way that organizations process and interpret large amounts of data. *Advanced analytic methods* examine large amounts of data using sophisticated techniques that go beyond traditional data analysis to generate new information, recognize patterns, and predict precise outcomes.

According to the ACFE's 2019 *Anti-Fraud Technology Benchmarking Report*, 55% of organizations in the study expect to increase their budgets for anti-fraud technology over the next two years.

As criminals find new ways to exploit technology, anti-fraud professionals must also adopt new technologies that are the most effective in managing ever-evolving fraud risks.

Artificial Intelligence

Artificial intelligence refers to computer systems that are able to perform human-like tasks, such as visual perception and decision-making. The term was first coined in 1956, but it has increased in popularity due to improvements in power and storage capabilities. Examples of artificial intelligence that people use every day—possibly without realizing it—include the autopilot function in commercial airplanes, spam filters in email boxes, and mapping applications for smartphones that can analyze the movement of traffic and suggest the fastest route to take to a desired location.

Employing the use of artificial intelligence in data analysis saves a company time, effort, and energy by automating mundane, repetitive, and mechanical tasks that fraud examiners would usually be responsible for completing. One method of automated fraud detection that is currently in use by Mastercard is artificial intelligence technology that helps financial institutions increase the accuracy of real-time approvals and reduces the amount of false declines. This type of artificial intelligence uses an algorithm that analyzes how a specific account is used over time to detect normal and abnormal spending habits.

MACHINE LEARNING

Machine learning, which is a subset of artificial intelligence, is a learning algorithm that enables programs to identify patterns and outliers in large data sets. This technology has the ability to uncover hidden patterns and allows fraud examiners to derive meaningful information from the data. Machine learning allows programs to improve over time by learning from the information inputted by humans or from the data points themselves.

SUPERVISED MACHINE LEARNING

With *supervised machine learning*, humans identify patterns for the programs to look for in data sets, and the programs flag any data that fit the patterns. Depending on the program or system, it might provide automatic responses to instances of flagged patterns or prompt humans to review any flagged data.

UNSUPERVISED MACHINE LEARNING

Unsupervised machine learning involves a program identifying similarities, patterns, or anomalies within a data set on its own. The program will not determine what the similarity, pattern, or

anomaly means, just that it exists. Unsupervised machine learning programs are most useful in identifying patterns in large data sets that can then be turned into rules for supervised machine learning programs.

DEEP LEARNING

Essentially a type of advanced machine learning, *deep learning* refers to a subset of artificial intelligence that uses *artificial neural networks*—systems that simulate the processes and functions of a brain—with many layers to accommodate more data and more sophisticated algorithms to identify complex patterns. Deep learning is capable of learning from unstructured and unlabeled data.

A traditional approach to fraud detection might involve flagging a transaction—one made online or a payment made by a customer that is automatically entered into a company's computer system—that exceeds a designated threshold. Deep learning techniques would be able to capture data such as time, geographic location, and the IP address of that transaction to connect additional elements that might indicate a pattern of fraud.

Predictive Analytics

Data analytics can be used to make predictions about the future. *Predictive analytics* uses historical data, along with analyses, statistics, and machine learning components, to build a mathematical model that captures important trends. This model is then used to process current data to create a quantitative prediction about future events or outcomes.

Fraud examiners can use predictive analytics to proactively identify whether future events might lead to fraud. By taking selected sets of variables known to have been involved in past fraud events and placing those same variables into predictive analysis processes, the likelihood that a future event will be fraudulent can be determined.

Robotic Process Automation

Robotic process automation (RPA) is a technology that allows for the configuration of a business program to emulate and integrate the actions of a human to execute certain business processes. RPA is useful for organizations that wish to increase efficiency and automate repetitive manual tasks.

One of the benefits that RPA provides in fighting fraud is the lessening of human interaction in day-to-day tasks. When employees are responsible for inputting data into systems, there is

an opportunity for them to manipulate the data for personal gain. By fully automating certain tasks, employees are turned into reviewers rather than inputters. Also, by limiting human interaction, RPA mitigates the risk caused by human error.

Examples of Data Analysis Queries

The following are typical examples of data analysis queries that can be performed by data analysis software.

General Ledger Analysis

The following are examples of data analysis queries that can be performed to detect fraud through examination of the general ledger:

- Select specific journal entries for analysis.
- Create actual-to-budget comparison reports.
- Analyze and confirm specific ledger accounts for legitimate transaction activity.
- Speed account reconciliation through specialized account queries.
- Calculate financial ratios.
- Calculate percentage comparison ratios between accounts.
- Prepare custom reports, cash flow, profit/loss, and asset and liability total reports.
- Compare summaries by major account in any order (low-high, high-low).
- Create reports in any format by account, division, department, etc.

Accounts Receivable

The following are typical examples of data analysis queries that can be performed to detect fraud by examining accounts receivable records:

- Create a list of customer limit increases and decreases.
- Age accounts receivable in various formats.
- Identify gaps in sequential forms such as invoices.
- Identify duplicate invoices or customer account numbers.
- Show specified reports on credits taken by customers.
- Report customer summaries by invoice, product, etc.
- Identify customer activity by age, product, etc.
- Compare customer credit limits and current or past balances.

Sales Analysis

The following are typical examples of data analysis queries that can be performed to detect fraud through examination of sales information:

- Create a report of all system overrides and sales exceptions.
- Analyze returns and allowances by store, department, or other areas.
- Summarize trends by customer type, products, salesperson, etc.
- Compare ratios of current sales to outstanding receivables or other variables.
- Generate reports on a correlation between product demand or supply and sales prices.

Accounts Payable

The following are examples of data analysis queries that can be performed to help detect fraud through examination of accounts payable:

- Audit paid invoices for manual comparison with actual invoices.
- Summarize large invoices by amount, vendor, etc.
- Identify debits to expense accounts outside of set default accounts.
- Reconcile check registers to disbursements by vendor invoice.
- Verify vendor tax forms (e.g., U.S. Form 1099 or Value Added Tax [VAT] forms).
- Create vendor detail and summary analysis reports.
- Review recurring monthly expenses and compare to posted/paid invoices.
- Generate a report on specified vouchers for manual audit or investigation.

Asset Management

The following are examples of data analysis queries that can be performed on asset accounts to help detect fraud:

- Generate depreciation to cost reports.
- Compare book and tax depreciation and indicate variances.
- Sort asset values by asset type or monetary amount.
- Select samples for asset existence verification.
- Recalculate expense and reserve/provision amounts using replacement costs.

Cash Disbursement

The following are typical examples of data analysis queries that can be performed to detect fraud through examination of cash disbursement records:

- Summarize cash disbursements by account, bank, department, vendor, etc.
- Verify audit trail for all disbursements by purchase order, vendor, department, etc.
- Generate vendor cash activity summary for analysis.
- Identify disbursements by department, supervisor approval, or amount limits.

Payroll

The following are examples of data analysis queries that can be performed to help detect fraud through examination of payroll records:

- Summarize payroll activity by specific criteria for review.
- Identify changes to payroll or employee files.
- Compare timecard and payroll rates for possible discrepancies.
- Prepare check amount reports for amounts over a certain limit.
- Check proper supervisory authorization on payroll disbursements.

Purchasing

The following are examples of data analysis queries that can be performed on purchasing records to help detect fraud:

- Track scheduled receipt dates versus actual receipt dates, in summary and detail.
- Compare vendor performance by summarizing item delivery times and amounts.
- Isolate purchase order types for analysis.

Data Analysis Checklist

The following are some key issues to address as one conducts a data analysis:

- *Ensure data validity and data integrity.* There are always concerns when the fraud examiner moves data from one place to another. One of the concerns is data validity. Are the data valid and pertinent to the investigation? Another concern is data integrity. Are the valid data that were selected correct? A simple check or audit of the validity and integrity of the data should be the first step in the data analysis.
- *Consider data format and structure.* This consideration is important when the fraud examiner wishes to import or export data with their computer. A date can be formatted into a number of different styles, such as mm/dd/yyyy. The structure of the data will also be important, along with the extension. A text file will have a .txt extension associated with it. In what format are the current data? What format will the computer require? How does the fraud examiner get the data from here to there if the data formats and structures are different?
- *Compare the cost and benefit of potential analysis.* The fraud examiner should perform a preliminary analysis to ensure that the key strategic issue they are about to develop is worth the effort before initiating a fraud investigation.
- *Consider the spectrum of distinct levels of aggregation at which fraud monitoring is required.* Determine the lowest level (transaction level), the highest level (multiparty criminal conspiracies), and the intervening layers that might be present in your industry and respective data.

- *Begin with the end in mind.* In his book, *The Seven Habits of Highly Effective People*, Stephen Covey states that it is a good idea to begin with the end in mind. When the fraud examiner develops their fraud intelligence action plan, they must consider the end result. One question to ask might be, “Will this algorithm/consultant hold up under the intense scrutiny of a court of law?”

Scheme-Specific Data Analysis Tests

Data analysis tests are useful for many types of fraud investigations. Whether the suspected scheme is a case of asset misappropriation, corruption, or financial statement fraud, there are often ways that data analysis can detect or offer insight into the fraud. For more information on these schemes, refer to the Financial Transactions and Fraud Schemes section of the *Fraud Examiners Manual*.

There are thousands of potential applications for data analysis in the anti-fraud profession. The following are a handful of examples to demonstrate how fraud examiners can use data analysis techniques to detect various types of schemes.

Asset Misappropriation

Asset misappropriation covers the largest percentage of occupational frauds committed. Data analysis can be helpful during these investigations, especially at organizations with many employees, customers, or transactions. Any of these factors can lead to a large amount of data needing to be parsed through and can make manual searches impractical.

One common asset misappropriation scheme is the ghost employee scheme. A ghost employee is someone who is on the payroll register but who does not actually work for the company. Finding ghost employees often coincides with an internal fraud scheme.

After gathering data, a fraud examiner would first need to determine what kind of tests to run if they suspected a ghost employee scheme. The following are some tests that can help to uncover ghost employee schemes:

- Multiple employees using the same bank account for direct deposit
- An employee using multiple bank accounts for direct deposit
- Invalid or blank tax/government identification numbers
- Multiple employees with the same tax/government identification number
- Multiple employees with the same home address
- Employees with PO Box addresses

- Employees with more than one address change within a year
- Employees on the payroll register prior to their start date or after their termination date
- Non-salaried employees on the payroll register but not in the timekeeping system
- Employees on the payroll register but not in the employee master file
- Manual payroll checks
- Multiple paychecks issued to an employee within a single pay period
- Employees with no deductions for taxes or benefits (where applicable)
- Bonuses paid during times when bonuses are not typically paid or to employees who are not normally eligible for bonuses
- Employees with no pay increases, or more than two pay increases, in the past year
- Employees with no paid time off, vacation time, or sick leave used

To get an idea of what a couple of these tests would look like using CaseWare IDEA Inc.'s IDEA Data Analysis software, look at the following examples.²

² The examples provided by software providers in this manual are for illustrative purposes only. The ACFE has no affiliation with any of these data analysis software providers.

Corruption

Data analysis can also help during examinations involving suspected corruption schemes. Corruption schemes involve the employee's use of their influence in a business transaction in a way that violates their duty to their employer for the purpose of obtaining a benefit for themselves or someone else. Bribes, kickbacks, extortion, and other similar devices are common in corruption schemes.

The fraud examiner should determine which types of tests apply to the case. Some examples of corruption-related tests include the following:

- Look for excessive quantities of inventory based on sales.
- Look for obsolete inventory based on quantity sold.
- Identify duplicate payments.
- Stratify vendor payments by approval limits, especially those directly below the approval limit.
- Calculate the ratio of the largest purchase to the next largest purchase by vendor.
- Summarize by vendor the number of inferior goods based on number of returns.
- Match the vendor master file to the employee master file on various key fields.
- Extract round-dollar payments and summarize by vendor.
- Identify payments with little or no sequence between invoice numbers.
- Summarize invoice payments by type of purchase and identify areas with fewer than three vendors.
- Calculate total purchases by ordering clerk and by vendor.
- Compute total business volume by agent and by vendor.
- Match contract price to invoice and report on variances.
- Stratify inventory actual price to standard price.
- Identify higher-than-average inventory costs.
- Compare order quantity to optimal reorder quantity.
- Identify delivery of inventory to employee address by joining employee address to shipment address file.
- Identify delivery of inventory to address not designated as a business address.
- Compare inventory levels and turnover rates.
- Match quantities ordered to quantities received.
- Calculate unit price by product.
- Identify cases in which inventory was written off and then a new purchase was made by comparing total write-off and purchase quantities by stock number.
- Calculate the total number and total value of contracts by contracting officer and by vendor.

- Calculate average value of contracts awarded by vendor.
- Calculate the percentage contract awards by vendor (contracts won divided by total number of bids).
- Calculate the percentage of sole-sourced contracts by vendor (contracts sole-sourced divided by total number of contracts).

EXAMPLE: ROUND-DOLLAR PAYMENTS

Financial Reporting Schemes

If the fraud examiner suspects that someone intentionally misstated or omitted financial statements or disclosures to deceive the users of the financial statements, data analysis techniques can aid the examination.

In addition to traditional horizontal, vertical, and ratio analyses often performed on the financial statements by auditors, the following techniques can help identify anomalies in financial reporting activities:

- Track year-to-date activity for large operating accounts.
- Compare summaries by major account in any order (e.g., low-to-high, high-to-low).
- Identify employees who made a large number of adjustments or reversing entries.
- Calculate and sort percentage variances in accounts between periods.
- Recompute trial balances.
- Prepare account reconciliations.
- Identify large adjustment transactions.
- Review transactions posted at unusual times.
- Review transactions posted on unusual dates.
- Review suspense transactions activity for appropriate and timely clearing and offsets.
- Review transactions split among a large number of general ledger accounts.
- Review transactions with large even-dollar amounts.
- Review debit balances in accounts that have normal credit balances, and vice versa.
- Review manual postings to auto-posted accounts.

Textual Analytics

Data analysis in the traditional sense involves running rule-based queries on structured data, such as that contained in transactional databases or financial accounting systems. This type of analysis can yield valuable insight into potential frauds. But, a more complete analysis requires that fraud examiners also consider unstructured data.

Data are either structured or unstructured. *Structured data* are the type of data found in a database, consisting of recognizable and predictable structures. Examples of structured data include sales records, payment or expense details, and financial reports. *Unstructured data*, by contrast, are data that would not be found in a traditional spreadsheet or database. They are typically text based.

Unstructured Data Sources

The amount of unstructured data is increasing significantly in most organizations. Employees are sending and receiving more email messages each year, retaining more electronic source documents, and using more social media tools. Unstructured data come from numerous sources, such as:

- Emails
- Journal entry explanations
- Social media posts
- Instant messages
- Videos
- Voice files
- User documents
- Mobile phone software applications
- News feeds
- Sales and marketing material
- Presentations

Textual analytics is a method of using software to extract usable information from unstructured text data. Through the application of linguistic technologies and statistical techniques—including weighted fraud indicators (e.g., fraud key words) and scoring algorithms—textual analytics software can categorize data to reveal patterns, sentiments, and relationships indicative of fraud. For example, an analysis of email communications might help fraud examiners to gauge the pressures/incentives, opportunities, and rationalizations to commit fraud that exist in an organization.

Textual analytics provides the ability to uncover additional warning signs of potentially fraudulent employee behavior. The following are some examples of how to take unstructured data analytics to the next level:

- Emotive tone—happy, sad, angry, confused communications
- Unethical behavior—harassing, secretive, cursing
- Entity extraction
- Text link analysis
- Social network analysis
- Fraud Triangle analytics

Fraud Key Words

Depending on the type of fraud risk present in a fraud examiner's investigation, they will want to come up with a list of fraud key words that are likely to suggest suspicious activity. This list will depend on the industry, fraud schemes, and the data set the fraud examiner has available. In other words, if they are running a search through journal entry details, they will likely search for different fraud key words than if they were running a search of emails. It might be helpful to look at the Fraud Triangle when coming up with a keyword list.

The factors identified in the Fraud Triangle are helpful when coming up with a fraud keyword list. Consider how someone in the entity under investigation might have the opportunity to commit fraud, be under pressure to commit fraud, or be able to rationalize committing fraud.

Pressure

Many people commit fraud because of something that has happened in their life that motivates them to steal. Maybe they find themselves in debt, or perhaps they must meet a certain goal to qualify for a performance-based bonus. Key words that might indicate pressure include *deadline, quota, trouble, short, problem, and concern*.

Opportunity

Think of words that would indicate someone has the opportunity or ability to commit fraud. Examples include *override, write off, recognize revenue, adjust, discount, and reserve/provision*.

Rationalization

Most fraudsters do not have a criminal background. Therefore, justifying their actions is a key part of committing fraud. Some key words that might indicate a fraudster is rationalizing their actions include *reasonable, deserve, and temporary*.

The Fraud Triangle is a good place to start when developing a keyword list, but also consider the nature of the entity's industry and the types of payments made or suspected of being made. Think about the fraud schemes that are likely to have occurred. Does the entity do a significant amount of work overseas or have many contractors? If so, there might be a high risk of bribery. Focus on the payment text descriptions, since no one calls it "bribe expense." Some examples of words in payment descriptions that should get special attention include:

- *Goodwill payment*
- *Consulting fee*
- *Processing fee*

- *Incentive payment*
- *Donation*
- *Special commission*
- *One-time payment*
- *Special payment*
- *Friend fee*
- *Volume contract incentive*

Any payment descriptions bearing these or other similar terms warrant extra attention to check for reasonableness. Also, be wary of large cash disbursements that have a blank payment description.

Sentiment Analysis

Another way to discover fraud clues hidden in text is to consider the emotional tone of employee correspondence. In emails and instant messages, for instance, a fraud examiner should identify derogatory, surprised, secretive, or worried communications. In one example, former Enron Chief Executive Officer (CEO) Ken Lay's emails were analyzed, revealing that as the company came closer to filing bankruptcy, his email correspondence grew increasingly derogatory, confused, and angry. This type of analysis provided powerful evidence that he knew something was wrong at the company.

While textual analytics can be extremely revealing and can provide clues for potential frauds that might otherwise go unnoticed, it requires the use of sophisticated software, as well as a thorough understanding of the legal environment of employee rights and workplace searches. Consequently, fraud examiners who are considering adding textual analytics to their fraud detection arsenal should consult with technological and legal experts before undertaking such techniques.

Visual Analytics

Even with the sophisticated data analysis techniques previously discussed, some data are so vast or complex that they remain difficult to analyze using traditional means. Visually representing data via graphs, heat maps, link diagrams, time-series charts, word clouds, and other illustrative representations can bring clarity to a fraud examination.

The utility of visual representations is enhanced as data grow in volume and complexity. Visual analytics build on humans' natural ability to absorb a greater volume of information in visual rather than numeric form and to perceive certain patterns, shapes, and shades more easily than others. By using mathematical techniques to evaluate patterns and outliers, effective visuals can translate multidimensional data such as frequency, time, and relationships into an intuitive picture.

Fortunately for fraud examiners, many data analytics software programs—including those for conflict checking, link analysis, and timeline analysis—feature visual analytic tools to help uncover relationships, patterns, and other important insights into data.

Heat Maps

A heat map is a graphical representation of data where the individual values contained in a matrix are represented as plots or colors. While not typically used in the detection of fraud, heat maps are an effective visual tool for internal auditors and risk management teams when conducting a fraud risk assessment. The vulnerability an organization faces to different fraud schemes is determined by plotting their likelihood and significance on a heat map.

EXAMPLE: HEAT MAP

Tree Maps

One type of heat map that uses data analysis to detect fraud is the tree map. A *tree map* is a type of heat map in which rectangular space is divided into regions and then each region is divided again for each level in the hierarchy. The size and shading of the rectangles represent two additional data points, allowing the viewer to identify patterns in complex data.

Tree maps are especially effective in showing data represented by several dimensions (e.g., region, department, line of business, product, account, and time period). The hierarchical structure provided by tree maps can reveal multi-faceted information more quickly than spreadsheets, bar charts, or line graphs.

Link Analysis

Link analysis is a type of software used by fraud examiners to create visual representations (e.g., charts with lines showing connections) of data from multiple data sources to track the movement of money; demonstrate complex networks; and discover communications, patterns, trends, and relationships.

A fraud examiner might use link analysis to determine whether collusion exists between employees and third parties. The fraud examiner might obtain data and compare attributes such as names, phone numbers, and addresses. Linking these attributes to identify common themes or links might reveal connections that could be an indicator for fraud. The diagram below represents how fraud examiners can use link analysis to detect similar attributes using data from various profiles within a financial institution. For example, Mike Jones shares a mobile phone number with Michael Witt. Robert Jones and Michael Witt share the same address. Shared links between these attributes can be indicative of fraud occurring within an organization.

EXAMPLE: LINK ANALYSIS BY ATTRIBUTE

Link analysis is very effective for identifying indirect relationships and relationships with several degrees of separation. For this reason, link analysis is particularly useful when conducting a money laundering investigation because it can track the placement, layering, and integration of money as it moves around unexpected sources. It could also be used to detect a fictitious vendor (shell company) scheme. For instance, the investigator could map visual connections between a variety of entities that share an address and bank account number to reveal a fictitious vendor created to embezzle funds from a company.

The following are some other examples of the analyses and actions fraud examiners can perform using link analysis software:

- Associate communications—such as email, instant messages, and internal phone records—with events and individuals to reveal connections.
- Uncover indirect relationships, including those that are connected through several intermediaries.
- Show connections between entities that share an address, bank account number, government identification number (e.g., Social Security number), or other characteristics.
- Demonstrate complex networks (including social networks).

Geospatial Analysis

Imagine a listing of vendors, customers, employees, or financial transactions of a global company. Most of the time, these records will contain a reference to a location, including country, state, city, and possibly specific street address. By visually analyzing the size or frequency of events in different geographical areas, a fraud investigator has yet another variable with which they can make inferences.

It is important for a fraud examiner to understand the relevance of the location in which events occur to determine and discover patterns in suspicious behavior. In a geospatial analysis, visual analytics depict intersections between various types of data and their corresponding geographical location, helping to uncover a hidden relationship or unknown trend, such as those present in a bribery or corruption scheme.

Geospatial analysis is also especially useful in uncovering fraudulent insurance claims; an insurance fraud ring might be far more obvious when an analyst plots claims data on a map rather than listing them on a spreadsheet. Additionally, analyzing accounts payable and travel and expense risk scoring and overlaying them by the vendor payment or expense location on a geospatial map can help identify high-risk regions.

Timeline Analysis

Timeline analysis software aids fraud examiners in transforming their data into visual timelines. These visual timelines enable fraud examiners to:

- Highlight key times, dates, and facts.
- More readily determine a sequence of events.
- Analyze multiple or concurrent sequences of events.

- Track unaccounted for time.
- Identify inconsistencies or impossibilities in data.

Word Clouds

A word cloud is a visual representation of key words in which the size of each word indicates its frequency or importance. Word clouds can quickly identify areas where more analysis or attention might need to be focused. In the word cloud below, results indicate that the key words *data*, *fraud*, and *analysis* are frequently used. Fraud examiners might use this visual aid to view results from a keyword search of documents, such as emails used during an investigation.

EXAMPLE: WORD CLOUD

Evaluating Data Analysis Software

When evaluating data analysis software, a fraud examiner should consider the following minimum requirements:

- *Data import/export capabilities:* Considering your data format and structure, how easily are data imported/exported?
- *Data visualization:* How easy is it to move your data from a spreadsheet into a graphic for analysis and interpretation?
- *Look for a suite of tools:* There is no single software program for the fraud examiner's fraud intelligence efforts. Therefore, they should choose the most appropriate set of tools according to their available data and then select the software that best fits their current and future needs.

Develop two methods of using the computer to acquire fraud intelligence: Use commercial software currently on the market and begin collaborative activities with the academics at your

local university. There are numerous software packages in various stages of development in academia that are in need of data to be tested. This can prove to be a win-win for both parties. The fraud examiner has the data and the academics have the prototype software.

Tailoring Data Analytics Software for Your Organization

Because no single software tool can satisfy all user purposes, fraud examiners must consider the applications with respect to their client's or organization's particular needs. Ken Collier—an expert in data warehousing, business intelligence, software engineering, and agile methods—and his colleagues established a framework for evaluating data mining software.³ The framework divided the criteria into the following four areas:

- *Performance*: Performance refers to the ability to handle a variety of data sources.
- *Functionality*: Functionality refers to the variety of capabilities, technical methods, and methodology for data mining included in the program.
- *Usability*: Usability refers to the conformation of different levels and types of users without losing usefulness or functionality.
- *Support of additional activities*: Additional task support permits the user to perform the variety of tasks that support data mining.

When creating or updating data analysis techniques, organizations choose a *platform*—the combination of hardware, software, and labor necessary to run the program. Some small organizations create in-house programs. While these can work, they can also be problematic, even if they function properly. Regulators might want to review the organization's controls at some point and might find an in-house program difficult to navigate compared to standard commercial options. Moreover, labor turnover might cause significant disruption, depending on how hard the program is to learn.

Commercial options also have downsides that should be avoided. There are many types available, and some representatives selling the platform will be more interested in maximizing the sale rather than suiting the needs of the organization. Beyond unnecessary costs, a platform that does not suit the organization will either not detect the transactions it needs to, or will return too many false positives (i.e., target suspicious items that turn out to be legitimate), making it hard for analysts to filter the transactions for review.

³ Ken Collier, Bernard Carey, Donald Sautter, and Curt Marjaniemi, "A Methodology for Evaluating and Selecting Data Mining Software," (IEEE, Proceedings of the 32nd Hawaii International Conference on System Sciences, 1999).

Because every organization has different needs, there is not one solution that will work for every company. Organizations should look to the best practices in their industry to see what platforms are most effective. Additionally, shopping around with commercial software product representatives will help determine which measures are necessary and which are cumbersome. A person with experience in developing platforms for similarly situated organizations should give input into the process.

Evaluating Data Mining Consultants

If an entity intends to use a data mining consultant, the following qualities should be assessed:

- *Innovation*: How does the individual stay current? Look for professional associations, publications, and training in your area of investigation.
- *Creativity*: Can the individual work in a creative environment, such as fraud intelligence? Can the individual work unsupervised and be expected to produce results? Because fraud is a moving target, how has a past client's platform altered from the original investigation? Why/how did that occur? What were the results?
- *Experience*: Does the individual have experience in the type of investigation you are planning? Does the individual have experience in the type of software/tools you are planning to use? Does the individual have experience in the type of data you have?

This expertise might take one, two, three, or more people. It is necessary to have people who understand what it is they are looking for—and what they can do with it once they find it.

Types of Data Mining and Analysis Software

There are many types of data mining and data analysis software on the market these days, and every year, new products and new versions of old products emerge. Because every fraud examination involving data analysis is different, it would be impossible to recommend one software product to serve every purpose. Choosing a data analysis tool is something that the fraud examiner must evaluate on each individual case. A fraud examiner should research applications intensively to decide which package is most appropriate for the current investigation. The most prominent data analysis software applications are listed below.

- Galvanize (www.wegalvanize.com)
- CaseWare IDEA (<https://idea.caseware.com/products/idea>)
- Microsoft Excel (www.microsoft.com/en-us/microsoft-365/excel)
- ActiveData for Excel (www.informationactive.com)
- AutoAudit (www.refinitiv.com/en/products/autoaudit-internal-auditor-software)

- Altair (www.altair.com/data-analytics-applications)
- Arbutus (www.arbutussoftware.com)
- Oversight (www.oversight.com)
- SAS (www.sas.com)
- Tableau (www.tableau.com)
- IBM Analytics (www.ibm.com/analytics)

Reporting and Case Management Software

There are a number of reporting and case management programs that can assist the fraud examiner in managing the data and information gathered during an examination. These programs can also be used to create reports, graphs, and charts of a particular case. Some of the most useful programs for fraud investigations include:

- IBM's i2 Anaylst Notebook (www.ibm.com/products/analysts-notebook)
- CaseMap by LexisNexis (www.lexisnexis.com/en-us/products/casemap.page)
- NICE Actimize's Enterprise Risk Case Manager (www.niceactimize.com/enterprise-risk-case-management)
- Xanalys Suite (www.xanalys.com)
- Regulatory DataCorp (<https://rdc.com>)
- Refinitiv's World-Check Risk Intelligence (www.refinitiv.com/en/products/world-check-kyc-screening)
- Accuity (<https://accuity.com/product/firco-insight>)
- GlobalVision Systems (www.gv-systems.com)
- i-Sight (<https://i-sight.com/software>)
- TeamMate Solutions (www.teammatesolutions.com)

DIGITAL FORENSICS

The presence of the internet and other technology in all aspects of life facilitates opportunities for technology to be used in perpetrating almost every type of fraud, and in most fraud cases, fraud examiners gather some type of digital evidence.

Fraud examiners must, therefore, be prepared to address the myriad issues related to examinations involving digital evidence.

Conducting an Investigation Involving Computers

Since virtually every modern investigation will conceivably involve computers and some form of digital evidence, fraud examiners must be aware of important distinctions in terminology and technologies, as well as the limits of their own technical expertise. Many circumstances will require the assistance of trained professionals with specialized knowledge related to extracting, recovering, handling, and preserving digital evidence.

Digital Investigations Versus Digital Forensics

While the term *digital investigation* might at first appear synonymous with *digital forensics*, there is an important distinction between the two. *Digital investigations* are investigations that involve relevant digital data processed or stored by *digital devices*—devices that process data in the form of numbers (digits). Digital devices can be used to communicate with others, create documents, access data online, input data online, and store information. A fraud examiner leading an investigation into a crime that involves a digital device is not necessarily—and, in most cases, should not be—the digital forensic examiner.

Conversely, *digital forensics* encompasses the recovery and investigation of material found in digital devices.

It is important to keep digital investigations and digital forensics separate. Combining the two, especially in cases in which the suspect is already named, will invite questions about the forensic examination's objectivity. Also, combining the two could subject fraud examiners to unwelcome scrutiny regarding whether they suppressed exculpatory evidence that might have been found during an examination by a more objective digital forensic examiner.

Hiring Digital Forensic Experts

When conducting an examination involving computers, fraud examiners should determine whether a digital forensic expert is needed. *Digital forensic experts* are trained professionals who specialize in identifying, recovering, collecting, preserving, processing, and producing digital data for use in investigations and litigation. Some organizations have their own in-house personnel whom they have trained and provided with the proper equipment and software tools to conduct the examination and analyze digital evidence, while others might prefer the use of an outside examiner who will be able to conduct a thorough examination, prepare a proper report, and deliver expert testimony if needed in legal proceedings.

Sometimes retrieving digital data is as easy as searching the target computer's hard drive, but other times, retrieval requires a thorough knowledge of computers. For example, many fraudsters delete or hide incriminating files, and in these instances, efforts must be made to recover or find such data. There are, in fact, a variety of ways of recovering deleted or hidden data from a target computer, and digital forensic experts are specially trained for such tasks.

Specifically, digital forensic experts are capable of analyzing digital media at the hexadecimal level, which means that such experts can view every sector, and all the bytes in those sectors, on a system. Thus, digital forensic experts can recover data from deleted files, both those that have been purposefully deleted and those that were accidentally deleted. Deleted files are recoverable until they are overwritten because data are not erased from a computer's hard drive until the operating system overwrites all or some of the files. So, deleted files that have been overwritten generally are not recoverable. Digital forensic experts can also recover temporary auto-save files, print-spool files, deleted emails, and deleted link (shortcut) files, and they can work with data at the hexadecimal level. The hexadecimal level contains various items found in restore points and registry files that define hardware, such as external drives and websites visited, in addition to the document revisions and files created and maintained by the user.

Digital forensic experts can recover, among other things, the following types of information from computer systems:

- Deleted files and other data that have not been overwritten (e.g., deleted documents, images, link or shortcut files, and email messages)
- Files deleted through computer-automated processes
- Temporary auto-save files
- Print-spool files

- Websites visited, even where the browser history and cache have been deleted
- Communications sent via chat or instant messenger
- Financial-based internet transactions
- Documents, letters, and images created, modified, or accessed, even if the data were not saved on the computer in some situations
- Data that have been copied, corrupted, or moved
- The time and date information about files (e.g., when files were created, accessed, modified, installed, deleted, or downloaded)
- Data from a drive that has been defragmented or reformatted

Modern hardware and operating systems allow computer systems to store extensive information about how people use their computers, and therefore, digital forensic examiners are able to uncover a large amount of data that relates to the use of a computer, what is or has been stored on it, and the details about the computer's user.

Moreover, digital forensic experts have special tools and software designed to facilitate a thorough and legally sufficient analysis of items that contain digital evidence. It is important to allow a trained digital forensic expert to conduct a proper seizure and examination on a piece of evidence that might contain relevant digital information, so the fraud examiner will have the best chance of using that evidence in a legal proceeding.

Whether technical specialists are needed to assist with an investigation will depend on the complexity of the examination required. The more technical the nature of the crime, the more technical and specialized the analytical skills required. Some computer investigations do not require sophisticated technical skills. For example, in cases where the computer is the instrument used to commit the crime (e.g., scams involving payroll applications, accounting irregularities, fraudulent electronic funds transfers, or insider trading), the fraud examiner need only know how to search a database and analyze the results.

Additionally, the determination as to whether a technical specialist is needed depends on the fraud examiner's skill level. Therefore, a fraud examiner conducting an examination involving computers must have a clear understanding of their own skill level and limitations in the field of computer technology because, in many instances, one or more technical specialists are needed to assist with an investigation.

Within the computer forensics field, there are several different types of technical specialists:

- *Operating and file system experts:* These experts are proficient in certain operating systems (e.g., Windows Vista, Windows 7, Windows 10, Linux, OS X, and macOS) and the various file systems they employ (e.g., Joliet, NTFS, FAT, VFS, Ext2), and they have the ability to convey operational characteristics and observe artifacts.
- *Data recovery experts:* These experts operate clean rooms designed to magnetically extract information from a damaged media source. Using special tools and equipment, these experts can disassemble a hard disk, separate the platters, and extract and reassemble the information for subsequent examination.
- *Recording and archival extraction experts:* These are experts in extracting information from tapes, digital media, or other system backups. Typically, backup solutions archive data in proprietary formats, making extraction very cumbersome.
- *Intrusion and malicious code experts:* These experts specialize in investigating computer network intrusions and can determine attack vectors, the tools employed, what occurred during access, and what, if anything, was taken.

Given the diversity of computer-related fraud, no person can be an expert in all aspects of computer technology.

Fraud examiners must be diligent when deciding to hire a digital forensic expert. The best way to hire an expert is to follow a few simple guidelines:

- Ask colleagues for referrals.
- Make sure the expert is properly licensed (if required) and insured.
- Ask the expert if they have worked on the type of case or technology that is at issue, and if so, what they were retained for and the outcome.
- Set up a budget for the investigation.
- Make sure there is a comfortable relationship and good communication between the client and the expert.
- Listen to the expert because they might have new, unique ideas and suggestions that were not previously considered.

Determine the Need for Law Enforcement Assistance

Once an organization has received evidence that misconduct involving digital devices has occurred, it should determine the need for law enforcement assistance. If it is determined that the victim organization will make a formal referral to law enforcement or a prosecuting

agency, then the organization should notify the authorities before conducting an investigation to determine whether law enforcement personnel should participate in the examination.

Digital Evidence

Digital evidence is information stored or transmitted in binary form (i.e., ones and zeroes) that can be used to prove something. And again, the proliferation of digital technologies has created new opportunities for technology to be used in perpetrating almost every type of fraud. Consequently, fraud examiners will gather some type of digital evidence in almost all fraud examinations.

Generally, when digital evidence is collected in an investigation, the facts at issue involve a computer, either as (1) a target of a criminal act, (2) an instrument of crime, or (3) a repository of evidence associated with the crime.

Computers themselves can be the targets of crime. Crimes committed against computers include computer and computer-component theft, system intrusions, unauthorized access, denial of service, software piracy, and software theft, to name a few.

Computers are often used to facilitate criminal conduct. When this occurs, the computer is known as the *tool* or *instrument* of crime.

Additionally, computers can be repositories of evidence associated with a crime. Generally, in an examination involving computers, the fraud examiner attempts to locate the storage of potential digital evidence, in one form or another, on the computer system. The computer system involved in the investigation is a potential repository of evidence whether the user intended to store an item or not. Therefore, in such situations, the fraud examiner is interested in incriminating or exculpatory evidence that the user intentionally or unintentionally stored on the computer system.

Volatility of Digital Evidence

Digital evidence is more volatile than tangible information because data can be altered or destroyed more easily than tangible information. Digital data are, by design, fragile and transient in nature; they are easily manipulated, substituted, modified, and deleted.

Generally, if a computer system is on, its files will be changing. Operating systems and programs frequently alter, delete, and modify digital data, and this might happen

automatically. Moreover, if a user interacts with a system, its files will change. In fact, digital information can be altered by seemingly harmless actions, such as shutting down a running system, starting up a system, or looking through files on a running computer. Also, if a computer system is connected to a network, its files will be changed.

The following is a list of some actions that can alter, delete, or modify data that is potentially relevant to an investigation:

- Using or interacting with a computer system
- Clicking on files or folders on a computer, which will result in information being written to the system's hard drive and could potentially overwrite valuable evidence
- Turning systems on or off
- Visiting websites
- Using software applications
- Downloading or transferring files

Because digital evidence can be easily altered or destroyed, the integrity of digital evidence must be preserved. Data that have been altered or destroyed are considered violations of data integrity. What is more, the alteration or destruction of digital evidence is irreversible. So, once the integrity of digital evidence has been violated, it usually cannot be restored.

The failure to preserve the integrity of digital evidence could result in several adverse consequences. For one thing, the failure to preserve the integrity of digital evidence could result in the government's questioning of the integrity of any evidence collected in a fraud investigation.

For another thing, digital evidence that is destroyed when litigation is expected, or in progress, might give rise to claims of spoliation of evidence, which, if proven, could lead to monetary fines and sanctions, adverse inference jury instruction sanctions, or dismissal of claims or defenses. *Spoliation* is broadly defined as the act of intentionally or negligently destroying documents relevant to litigation.

Additionally, the failure to preserve the integrity of digital evidence could result in evidence being deemed inadmissible in a legal proceeding, or, even if admitted, it might not be given much weight because evidence of questionable authenticity does not provide reliable proof.

Generally, evidence will not be admitted (or it might not constitute reliable proof of what it is offered to prove) unless it is authenticated. Evidence is authenticated when the party offering the item produces some evidence (e.g., testimony from a person with direct knowledge) to show it is, in fact, what the party says it is and to show it is in the same condition from the moment it was seized until it is used in court. Thus, if it is determined that a piece of digital evidence cannot be authenticated, it might not be admitted even if it is plainly relevant, or it might be rejected because it is deemed unsuitable to prove the facts in question.

Although digital evidence is different from—and more volatile than—tangible evidence, the rules regarding the admissibility of digital evidence in court are really no different from the rules regarding the admissibility of any other type of evidence.

The rules of admissibility, however, differ in civil law and common law systems. Because civil law systems do not rely on juries as common law systems do, there are fewer limitations on the admissibility of evidence in civil law jurisdictions than in common law ones.

Generally, in civil law systems, evidence is admitted if the presiding judge determines it is relevant, even if the authenticity of an item of evidence is in question. But even though any relevant evidence is admissible, the court will evaluate how much weight is to be given to an item of evidence, and courts consider authenticity when determining what weight is appropriate for evidence. Authentic evidence is reliable proof of what it purports to show, but evidence that lacks authenticity is not reliable proof of what it purports to show. So, even if an item of evidence of questionable authenticity is admitted, it will not be given much weight because it will not be helpful to a fact finder due to the fact that such evidence is not reliable proof of what it purports to show.

In contrast, the common law contains several rules that restrict admission of evidence. But generally, to be admitted into evidence in common law systems, evidence must be:

- *Relevant to an issue that is in dispute in the case*: Relevant evidence is evidence that tends to make some fact in issue more or less likely than it would be without the evidence.
- *Material*: Material evidence is evidence that has important value to a case or that can be used to prove a point. Repetitive or additive evidence is nonmaterial evidence.
- *Established as authentic*: Again, to be admissible, evidence must be established as authentic, which requires proof to show the item is, in fact, what the party offering the item says it is and to show the item has remained in the same condition from when it was initially seized until its use in court.

Therefore, if fraud examiners collect digital evidence, they should be able to state unequivocally that the evidence was not changed in any way by their actions. This requires that strict forensic methodologies be followed to satisfy the stringent evidentiary standards necessary to ensure the integrity of the evidence beyond a reasonable doubt for presentation in court. That is, digital evidence must be properly preserved in a forensically sound manner so that it will be admissible.

Locating Digital Evidence

To conduct a successful examination, fraud examiners must know what to look for and where to look for it, but this can be difficult because digital data can be stored in large volumes and in a number of different locations. For example, the fraud examiner should know where to look for information on any suspect computer systems, information on a suspect's workstation (including any peripherals or other portable media devices that contain data), information stored on any network from which the suspect's traffic flows, and information stored in cloud storage services.

This discussion examines where digital evidence might be located on computer systems, workstations and peripheral devices, networks, mobile devices, and cloud environments.

COMPUTER SYSTEMS

A wealth of information can be recovered and analyzed on seized computer systems. Common files containing evidence stored in computer systems include user-created files, user-protected files, and computer-created files.

USER-CREATED FILES

User-created files are digital files created under the user's direction, and these files include text-based documents, spreadsheets, databases, emails, address books, presentation slides, audio/video files, image files, and internet bookmarks.

USER-PROTECTED FILES

Often, users hide files to prevent them from being found. There are a variety of techniques to hide files, but some of the most common methods include camouflaging, steganography, and encryption.

A user might camouflage certain files under an innocent name or different file extension to prevent others from discovering them. For example, a suspect might change a file name from

“evidence.doc” to “install.exe” and place the file in a directory that stores program files. Therefore, fraud examiners should analyze a target’s hard drive to determine whether any file types have been camouflaged. This is done by analyzing the file header—the first bits of data in a file—which contains data identifying the file format. Fraud examiners should pay extra attention to files created during the time period in which a fraud is suspected to have occurred.

A user might also seek to protect files using steganography. *Steganography* is the process of hiding one piece of information within an apparently innocent file. For example, a user can use the least significant bits of a bitmap image to hide a message. By hiding the message in the least significant bits of an image, there is almost no perceivable change in the bitmap image itself. And without directly comparing the altered image to the original, it is practically impossible to tell that the image was altered.

EXAMPLE

After a French defense contractor suspected that some of her critical designs were being compromised, the government conducted an investigation. The investigation revealed that an employee had obtained his position at the company to steal the contractor’s trade secrets. To transmit the trade secrets out of the company, the employee imbedded them into graphic images used on the company’s public access website using steganography. Another party then copied the image files from the website and extracted the proprietary designs.

Digitized audio files are another type of file that can be used to hide messages. For example, by encoding a message in the least significant bits of a WAV file, a user can make the message almost impossible to detect.

There are a number of tools that fraud examiners can use to detect steganography, and these tools use different methods to detect the use of steganography. Some common methods of detecting the use of steganography are:

- Visual detection by looking for visual anomalies in jpeg, bmp, gif, and other image files
- Audible detection by looking for audible anomalies in wav, mp3, mpeg, and other media files
- Statistical detection by determining whether the statistical properties of files deviate from the expected norm
- Structural detection by looking for structural oddities that suggest manipulation (e.g., size differences, date differences, time differences, or content modification)

A user might also protect files by encrypting them. *Encryption* refers to procedures used to convert information using an algorithm (called a *cipher*) into a coded format that makes the information unreadable to anyone without the encryption key. There are two primary ways to access encrypted information without a key. First, numerous utility programs can decrypt documents encrypted by many of the more common software applications. In addition, some encryption programs have a secret “key” for emergencies that may be used to decrypt encrypted data. There are also several companies that specialize in decryption.

Second, there is precedent for forcing a suspect (or employee) to divulge the decryption key. The computer is only a container, and encryption is an additional lock prohibiting the fraud examiner from reviewing the files for potential evidence. A fraud examiner with a legal right to examine encrypted data might be able to force a suspect to divulge the decryption key because doing so is no different than ordering a suspect or employee to unlock a file cabinet to inspect its contents.

COMPUTER-CREATED FILES

Evidence might also be found in information generated by a computer’s operating system. This type of information is important because it can identify that a certain activity has taken place, and in most cases, the user is not aware that this information is being written. Some common examples of computer-generated data available for examination include:

- *Metadata*: Metadata is data about data, and these files contain a tremendous amount of information. Metadata information can help determine who wrote a document; who received, opened, copied, edited, moved, or printed the document; and when these events occurred.
- *Registry*: The registry, which is a central database that stores settings and configurations for the operating system and most applications installed on the system, is an important source of potential evidence because it contains information on user accounts, typed URLs, networks shared, the run command history, and so on.
- *Event logs*: Every operating system generates event logs, which are files that record events or transactions on a computer. In fact, a log entry is created for each event or transaction that takes place on any computer, and consequently, there are numerous types of event logs. Some common types of logs include system logs, application logs, and security logs. *System logs* record events executed on an operating system, including miscellaneous events and those generated during system startup, like hardware and controller failures. Other common types of system events include starting up and shutting down, configuration updates, and system crashes. *Application logs* record the events regarding access to

application data. Such events would include data files being opened or closed; specific actions such as reading, editing, deleting, or printing of application files; or the modification of records in an application file. *Security logs* track security-related events like log-on and log-off times and changes to access rights.

- *Internet activity*: Internet browsers create temporary files that store information about websites that a user has visited. These files can show websites that were recently visited and usually include time and date information relevant to the visit; they can also show images previously viewed online. This information allows the fraud examiner to recover websites and images previously viewed by the system's users.
- *Temporary files*: Applications will create temporary files like those created by internet browsers. For example, certain communication software like instant messaging (IM) and chat software will keep a history of the user's conversations in a proprietary and sometimes encrypted format.
- *Deleted data*: Deletion is a widely misunderstood function in computing because deleting data is not the same as destroying data. Choosing the delete option erases the file's reference from the table of contents, but it does not erase the file. In fact, data are not erased from a computer's hard drive until the data are overwritten. Therefore, deleted files might be recoverable.

WORKSTATIONS

In addition to investigating any computer systems at issue, evidence might be stored on any form of technology that can be used to transmit or store data. Therefore, it is also important to investigate any suspect workstations, including any peripherals or other portable media devices that can be used to transmit or store data. A *peripheral device* is an auxiliary device that is connected to, but not part of, a host computer.

As data move to and from peripheral devices, they leave evidence of their presence and sometimes leave full copies of their contents. Therefore, fraud examiners should consider the many different types of peripherals that might contain evidence. Items to be seized might include any or all of the following items, depending upon the nature of the fraud case.

PRINTERS

Fraud examiners must be aware that it might be possible to recover previously printed documents. Although the odds of recovery can be low depending on a variety of factors, understanding how retrieval can be achieved can be of great value to the fraud examiner.

Printers might contain valuable evidence. Many printers have internal hard drives that might contain information relevant to a fraud examination. In general, any information sent to and stored by a printer is recoverable unless the printer has overwritten the data. So, when seizing a computer for forensic analysis, it is generally necessary to seize any printers connected to it.

In addition, when a printer is connected directly to a computer (when a printer is connected in this way, it is referred to as a local printer), it might be possible to recover print data from print-spool files, which are stored on a system's hard drive. When computers running Windows operating systems print files, a print-spooling process occurs. The process involves writing the print job to files, allowing users to keep working while the print job runs in the background. After the user creates a print job, it is not immediately sent to the printer; instead, it is stored in a local file that is sent to the printer when the printer becomes available to perform the job. Once printing is complete, the operating system deletes the files; but again, deleted files can be recovered.

Furthermore, some printers have *memory buffer*—temporary storage area of jobs waiting to be printed—which might also contain important information. Information contained in memory buffer, however, is generally limited to recently created and stored data.

COPIERS, SCANNERS, AND MULTIFUNCTION DEVICES

Copiers, scanners, and other multifunction devices—machines that provide printing, copying, scanning, and faxing functionalities in one device—might have internal storage devices that store relevant data. In fact, almost every copier built since 2002 has a hard drive that stores images of documents the machines have copied, scanned, or emailed. Some copiers store user access records and a history of copies made. And, as with most file systems, it might be possible to retrieve information from a copier's hard drive that has been deleted. As a result, a copier might be brimming with important information. So, when seizing a computer for forensic analysis, it is generally necessary to seize any copiers and scanners connected to it.

FAX MACHINES

Although some kinds of stand-alone fax machines simply scan and send data without storing them, like many printers and copiers, some fax machines store faxing data on their own internal hard drive. These data might remain in the machine's memory until overwritten.

BACKUP STORAGE DEVICES

Backup storage devices store data, and some of them can be easily removed from a computer system. Most computer users archive their activities on backup devices, and most companies use them to store old data, including archived emails, that were once stored on their servers.

REMOVABLE STORAGE DEVICES

In addition to backup devices, any relevant removable storage devices should be examined. Removable storage devices such as CD-ROMs, DVDs, USB flash drives, external hard drives, mp3 players, and various other devices provide users with the ability to store large amounts of data. Such devices can be used to facilitate a variety of frauds. They provide users with the ability to store files that could go undetected by anyone accessing the computer. Removable media can also be used to store copies of files containing sensitive information to facilitate unapproved use.

NETWORKS

In addition to searching for evidence on the suspect's workstation, it is also important to examine information stored on any network from which the suspect's traffic flows. A wealth of information that is separate from a user's workstation might be stored on company servers. Data stored on networks might include documents posted to a suspect's own home directory on the network; collaborative work saved to a shared folder or directory; email messages that have been sent, received, deleted, or archived; calendars; contact lists; and so on.

SMARTPHONES

The proliferation of smartphones has made them an extremely valuable source of information. Smartphones (e.g., Androids and iPhones) are mobile phones that also have the ability to store personal data, search the internet, check email, IM, make video calls, download/upload content to and from the internet, take pictures, and record video, among other tasks. The information that can be stored on these small devices can be very important in many cases. For more information on recovering evidence from smartphones, see the subsequent discussion on mobile forensic investigations later in this chapter.

CLOUD ENVIRONMENTS

Organizations and individuals are increasingly storing data and applications on the cloud. The cloud is a metaphor for the storage and utilization of data online rather than locally. *Cloud storage* refers to information stored by a third-party host that is accessible online.

Cloud computing offers numerous benefits. For one thing, the cloud can provide savings on hardware, software, or licensing fees, and cloud services offer a cost-effective alternative to building out IT infrastructure. For another thing, the cloud improves accessibility because users can access the cloud anytime and anywhere as long as they can access the internet. And finally, with cloud computing, organizations can easily scale IT resources up or down to suit their business needs.

Virtually anything that can be stored on a hard drive can be uploaded to the cloud (available space is normally the primary limitation). Accordingly, information relevant to a fraud examination might be stored in the cloud. Fraudsters might save records or other key evidence to cloud storage to avoid possessing a copy on their own storage devices, so fraud examiners should search these places, if possible.

Determining whether a subject uses cloud storage can be done by searching for payments made to cloud services, searching browser history (for types of cloud storage accessed via browsers), reviewing smartphone applications linked to cloud services, or making a request through discovery in litigation. If a subject attempts to upload organizational assets to cloud storage from work devices, evidence pointing to what was shared or to which cloud service it was shared might be found on the workstation or the network's event logs.

Investigations and Digital Forensics

The following discussion provides a process for conducting investigations involving digital forensics. Although there are several definitions and different schools of thought for investigations involving digital devices, most practitioners in the field will agree that investigations typically involve the following phases:

- Planning
- Seizing
- Imaging
- Processing
- Analyzing
- Reporting and testifying

Each phase is dependent on the phases that come before it. For instance, if the seizure phase is handled incorrectly, then each of the following phases can suffer and ultimately render the reporting and testifying phase moot.

Planning

Before fraud examiners can seize evidence, they must take certain steps to help ensure that the evidence will be admissible. Such steps include determining whether there are any privacy interests in the item(s) to be searched; making appropriate preparations if the investigation involves the use of a legal order; and ensuring that all equipment used in a forensic capacity is legitimate and reliable (e.g., only use licensed software applications, independently validate all forensic equipment and maintain the validation on file). In addition, fraud examiners must also ensure that only trained professionals use any digital forensic tools during an engagement and that the equipment is employed in the manner for which it was designed (e.g., know when to use write-blocking software prior to viewing data, confirm that imaging software was designed for use with the applicable operating system).

The following content explores considerations for fraud examiners regarding privacy and government searches. For additional information regarding laws related to privacy and unreasonable searches by government authorities, see the “Individual Rights During Examinations” chapter in the Law section of the *Fraud Examiners Manual*.

Privacy Issues

Before searching and seizing an item, the fraud examiner must determine whether the individual who is the subject of the search has a privacy interest in the item to be searched. In every case where it becomes necessary to seize a computer or other device capable of storing digital evidence, the fraud examiner should consult with legal counsel. It is imperative that legal counsel be involved in the seizure process, and the fraud examiner must be knowledgeable of the law pertaining to workplace seizures.

Government Searches

Most countries have laws that provide the public with the right to be free from unreasonable search and seizure by government authorities. This right sometimes requires that the government obtain authorization (e.g., a search warrant) by a judicial officer or other authorized person before it conducts a search of a person, location, or vehicle for evidence of a crime. Therefore, fraud examiners should seek legal advice before seizing evidence as part of a government investigation.

For additional country-specific information regarding considerations that a fraud examiner should make when obtaining proper authorization for a government search and seizure, see

the content on “Government Search and Seizure” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Seizing

Perhaps the most critical step in the forensics process is how data are collected or acquired. Acquisition of digital evidence must be completed in such a way as to ensure that all relevant evidence is seized and secured in a forensically sound manner so that the evidence is not tainted or destroyed.

In fact, there are a number of practical considerations and procedures to employ when the decision is made to go forward with a computer seizure. For example, fraud examiners often fail to debrief the subject, which should be a primary consideration for any examination involving computers. Debriefing the subject involves asking the subject for passwords and whether any encrypted data exist on the target computer.

The Scientific Working Group on Digital Evidence (SWGDE) from the Organization of American States (OAS) published a general document in 2014, titled *SWGDE Best Practices for Computer Forensics*, which provides a good foundation for digital forensic examiners. The SWGDE has since published additional documents that provide further guidelines or frameworks for the collection of digital evidence that are available on the organization’s website. These documents focus on individual aspects of computer forensics, such as the collection and examination of digital evidence, the capture of live systems, and mobile device forensics.

Although a complete review of the entire document is beyond the scope of this manual, several guidelines deserve review. According to the SWGDE, digital forensic examiners should adhere to the following guidelines:

- Before obtaining evidence, ensure that there is legal authority to seize evidence and review the data associated with the evidence. This might require obtaining a warrant in a criminal matter, some other court order, or ensuring that internal policies authorize seizure for an internal investigation.
- If removing evidence from the scene is impractical, copy or image the items of evidence according to established procedures.

- Remove all suspects, witnesses, and bystanders from the proximity of the digital evidence. Keep in mind that remote access to computers can put potential evidence at risk even if no person has physical access to the computer. Also, consider the wide range of mobile data storage devices today (e.g., USB flash drives) that can be hidden.
- Ensure that no suspects, witnesses, and bystanders possess any items containing potential evidence.
- Thoroughly and systematically search the scene for potential evidence. Once again, consider the wide range of data storage media and devices.

Generally, data should not be analyzed on the machine from which they were collected. Instead, the digital forensic examiner should make forensically sound copies of all data storage devices—primarily hard drives—and analyze the data on these copies.

Moreover, when seizing a computer that is running, the party seizing the system should not, in most situations, use the computer or search it for evidence. Any such use of a computer could damage and taint any evidence that it might contain.

To ensure that a machine can be fully analyzed, the fraud examiner should adhere to the following practices:

1. Examine and document the machine's surroundings.
2. Inspect for traps.
3. If the computer is off, leave it off.
4. Consider collecting volatile data "live."
5. Secure the evidence.
6. Image the system hard drives.
7. Document the collection process.
8. Implement a system to manage the evidence.

Examine and Document the Machine's Surroundings

The first step in the evidence-collection process is to examine and document the machine's surroundings. The party seizing the computer should collect all printouts, disks, notes, and other physical evidence for further analysis and should document the scene with photographs or a diagram, depending on the complexity of the setup. Documenting the machine's surroundings is important because the party seizing the computer might have to testify about what the area looked like on the day of the seizure, and it might be a year or longer before such testimony occurs.

The party seizing the computer should also document the condition of the machine and any relevant evidence. When doing this, the following should be considered:

- Documenting what is on the screen, if the system is on
- Documenting any processes that are currently running
- Taking photographs of the various views of the equipment and media to document any damage or defects
- Taking photographs of the equipment's physical connections
- Making a drawing of the location to document the layout and relative locations from which evidence was seized

Additionally, because many people write down or record their passwords near their computers, fraud examiners should look around for notes that might appear to be passwords. This might aid in discovering passwords needed to access encrypted or password-protected data if the individual who knows the password is uncooperative and will not divulge it. Although there are ways to access encrypted information without an encryption key (e.g., decryption, emergency keys, forcing cooperation), having the passwords for protected files will save time and reduce efforts.

Fraud examiners should take good notes on the machine's state at the time of the seizure and record the time and date that the system was seized, as well as make note of the personnel involved in the seizure. The status of the system should also be noted. Was it on, off, or on standby? Was there anything unusual attached to the system? Was there any obvious damage or alteration? Did any files have to be saved? Also, if the computer was active, fraud examiners should record any open applications. Furthermore, they should make sure to start a chain of custody document and note each person and storage location through which each piece of evidence passes.

In addition to documenting the machine's state at the time of seizure, fraud examiners should document any serial numbers and other potential identifying markings (e.g., manufacturer, model number, asset tracking number), and they should photograph and diagram the system's entire configuration.

Inspect for Traps

Fraud examiners should also inspect the computer for traps, intrusion detection software, and self-destruct mechanisms.

If the Computer Is Off, Leave It Off

A computer system that is switched off should not be turned on during the seizure process. Turning a system on might damage and taint any evidence that it contains. For example, the boot process in a Windows operating system will access and change the contents of the system's hard drive. In fact, each time a Windows operating system is booted up, some change, however small, is made to the system's hard drive. In particular, when a user boots up a Windows system, the computer's last access dates and times will be modified.

Collect Volatile Data “Live,” as Required

If a formally trained digital forensic examiner is present, they should consider engaging in collecting volatile data “live,” which refers to the collection of evidence performed during the seizure phase when a digital device is open and running. It involves the retrieval of data from a digital device directly via the device's normal interface.

When collecting digital evidence, fraud examiners should not do anything that will alter digital data. And because evidence on a running computer system can be altered by seemingly harmless actions (e.g., looking through files on a running computer system), historically, it was recommended that those seizing digital evidence adhere to a strict, traditional methodology to ensure that data are not changed in any way. The traditional methodology stated that when seizing running systems, those responsible should simply unplug the systems from their power sources and secure them for future examination by trained digital forensic examiners. In short, the traditional methodology provided that when individuals are seizing a running computer system, they should unplug it from its power source. They should not use the computer or search it for evidence.

Although the traditional methodology has been a central premise in recommendations for dealing with digital evidence, and even though it is appropriate in many circumstances, there are situations where the traditional methodology is not appropriate.

Accordingly, the forensic industry has begun adopting methodologies that include *live evidence collection*, or *live acquisition*—evidence collection performed during the seizure phase when a suspect system is open and running—and it has been shying away from stating that “pulling the plug” should be the first step in the collection process in every situation. This trend has occurred because often, the most important evidence exists only in the form of volatile data (e.g., RAM) stored within a system. *Volatile data* refers to forensic artifacts in a state of flux that can be lost when power (or network connections, in some cases) has been

removed from a computing device. So, if volatile data are not collected live from a suspect computer, they might be altered or lost when the system is shut down or disconnected from its network.

Because a computer system's volatile data disappear and are irretrievable when the system is off, fraud examiners seizing a system should consider live evidence collection when volatile data could be of interest to an investigation, but they should ensure that only trained professionals conduct any live evidence collection. So, for example, if the evidence that a formally trained digital forensic examiner needs to collect exists only in the form of volatile data stored in volatile computer memory, such as RAM, and the data are expected to disappear when the computer is shut down, they should collect the data live from the suspect computer.

Here is a list of reasons for performing live digital evidence collection to obtain volatile data:

- Volatile data might help identify evidence of misconduct on a system that can be lost if the system loses its power.
- Volatile data might contain encryption keys.
- Volatile data might show the existence of memory-resident malware.
- Live data collection can provide information before a full-blown forensic analysis can be performed.
- Some systems are critical and cannot be shut down.
- Shutting down a system might damage equipment or result in unintentional loss of data.
- Live digital evidence collection is less intrusive than traditional methods.

In addition to situations in which there are volatile data that could be of value in an investigation, other circumstances in which live data collection should be seriously considered include:

- The suspect is using the machine at the time of seizure.
- An attack is in progress at the time of seizure.
- Shutting down the computer might cause data to be unusable by drive encryption, running processes, network connections, and so on.

Common sources of volatile data include:

- *Random access memory (RAM)*: Volatile data in RAM include recently accessed data, such as data files, recent commands, and password hashes, and residual data in slack space and free space.

- *Operating system*: Volatile data that might exist in an operating system include currently running programs, login sessions, open files, network configuration settings, incoming and outgoing network connections, and the operating system time.
- *Network device logs*: Volatile data in network device logs include the logs created by networking gear, such as routers and switches.

When collecting data, the digital forensic examiner should collect the most volatile data first, as they will be lost the quickest, and live digital evidence collection organizes the collection of digital evidence based on the life expectancy of the evidence at issue. The following is a list of volatile digital information, from the most volatile to the least:

- Central processing unit (CPU) registers, cache, and peripheral memory
- Contents of main/physical memory
- Virtual memory (e.g., swap files also known as paging files)
- Network connections
- Running processes
- Data stored on local disk drives
- Data stored on backup media, etc.
- Data stored on archive media (e.g., CD-ROMs, USB flash drives, external hard drives)

Registers, cache, and peripheral memory; main/physical memory; virtual memory; network state; and running processes will all be lost when a system is shut down.

Despite the benefits of live data collection, it has its challenges, including:

- Untrained individuals using live data collection methods can compromise the data.
- A number of live data collection toolkits are untested.
- There is a lack of established processes and procedures for live data collection.

In *Collecting Evidence from a Running Computer: A Technical and Legal Primer for the Justice Community*, the authors recommend that fraud examiners employ the following basic steps when collecting volatile evidence:¹

1. Maintain a log of all actions conducted on a running machine.
2. Photograph the screen of the running system to document its state.
3. Identify the operating system running on the suspect machine.

¹ Todd G. Shipley and Henry R. Reeve, *Collecting Evidence from a Running Computer: A Technical and Legal Primer for the Justice Community*, The National Consortium for Justice Information and Statistics, www.euro.ecom.cmu.edu/program/law/08-732/Evidence/RunningComputer.pdf.

4. Note date and time, if shown on screen, and record with the current actual time.
5. Dump the system RAM to a removable storage device or a remote system.
6. Check the system for the use of whole disk or file encryption.
7. Collect other volatile operating system data and save to a removable storage device or a remote system.
8. Determine evidence seizure method (of hardware and any additional artifacts on the hard drive that might be determined to be of evidentiary value).
9. Complete a full report documenting all steps and actions taken.

Secure the Evidence

When collecting evidence from a computer system, fraud examiners should also secure the evidence.

The primary concern when collecting and analyzing digital evidence is to maintain its integrity; therefore, digital forensic examiners must take steps to avoid and counter allegations that the methodology used to collect or analyze data was improper and could have damaged or altered the evidence. So, for example, if a computer system is off, the individual securing it should not turn it on.

In short, fraud examiners must secure computers in such a way that will allow them to testify, if need be, that no unauthorized access to the suspect system occurred. Thus, in most situations involving the seizure of a running system, fraud examiners should not peek through the files on the system. If a system is running, a fraud examiner might be tempted to explore the system's files and folders for evidence or to copy the computer's files to an external storage device. Generally, this should not be done because such actions will alter data on the system. Each file or folder that the fraud examiner touches will have its original time stamp changed, and once a time stamp changes, the original one cannot be recovered.

But generally, proper seizure should include:

- Disconnecting all cords and devices
- Prohibiting access
- Maintaining a chain of custody
- Using write-blocking devices, if necessary
- Using appropriate packaging materials
- Using encryption technologies, if necessary

DISCONNECT ALL CORDS AND DEVICES

Also, proper seizure requires that when seizing a system, the fraud examiner should disconnect all cords, including the power supply, and devices and secure it for future examination by trained digital forensic examiners. If the fraud examiner is seizing a running system, disconnection should occur once the collection of volatile data is complete, but otherwise, disconnection should occur after documenting the machine's surroundings and inspecting for traps.

Accordingly, when seizing a running system, those responsible should not turn the system off using normal shutdown routines. There are two methods for shutting down a running system: a hard shutdown and a graceful shutdown. A *hard shutdown* occurs from power failure. Thus, a hard shutdown is performed by unplugging all power from the computer including power cables. A *graceful shutdown* occurs when the user relies on the set of built-in processes that prepare a computer for shutdown. If the fraud examiner uses the normal shutdown routines, a number of temporary files will be deleted and possibly overwritten during the shutdown process, and such files might be important to the investigation. The following is a list of data that are typically lost when a system is turned off using a graceful shutdown:

- Open files are closed.
- Temporary files are deleted.
- In Windows, the swap file is erased.
- Malicious material (e.g., memory-resident rootkits, Trojan horses, rootkits, or malware) might disappear or be removed.

Hard shutdowns, in contrast, will preserve swap files, temporary files, and other information that might be altered or deleted during a graceful shutdown. Therefore, disconnecting a running system from its power sources seeks to preserve the state of the system at the time of seizure.

Although hard shutdowns can preserve the state of the system at the time of seizure, they are not without risks. For example, hard shutdowns might cause:

- The disappearance or removal of malicious material (e.g., memory-resident rootkits, Trojan horses, rootkits, or malware)
- The corruption of operating system data

Nevertheless, in most cases, if a computer identified for seizure is running and no live acquisition is to be conducted, the fraud examiner should simply unplug it (i.e., perform a hard shutdown) and secure it for future examination by trained digital forensic examiners.

In some situations, however, there might be extenuating circumstances where a graceful shutdown would be best. Accordingly, it is important to evaluate the best shutdown option based on the type of data being preserved and the possible ramifications of a hard shutdown based on the type of operating system installed.

Moreover, laptop computers require additional considerations. When seizing a laptop, it is important to disconnect the laptop's power sources when performing a hard shutdown. This can be done by removing laptop's battery. But if the laptop is also plugged into an electrical source, remove the battery first and then unplug the power supply from the laptop and the wall outlet. If, however, the battery cannot be removed, unplug the laptop's power supply from the laptop and the wall outlet, and then press the power button for about thirty seconds to perform a hard shutdown. Additionally, when seizing a laptop, it is essential to recover all of the components that belong to the laptop, such as flash drives, CD- and DVD-ROMs, external hard drives, and power supply cords and related components. Often, laptop computers must be imaged with their drives installed, and because of the proprietary nature of the laptops themselves, they will only function with their own components. Many times, these components can be located in the laptop carrying case.

Like laptops, networked computers present unique considerations. Shutting down or disconnecting a networked system might alter evidence. Also, it is important to use extreme caution when removing power from a networked system without using proper shutdown methods because this can damage the system and expose the fraud examiner to liability.

Input from a digital forensic expert at the time of acquisition or seizure can help fraud examiners arrive at the appropriate decisions for securing evidence from computers or systems with special circumstances in a way that will best preserve the digital evidence's integrity.

PROHIBIT ACCESS

Once a computer system is seized, it is necessary to secure it in such a way that will allow the fraud examiner to testify, if need be, that no unauthorized access to the suspect system occurred. Thus, once the fraud examiner takes possession of the computer, no one else should be allowed to access it, with the exception of a trained digital forensic examiner.

MAINTAIN A CHAIN OF CUSTODY

Another method to help ensure the integrity of digital evidence is to maintain a chain of custody for all evidence gathered and analyzed. Again, the *chain of custody* is a recordkeeping

procedure that documents who had possession of an item and what that party did with it. The chain of custody is a means of establishing that there has not been a material change or alteration to a piece of evidence. Therefore, from the moment evidence is collected, its chain of custody must be maintained.

In general, to establish the chain of custody, fraud examiners must make a record when they receive an item or when it leaves their care, custody, or control. This is best handled by a record document when the evidence is received and turned over to someone else. At a minimum, the memorandum should:

- Identify each item that contains relevant information.
- Document each item that was received, who it was received from, who authorized its removal, the location of the item, and the date and time the item was received.
- Maintain a continuous record of the item's custody as it changes hands.

Gaps in the chain of custody (e.g., when it is not clear what occurred with a set of records) or outright mishandling (e.g., a group of questioned documents was not properly sealed) can harm a case.

WRITE-BLOCKING DEVICES

Fraud examiners should consider using a hardware or software write-blocking device to protect the integrity of digital evidence. These devices allow the user to acquire information on a drive without damaging the drive contents by allowing read commands to pass and blocking write commands.

A *hardware write-blocking device* stops any automated processes or incidental processes that an operating system or fraud examiner might use to interact with a piece of digital media. That is, these devices trick the operating system into believing that the interaction occurred so that it will not generate an error and thwart the acquisition process. What actually happens is that the write commands are intercepted and cached by the write-blocking device instead of reaching the target; therefore, no writes to the media occur. The device allows only read permissions to the media.

A *software write-blocking device*, however, denies access to media by filtering out certain prohibited requests. When a software write-blocking device is in place, only read requests are accepted and all write requests are denied. Software write blockers must operate at a separate level than a standard graphical user's interface (GUI), such as in DOS mode.

APPROPRIATE PACKAGING MATERIALS

Fraud examiners should use appropriate packaging materials for evidentiary items. They should consider using tamper-proof evidence tape to document any future access to the evidence. Also, devices with volatile memory, such as mobile phones, should be packaged separately so that power to the device can be maintained.

ENCRYPTION

Furthermore, because digital forensic examiners frequently acquire data that contain sensitive or confidential information, they should consider using encryption techniques to protect sensitive data.

Imaging

Once a computer system is seized and before any analysis occurs, it should be imaged for analysis. Forensic analysis should not be performed on suspect devices directly because doing so can alter or damage digital evidence, and imaging the data from suspect devices allows a fraud examiner to view and analyze a computer's contents without altering the original data in any way.

Imaging refers to the process whereby a forensic image of a hard drive or other digital media is made and imaged to another hard disk drive or other media for forensic analysis. A *forensic image* (also called a *forensic copy*, *mirror image*, or *ghost image*) is a duplicate or exact copy of a hard drive or other digital media.

The acquisition of a forensic image involves using a standalone hard drive duplicator or similar device to make a duplicate or exact copy of a hard drive or other digital media. The process can be divided into the following three steps:

- Acquire the original storage media.
- Create the forensic image of the original storage media.
- Verify the image of the original storage media.

Once a forensic image of the data on digital media has been made, it can be analyzed for potential probative data.

Also, the image must be created and preserved in a manner that will withstand a legal challenge; therefore, before imaging a hard drive, the best method for acquiring the image and the proper procedures for facilitating the image capture must be determined.

Furthermore, during the imaging process, those responsible should use some type of write-blocking device or application to ensure no information is written onto the original drive, and after the hard drive is duplicated, they must move the original drive to a secure location to prevent tampering. Again, any such procedures must be documented in the chain of custody.

Document the Collection Process

When conducting an investigation of a digital device, fraud examiners should document the investigation throughout the process by making notes regarding what they did during the investigation. Generally, such notes should include information such as:

- Date and time the examination began
- Photographs of the device and its components
- The status of the system when seized (on or off)
- The identification information of the device (e.g., make, model)
- Tools used in the examination
- Data documented during the examination

Implement a System to Manage the Evidence

Fraud examiners should have a system to track and manage physical and digital evidence. There are a number of software products that facilitate evidence management, and these products contain various tools to help fraud examiners meet digital-evidence handling needs. For instance, users can use such programs to search, categorize, and distribute digital evidence while helping to maintain chain of custody controls and restricting access.

Processing

Once the collection process is complete, fraud examiners are left with large volumes of digital data that might contain relevant or irrelevant information. At this point, the fraud examiner must process and filter the digital information to reduce the amount of data (commonly known as *data culling*) that has been collected by identifying relevant information and by setting aside duplicates and other information that is not relevant due to its type, origin, or date. While doing this, the fraud examiner must preserve the integrity of the data.

There are several methods that fraud examiners can use to filter large amounts of data, but the techniques the team employs to process information will vary depending on the investigation's goals. Some common methods include:

- Keyword searches
- Deduplication filtering
- Date-range filtering
- File-type filtering

Keyword Searches

Keyword searches involve identifying relevant evidence by searching for words that are material to a case (e.g., names, dates, account numbers). This type of search will minimize the amount of time used to complete an analysis, and it will help protect the fraud examiner from allegations that their search was overly broad.

To conduct a keyword search, the fraud examiner should establish a list of relevant keywords that are based on the information known about the case. Because enormous amounts of data will need to be searched in most fraud examinations, fraud examiners should take care in keeping the list as short and relevant as possible, and they should avoid common words or words that can be part of other words. As a case progresses, there is a strong likelihood that more keywords will be identified, including terms designed to help establish patterns in data.

Deduplication Filtering

An issue faced in most examinations is that multiple copies of various files will be collected as part of the investigative process. Because reviewing such duplicative materials is expensive and time consuming, the fraud examiner should identify and eliminate duplicates in the collected data. This process is referred to *deduplication filtering*, and it is critical to help reduce the vast amounts of information collected during a fraud examination.

Date-Range Filtering

If an analysis involves activities within a certain period, it might be useful to limit the search to data that fall within a specific period. For computer files, filtering can be based on the operating system's metadata (e.g., based on the files created, modified, or last accessed dates). Similarly, email messages can be filtered by their sent date.

File-Type Filtering

There might be cases where only certain types of information are required, and in such cases, *file-type filtering* (i.e., filtering data based on file type) will be useful.

Analyzing

The analysis phase involves the use of specialized software designed to give the fraud examiner the means to identify, extract, collect, examine, and store digital artifacts that will be used as evidence in the investigation.

There are a number of analytical review products that can assist in analyzing volumes of data for relevant evidence. But generally, these products employ various ways to search and analyze data for relevant materials. Unfortunately, due to the vast array of digital devices available, there is no single perfect tool or platform. No single analytical review tool can recover everything; each tool has its own strengths and weaknesses. Therefore, it is best to use a combination of the various tools during the analysis phase, allowing for the identification and recovery of more information.

Also, when analyzing data for evidence, the fraud examiner should look for inculpatory evidence (i.e., evidence that serves to incriminate the subject of the investigation) and exculpatory evidence (i.e., evidence that serves to disprove the subject's involvement in the misconduct).

The primary concern when analyzing digital evidence is to maintain the integrity of the data at all times. Fraud examiners must be careful with computer equipment because a careless fraud examiner might inadvertently alter important evidence. Therefore, it is helpful to develop procedures to prevent the opposing party from raising allegations that the methodology used to collect or analyze data was improper and could have damaged or altered the evidence. Again, it might be helpful to use a hardware-based write-blocking device to protect the integrity of digital evidence.

Reporting and Testifying

The reporting and testifying phase is where the hours of analysis are reported fairly and objectively. In this phase, a qualified expert might be asked to render an opinion about the use or misuse of a computer system. This is where experience and training are tested and where fraud examiners must know with certainty that their opinion is based on their research, knowledge, and experience and that an opposing expert will not find fault with their conclusions.

Additionally, the fraud examiner might provide witness testimony at a deposition, trial, or other legal proceeding.

Investigating in the Cloud

Although information relevant to a fraud examination might be stored in the *cloud*—a metaphor for the storage and utilization of data online—conducting digital forensic investigations in the cloud environment (i.e., *cloud forensics*) presents challenges not encountered in traditional forensic practices. This discussion explores some of those challenges.

Challenges of Cloud Forensics

Some of the important challenges of cloud forensics are:

- Lack of frameworks and specialist tools
- Lack of information accessibility
- Lack of data control
- Jurisdiction of storage
- Electronic discovery
- Preserving chain of custody
- Resource sharing
- Lack of knowledge

Lack of Frameworks and Specialist Tools

Unlike traditional forensics, which have clear, step-by-step frameworks and specialist tools for the collection of evidence suitable for presentation in court, there are no such widely recognized frameworks or tools for collecting evidence in the cloud. In fact, many digital forensics tools are not designed to operate within the cloud environment, and tools and procedures for locating, isolating, and preserving data in the cloud are not standardized.

Lack of Information Accessibility

Cloud computing complicates the collection of data because cloud storage systems are not local, and therefore, there is a lack of access to forensic data stored on the cloud.

Cloud customers do not typically have physical access to data stored on the cloud, and they generally have limited to no access to their cloud data's log files and metadata.

Accordingly, fraud examiners generally do not have physical access to evidence stored on the cloud—something that fraud examiners typically have when examining traditional privately-owned and locally-hosted systems. For instance, if a suspect's files relevant to an investigation are on the cloud, fraud examiners cannot simply confiscate the suspect's computer and get access to the relevant files.

Lack of information accessibility also means that, often, cloud customers do not have much information about the physical locations of their data. So, due to the nature of the cloud, it might not be clear what data are available. Moreover, if an entity uses more than one cloud provider, it might not be clear which provider has stored the data.

Also, a cloud customer's accessibility to data stored on a cloud provider's servers might depend on the contracts between the provider and the customer. Therefore, in some cases, it might be necessary to review such contracts to determine the contractual obligations of the providers, the access the customer might have to the data stored on the provider's servers, and ownership rights to data. Thus, companies that use cloud-computing providers should include clauses in their service-level agreements that address investigative and data preservation responsibility and liability.

Likewise, many cloud providers do not provide for the facilitation of forensic readiness in the cloud. Many cloud providers do not furnish services or interfaces for the collection of forensic data. In fact, many customers of cloud service providers have limited access to their cloud data's log files and metadata.

Lack of Data Control

With cloud computing, clients of cloud service providers do not have physical control of the media or the network on which their data reside, which can complicate efforts to collect data stored on the cloud.

Additionally, there are many providers of cloud services, and each service has proprietary implementations that might influence the data available, how that data are collected, how the data are provided in response to requests, and who has access to the data.

Cloud providers might not maintain detailed logs of transactions on their systems, which can minimize the amount of useful information available in an investigation.

Likewise, relevant data stored in the cloud must be preserved until they can be lawfully acquired, but a provider's practices can inhibit preservation.

Jurisdiction of Storage

Cloud providers commonly store data in servers in different locations around the world. Consequently, it is possible that evidence related to individuals within the same organization

could be segregated in different physical locations, thus complicating a fraud examiner's ability to determine jurisdiction. Because all jurisdictions impose different laws and regulations regarding the storage, use, and access of data, the collection of relevant data might be deemed complicated by the distribution of servers among multiple jurisdictions.

Electronic Discovery

Even if information on the cloud can be obtained through *discovery*—the phase where parties to litigation obtain information or evidence that might be used during trial—collecting information through discovery mechanisms has its own challenges. Information stored in the cloud is different than other forms of evidence because cloud customers do not typically “possess” the evidence, which is often an element required to successfully demand discovery of evidence.

Preserving Chain of Custody

Maintaining the integrity of evidence stored in the cloud is difficult because the following information typically is missing from such data:

- How the data were processed and by whom
- Who had access to the data and when they were accessed
- Whether the data were commingled with the data of the provider's other clients
- Who acquired the data submitted for analysis (e.g., a trained digital forensic examiner or an employee of the cloud-computing provider)
- How the data were preserved and by whom

Resource Sharing

Under the traditional computing model, resources tend to be used exclusively by a single entity, but in the cloud environment, providers allocate resources for multiple customers on the same physical infrastructure. This difference exists because cloud-computing providers use server virtualization, which involves the partitioning of an existing server in such a way that it effectively becomes multiple servers. Server virtualization allows individual virtual servers to be used without affecting the server as a whole. As a result, computing resources are made more efficient and data resources become more flexible.

But under this type of infrastructure, a cloud customer's data get stored on the same physical infrastructure used to store data belonging to other customers. That is, each cloud server contains files belonging to multiple customers.

Server virtualization affects the privacy of cloud users. Because each cloud server contains files of multiple customers, fraud examiners cannot seize servers from a provider's data center without potentially violating the privacy of many other cloud customers. For example, if a cloud user's data are stored on a physical system that also contains another user's data that are needed in a fraud investigation, the first user's data might be inadvertently gathered during the fraud investigation. And in some jurisdictions, the inadvertent access of data not relevant to an investigation can infringe upon privacy legislation.

Also, if a cloud provider stores the data of multiple cloud customers on the same physical computer, the provider will likely prohibit any effort to create a forensic image of its physical storage media if the forensic image would likely contain the data of other customers.

And even if fraud examiners can seize or image servers from a provider's data center, they must separate the data of the different users, which is a complicated and difficult task.

Lack of Knowledge

Even if a fraud examiner has complete access to a cloud provider's storage media, it would be difficult to interpret relevant data from the system. Generally, to extract useful information from storage media, the fraud examiner needs to have knowledge about the system from which the image was obtained, including information about its operating system, its application(s), and the operations of its user logging system.

Conclusion

The growing complexities of the IT cloud-computing infrastructure can impede fraud examinations, and it follows that overhead costs will rise as companies have to hire highly specialized digital forensic examiners to identify and forensically preserve relevant data in cloud-computing environments.

The Cloud Security Alliance (CSA) is a not-for-profit organization tasked with promoting the use of best practices for providing security within cloud computing environments. In 2013, the CSA published a white paper titled *Mapping the Forensic Standard ISO/IEC 27037 to Cloud Computing*, and the paper details some of the key digital forensics challenges posed by cloud computing. The CSA continues to publish valuable resources covering cloud security and forensics, which are available on the website at <https://cloudsecurityalliance.org>.

The Scientific Working Group on Digital Evidence (SWGDE) also provides guidance related to acquiring evidence from cloud service providers on its website at www.swgde.org.

Mobile Forensic Investigations

As a result of the proliferation of smartphones and other mobile devices, mobile forensics have become an essential element of most civil and criminal investigations. *Mobile forensics* refers to techniques used to gather data from mobile devices so that the data will be admissible in court. Organizations can use mobile forensics to determine whether a company device has been used in violation of its use policies or analyze an employee's personal device, if circumstances permit.

There are many companies that provide mobile forensic services, and there are numerous readily available tools available that can extract information from the hardware, microchips, and software of mobile devices. Generally, these forensic tools employ various means to extract data from mobile devices, and in many investigations, it is best to use a combination of methods when gathering evidence. The main areas for recovering data on mobile devices are as follows:

- *Logical*: This includes the logical storage objects that reside on a logical store (e.g., a file system partition). The actual data that can be retrieved using a logical examination will vary, depending on the type of device, but the retrievable information could include text messages, multi-media messages, call registers, contacts, tasks, images, audio, videos, calendar entries, and so on.
- *File system*: This includes information in the logical extraction and hidden information such as deleted information and operating system files.
- *Physical*: This includes information on a physical store (e.g., flash memory or memory chip).

Unfortunately, due to the vast array of mobile devices available, there is no single forensic tool that will cover the wide range of today's devices.

To complicate things further, mobile device forensics use methods different from traditional computer forensics because, among other things, mobile devices store data in various unique formats that prevent mobile devices from being copied in the same ways that computer hard drives can be imaged. Regardless of the differences, it is essential that mobile forensic procedures maintain the integrity of any data collected. The Association of Chief Police

Officers' (ACPO) *Good Practice Guide for Digital Evidence*² provides four principles that fraud examiners should adhere to when dealing with digital evidence. Those four principles are summarized as follows:

- Fraud examiners should not perform any action that will change data contained on digital devices or storage media that might subsequently be relied upon in court.
- Individuals accessing original data must be competent to do so and have the ability to explain their actions.
- When examining a mobile device, an audit trail or other record of applied processes, suitable for replication of the results by an independent third party, must be created and preserved to accurately document each investigative step.
- The person in charge of the investigation should have overall responsibility for ensuring the aforementioned procedures are followed and in compliance with governing laws.

The following discussion provides a methodology for conducting mobile device investigations. Typically, such investigations will involve the following phases:

- Plan
- Seize
- Extract
- Analyze
- Document
- Report and testify

The following discussion, however, is not an exhaustive discussion on mobile forensics. Rather, the discussion is a brief description of the routine processes involved in mobile forensics. For more information on mobile forensics, see the National Institute of Standards and Technology's (NIST) *Guidelines on Mobile Device Forensics*.³

Plan

Just as when conducting a traditional computer forensic investigation, fraud examiners who are conducting a mobile forensic investigation must prepare for the investigation. Among other things, the planning phase should address the following:

² Association of Chief Police Officers, *Good Practice Guide for Digital Evidence*, March 2012, <http://library.college.police.uk/docs/acpo/digital-evidence-2012.pdf>.

³ National Institute of Standards and Technology (NIST), "Guidelines on Mobile Device Forensics," May 2014, <https://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-101r1.pdf>.

- The legal authority to examine the device
- The goals of the investigation
- The make, model, and identifying information of the device to be seized
- Any other sources of potential evidence

After identifying the make and model of the device to be seized, the fraud examiner can conduct research to determine what forensic tools are capable of extracting data from the target device.

Seize

Next, the fraud examiner must seize and collect the device, isolate it, and document the device at the time of seizure. When seizing mobile devices, the fraud examiner should seize any supporting devices and information available, including:

- Removable storage media
- Cables for transmitting data
- Power chargers
- Documentation relating to the devices' purchase

Also, when seizing a mobile device, the fraud examiner should isolate the device to prevent unnecessary changes to the device's data because the data on mobile devices are volatile and always changing. The procedures, however, will vary for devices that are powered on and those that are powered off.

If a device is powered off, the fraud examiner should leave it off to prevent any changes to its data.

If, however, the device is powered on, the fraud examiner must consider several things. The fraud examiner should not unnecessarily scroll through the device because doing so will likely change the device's data. Additionally, if a device is powered on, the fraud examiner should not turn it off in most cases. If a device is password protected or encrypted, powering it off might prevent subsequent access to it. But because a device that is turned on might communicate with the network—which will cause data changes—the fraud examiner should isolate such devices from the network. Isolating a device from the network will also prevent:

- The device's user from remotely accessing the device to destroy data
- Cross contamination
- New data from overwriting old data
- New data from contaminating the existing data

There are three basic options for isolating mobile devices in a manner to prevent unnecessary data changes. The first option is to use a Faraday container—a container that shields devices from electromagnetic signals—to prevent the device from communicating. One disadvantage of this method is that when the device is placed in a Faraday container, it will constantly scan for a network to connect to, causing its battery to deplete quickly.

Wrapping a device in several layers of aluminum foil will approximate a Faraday container. If placing a device in a Faraday container, it should not be connected to an outside power supply; instead, fraud examiners might consider using a portable power supply that can be connected to the device while leaving it secured inside of the Faraday container.

Second, the fraud examiner can set the device to flight or airplane mode. This setting will isolate the device's transceiver but will allow its other functions to continue running normally. However, putting a device in flight mode requires user input. Furthermore, flight mode typically does not isolate the phone from Wi-Fi or Bluetooth signals, each of which might require additional steps to disable.

Third, the fraud examiner can turn the device off by removing its battery instead of using the device's normal shutdown routines. A fraud examiner should turn the phone off if the device cannot be processed immediately. The benefits of turning a phone off include:

- Preserving the call log
- Preserving the information of the last cell tower location
- Preventing the overwriting of deleted data
- Preventing communications from reaching the device and changing data
- Preventing the device from being handled improperly

Once the device is isolated from the network and ready for forensic analysis, the analyst should document the device at the time of seizure by:

- Recording all the details of active applications on the device
- Conducting a photographic survey to show the state of the device when it was found or received
- Identifying the device's model and type and searching for the device's user manuals and technical characteristics

Extract

Once a device is seized, a professional analyst should extract and examine the device with professional forensic tools. But due to the vast array of mobile devices available, there is no single tool that can be used to extract all potential evidence from mobile devices. Instead, fraud examiners likely will have to use a combination of various techniques and available mobile forensic tools to extract the best data from most devices.

The following discussion provides a brief summary of the basic extraction processes using widely available forensic tools. As these forensic tools do not work for all devices, such cases will require that advanced extraction techniques must be used.

Typically, when using off-the-shelf mobile forensic tools, the analyst must decide on the base forensic application to use for collecting data from the device and then connect the device to the forensics tool. There are three basic connection methods to extract data from mobile devices—cable, infrared, and Bluetooth—but because each method has its benefits and drawbacks, it might be necessary to use a combination of each connection method when extracting data from a mobile device.

Once a connection has been established, the analyst should extract information from the device's hardware, removable storage media, and the SIM card if working with a GSM (Global System for Mobile Communications) device.

Next, the analyst should record the device's make, model, and International Mobile Equipment Identity (IMEI) number. Usually, this information is found printed inside the device's battery compartment.

After recording the device's identification information, the analyst should remove the device's SIM card and any removable media. The analyst should then extract the data from them using forensic tools.

After extracting the data from any removable media, the analyst should manually examine the device to verify the accuracy of the extracted information, create a working copy of the extracted data for analysis purposes, and secure the data from the original extraction for storage. Extracted data can be verified in various ways, including:

- Checking to ensure that the extracted data match the data displayed by the device
- Using more than one forensic tool to extract the data from the device and cross verifying the results by comparing the extracted data from each tool
- Checking the hash values of the extracted data against the originals to verify individual files

Finally, after successfully extracting the data from the device, the analyst should conduct a photographic survey to show the state of the device after the extraction.

Analyze

Like the analysis phase in traditional computer investigations, the analysis phase in mobile forensic investigations involves efforts to identify inculpatory and exculpatory evidence. The potential evidence on mobile devices includes the following items:

- Subscriber and equipment identifiers
- Settings (e.g., date, time, language)
- Contacts
- Calendar information
- Call history (e.g., dialed, incoming, and missed calls)
- Text and multimedia messages
- Email
- Photos
- Audio and video files
- Internet history
- Downloaded applications
- Social media application data
- Electronic documents
- Location information

Document

When conducting an investigation of a mobile device, fraud examiners should document the investigation throughout the process by making notes regarding what they did during the investigation. Generally, such notes should include information such as:

- Date and time the examination began
- The condition of the device
- Photographs of the device and its components
- The status of the phone when received (on or off)

- The identification information of the device (e.g., make, model, IMEI number)
- Tools used in the examination
- Data documented during the examination

Report and Testify

The reporting and testifying phase in mobile forensic investigations is similar to the last phase in traditional computer forensic investigations. In this phase, fraud examiners make a fair and objective report of their analysis and, if necessary, testify about the investigation at a deposition, trial, or other legal proceeding.

Digital Forensics Software

There are a number of products that can assist in identifying, extracting, collecting, and storing digital evidence. Although these tools range in complexity, features, and price, they employ various methodologies to extract and analyze data from computer systems. And again, because these tools employ different methodologies, it is best to use a combination of them when gathering evidence.

Also, when using such tools, it is important to understand and be able to articulate how the tools work. This means that a digital forensic examiner who uses an automated tool should be able to explain how to conduct the same process manually.

The following is a general listing of the most frequently used products on the market today. This list, however, is sure to change. (Please note that the product descriptions are adapted from materials provided by the manufacturer, and the ACFE does not endorse any particular product.)

EnCase Forensic

EnCase Forensic is a computer forensics software program by Guidance Software. It gives fraud examiners the ability to image a drive and preserve it in a forensic manner using the EnCase evidence file format (LEF or E01), a digital evidence container vetted by courts worldwide.

For more information about EnCase Forensic, visit www.guidancesoftware.com.

Forensic ToolKit

Created by AccessData, the Forensic Toolkit (FTK) offers law enforcement and corporate security professionals the ability to perform complete and thorough computer forensics examinations. The FTK features file filtering and search functionality. FTK's customizable filters allow fraud examiners to sort through thousands of files to locate evidence. FTK is also a forensic tool to perform email analysis.

For more information on AccessData, visit <https://accessdata.com/products-services/forensic-toolkit-ftk>.

Password Recovery Toolkit

The Password Recovery Toolkit (PRTK) from AccessData is geared toward law enforcement and corporate security professionals. It allows users to find and identify encrypted files on handheld, desktop, and server computer systems. PRTK recovers lost, forgotten, or unavailable passwords. If users need access to locked files or if they have simply locked themselves out of their files, the PRTK can get them back in.

For more information on AccessData, visit <http://accessdata.com/product-download/password-recovery-toolkit-prtk-version-7.6.0>.

Magnet Forensics

Magnet Forensics offers several digital forensic software products for fraud examiners, with each product specifically designed to target systems (e.g., smartphones, computers, or clouds) or functions (e.g., triage or case management). Magnet Forensics also offers training in digital forensics and several free tools for computer investigations via its website.

For more information on Magnet Forensics, visit www.magnetforensics.com.

Intella

Vound Software offers the Intella software as a tool to process, search, and analyze electronically stored information, focusing on establishing relationships, timelines, and data visualizations. Potential users can download a free trial version of the software before purchasing.

For more information, visit www.vound-software.com/solutions.

StegoHunt Suite

StegoHunt suite by WetStone is a software bundle available for the investigation, detection, analysis, and recovery of digital steganography. It identifies the presence of steganography without prior knowledge of the steganography algorithm that might have been used against the target file.

WetStone's StegoHunt suite is composed of three products: StegoAnalyst, an imaging and analysis tool; StegoBreak, a password cracker; and StegoHunt, a steganography application identifier and report generator.

For more information about the StegoHunt suite and other products by WetStone, visit www.wetstonetech.com.

Mobile Device Forensic Tools

Again, mobile device forensic tools allow for the acquisition and examination of mobile devices.

Cellebrite UFED

Cellebrite manufactures various data extraction, transfer, and analysis devices for cellular phones and mobile devices. Cellebrite's UFED systems are standalone, handheld devices that extract mobile device data directly onto an SD card or USB flash drives (although it does not store data within its own memory). Because Cellebrite's UFED products are standalone devices, they can be used for in-field data extraction and analysis under adverse conditions.

For more information about the Cellebrite UFED systems, visit www.cellebrite.com.

XRY/XAMN

MSAB's XRY/XAMN series of software applications can be used to perform logical data acquisitions and physical dumps in one platform.

XRY software applications can be used to acquire data from more than 29,000 device and application profiles. The XRY tool connects to the device and the software stores data in a proprietary format that cannot be altered, but data remain exportable. The XRY software allows for examination and reporting on the content of the device and its SIM card, in the case of a GSM (Global System for Mobile Communications) device.

XAMN is a separate family of software that complements XRY, allowing fraud examiners to view the raw hexadecimal data extracted during a physical dump of a mobile device. Thus, XAMN allows digital forensic experts to perform physical data acquisitions that recover deleted information from confiscated mobile phones without compromising the quality of the information or legal standings in court.

For more information about MSAB's XRY/XAMN system, visit www.msab.com.

Paraben E3

Developed by Paraben, a variety of E3 tools assist in the examination of digital evidence, including E3:DS, which provides broad support of all mobile devices. Paraben also offers bundled kits containing software and accessories for mobile investigations.

For more information about Paraben, visit <https://paraben.com>.

EnCase Forensic and Mobile Investigator

EnCase Forensic and Mobile Investigator includes the capability to, among other things, review and forensically collect data from more than 26,000 mobile device profiles and more than 25 mobile device types.

For more information about EnCase Forensic and Mobile Investigator, visit www.guidancesoftware.com/encase-forensic.

TRACING ILLICIT TRANSACTIONS

Tracing refers to the search for evidence for the purpose of showing what has happened to property, identifying the proceeds of property, and identifying those who have handled or received property or the proceeds of property. Accordingly, fraud examiners are often tasked with tracing illicit transactions and the associated assets. For example, a fraud examiner might be engaged to assist:

- A victim of fraud who wants a tracing search to facilitate the recovery of criminal proceeds
- A potential plaintiff who wants a tracing search to determine if the potential defendant can pay a court-ordered sum if a judgment is ordered
- A judgment creditor who needs to identify the judgment debtor's assets

This section seeks to demystify the process of tracing illicit transactions and provide tools for success in this complex work. This section is organized into the following sections:

- General process for tracing illicit transactions
- Direct methods of tracing financial transactions
- Indirect methods of tracing financial transactions
- Locating hidden assets

General Process for Tracing Illicit Transactions

Although the procedures performed during a tracing investigation vary depending on the circumstances, an actual investigation to trace transactions should generally involve the following elements:

- Collect information.
- Profile the subject (i.e., assemble the personal—financial and behavioral—profile).
- Review information for leads and prioritize leads.
- Trace the illicit transactions.
- Evaluate recovery options.

Collect Information

To trace transactions, fraud examiners must collect information about the parties and transactions involved. Because not all of the parties or transactions involved are known from the outset of an investigation and might only become known in the course of an investigation, the collecting of information is an ongoing process.

Generally, fraud examiners should begin tracing investigations by compiling everything known about the subject, and once this is done, they should search public records and other open sources, collect nonpublic records (if available), and conduct interviews.

Compile Information About the Subject

To begin a tracing search, the fraud examiner should compile everything known about the subject. If the subject is an individual, the subject's legal name and current address are essential to any tracing investigation. In addition, other relevant items of information include:

- The subject's place of employment
- The subject's date of birth and place of birth
- The names and birthdates of the subject's close relatives (e.g., spouses, children, parents, siblings, spouses of siblings, grandparents, grandchildren, uncles, aunts, or cousins)
- The identities of the subject's close friends
- The subject's national identification number (e.g., Social Security number, personal identification number, social insurance number, or Personal Public Service Number)
- The subject's last known address
- Relevant telephone numbers
- Relevant email addresses
- Contact details of any internet communication by the subject
- The subject's social media accounts or profiles
- Criminal record search results
- Results of public-information searches
- Results of private-records searches
- Records of any relevant real estate
- Financial account information

Much of the basic information about a subject can be found in audit documents, business records, personnel records, the internet, and conversations with people who know the subject. Some details will require court orders or the consent of the subject.

Search Public Record Sources

Once the fraud examiner has basic information about the subject, they can use it to search public records and gain intelligence to trace the transactions. They can gather relevant information from online sources, government agency databases, public databases, and through the use of other special investigative techniques, such as physical surveillance.

Collect Nonpublic Records

The fraud examiner should also obtain nonpublic records, if available by legal means. Nonpublic records, however, are difficult to obtain unless the subject of the information voluntarily turns the records over, the person to whom the records pertain consents to their release, or the disclosure of such records are required by some type of legal process.

Conduct Interviews

Also, the fraud examiner should conduct *interviews*—question-and-answer sessions designed to elicit information—of relevant parties who might have information concerning the matters at issue.

Information obtained during an interview can corroborate or illuminate information obtained from documentary evidence, identify new financial documents to obtain, fill in the information gaps that remain, or expose new leads.

Fraud examiners should conduct interviews with the subject and those who are close to the subject or have knowledge of any transactions in question. Often, when tracing illicit transactions, fraud examiners will not have access to the subject, but they might have access to individuals close to the subject (e.g., friends, family, associates, or coworkers). Typical interviewees include complainants; employees of financial institutions involved; the suspect's business associates, ex-spouses, friends, relatives, neighbors, employees, business rivals, or other associates; other individuals who have been in contact with the target; and people who have a stake in an asset or transaction at issue.

Often, the interviews conducted in tracing examinations are of a financial nature. Although financial interviews are similar to other interviews, in financial interviews, evidence often develops incrementally and, when viewed separately, might appear to lead nowhere. Consequently, frustration is common in financial interviews.

When seeking information about an illicit transaction, the fraud examiner should ask interviewees for records, documents, and other types of information that might identify, trace, and locate assets. Questions might seek to obtain information about the subject's:

- Employment and sources of income
- Real and personal property
- Financial needs (e.g., medical, educational, or other ongoing expenses)
- Investments

- Business or financial dealings
- Debts and other financial obligations
- Lifestyle habits
- Family

Also, when interviewing subjects, fraud examiners should ask them to discuss:

- Sources of funds they received during the relevant period
- The amounts of current liquid assets
- Any significant transactions and the reasons behind such transactions
- Their accounts at financial institutions
- Their principal assets, their purchase dates and costs, and how they paid for them
- Their principal liabilities
- Any and all associations they might have with registered businesses or other organizations
- Their average total monthly expenditures and how they pay living expenses
- Their estimated current net worth
- Litigation in which they have been involved during the relevant period
- The professionals (e.g., accountant, lawyer, or travel agent) they consult or hire in relation to financial arrangements and services

Checklist of General Information for Tracing Investigations

The following is a checklist of general information that should be sought in tracing investigations.

IDENTIFICATION INFORMATION ABOUT THE SUBJECT

- Full name
- Alias(es)
- Reason for alias(es)

THE SUBJECT'S BIRTH INFORMATION

- Date and place of birth
- Citizenship
- Father's name; living? (If deceased, when?)
- Mother's name; living? (If deceased, when?)

THE SUBJECT'S ADDRESS(ES) DURING PERTINENT YEARS

- Resident address; phone number
- Business address; phone number
- Other present or prior address(es)
- Marital status; if married, date and place of marriage
- If divorced, when and where
- Spouse's maiden name
- Spouse's parents; living? (If deceased, when?)
- Children's names and ages; other dependents

THE SUBJECT'S OCCUPATION INFORMATION

- Present occupation
- Company name and address
- Present salary
- Length of time employed
- Additional employment
- Prior occupations
- Spouse's occupation

GENERAL BACKGROUND INFORMATION ABOUT THE SUBJECT

- Physical health
- Mental health
- Education
- Professional qualifications
- Military service
- Passport, Social Security, and/or social insurance numbers (for identification purposes)
- Criminal history
- Arrest history
- Bankruptcy history; who acted as receiver/trustee?
- Social media accounts
- Email addresses
- Phone numbers
- Hobbies and interests

INFORMATION ABOUT THE SUBJECT'S FINANCIAL INSTITUTIONS (BUSINESS AND PERSONAL)

- Financial institution accounts
- Safe deposit boxes (request inventory); in whose name; contents; does anyone else have access?
- Credit cards
- Trusts; beneficiary, donor, or trustee
- Mutual funds or other securities owned
- Brokers; currency exchanges used
- Cryptocurrency assets; digital wallets
- Life insurance
- Indirect dealings (e.g., through lawyers or accountants)
- Cashier's checks
- Money orders, bank drafts, traveler's checks

THE SUBJECT'S SOURCES OF INCOME

- Salaries, wages, business receipts
- Interest and dividends
- Sale of securities
- Rents and royalties
- Pensions, trusts, annuities, etc.
- Gifts (e.g., money, property)
- Inheritances
- Loans
- Mortgages
- Sales of assets
- Municipal bond interest
- Insurance settlements
- Damages from legal actions
- Any other source of funds, ever

THE SUBJECT'S NET INCOME AND EXPENDITURES

- Current cash on hand, including cash in safe deposit boxes, but not cash in bank accounts
- Location of current cash
- Largest amount of cash ever on hand; location
- End-of-year cash

- Notes receivable
- Mortgages receivable
- Life insurance policies
- Automobiles
- Real estate
- Stocks, bonds, and other securities
- Luxury items (e.g., jewelry, furs, exotic vehicles)
- Airplanes, boats
- Any other assets valued

THE SUBJECT'S LIABILITIES

- Payables
- Loans
- Assets purchased by financing
- Mortgages
- Bonds
- Judgments

THE SUBJECT'S EXPENDITURES

- Debt reduction
- Insurance premiums
- Interest expense
- Contributions
- Medical
- Travel
- Real estate and other taxes
- Household wages (e.g., babysitter, housekeeper, gardener)
- Casualty losses
- Charitable donations

THE SUBJECT'S BUSINESS OPERATIONS

- Name and address
- Date organized and nature (corporation, partnership)
- Company or business registration numbers
- Tax identification numbers
- Title and duties

- Reporting arrangements—to and from whom?
- Banking and cash handling arrangements
- Investment; where and when
- Subsidiaries and associates
- Key people
- Business license(s)

THE SUBJECT'S BOOKS AND RECORDS

- Nature of accounting system (e.g., cash, accrual)
- Period covered
- Location
- Name of person maintaining and controlling
- Types (journal, ledgers, minute books, canceled checks, bank statements, invoices, cash)
- External auditors

THE SUBJECT'S BUSINESS RECEIPTS

- Form (electronic, check, or cash)
- Are all receipts deposited? Where?
- Are business receipts segregated from personal ones?
- Are expenses ever paid with undeposited receipts?
- Arrangements for foreign currency payments
- Trade finance arrangements, letters of credit, etc.

Profile the Subject

Once the fraud examiner has begun collecting information, they should then begin creating a personal profile of the subject. The personal profile, which is comprised of the financial and behavioral profile, will contain information on the subject's financial condition.

The financial profile is essentially a financial statement with some modifications and additions. It shows what the subject earns, owns, owes, and spends at any given point, or over a period of time; it reflects the subject's income, expenses, assets, and liabilities. That is, it shows the subject's financial condition.

The behavioral profile is comprised of outside pieces of information that can support estimates and fill information gaps. The behavioral profile contains information about the

suspect's personal characteristics (e.g., carries large amounts of cash, wears expensive clothes, or has club memberships), home and furnishings, automobiles, and leisure activities.

Review Information for Leads and Prioritize the Leads

Early on, as the fraud examiner begins collecting information, they should review it for leads and subsequently prioritize those leads.

The leads, however, will vary depending on the facts of each case. Potential leads might include information on accounts, assets, persons, entities, technology, and so on. More specifically, the leads might include information about:

- The subject's educational background
- The subject's employer
- The subject's occupation
- The subject's marital status
- The names of the subject's family members, friends, or business associates
- The subject's address
- The subject's interests or hobbies
- The subject's property
- Any membership organizations to which the subject belongs

When reviewing data for leads, the fraud examiner should note the names of any attorneys, corporate officers, lending officers, and notaries found on any uncovered records. When doing so, they should look for connections between these individuals and the subject.

Also, once the fraud examiner has identified potential leads, they should prioritize the leads and select which ones might result in the development of the most significant evidence in a timely manner.

Trace the Illicit Transactions

After the fraud examiner has identified, compiled, and reviewed documents indicating ownership, they should begin analyzing financial records and begin tracing. Again, *tracing* refers to the search for evidence showing what has happened to property, identifying the proceeds of property, and identifying those who have handled or received property or the proceeds of property. That is, tracing involves documenting the movement of assets in and out of accounts.

Tracing will involve identifying those persons, organizations, and assets at issue and the connections between them, and it should include an analysis of the assets and financial flows. For example, once the fraud examiner has established the financial profile, they can compare and contrast the information in the financial profile with known information about suspicious transactions (e.g., dates, origins, destinations, account holders, banks) to group and reconcile the transactions and identify any gaps in data. This will help the fraud examiner understand the flow of assets and identify leads.

Also, the tracing analysis should look for unexplained changes in the subject's income, expenses, lifestyle, travel patterns, and behavior to determine whether the subject has hidden assets. Such analysis might indicate activities designed to conceal income or income-producing property.

Here are three key questions to consider when conducting a tracing analysis:

- What are the sources of the subject's income, assets, and liabilities?
- Is there any missing or inconsistent information?
- Does the subject live a lifestyle that is in excess of the reported income?

Generally, fraud examiners can trace illicit transactions using a direct method or an indirect method. A *direct method* identifies the receipt or disposition of funds or assets through the analysis of specific financial transactions, whereas an *indirect method* employs circumstantial evidence to analyze the relationship between a suspect's receipt and subsequent disposition of funds or assets.

More specifically, a direct method employs direct evidence of the subject's books and records (or financial transaction records belonging to third parties) to analyze the relationship between a suspect's receipt and subsequent disposition of funds or assets.

But in many situations, direct evidence of a subject's books and records is not available; in such cases, the fraud examiner must use an indirect method, employing circumstantial evidence to analyze the relationship between a suspect's receipt and subsequent disposition of funds or assets.

Evaluate Recovery Options

If the perpetrator(s) or their assets can be identified and the proceeds of the fraud traced, then it is possible for victims to recover their losses. Nevertheless, successful recovery of fraud losses

requires familiarity with a variety of legal theories, procedures, and remedies, as well as an understanding of the practical and tactical issues that often arise in fraud recovery efforts.

Direct Methods of Tracing Financial Transactions

Direct methods of tracing financial transactions require access to the subject's financial records and involve the use of *direct evidence* (i.e., evidence that tends to prove or disprove a fact in issue directly), such as eyewitness testimony or a confession. Direct evidence is conclusive—the fact is established if the evidence is believed. For example, when a corrupt official is caught in the act of soliciting a bribe payment, witnesses' observations and video of the official's act are direct evidence against them. These items of evidence are conclusive to prove that the official attempted to receive an illicit payment.

Under a direct method, the fraud examiner uses the information in the individual's financial records to establish the subject's financial profile, which is then used to identify the subject's accounts, assets, and expenditures. Once these items are identified, the fraud examiner can use them to trace back the source of funds in each. In other words, under the direct process, the fraud examiner traces the funds the subject used to purchase assets or make deposits back to their source.

There are several sources the fraud examiner can use to demonstrate a subject's financial standing and profile under the direct approach, but some common sources include:

- Documents from financial service providers (e.g., accountants or bankers)
- Tax records
- Accounting reports
- Financial statements
- Bank account records
- Payroll records
- Credit reports
- Court records
- Mortgage and loan records
- Credit card records

If the fraud examiner has access to the relevant accounting and business records, they should analyze them to:

- Identify money deposited into the accounts.
- Discover money transferred out of an account by cash withdrawal, check, debit memo, or wire transfer.
- Identify increases and decreases in account balances.
- Identify any payments to, or deposits from, cryptocurrency exchanges.
- Create a summary of deposits and withdrawals.
- Develop a summary of checks written on the account.
- Establish a summary of wire transfers into or out of the account.

When analyzing such records, the fraud examiner must be sure to record the dates, amounts, check numbers, names of payees, and the name of the endorsing bank for any relevant transaction.

Records obtained from financial institutions are perhaps the single most important financial source available to a fraud examiner for asset-tracing purposes. They can be used as evidence for fraud, as well as to:

- Identify witnesses and other evidence.
- Uncover criminal profits.
- Identify criminal assets.
- Locate assets that can be used to satisfy a judgment.
- Identify localities where assets are stored.
- Determine the lifestyle of an account holder.
- Determine the financial health of an organization.
- Determine the source of funds placed into the account.
- Determine the use of the funds from the account.

Although financial records are one of the most important sources available to fraud examinations, they are not available to the public and, therefore, might be difficult to obtain. In fact, financial records are private in almost all countries, including the United States. For example, in the United States, the Right to Financial Privacy Act (RFPA) prohibits financial institutions from disclosing financial information about individual customers to governmental agencies without following certain procedures specified in the law.

This discussion will examine how to use financial records to locate hidden assets, and it covers the following topics:

- Gaining access to financial records
- Establishing a database
- Types of financial records to examine
- Types of financial records to request
- Tracing financial transactions

Gaining Access to Records Held by Financial Institutions

Again, financial records are not available to the public and, therefore, might be difficult to obtain.

Often, fraud examiners use informants, witnesses, and surveillance operations to obtain information about financial records. But typically, these sources only help identify people or businesses with whom the subject is conducting financial transactions; they do not provide access to financial records.

Generally, suspects will not willingly give their records to a fraud examiner, and financial institutions' authority to disclose bank records is restricted by laws at national and, sometimes, local levels. In general, banks will not provide financial records to anyone, including law enforcement, unless the customer has consented or the institution is legally compelled to do so.

Generally, bank records can be obtained in most jurisdictions by using one of the following methods:

- A discovery request in a civil trial
- A legal order to produce documents, witnesses, or other things (e.g., a subpoena) or a summons issued by a government agency
- Civil summons
- Customer consents to disclosure by signing a release indicating that the information could be shared with a particular entity, usually in relation to a stated purpose (e.g., compliance with a financial disclosure requirement for employment or compliance with some court order)
- A court order that grants government authorities the right to search a premises or property for information pertinent to a case (e.g., a search warrant)

Furthermore, the cost of obtaining bank records can be high. Banks generally charge both public and private entities to search and retrieve records, and they might charge additional fees for the reproduction of records.

Yet, despite the limitations on obtaining financial records, fraud examiners might be able to, depending on their circumstances, obtain bank records from other sources. For example, the fraud examiner might seek to obtain access to financial records by contacting the subject's former spouse. Former spouses might have banking records useful to the fraud examination. Similarly, a suspect's banking records or a portion of them might be available as part of a divorce settlement or a lawsuit.

Establishing a Database

To aid in the analysis of financial records, fraud examiners should establish a database to sort and analyze the financial data for patterns of activity, as well as to code all records. By placing the records into a spreadsheet, database, or other type of data analysis software, the fraud examiner can compare records, uncover patterns, and execute a number of different searches and analyses of the data collected during the investigation.

Although a standard spreadsheet program might be fine for this purpose, databases are more effective than spreadsheets when dealing with large sets of raw data records.

When creating a database for financial data, the fraud examiner should create a profile for each bank account at issue and, as data is collected, the account profile information for each bank account can be combined with other collected data.

Bank profiles should include the following information:

- Bank name
- Bank address
- Account number
- Type of account
- Name of account holder(s)
- Date of account opening and closing, if applicable
- Currency
- Current balance
- Annual credit turnover
- Annual debit turnover

Once the account profile is established, the fraud examiner can enter additional data about each account, such as credit and debit activity that occurs during the relevant period, date, amount, and, if available, the source or recipient of the funds.

The financial information available for each record varies, meaning the data entered in a spreadsheet or database might not be completely consistent across entries. But a basic list of elements that can be obtained from financial records can be obtained by considering the types of information contained in check records.

As illustrated in the following list, there are 17 primary elements that can be pulled from check records, including an element for general comments, and these elements can be used for almost all bank records.

Financial Record Elements	
1. Check number	10. Account number from
2. Entity from	11. Transaction type
3. Bank from	12. First endorser
4. Date written	13. Transaction bank
5. Payee	14. Deposited to account
6. Amount written	15. Date of transaction
7. Amount deposited	16. Location
8. Memo written	17. Comments
9. Signatory	

Details on what goes into each of these fields are provided below:

1. *Check number*: This field should contain the number of the financial instrument written on or deposited to the account. The following items, however, will not contain a check number: wire transaction, automated teller machine (ATM) transaction, point-of-sale (POS) transaction, and debit memo. A deposited amount would include a check number unless the deposit was cash, an incoming wire, or a credit memo.
2. *Entity from*: This field should contain the name of the company or person the check is from—the owner of the account on which the check is written.
3. *Bank from*: This field should contain the name of the bank from which the check, debit memo, or wire transfer was issued. If desired, the fraud examiner can enter the bank identification number to identify the bank's source of the funds.

4. *Date written:* This field should contain the date the check was written, the transaction (e.g., wire transfer or debit memo) was generated, or the withdrawal was made. This is not the date shown on the bank statement; bank statements show the clearing dates—the dates that checks clear the bank. The clearing date can be used if no other dates are present (e.g., if there is no check copy provided by the bank, but the check is listed on the statement).
5. *Payee:* This field should contain the name of the payee—the person or entity to whom the check was written.
6. *Amount written:* This field should contain the amount written on the face of the check. If there is a discrepancy between the numerical and written amounts, the bank will usually honor the written amount. Check the amount the bank has imprinted on the bottom right-hand side of the check in magnetic ink character recognition (MICR) to determine which amount the bank used.
7. *Deposited amount:* This field should contain the amount of money credited to the bank account by a cash or check deposit, wire transfer, or credit memo. This amount is put into a field separate from the amount written for ease of separating, sorting, and adding the amounts.
8. *Memo:* This field should contain any notation written on the memo line or box on the check.
9. *Signatory:* This field should contain the name of the person (or persons) who signed the check as the authorized signatory. When entering the data into this field, initials are sufficient if the person referenced is clear.
10. *Account number from:* This field should contain the account number on which the check, debit memo, or wire transfer was written.
11. *Transaction type:* This field should contain the type of transaction (e.g., check, transfer, wire, debit memo, credit memo, deposit, ATM deposit or withdrawal, or ATM purchase).
12. *First endorser:* This field should contain the name of the first endorser. The first endorser is the person or persons who endorsed the check (i.e., signed the check on the back as the endorser). On checks made out to a company, the back of the check might be stamped with the company name, bank, and account number and no endorsing signature should be shown.
13. *Transaction bank:* This field should contain the name of the bank the item was deposited to (or where the check was cashed). This could be the bank from which records have been subpoenaed, the bank stamped on the back of the check, or the bank at which the check was cashed. If the check was negotiated at a non-bank financial institution (e.g., check-cashing agency, money transmitter, or casino), the name of that company can be placed here with other specifics entered in the comments field.

14. *Deposited to account:* This field should contain the account number to which the check was deposited. It should be noted that some banks write the account number on the back of checks when cashed; this serves as an identifier for the check casher. Therefore, a bank account number located on the back of a check might not mean that the check was deposited into that account. Remember to check the front of the check for a cashed stamp.
15. *Date of transaction:* This field should contain the date the check was deposited or negotiated.
16. *Location:* This field should be used for transactions made at an ATM or a POS if the location is important.
17. *Comments:* The comments field is used for other comments about the transaction. “NSF” could be entered into the comments field to signify that there were non-sufficient funds to cover the check. Additional information about the endorser (e.g., driver’s license or alien registration number), the name of a secondary endorser, or notes written on the back of the check by the teller could also be placed in the comments field.

Here are some basic rules to follow when entering records into a spreadsheet or database:

- Enter data as fully as possible.
- Assign unique names to identify each person, place, or thing in the case.
- Be consistent when assigning names and avoid giving multiple names for the same person, organization, or document.
- Have all records reviewed for accuracy.

Also, to foster uniformity in style and formatting, follow a set of standards for entering content. For example, when entering names, adhere to the following guidelines:

- Enter names in normal sequence (e.g., first, middle, and last).
- Use only capitals for initials.
- Omit titles, such as Ph.D., M.D., B.A., M.A., or D.D.S.
- Eliminate periods after abbreviations and middle initials.
- If the given name or the surname is missing, use five underscore lines as a substitute for the unknown name (e.g., _____ Brandt, John H _____).
- If a person is known primarily by their middle name, enter the name in all capital letters (e.g., Randy THOMAS Smith, Jane MARIA Smith).

Types of Financial Records to Examine

While investigating financial records, the fraud examiner should review the following types, if available:

- Account-opening documents
- Negotiated (canceled) checks
- Deposit tickets
- Wire transfer records
- Correspondent banking records
- Intrabank transfer records
- Electronic payment records
- Savings account records
- Certificates of deposit (CDs)
- Account statements (e.g., bank statements)
- Exchange instruments
- Loan records
- Credit card records
- Prepaid access card records
- Bank collection department records
- Safe deposit box records
- Financial intelligence unit (FIU) documents and reports
- Stock brokerage records
- Tax-related documents
- Accounting records
- Purchase and sale documents

Account-Opening Documents

Account-opening documents include the records required to create a bank account, but the types of files required might vary depending on the type of account. This discussion will focus on two types of bank accounts: personal accounts and business accounts.

PERSONAL ACCOUNTS

To open a personal account, the individual opening the account must provide a signature card, or similar document, evidencing a contract between the customer and bank. When a depositor opens an account, the bank requires that a signature card, or equivalent record, be signed (by hand or electronically). By signing the card or similar document provided by the

bank, the depositor becomes a party to a contract with the bank under which they accept all rules and regulations of the bank and authorizes the bank to honor their orders for withdrawing funds.

The signature card is a source of valuable information. Although the form of these cards varies, the card usually contains the person's name, address, telephone number, identification number (e.g., national number, uniform civil number, national identification number, national identity number, National Insurance Number, personal identification number, Social Insurance Number, or government identification number), amount of the opening deposit (and possibly the source of the opening deposit), and security data (e.g., mother's maiden name). The person's identification information might be significant, especially if the depositor used an alias. Also, a fraud examiner might be able to trace the opening deposit through the bank's records to disclose a source of income.

In addition to containing a signature card, the account-opening file for a personal account might contain a copy of the account holder's driver's license or other photo identification provided to the bank.

Many banks investigate the references given by a new customer. They might also make inquiries of various credit reporting agencies. This information is contained in a correspondence file or a credit file that can contain comments of the person who opened the account and might show information given by the depositor when opening the account.

In tracing information about a subject's transactions with the bank, the signature card and account number should be used. The signature card might contain the customer's taxpayer identification number (e.g., Social Security number) and account number, but if the account number does not appear on the signature card, it can be located in other places. Assigned account numbers can be located in the bank's customer information file, and they are encoded on customers' checks and deposit slips.

When requesting the signature card, the fraud examiner should determine whether the bank maintains any type of central file. Most large banks have a central file that lists all departments with which a customer has had dealings. If the bank has such a file, the fraud examiner does not need to check with each department to obtain information. The subject might at one time

have had a bank account that later was closed. Requests for information from a bank about a subject should always include a reference to both active and closed accounts. Records of closed accounts are usually maintained in a separate file.

BUSINESS ACCOUNTS

To open a business account, the party opening the account must provide additional documentation beyond what is already required for opening a personal account.

To open a business account for a corporation, the opening party must provide a signature card, or similar document, and copies of corporate resolutions of the board of directors authorizing the opening of the bank account and naming the person who may authorize payments on the account. Also, the bank might require a copy of the company's organizational or business filings (such as articles of incorporation). These documents should indicate who the company's corporate officers are and its date of incorporation.

To open a business account for a partnership, the opening party must provide a signature card, or equivalent record, and a partnership agreement authorizing the opening of the bank account and naming the person authorized to draw checks on the accounts.

For an unincorporated company to open a bank account, the banking institution might require the company to provide a doing-business-as (DBA) registration, fictitious name registration, or business registration certificate. Generally, the required documentation depends on the jurisdiction's applicable laws.

Negotiated (Canceled) Checks

Checks are a type of negotiable instrument—a written order promising to pay a sum of money—that instructs a financial institution to pay a specific amount of money from the check writer's account to the entity named on the check.

Negotiated (canceled) checks are checks cleared by a bank or other financial institution and may serve as proof of payment. A check becomes canceled once it is processed and all appropriate accounts have been credited. Once canceled, a check is no longer negotiable.

Canceled checks written by a subject or received from others can provide valuable information. Canceled checks provide information on, among other things, the amounts, payees, and endorsees of payments made by check, and this data can provide leads and help identify a subject's assets.

Canceled checks can lead to hidden funds. For example, the absence of a check for a recurring payment for a particular month might indicate a cash payment, which in turn would indicate possible undisclosed cash income. Alternatively, the absence could indicate the payment of an expense by a third party, which could suggest a suspicious relationship or conflict of interest.

The back of canceled checks can contain many items of interest. An endorsement signature on the back of a check can be compared to other examples of that individual's signature and indicate a forgery, or the endorser might not be the individual usually responsible for depositing an organization's checks and represent a potential source or lead. A deposited check might show the name of the entity to whose account the money has been deposited and the account number. Also, it might contain the names of the financial institutions through which the check traveled.

In addition, the depository stamp on a check can identify the bank at which the check was cashed, and this information might provide a lead to another bank account.

When examining financial records, fraud examiners should study the checks written on the subject's account. Checks written on the subject's account can reveal various things, such as:

- Other bank accounts held by the subject
- The subject's credit cards
- Assets the subject has purchased
- The locations of the subject's assets (e.g., through the payment of real estate taxes, broker's fees, or utility payments)
- Loans the subject has obtained (which can provide valuable leads through the loan applications and financial statements that might be attached)

Even though records of negotiated checks might contain valuable information, check usage has fallen, being mostly replaced by electronic payment systems.

TRACING CHECKS

Fraud examiners can use bank identification symbols to trace negotiated checks. Fraud examiners do not have to understand the internal bookkeeping procedures used by banks to trace checks, but they should be familiar with the concept of bank identification numbers.

All checks printed for banking institutions contain a bank code (also known as *institution number*, *routing code*, and *clearing code*), and this number can be used in the tracing process. The bank code enables a check to be routed to the bank of origin, and it is essential for delivering payment through the clearing system. In the process of routing, a trail is left.

Bank codes and the rules governing them, however, vary from country to country. Canada uses routing numbers, the United Kingdom uses Sort Codes, Ireland uses National Sort Codes, Germany and Austria use Bankleitzahl (BLZ codes), Switzerland uses Bankenclearing-Nummer (BC) and SIX Interbank Clearing Codes (SIC), France uses Code Banque and Code Guichet, and Australia uses Bank State Branch (BSB) numbers.

In the United States, checks contain a transit number that is based on an identification code developed and assigned by the American Bankers Association (ABA) called the *ABA transit number* (also known as a *routing number* or *routing transfer number*). Banks use this number to identify specific financial institutions in the United States; ABA transit numbers on a check identify the bank on which it was drawn. The ABA number was designed to facilitate the sorting, bundling, and shipping of paper checks back to the check writers' accounts. The ABA number is also associated with online banking and electronic funds transfers (EFTs), and it designates automated clearinghouses.

Such national codes, however, differ from the SWIFT Code (also known as *BIC* [Bank Identifier Code]). The SWIFT Code is the standard format used to identify a financial institution when transferring money internationally between banks.

MAGNETIC INK CHARACTER RECOGNITION

Many countries use MICR technology to facilitate the processing and clearing of checks, drafts, and similar items. MICR is a machine language, and the MICR encoding, called the MICR line, is comprised of numeric information that is printed on the bottom of checks using magnetic ink. This coding is electronically scanned by computers that convert the magnetic ink notations into electronic impulses that can be scanned and read by MICR readers.

Checks, drafts, or similar items that are not encoded with magnetic ink cannot be processed through the clearing system without special handling.

MICR information is printed in groupings called fields. Typically, the MICR is composed of the branch transit (routing) number, the customer's account number, and the amount field, and some checks contain serial numbers. The transit number indicates the institution on which the check was drawn. The account number field shows the drawer's assigned account number at the bank. The amount field shows the amount of the check, which is added to the check when it is processed through a bank. The dollar amount of the check should always equal the encoded MICR amount. These two figures should be compared to make sure that the subject did not alter the returned check.

The fraud examiner should physically inspect checks to ensure that the MICR information is consistent with any other written or printed information on the check's face. It is particularly important to ensure that the check has not been defaced and the MICR information has not been altered in any way.

Deposit Tickets

All deposits into financial institutions are accompanied by some type of deposit ticket. Deposit tickets are written records of money deposited into accounts. The deposit ticket is the principal source document for crediting the customer's account. Banks use them to keep track of money deposited.

Deposits are first recorded on the deposit ticket or slip and usually show the respective amounts of bills, coins, checks, and other forms of currency deposited. If the deposit was in check form, the deposit slip might show the bank identification number (e.g., ABA code in the United States) identifying the bank on which the deposited check was drawn.

Financial institutions will only accept cash items (e.g., currency, checks, and bond coupons) and cash equivalents for deposit.

Deposit tickets can provide various leads. With the information contained on deposit tickets, fraud examiners can potentially identify and trace deposits to their sources. Deposits made with checks can identify people who conduct business with the subject and other bank accounts the subject controls. In contrast, cash deposits can identify patterns of the subject's activities.

Also, when working with deposit tickets, the fraud examiner must remember that sometimes the depositor splits the deposit, meaning only part of the money is actually deposited. In these instances, the depositor either receives cash or requests that part of the proceeds be applied to a note or interest due to the bank.

Wire Transfer Records

A *wire transfer* is a transfer of money from one bank to another through a secure system. These transfers are processed by banks and by wire remittance companies such as Western Union and MoneyGram.

Often, fraudsters will move illicit funds abroad through wire transfers to break the audit trail and secure the funds in jurisdictions with relaxed standards. They also might use wire transfers to move assets abroad. Consequently, wire transfer records might contain evidence that money has been moved abroad.

As with other financial transactions, banks keep records of the wire transfers performed. Wire transfer records maintained by a bank might include:

- Fedwire, the Clearing House Interbank Payments System (CHIPS), SWIFT, or other documents reflecting wire transfers of funds to, from, or on behalf of (the subject)
- Documents reflecting source of funds for wire transfer out
- Documents reflecting disposition of wire transfer in

Generally, to send a wire transfer, the issuing party will need the following information:

- The receiver's name
- The receiver's address
- The receiver's account number
- The name of the receiver's financial institution
- Wiring instructions for the receiving financial institution
- The city and state of the receiving financial institution
- The name and address of the person sending the wire

Thus, the information contained on a wire transfer will generally include the following items:

- The amount of the transfer
- The date of the transfer
- The purpose of the transfer
- The name of the sender or originator

- The routing number of the originating bank or financial institution
- The identity of the designated beneficiary or receiver of the funds
- The routing number of the recipient bank

The following is a list of the forms and documents produced in connection with a wire transfer that the originating bank or financial institution might maintain:

- The wire transfer request form
- A copy of the wire transfer
- A confirmation or an advice statement confirming the wire transfer
- An entry of the wire transfer that appears on the originating customer's account statement as a debit memo
- The originating customer's monthly account statement
- An internal log of outgoing wires
- A journal entry

Wire transfer documents maintained by the recipient institution might include:

- The wire transfer request form
- A copy of the wire transfer
- The credit memo the originating bank or financial institution sent to the beneficiary (if deposited)
- The customer's monthly account statement
- A journal entry
- A cashier's check
- Correspondent banking information
- Information on interbank book transfers that banks keep to clear transactions

Accordingly, wire transfer records might contain valuable information. The records of a wire transfer will identify who sent the wire, where it was sent, the date, and the amount. Also, the records of an international wire transfer will vary depending on the laws and policies of the receiving and origin countries and the receiving institution. Thus, if the wire transfer was sent out of the country, tracing the transfer depends on the laws and policies of the relevant countries and institutions. If, however, the wire transfer was sent to a bank in the United States, the recipient bank should have a record of the number of the account into which the funds were deposited.

Correspondent Banking Records

A *correspondent banking relationship* is generally defined as an arrangement in which one bank maintains a correspondent account at another bank for the purpose of settling transactions for itself or its customers. In other words, one financial institution has the authority to provide certain financial services on another institution's behalf.

A *foreign correspondent relationship* involves a correspondent banking relationship between foreign and domestic institutions. Permissible foreign correspondent relationships are not limited to banks or deposit accounts in most jurisdictions. A financial institution can typically maintain foreign correspondent relationships with any organization that regularly provides financial services to it, which could potentially include foreign broker-dealers and money services businesses (MSBs). Fraudsters might take advantage of foreign correspondent relationships to move illicit funds abroad and can use them to orchestrate transfers designed to conceal the funds' movement. For example, fraudsters might utilize a correspondent financial institution in a jurisdiction with more lax anti-money laundering (AML) or know-your-customer (KYC) requirements to serve as a pass-through to make the origin of the funds more difficult to determine. This can potentially be accomplished through the use of financial services such as international fund transfers, letters of credit and loans, foreign exchange services, or lines of credit.

Due to risks of illicit transactions, such as money laundering, most jurisdictions require financial institutions to obtain information from other financial institutions with which they maintain a foreign correspondent relationship. The information to be obtained might include the institution's ownership details, the identities of agents authorized to conduct business on the institution's behalf, the institution's AML and KYC processes, and the institution's licenses or certifications. Fraud examiners might be able to obtain this information through court orders, although some jurisdictions only require financial institutions to make foreign correspondent relationship records available to law enforcement agencies.

Intrabank Transfer Records

Intrabank transfers are transfers of funds between different accounts (e.g., checking and savings) that a customer has at the same bank. Other departments within a bank can credit the depositor's account for funds collected, such as the proceeds of loans or items held by the bank for collection. Items held by the bank for collection are not always deposited to the customer's account; they are sometimes remitted directly to the customer.

Electronic Payment Records

Electronic payments (or *e-payments*) refers to any type of noncash payment that does not involve a paper check. Methods of electronic payments include credit cards, debit cards, mobile payments, and the automated clearing house (ACH) payments, which include direct deposit of payroll, social security benefits and tax refunds, direct payment of consumer bills, direct debits, business-to-business payments, federal tax withholdings, and electronic checks (e-checks).

Despite the numerous methods of electronic payments, there are three main types of electronic payment transactions:

- *One-time customer-to-vendor payments*: This type of transaction occurs when a customer needs to pay a company or individual once and a continuing monetary relationship is not expected. This transaction can include peer-to-peer payments.
- *Recurring customer-to-vendor payments*: This type of transaction occurs when a customer pays a bill through a regularly scheduled direct debit from their checking account or an automatic charge to their credit card.
- *Automatic bank-to-vendor payments*: Bank-to-vendor payments occur when bank customers make payments electronically from their bank accounts via electronic check or from their credit cards and debit cards directly to vendor accounts. Online bill pay is an automatic bank-to-vendor payment method.

Electronic payment records can be valuable in tracing investigations. They can serve as proof of payment, and they can reveal, among other things:

- Assets the subject has purchased
- The locations of the subject's assets (e.g., through the payment of real estate taxes, broker's fees, or utility payments)
- The locations of the subject's residences and businesses (e.g., through analyzing the payments of utility bills)
- Loans the subject has obtained (e.g., through analyzing loan payments)
- Payments made to nonexistent employees with direct deposit
- The cities and countries in which the subject conducts business (e.g., through analyzing the payments for carrier services to deliver packages)
- Transfers of funds between individuals without an established business relationship

- Assets ostensibly owned by family members or close associates but effectively controlled, held, or gifted by the subject
- Hotel payments
- The true owner of a property (e.g., through analyzing the mortgage payments and payments for homeowner's insurance)

Also, the absence of a recurring payment might indicate a cash payment or payment of an expense by a third party, which in turn could suggest possible undisclosed source income.

Generally, records of a subject's electronic payments can be obtained from various sources. Financial institutions maintain electronic payment records. Also, businesses must record all electronic payments; therefore, vendors should have records of one-time customer-to-vendor payments, recurring customer-to-vendor payments, and automatic bank-to-vendor payments. Moreover, the subject might keep records of their online payments. When a customer makes an electronic payment online, they will receive payment confirmation. Often, customers print, write down, or otherwise save their payment confirmation information. For more information, see the "Payment Fraud" chapter in the Financial Transactions and Fraud Schemes section of the *Fraud Examiners Manual*.

Savings Account Records

Savings accounts are accounts maintained by financial institutions that pay interest but cannot be used directly as money. Often, savings accounts are referred to as *time deposits*, which are money deposits that cannot be withdrawn for a certain period of time. Thus, sometimes savings accounts are not as readily available to the customer as checking account deposits. Funds in a savings account might be subject to a thirty-day notice of withdrawal. Records of deposits into or withdrawals from savings accounts, along with account statements, might be used to either trace assets or establish a financial profile in a fraud examination.

Certificates of Deposit

CDs are interest-bearing investment products that provide limited access to the money invested and a modest rate of interest. CDs are intended to be held until maturity, at which time the money may be withdrawn together with the accrued interest. Many banks impose penalties on money withdrawn from a CD before maturity.

The financial institution issuing a CD will maintain records related to the CD. The records will contain information identifying the customer purchasing or presenting the CD (i.e., name, address, and taxpayer identification number), and they will describe the CD, note the method of payment if purchased, and list the date of the transaction.

Account Statements (Bank Statements)

An *account statement* (or *bank statement*) is a summary of all the transactions and financial activity of a bank account and the account holder for a specified period (usually a month).

Account statements are provided for all types of bank accounts, including checking accounts, money market accounts, savings accounts, command asset program (CAP) accounts (used by those who often deal in securities transactions), and others.

Account statements contain important information. In general, the details on an account statement include:

- The name and address of the bank in which the account is held
- The name and address of the account holder
- The account number
- The opening balance of the account for a specified period
- A record of all debit transactions (e.g., cash withdrawals from a teller, ATM cash withdrawals, check payments, online payments, debit card payments, or bank fees) from the account for a specific period
- A record of all credit transactions (e.g., direct transfers, cash deposits, or check deposits) on the account for a specific period
- The account's closing balance for a specific period

In general, when examining account statements, fraud examiners should look for various things. In particular, they should seek to identify significant deposits made into the account. When doing so, fraud examiners should:

- Note whether there are any unusually high monthly balances. If there are, this fact might provide circumstantial evidence of illicit funds, even if the individual deposits cannot be identified.
- Identify deposits in even numbers, deposits made on regular dates, or deposits that cannot be connected to legitimate sources of income. (Legitimate deposits can be determined by comparing dates and amounts to company payroll information.)

- Identify large or unusual currency transactions or credit memo entries. Memo entries might indicate wire transfers, loans, certificates of deposit, investments, or other hidden assets.
- Obtain copies of any suspicious deposit items from the financial institution, if possible.

In addition, when examining account statements, fraud examiners should seek to identify the origin of the funds entering the account and the location where the funds have been transferred.

Moreover, when looking at account statements, fraud examiners should try to:

- Identify any large transfers or withdrawals.
- Identify any patterns of transfers deposited on a regular basis.
- Identify any transfers to a friend or family member on a so-called debt.
- Identify any transactions involving cryptocurrency exchanges.
- Identify any ATM withdrawals that do not reflect normal spending patterns.

Furthermore, when reviewing the subject's account statements, fraud examiners should review any checks written on the account, looking to identify:

- Other bank accounts
- Credit cards
- The purchase of major assets
- The location of major assets
- Evidence of loans (which can provide valuable leads through the loan applications and financial statements that might be attached)
- The absence of a check for a recurring payment because it might indicate that the payment was made in cash or by a third party, which could indicate an undisclosed cash income
- Any checks made out as payable to "cash" (record where the check was cashed)

Exchange Instruments

Exchange instruments are vehicles by which the bank transfers funds, including cashier's checks, bank drafts, traveler's checks, bank money orders, and certified checks. Bank exchange instruments are often purchased with currency; therefore, they might be good sources of information about a subject's currency transactions.

CASHIER'S CHECKS

Cashier's checks (also called *bankers' drafts*, *bank checks*, or *certified checks*) are checks that have been issued and certified by a bank with itself as the drawer. These items are called *treasurer's checks* when issued by a trust company. Cashier's checks are frequently an excellent lead to

other bank accounts, stock, real property, and other assets. Because cashier's checks can be held indefinitely, subjects sometimes purchase cashier's checks instead of keeping large amounts of currency on hand.

To reconstruct a subject's transactions with cashier's checks, the fraud examiner must be sure that all checks are accounted for because subjects sometimes exchange previously purchased checks for new ones.

Bank checks, such as cashier's checks, can be extremely time consuming and expensive to locate unless the fraud examiner knows the date and number of the check. However, if the subject has deposited a bank check into their account or purchased a bank check using a check from their account, copies of bank checks are much easier to obtain because the subject's account records will reveal the date and number of the bank check.

BANK DRAFTS

Bank drafts are checks drawn by the issuing bank on its account with another bank. Often, this other account is in the geographical area where the purchaser desires to make a payment. Bank drafts also can be used when a subject does not want to carry a large amount of cash.

TRAVELER'S CHECKS

Traveler's checks are checks issued in predetermined amounts by the American Express Company and other banks.

Traveler's checks are traced by their serial number. The issuing company usually keeps records of traveler's checks sent to it by the selling bank. The local bank that sold the checks might keep a copy of the sales order that lists the serial numbers. If the numbers are not available, the issuing bank might be able to supply the information if it is known when the checks were purchased. Canceled checks can be obtained from the issuer.

A target can purchase large amounts of traveler's checks from one bank and place them in another bank to avoid arousing suspicion by depositing cash.

It is important to note, however, that traveler's checks are declining in use. According to the U.S. Federal Reserve, usage of traveler's checks has declined each year since their peak in the mid-1990s.

BANK MONEY ORDERS

Bank money orders are similar to cashier's checks but usually are for small amounts. As with cashier's checks, subjects who are reluctant to use cash might use money orders.

CERTIFIED CHECKS

Certified checks are a customer's checks stamped with the paying bank's guarantee that the maker's signature is genuine and that there is enough money available in the holder's account to cover the amount to be paid. Certified checks are liabilities of the bank and, when paid, are kept by the bank. These checks are immediately charged against the customer's account by debit memorandums. Some banks permit customers to retrieve the original checks by surrendering the debit memorandum.

Loan Records

Loan records can provide important information regarding a subject. When a bank makes a commercial loan to an individual, it requires detailed statements of assets and liabilities from the borrower (e.g., income and the value of assets, such as homes, vehicles, real property, and business interests), and these records will be contained in the loan records. The loan file also might include the results of credit inquiries regarding paying habits, loan amounts, and present unpaid balances.

A bank credit department generally maintains the following basic records:

- *The credit or loan file.* This file includes the customer's loan application, financial statements, and general economic history.
- *The liability ledger.* This contains the customer's past and present liability to the bank. These sheets also contain information such as the loan date, note number, amount of the loan, interest rate, due date, and payments.
- *The collateral file.* This contains a complete description of the items pledged as security for loans. Records of such collateral can provide valuable information about a subject's assets.

When examining loan records, fraud examiners should look for red flags of unusual loans, including loans in odd amounts or loans that were not deposited into the subject's bank account.

Moreover, fraud examiners should look for loans with unusual repayments and trace them. Lump-sum payments, payments in odd amounts, accelerated payments, and large paydowns

are unusual. These are all considered red flags indicating that an individual is seeking to conceal ill-gotten assets through a loan repayment, and loans with any such red flag should be investigated further.

If a fraud examination involves a loan with proceeds that have been disposed, the fraud examiner should trace the disposition of the loan's proceeds. *Loan proceeds* refers to the net amount a lender disburses to a borrower under the terms of a loan agreement. A fraud examiner can trace loan proceeds to determine if hidden accounts were used for loan payments or if the proceeds were deposited into hidden accounts. Also, because loans might be secured by hidden assets or co-signed by previously unknown cohorts, tracing loan proceeds can uncover hidden assets or unknown witnesses. Moreover, if the subject has taken out a loan for someone else, tracing the disposition of the loan proceeds will uncover those leads.

Fraud examiners should also trace the source of loan payments for leads. For instance, if the loan payments were made from a previously unknown account, tracing the payments will uncover the unknown accounts. Payments made by a third party might reveal a cohort, kickback, or bribery scheme.

Tracing the disposition of loan proceeds is similar to tracing deposit transactions. When a lender disburses loan proceeds to a borrower, the borrower can use the proceeds in various ways. The borrower can deposit the proceeds into an account they have with the lender or into an account in someone else's name. The borrower can use the proceeds to purchase a certificate of deposit. The borrower might send the proceeds of a loan to another bank through a wire transfer. But commonly, the lender gives the borrower the loan proceeds in the form of a bank check, and if this occurs, the lender should be able to trace the check to determine where it was deposited or cashed.

Also, when fraud examinations involve loans with proceeds that have been disposed, fraud examiners should consider examining the loan application. The loan application should contain a financial statement, or its equivalent, on which the subject might identify other accounts and assets. The file might also contain tax returns, credit agency reports, and notes of interviews by the loan officer. The security used to obtain the loan, if any, might be a hidden asset.

LINES OF CREDIT

Lines of credit are another type of loan service that banks offer, and records of this type of loan services might contain valuable information. A line of credit is an arrangement between a bank and a customer whereby the bank extends a maximum loan balance that the customer can draw on when needed, as long as the customer does not exceed the maximum amount established in the agreement. And with most lines of credit, the customer makes payments only on the credit they actually used.

Generally, line of credit privileges are recorded on the customer's checking account, and the loan statement and check statement become one and the same. Copies of loan agreements and statements can be obtained from the bank.

MORTGAGE LOAN FILES

Mortgage loan files often contain the most detailed financial statements submitted by a subject. The mortgage loan file should identify the party (e.g., title company or lawyer) that handled the closing, the homeowner's insurance carrier, the closing attorney (if applicable), and perhaps the real estate broker.

Additionally, the title company files often contain copies of the cashier's checks used for the down payment, and this can identify new accounts.

Also, the closing attorney will have many of the same materials that the title company maintains.

Similarly, the real estate broker might keep copies of personal checks used for deposits, and they might be able to provide information about other real estate transactions by the subjects.

A mortgage loan file often contains a copy of the borrower's homeowner's insurance policy, which might also contain valuable information. It might contain a rider that lists the homeowner's valuable assets, such as jewelry or furs, perhaps with appraisals and purchase receipts.

Fraud examiners should remember to look for accelerated or lump sum payments on the mortgage balance.

INSTALLMENT LOANS

Installment loans are loans in which the principal and interest are repaid in periodic installments. Often, installment loans are lent to individuals for personal, family, or household purposes. Lending institutions create computer-generated reports that record the loan particulars and payment history.

Credit Card Records

Credit card records are important in tracing assets because they reveal a great deal of personal and business information about the account holder or cardholder. Among other things, credit card records show card purchasing limits, previous payment history, account balance, when and where the subject has traveled, restaurants frequented by the subject, and assets the subject has acquired. In short, these records show the movements and habits of the person to whom the records pertain.

The credit card application and the monthly statements that the bank sends to the cardholder are the records that are most valuable to fraud examiners. Credit card applications require an applicant to disclose financial information, and they generally require the same type of information found on a bank loan application. In today's environment, credit cards might be tied to bank accounts and might not require a separate application.

Credit card statements also contain a great deal of important information. Generally, these statements contain the name of the credit card issuer, the cardholder's account number, a summary of the transactions on the account, payment information, and a list of all the transactions that occurred during that month's billing cycle (i.e., purchases, payments, credits, cash advances, and balance transfers). Credit card records can document out-of-town travel, and, often, the records will name people or entities with whom the subject conducts business.

An abnormally high balance on credit cards might provide circumstantial evidence that the subject has a hidden source of income or a motive to establish illicit income.

Additionally, information on credit card charges might provide leads to identifying hidden assets. For example, if a fraud examiner notices that the subject used their credit card to purchase items at a marina, the fraud examiner should investigate further to determine if the subject owns a boat.

Prepaid Access Card Records

Prepaid access cards are similar to debit and credit cards, but unlike debit and credit cards, prepaid cards do not require a checking or savings account or an extension of credit. Instead, with prepaid access cards, users pay in advance on an account and can use the funds anywhere credit and debit cards are accepted. Some cards even allow users to withdraw cash from the account at any ATM in the world. This payment method is popular with the so-called under-banked, or people who cannot or do not want to open traditional checking accounts (e.g., someone with bad credit, foreign travelers or laborers). The requirements for setting up a prepaid access card account are less stringent than those at traditional banks.

However, due to the threat of money laundering and asset hiding that accompanied the increased popularity of prepaid access products, various jurisdictions have passed regulations that require prepaid providers and sellers to adopt anti-money laundering (AML) controls similar to those required for banks. For example, the Financial Crimes Enforcement Network (FinCEN), a bureau of the U.S. Department of the Treasury (the Treasury), adopted AML regulations that generally affect any prepaid product that is both easy to transfer funds or make purchases with and can be loaded with substantial funds (e.g., more than \$2,000 per day). Therefore, such providers of prepaid access must maintain AML programs and take measures to verify customers' identity.

In Europe, the Anti-Money Laundering Directive (referred to as the Fifth Directive) requires customer due diligence (CDD) and identification of prepaid card users for any single electronic transaction exceeding EUR 50 or any monthly activity exceeding EUR 150.

Bank Collection Department Records

A bank's collection department, which is normally involved in collecting amounts due on installment contracts and notes, can be used to collect personal checks (usually in large amounts and with special instructions), thus circumventing the normal recordkeeping associated with checking accounts. Such a transaction will not be reflected on the target's regular checking account statements but will appear in the collection department records.

Safe Deposit Box Records

Safe deposit boxes are private vault spaces rented by banks to customers. The nature of the relationship may vary between banks and their safe deposit box holders.

Banks keep no record of safe deposit box contents and rarely know what the boxes contain, but, generally, banks maintain the following related records:

- Rental contract records
- Access records and entry logs

A safe deposit box's rental contract records identify the renters, the person or people who have access to the boxes, their signatures, and the dates of the original agreements and later renewals. They also might contain other identifying information, including the name of the initiating bank officer. The officer's name could be significant if the subject (who might have used an alias in renting the box) must be identified.

Records showing access to the boxes vary from bank to bank. But generally, they contain the signatures of the people entering the boxes and usually the dates and times of entry. The entry records are filed in box-number order. The frequency of entry and the times and dates of entries might be significant and might correspond to the times and dates of deposits, withdrawals from other accounts, the purchases and sales of securities or property, and in other situations. Of course, proper authorization must be obtained before the bank will turn over any such records.

Because the bank records will not show the contents of the box, the fraud examiner can request permission to inventory the box with the presence of someone who is authorized to access it. If the fraud examiner does this, they should carefully note and describe the box's exact contents (e.g., legal description on deeds, numbers of insurance policies).

Financial Intelligence Unit Documents and Reports

FIUs are national centers that are responsible for receiving and analyzing information on suspicious or unusual financial activity in order to combat international financial crimes. FIUs are also designed to improve global cooperation and promote mutual exchange of financial intelligence information.

Financial regulations and legislation obliges banks and other financial institutions to file reports detailing large cash transactions or suspicious activity with FIUs, and the documents and reports filed with FIUs might contain valuable information that can be useful in tracing hidden assets.

In the United States, for example, the Bank Secrecy Act (BSA) sets forth a system of reporting and recordkeeping requirements designed to help track large or unusual financial transactions. Under the BSA, banks and other financial institutions are required to file reports detailing large cash transactions or suspicious activity with the Financial Crimes Enforcement Network (FinCEN), the U.S. version of a FIU. FinCEN was designed to safeguard the financial system from the abuses of financial crime, and it works to maximize information sharing among law enforcement agencies and its international partners in the regulatory and financial communities.

FinCEN maintains information from various reports and forms that might be relevant to an asset investigation, including:

- Currency Transaction Reports (CTRs)
- Suspicious Activity Reports (SARs)
- Foreign Bank and Financial Account Reports (FBARs)
- Currency or Monetary Instrument Reports (CMIRs)
- IRS/FinCEN Form 8300

Similarly, in Australia, the Anti-Money Laundering and Counter-Terrorism Financing Act 2006 (AML/CTF Act) sets forth reporting obligations designed to combat money laundering or terrorism financing. The Australian Transaction Reports and Analysis Centre (AUSTRAC), which is the Australian FIU, regulates the AML/CTF Act.

In the United Kingdom, the law provides that organizations must report activity that may be linked to money laundering or terrorist financing to the National Crime Agency (NCA). A report to the NCA is commonly known as a SAR.

In Canada, similar reporting obligations are imposed under the Proceeds of Crime (Money Laundering) and Terrorist Financing Act, and the Financial Transactions and Reports Analysis Centre of Canada (FINTRAC) is Canada's FIU.

Like their U.S. counterpart, the AML and CTF laws in countries around the globe impose reporting and recordkeeping requirements on banks and other financial institutions within their jurisdictions. Such laws require that suspicious transactions be reported to the FIUs, and these reports contain, among other things, the identity of the persons making the transactions and the amount of the transactions. They can also provide valuable information that can be used to:

- Identify illegal activity.
- Detect the flow of illicit funds.
- Identify leads to assets purchased with ill-gotten gains.

Stock Brokerage Records

When attempting to trace illicit transactions, the fraud examiner should look at the subject's brokerage account records, if available. Because brokers place customer orders, maintain customer accounts, and send account statements to customers, a subject's broker or brokerage firm will have all source documents relating to the subject's securities account activity.

Many stock brokerage houses now offer the same type of services as banks, such as check-writing privileges, credit cards, and loans (against the value of securities held), as well as their normal securities business.

If stock brokerage records are at issue, the fraud examiner should request all records pertaining to the subject; however, they should make sure that the request specifically includes the following items:

- *Account application*: When a customer opens an account, they will typically fill out an account application that will contain personal and financial data, such as bank accounts.
- *Customer account information*: This information is usually computerized and is kept in the broker's files for reference. It will include all transactions conducted for the customer.
- *Signature card*: A signature card should be on file that will show all those authorized to conduct transactions on the account.
- *Securities receipts*: These receipts are issued to a customer when they deliver securities to the broker for sale.
- *Cash receipts*: These receipts are issued to a customer when they deliver currency to the broker.
- *Confirmation slips*: These are issued to a customer to show the type of transaction (buy or sell) and the amount involved in the transaction.
- *Securities delivered receipt*: This receipt is signed by the customer when a securities purchase is delivered to the customer.
- *Brokerage account statement*: This statement is usually issued monthly and provides information on all transactions conducted during the reporting period. It lists all purchases and sales, the name of the security, the number of units, the amount per unit, the total amount of the transaction, the account balance, payments received from the customer, disbursements to the customer, and the securities that are held by the brokerage firm for the customer.

Securities are held in two principal ways. First, securities may be held in the name of the account holder, and, under this method, the securities reflect the name of the customer who maintains the account. Second, securities may be held in a street name. When securities are held in a street name, they are registered in the name of the broker.

When looking at stock brokerage records, the fraud examiner will be primarily interested in the source of the funds used to purchase securities or deposited to a cash account. The subject's monthly account statements, which are somewhat more complex than equivalent bank statements, reflect these transactions. Monthly account statements can be interpreted with the help of explanatory material on the statement or with the assistance of a brokerage firm employee.

All receipts for the purchase of stock should note whether the payment was made in currency or check. If payment was made by check, the fraud examiner should make a note of the bank code on which the check was drawn. This information might lead to a previously undiscovered bank account. Bank codes for check processing vary from country to country. Many countries, especially in Europe and the Middle East, use International Banking Account Numbers (IBANs), which is an international format for banking account numbers designed to avoid confusion in international transactions. SWIFT is the official registrar of IBAN codes. U.S. banks will be listed under an ABA code.

Additionally, the fraud examiner should look at any checks the brokerage firm issued to the subject for proceeds generated from the sale of stock.

To obtain information about a particular securities dealer or broker in the United States, check the Central Registration Depository (CRD). The CRD is run by the Financial Industry Regulatory Authority (FINRA), and it is a national database of information on registered (and some unregistered) brokerage firms, individual brokers, investment advisor firms, and individual investment advisors. The CRD is available on the internet to authorized users, and it maintains qualification, employment, and disciplinary actions, in addition to basic biographical data.

Moreover, the fraud examiner should look for purchases the subject might have made under other names, since stocks, bonds, mutual funds, and so on can be purchased easily through a stockbroker or under the names of friends and relatives.

Tax-Related Documents

Tax-related documents (such as W2s and 1099s in the United States) might explain what entities earn and what deductions they take.

Personal tax records, if available, might provide indirect evidence of illicit payments, such as profits or losses from previously undisclosed business ventures, or interest and dividends on hidden CDs and bank accounts. Tax records might also reveal deductions and expenses that can lead to previously unknown funds or assets.

In addition to examining the subject's tax records, fraud examiners should interview the subject's accountant and tax preparer, and, if possible, obtain their files and work papers.

Specifically, tax-related documents can provide the following information:

- The subject's address
- Where the subject works
- The subject's interest income
- The subject's dividend income
- Details about the subject's businesses and partnerships
- Income-producing property owned by the subject
- Royalties the subject receives
- The subject's sources of income
- The subject's government identification number

Accounting Records

Businesses record financial transactions through journal entries that identify account names and amounts, and these entries are summarized in each entity's financial statements, which include the income statement, balance sheet, and cash flow statement.

Accounting records can be valuable to a fraud examination because fraudsters often manipulate accounting records to conceal their misconduct. Thus, fraud examiners should review any relevant financial account and transaction records, such as bank statements, the cash journal, the petty cash journal, expense reports, and so on.

Purchase and Sale Documents

Documents concerning the purchase or sale of assets can be of value to an asset investigation. Such documents might include land registry documents, purchase agreements, sale agreements, loans, mortgages, tax returns, or credit card statements.

When a fraud examiner has obtained purchase or sale documents, they should examine the following items:

- The date of the purchase and sale
- The value at the date of the purchase and sale
- The name of the seller and buyer
- The method of payment used
- The source of the funds used

Indirect Methods of Tracing Financial Transactions

If illicit transactions cannot be traced directly to the subject using specific documentation, then an indirect method of proof might be required to corroborate evidence of funds from unknown or illicit sources. In contrast to the direct approach method, which relies on specific transactions, the indirect approach relies on circumstantial proof.

Circumstantial proof refers to evidence that tends to prove or disprove facts in issue indirectly, by inference. For example, in a bribery case, the prosecuting attorney might offer circumstantial evidence that the defendant, who is accused of receiving bribes, has lived beyond their means for over seven years. To show that the defendant has been living beyond their means, the government might present a summary of the defendant's assets and compare them to their reported income during those seven years; this analysis serves as circumstantial evidence that the defendant has been living beyond their means.

Almost all individuals and business entities determine income by the specific-items or specific-transactions method. Most entities that engage in legitimate pursuits maintain accounting and business records in which they record transactions as transactions occur, and their income computations are based upon the total transactions during a given period. In fraud examinations, income can usually be established more readily by the direct approach; for this reason, it should be used whenever possible.

But in many cases, an entity's accounting and business records are not made available to the fraud examiner, are incomplete, or are inaccurate. In such cases, the fraud examiner must use an indirect approach to prove income. An indirect analysis can reveal that a suspect has more money available or has acquired more assets than can be accounted for from legitimate sources. In addition, evidence that the suspect lives beyond their means might demonstrate that they have unexplained income. Such evidence can also be used to corroborate the testimony of co-conspirators as circumstantial evidence of the underlying misconduct or as evidence to impeach testimony denying the allegations.

Generally, fraud examiners should use indirect methods of proof in the following situations:

- The accounting and business records related to the case are not made available to the fraud examiner, and therefore, they must use an indirect approach to establish the subject's income and assets.
- The fraud examiner suspects that the accounting and business records related to the case do not reflect all of the subject's income.
- The subject experienced a significant increase in net worth.
- The relevant entity's gross profit percentage, which represents how much sales revenue is spent on providing the goods and services sold, changes significantly.
- The subject's expenses exceed their reported income without cause.
- The subject has a large amount of income from unidentified sources.

There are three basic approaches, discussed in further detail later in this chapter, that use circumstantial proof to prove a subject's sources of funds:

- The asset method (net worth)
- The expenditures (source and application of funds) method
- The bank deposit analysis method

If fraud is suspected, then using any of these indirect methods might help in establishing evidence of misconduct by proving the existence of funds from unknown, and potentially illicit, sources. These methods are used extensively by criminal investigators around the world, especially in drug and money laundering cases.

To use either the asset method or the expenditures method, fraud examiners must obtain information about the subject's assets, liabilities, and living expenses. Such information can be determined from a variety of sources, such as:

- Interviews with:
 - The subject
 - Informants or sources
 - The subject's companions or associates
- Surveillance (i.e., observing targets for information-gathering purposes)
- Public records
 - Real estate records
 - Court judgment and lien records
 - Bankruptcy records
 - Motor vehicle records
- Loan applications
- Financial statements
- Accountant's work papers
- Lawsuits and depositions
- Credit card applications or statements
- Tax returns
- Insurance records
- Child support and divorce records
- Canceled checks and deposited items
- Employment applications and salary checks
- Commercial database vendors and investigative service providers
- Online sources (e.g., commercial databases, websites, social media sites)

The asset method and the expenditures method are appropriate in different circumstances. Fraud examiners should use the *asset method* when the subject has invested illegal funds to accumulate wealth and acquire assets or pay down debts, causing their net worth (the difference between assets and liabilities) to increase from year to year. The *expenditures method* works best when the subject spends illicit income on consumables (e.g., travel and entertainment), because when the subject spends the illicit income, it will not cause an increase in net worth.

The asset method and the expenditures method involve similar steps. Both begin with the fraud examiner assembling a personal profile for the subject based on finances and behavior. Next, the fraud examiner should identify all major assets and liabilities, sources of income, and major expenses during the relevant period. After these items are identified, the

fraud examiner should compare the increase, if any, in the subject's net worth or the level of expenditures to the legitimate funds available. Unaccounted-for funds might be inferred to come from illicit or hidden sources.

Develop a Personal Profile for the Subject

Again, the first step in performing both the asset method and the expenditures method is to assemble a personal profile for the subject. The personal profile should include a financial profile and a behavioral one.

The Financial Profile

The *financial profile* is essentially a financial statement about an individual. It shows what the subject earns, owns, owes, and spends at any given point, or over a period; it reflects the subject's income, expenses, assets, and liabilities.

The subject's financial profile contains financial information that can identify inappropriate activity. The numbers in a subject's financial profile will indicate where the subject's money is coming from (income) and where it is going (expenses).

Accordingly, the financial profile can serve various purposes. The financial profile might yield direct evidence of illegal income or hidden assets, or circumstantial evidence thereof, by showing that the suspect's expenditures exceeded known sources of income. It can be used to establish the level of criminality, to build evidence for litigation, to support a request for an enforcement order, to identify fund transfers between entities, and so on.

The financial profile can reveal transactions involving significant amounts, such as large deposits or expenditures, but not smaller currency transactions, particularly transactions for concealed activities, consumables, or unusual one-time expenses, such as medical bills.

Fraud examiners can create a financial profile with the subject's books and records (e.g., financial records, tax records, accounting records, payroll records), but without access to such sources, fraud examiners can rely on circumstantial proof that suggests or leads to information from which a subject's financial standing can be inferred. Typically, fraud examiners can develop a subject's financial profile by:

- Conducting interviews with the subject and their associates
- Observing the subject's lifestyle, habits, and assets (e.g., identifying the subject's residence, hobbies, and vehicles)

- Using public records (e.g., criminal court records, civil court records, business filings, or real property records)
- Using online resources
- Viewing the subject's charitable or political contributions
- Obtaining anecdotal information

To prepare the financial profile, fraud examiners should take the following five steps.

STEP 1

First, identify all significant assets held by the suspect. An *asset* is cash (on hand) or anything else of value that can be converted into cash.

Cash on hand comprises coin and currency (e.g., bills, coins, notes, virtual currencies) in the subject's possession (i.e., on the subject's person, in a digital wallet, in the subject's residence or other place in a nominee's hands, or in a safe deposit box). For purposes of this discussion, cash on hand does not include money in any account with a financial institution.

In addition to cash on hand, assets include checking accounts, savings accounts, certificates of deposit (CDs), stocks, bonds, mutual funds, real property (residence and other property), vehicles, boats, aircraft, life insurance policies, annuities, business interests, and substantial personal property.

The amount of cash on hand might be the most difficult item to verify. Usually, suspects will claim that their cash on hand is sufficient to account for any unknown sources of income.

To establish a firm starting net worth, the fraud examiner must show that the subject had no large cash sums for which they were not given credit. This is usually done by offering evidence that negates the existence of a cash hoard. Such evidence might include:

- Written or oral admissions of the subject concerning net worth (a signed net-worth statement or an oral statement as to cash on hand)
- Low earnings in pre-examination years, as shown by records of former employers and/or tax returns filed by subject
- Net worth, as established by books and records of the subject
- Financial statement presented for credit or other purposes at a time before or during the period under examination (banks, loan companies, and bonding companies are some of the better sources from which to obtain this type of document)

- Bankruptcy before examination periods
- Prior indebtedness, compromise of overdue debts, and avoidance of bankruptcy
- Installment buying
- History of low earnings and expenditures, and checks returned for insufficient funds (a financial history covering members of the subject's family also might be helpful)
- Receipt of some type of public assistance

STEP 2

Second, identify all significant liabilities. A *liability* is an obligation (debt) arising from an oral or written promise to pay, and it includes mortgages, loans, credit card debt, installment loan payments, and other debts. Record all of the subject's liabilities.

STEP 3

Third, identify all income sources during the relevant period. *Income* includes money, or other things of value, received in exchange for services or goods. Income is never included as an asset. Loan proceeds are not included as income but are treated as an asset that is offset by a corresponding liability.

STEP 4

Fourth, identify all significant expenses incurred during the relevant period. An *expense* is any payment for consumables, for personal or business reasons, over the relevant period. Expenses are not included as liabilities.

STEP 5

After identifying a subject's assets, liabilities, income, and expenses and assigning them values, analyze the collected information using the following chart.

The Financial Profile		
TYPICAL ASSETS		FOR EACH SIGNIFICANT ASSET, DETERMINE:
• Residence • Real estate • Mineral rights • Bank accounts • Stocks and bonds • Automobiles • Insurance • Cash on hand	• Jewelry • Clothing • Collectibles • Pensions • Home furnishings • Boats • Cryptocurrency	—When was it acquired and from whom? —How much did it cost? —How was it paid for (currency, check, cashier's check)? —What source of funds was used to acquire it? —What documentation exists for the purchase and where is it?
TYPICAL LIABILITIES		FOR EACH SIGNIFICANT LIABILITY, DETERMINE:
• Mortgage(s) • Other loans • Lines of credit • Credit cards • Installment purchases • Accounts payable • Taxes and other bills • Alimony and child support		—What was the original amount of the liability? —What is the present balance due? —When was the liability incurred? —What was the purpose for the loan or debt? —How were the proceeds used and where were they deposited? —What security (collateral), if any, was given for the debt? —What documentation exists for the transaction and where is it? —Was the debt written off as a bad loan for tax purposes? —Who was the creditor or lender?
TYPICAL SOURCES OF FUNDS		FOR EACH SOURCE OF FUNDS, DETERMINE:
• Salary • Gifts • Rental income • Dividends • Interest • Sale of assets • Royalties	• Insurance proceeds • Commissions and fees • Awards • Inheritances • Disability payments	—What was the total amount during a given period? —What was the source? —How was it paid for (currency, check, other means)? —When were the funds received? —Where was it deposited? —How was it spent? —What documentation exists and where is it?
TYPICAL EXPENDITURES		FOR EACH MAJOR EXPENDITURE ITEM, DETERMINE:
• Rent and mortgage • Health costs • Interest on loans • Credit cards • Food	• Car payments • Travel • Clothing • Utilities • Insurance	—What was the total amount spent? —How was it paid for? —Where were the funds obtained to pay the expense? —What documentation exists and where is it? —When was the payment made?

The Behavioral Profile

Situational factors can affect the reliability of a financial profile. A financial profile might have information gaps, but such factors and gaps might be filled in by preparing the behavioral profile. The behavioral profile is comprised of outside pieces of information that can support estimates and fill information gaps.

The behavioral profile complements the financial profile. While the financial profile works best for large transactions, the behavioral profile is best at identifying smaller activities and smaller currency transactions.

The behavioral profile contains information about the suspect's personal characteristics (e.g., carries large amounts of cash, wears expensive clothes, or has club memberships), home and furnishings, automobiles, and leisure activities.

Accordingly, the behavioral profile reveals the subject's lifestyle habits (or lifestyle indicators) that might lead to identifying hidden wealth or assets—what is important to them that would cause the fraudster to start accumulating illicit income (e.g., where they travel, what type of expenditures they make, associates, significant others, pertinent habits, interests, and addictions). The information in the subject's behavioral profile might suggest that they are living beyond their apparent means, and thus probably have hidden income or hidden sources of income.

The following table contains lifestyle indicators that, if present, might suggest that the subject is living beyond their apparent means or has hidden wealth or assets.

Lifestyle Indicators			
PERSONAL CHARACTERISTICS	LODGING	TRANSPORTATION	LEISURE ACTIVITIES
Large amounts of cash	Expensive housing	Luxury or exotic cars	Expensive vacations
Designer clothes	Expensive furnishings	Numerous vehicles	Cruises
Expensive jewelry	Valuable art	Late model vehicles	Boats
Club memberships	Vacation homes		Planes

Information for the behavioral profile is gathered from interviews and observation of lifestyle and habits, as well as from documentary sources.

To illustrate the behavioral profile, consider the conduct of convicted fraudster Donald Boyd. While working for Audio Aid, a telecommunications company, Boyd manipulated the company's financial records to skim \$6 million, and once he began the scheme, Boyd made many changes to his lifestyle. Among other things, Boyd purchased high-priced cars, boats, jewelry, and a lake house where he enjoyed golfing, horseshoes, and boating. Boyd also frequented a casino where he gambled more than \$260,000.

Information gathered for the behavioral profile might indicate the existence of illicit income or hidden assets. For example, if the suspect spent significant amounts of cash but had no corresponding cash withdrawals from their known bank accounts and no disclosed sources of cash income, the fraud examiner might presume that the suspect has other, undisclosed sources of income.

Additionally, the behavioral profile might also provide evidence of a possible motive of the crime, such as large debts, as well as further evidence of illicit funds.

Asset Method (Net Worth)

Again, fraud examiners should use the asset method when it is suspected that the subject has accumulated wealth and acquired assets with illicit proceeds, which causes the subject's *net worth*—the difference between a person's assets and liabilities at a particular point in time—to increase.

The asset method allows the fraud examiner to prove income circumstantially by showing that the subject's assets for a given period exceed those that can be accounted for from known or admitted sources of income. Under the asset method, the fraud examiner determines the increase or decrease in the subject's net worth from year to year by comparing the subject's net worth at the beginning and end of the period in question. And, once the fraud examiner makes this determination, they can make adjustments for the subject's living expenses to calculate the subject's total income (i.e., money derived from all sources). By then subtracting the subject's known sources of income (e.g., salary, wages, interest, or dividends) from this amount, the fraud examiner can identify funds that the subject received from unknown or illegal sources.

Although the asset method can be applied for any number of years, it is best to start with the year before the suspected fraudulent activity began.

The formula for the asset method is:

	<i>Assets</i>
–	Liabilities
=	<i>Net worth</i>
–	Prior year's net worth
=	<i>Net worth increase</i>
+	Living expenses
=	<i>Income (or expenditures)</i>
–	Funds from known sources
=	<i>Funds from unknown sources</i>

When using the asset method, consider the following issues:

- All assets should be valued at their historical cost, not fair market value. Subsequent appreciation or depreciation of assets is ignored.
- The amount of funds available to the subject from legitimate sources should be estimated or computed generously. The amount of the subject's expenditures, particularly hard-to-document living costs, such as food and entertainment, should be estimated conservatively to give the subject the benefit of any doubt.
- The subject should be interviewed to identify all alleged sources of funds and to negate defenses that they might raise later.

To compute the subject's net worth using the asset method, first establish the starting point, generally the year before the target's illegal activities begin. This will be referred to as year one in the following computations.

Next, compute the target's net worth at the end of year one. Identify all assets held by the subject, valued at cost, including assets acquired earlier, and the amount of current liabilities.

Calculate the difference between the value of the assets and the liabilities to determine the target's net worth at year one or opening net worth.

EXAMPLE

Year One

Assets at Cost		Liabilities	
Residence	\$100,000	Mortgage balance	\$ 90,000
Stocks and bonds	30,000	Automobile loan	
Automobile	<u>20,000</u>	balance	<u>10,000</u>
TOTAL	\$150,000	TOTAL	\$100,000
Assets	\$150,000		
Liabilities	<u>-100,000</u>		
Net Worth	\$50,000		

Compute the target's net worth for year two, using the same method.

EXAMPLE

Year Two

Assets at Cost		Liabilities	
Residence	\$100,000	Mortgage balance	\$50,000
Stocks and bonds	30,000		
Automobile	20,000	Automobile loan	
CD	<u>50,000</u>	balance	<u>0</u>
TOTAL	\$200,000	TOTAL	\$50,000
Assets	\$200,000		
Liabilities	<u>-50,000</u>		
Net Worth	\$150,000		

Note that in the example the target's net worth increased by \$100,000 during year two. To determine the source of such an increase, determine the target's known income during year two and subtract known expenses for year two.

EXAMPLE

Year Two

Income		Expenses	
Salary	\$30,000	Mortgage interest payments	\$20,000
Commissions	<u>20,000</u>	Living expenses	<u>10,000</u>
TOTAL	\$50,000	TOTAL	\$30,000

The difference between the target's income and expenses equals the increase (or decrease) in net worth from year one to year two, which can be attributed to known sources. Here it is \$20,000. Subtract the increase in net worth from known sources from the total increase in net worth to determine the amount from unknown sources.

EXAMPLE

Total increase in net worth	\$100,000
Increase attributed to known sources	<u><20,000></u>
<i>Funds from unknown sources</i>	\$80,000

Repeat these steps for subsequent years as necessary.

Expenditures (Sources and Application of Funds) Method

The expenditures method (also known as the sources and application of funds method) compares the suspect's known expenditures and known sources of funds during a given period of time. That is, this analysis seeks to quantify the cost of the subject's lifestyle and determine whether the subject's reported income is sufficient to support their lifestyle.

To conduct this analysis, quantify the subject's known living expenses (e.g., groceries, mortgage, auto lease, insurance, credit card payments, income taxes), and then compare those expenses to the subject's known sources of income (e.g., wages, bonuses, dividends, gifts, and loan proceeds). If, after conducting this analysis, there are differences between the subject's expenses and the known income (i.e., the subject's spending exceeded the known sources of income), it is likely that the remaining differences can be attributed to hidden income.

The expenditures method is closely related to the asset method; they are accounting variations of the same principle.

This method is best used when the subject spends illicit income on consumables (e.g., travel and entertainment) that would not cause an increase in net worth. Thus, this method might be valuable in the following situations:

- There is evidence that the subject's income cannot support their lifestyle and spending habits.
- The subject operates mostly on a cash basis.
- The subject has little or no net worth, but they have large expenditures.
- The subject experiences little or no change in assets or liabilities.

The following table illustrates the formula used to analyze a subject's income using the expenditures method.

	<i>Expenditures (application of funds)</i>
–	Funds from known sources
=	<i>Funds from unknown sources</i>

To analyze the subject's financial status using the expenditures method, follow three steps:

1. Establish the subject's known expenditures for the relevant year. Expenditures include the use or application of funds for any purpose, including deposits to bank accounts, purchase of major assets, travel and entertainment expenses, and payment of loan and credit card debts.
2. Identify all sources of funds available to the subject, including loans and gifts, as well as cash on hand from previous years.
3. Compute the difference between the amount of the suspect's expenditures and their known income to determine the amount attributed to unknown sources.

EXAMPLE

Subject	Year One	Year Two
<i>Application of funds:</i>		
Increase in bank balance	\$2,000	\$10,000
Down payment on residence	—	10,000
Purchase of automobile	10,000	—
Mortgage payments	8,000	20,000
Credit card payments	5,000	10,000
Other expenses	15,000	30,000
TOTAL	\$40,000	\$80,000
<i>Less funds from known sources:</i>		
Cash on hand	1,000	
Salary	30,000	38,000
Interest earned on savings		
Account	1,000	2,000
Loan proceeds	8,000	
TOTAL	\$40,000	\$40,000
<i>Funds from unknown or illegal sources</i>	0	\$40,000

Bank Deposit Analysis Method

The bank deposit analysis method is another method that can be used to prove unknown sources of funds by indirect or circumstantial evidence. It is a variation of the expenditures method in which deposits to financial institutions are compared to legitimate income.

The bank deposit analysis method computes income by showing what happened to a subject's funds. It is based on the theory that if a subject receives money, they can only do two things with it: deposit it or spend it.

The bank deposit analysis method is best applied in situations when the majority of the subject's income is believed to be deposited into known bank accounts, the subject's assets and liabilities are fairly constant from year to year, and there are no indications of extravagant expenditures.

Under this method, the subject's income is established by analyzing the subject's deposits to financial institutions, canceled checks, and the subject's currency transactions, as opposed to

the direct evidence in the accounting or business records of the subject's employer. Next, adjustments for non-income items are made to compute the subject's income.

The basic formula for the bank deposit analysis method is:

	Total deposits to all accounts
–	Transfer and redeposits
=	<i>Net deposits to all accounts</i>
+	Cash expenditures
=	<i>Total receipts from all sources</i>
–	Funds from known sources
=	<i>Funds from unknown or illegal sources</i>

The bank deposit analysis method is recommended as a primary method of proof when most of the subject's income is deposited and the accounting and business records of their company or employer are unavailable, withheld, incomplete, or maintained on a cash basis. The use of the bank deposit analysis method is not limited to these circumstances, however. Even if the target entity's accounting and business records appear to be complete and accurate, the bank deposit analysis method can still be used to illustrate the existence of funds from unknown or illegal sources.

The basic sources of information for conducting a bank deposit analysis include interviews, analyses of the subject's personal financial records, and analyses of the bank accounts. An interview with the subject should seek to determine the subject's expenditures by cash and checks, bank accounts, and loans and other receipts.

Total Deposits to All Accounts

The subject's total deposits consist of amounts deposited to all bank accounts maintained or controlled by the target, as well as deposits made to accounts in savings and loan companies, investment trusts, brokerage houses, and credit unions. Total deposits also include the accumulation (increase) of cash on hand. Because some subjects have bank accounts in fictitious names or under special titles, such as "Special Account No. 1," "Trustee Account," or "Trading Account," the investigator should look for this type of account during the investigation. If a subject lists checks on a deposit ticket and deducts an amount paid to them in cash (split deposit), only the net amount of the deposit should be used in computing total deposits.

Additional items that must be included in deposits are property and notes that the subject received in payment for services. The accepted practice is to consider these items as depositories into which funds have been placed for future use.

Net Deposits to All Accounts

Once the total deposits to all accounts has been established, the net deposits must be established. To calculate net deposits, subtract all transfers or exchanges between bank accounts, as well as funds that are redeposited as non-income items from total deposits. Failure to eliminate these items will result in an overstatement of income.

Cash Expenditures

Next, determine the subject's cash expenditures and add them to the amount of net deposits to determine the total receipts from all sources. Cash expenditures consist of the total outlay of funds less net bank disbursements.

The basic cash expenditures formula is:

	Total outlay of funds
–	Net bank disbursements
=	<i>Cash expenditures</i>

TOTAL OUTLAY OF FUNDS

The total outlay of funds includes all payments made by cash or check. There is no need to determine which part was paid by cash and which part by check. Total outlays include, but are not limited to:

- Purchase of capital assets and investments (determined from settlement sheets, invoices, statements, and the like)
- Loan repayments (determined from loan ledgers of banks or other creditors)
- Living expenses (can be determined from the same sources presented in the net worth and expenditures sections)
- Purchases, business expenses (less noncash items, such as depreciation), rental expenses, and the like

NET BANK DISBURSEMENTS

The net bank disbursements can be determined using the following formula:

	Net deposits to all accounts
+	Beginning balances
=	<i>Net bank funds available</i>
–	Ending balances
=	<i>Net banking disbursements</i>

Funds from Known Sources

Once the total receipts from all sources is determined, subtract the funds from known sources of income from the total receipts (of income) to calculate the funds from unknown sources.

Funds from known sources include, but are not limited to, salaries, business profits, insurance proceeds, gifts received, loans, and inheritances.

Rebutting Defenses to Indirect Methods of Proof

If a party uses an indirect method to prove the defendant's illicit assets circumstantially, the defendant will try to rebut such evidence. Often, the defendant will claim that the excess income came from legitimate sources. The defendant might claim that the funds are cash that they accumulated earlier or cash from other legitimate sources, such as loans or gifts from relatives.

To counter such defenses, the fraud examiner must specify the amount of cash the defendant had on hand at the beginning of the relevant period and do the following:

- Develop a financial history of the subject and subject's spouse, showing the dates and places of their employment, their salary and bonuses, and the sources of any other legitimate income.
- Establish that the defendant did not have a cash hoard by showing that they borrowed money, made installment purchases, incurred large debts, were delinquent on their accounts, had a poor credit rating, or filed for bankruptcy.
- Establish that the funds did not come from private loans from family or friends by showing that the alleged lender was incapable of generating the amounts supposedly lent, that there is no documentation reflecting the source of the alleged loan (i.e., no bank account withdrawals), and that there was an absence of funds available to the alleged lender.

Indirect methods of proof are significant tools in documenting ill-gotten gains. With this as a basis, the following section covers the major schemes used to commit fraud against companies and governmental agencies by hiding assets and how fraud examiners might be able to locate hidden assets.

Locating Hidden Assets

Fraudsters tend to hide their illicit assets. To review, an *asset* is anything of material value or usefulness that a person or organization owns. Thus, everything a person owns is potentially an asset.

Although any type of asset can be hidden, fraudsters tend to hide *liquid assets* (assets that can be purchased and sold quickly) more frequently than *illiquid assets* (assets not easily converted into cash). Nevertheless, illiquid assets, such as real property, vehicles, boats, and planes, can be hidden by transferring ownership and title to another person or entity.

Generally, asset hidiers look to conceal their assets with financial vehicles that have certain characteristics. For one thing, asset hidiers want products that are difficult to trace or untraceable. With such instruments, asset hidiers can break or obscure links between the initial receipt of the assets and their final disposition. For another thing, asset hidiers want products that are secure and accessible. Assets hidiers also want products that are liquid.

Why People Hide Assets

People hide assets for a variety of reasons, such as to:

- Conceal their connection to a criminal act and to disguise illicit assets as legitimate.
- Fraudulently reduce the holdings of a marital estate in divorce proceedings.
- Keep them away from creditors or remove them from bankruptcy.
- Misrepresent the assets of their company.
- Avoid having to pay a civil judgment.
- Evade taxes.

Common Ways to Hide Assets

Fraudsters can use many techniques to hide ill-gotten gains, but some common ways individuals hide assets include:

- Hoarding assets
- Hiding assets in someone else's name (e.g., the name of a spouse, other relative, friend, business partner)
- Depositing funds into financial institutions
- Converting cash into negotiable instruments (e.g., traveler's checks, savings bonds, cashier's checks)
- Overpaying taxes
- Purchasing real estate
- Purchasing cryptocurrency
- Using assets to pay down debt (e.g., mortgages, credit card balances)
- Purchasing assets and collectibles, such as art and antiques
- Transferring assets into tax havens
- Transferring assets into secrecy jurisdictions
- Transferring assets into trusts
- Using assets to purchase insurance products
- Investing assets
- Hiding assets in businesses
- Purchasing prepaid access cards

Hoarding Assets

Hoarding is the most basic way to hide assets and occurs when a person stores assets in a hidden location, usually in their home or on their property. This is the proverbial “cash under the mattress” technique.

There are many places to hide assets in a typical home. An individual can hide assets in the space beneath the bottom drawer of bureaus, chests, and cabinets. Loose bricks in a wall or fireplace can disguise small spaces for hiding things, and assets can be hidden in furniture. In a more extreme example, an individual can hide precious metals and jewelry in a layer of cooking grease at the bottom of a pot.

Additionally, the structure of a home itself provides options for hiding assets. Assets can be hidden in walls and beams. Cunning hidiers might construct false walls in closets or pantries, or they might dig a cavity into a wall and then cover it with a mirror or painting.

Moreover, asset hidiers often hide currency and other valuables in locations outside their homes. For instance, they might place their assets in bank *safe deposit boxes*, which are private

vault spaces rented by banks to customers. Banks keep no record of the contents of safe deposit boxes, and they rarely know what the boxes contain. Often, to better conceal assets, individuals place assets in safe deposit boxes that are held in someone else's name.

Hiding Assets in Someone Else's Name

Another method used to hide ill-gotten gains is to transfer them into another person's name by gift, loan, or other means. By creating the illusion that the assets are in someone else's possession, these techniques serve to protect the assets from taxes, seizure, and creditors. They are designed to leave little or nothing in the debtor's name so that they become essentially judgment proof (i.e., lack sufficient funds to satisfy a legal judgment).

When an individual gives assets to relatives or friends as gifts, the gifts might be exempt from creditors or court judgments. If, however, an individual transfers their assets to evade a creditor's efforts to collect against the asset, the transfer is fraudulent and voidable. A *fraudulent transfer* is a transfer that a debtor makes to try to defeat a creditor's efforts to collect against the asset.

Also, asset hidiers might use loans—fraudulent or otherwise—to conceal their assets. Often, hidiers make fraudulent loans to friends, relatives, or other close associates to create the appearance that the assets have been disbursed and are no longer in the loaner's possession, even though no money ever changes hands.

Deposits to Financial Institutions

Often, fraudsters deposit their illegal proceeds into accounts in financial institutions. Banks and other depository institutions are susceptible to individuals attempting to hide illicit funds because they are the primary gateway to the financial system, and once funds are placed in a depository institution, the proceeds can be concealed by commingling them with legitimate funds or transferring them to different accounts.

To conceal their illegal proceeds, fraudsters might deposit funds into accounts in financial institutions and then use wire transfers to move the funds between different accounts and break the audit trail. Wire transfers are used to move money from one account to another. Many fraudsters use wire transfers to transmit their illegal proceeds to offshore accounts.

Depository institutions are required to take measures to prevent efforts to conceal unlawful assets. Generally, depository institutions must attempt to confirm the identity of customers,

report suspicious activity, and meet various other requirements. Despite such requirements, there are many schemes by which asset hidiers attempt to escape detection, including:

- Structuring transactions to evade currency reporting requirements by breaking down a large transaction into a number of smaller ones (i.e., smurfing or structuring)
- Using temporary bank accounts
- Colluding with employees of depository institutions

Negotiable Instruments

Cashier's checks, traveler's checks, and other *negotiable instruments*—written orders promising to pay a fixed sum of money—can also be used to hide assets. These instruments are useful to asset hidiers for several reasons, including:

- They disguise an individual's financial dealings.
- They reduce the amount of currency to be carried.
- They can be exchanged almost anywhere in the world.

Tax Overpayment

Some individuals choose to overpay their taxes, and by doing so, a perpetrator causes their money to be safely held by the agency responsible for tax collection (e.g., the Internal Revenue Service [IRS] in the United States) until it is refunded at the end of the year.

To identify advance payments, look for payments to tax collection agencies that are larger than they should be.

Real Estate

Often, individuals conceal their assets by purchasing real estate, although real estate investments leave an audit trail. An asset hider might try to conceal such investments by making them in their spouse's maiden name, in the name of other family members, or in corporate names.

Asset hidiers often invest in real estate in different jurisdictions because real estate investments can be made almost anywhere, making it difficult to locate real estate holdings in different jurisdictions.

Moreover, the real estate industry offers a vast array of financial transactions that often involve multiple parties (e.g., brokers, agents, and appraisers), which can obscure the source

of funds and the identity of the true owner. Although real estate is less liquid than many assets, it can generate additional profits, especially in vibrant or rebounding markets.

Cryptocurrency

Since the introduction of bitcoin in 2009, thousands of cryptocurrencies have been created. A *cryptocurrency* is a type of digital currency that uses public or private key encryption in the currency's creation and transfer. Cryptocurrencies are stored and transmitted through *digital wallets*, which act as financial accounts that securely hold and organize a user's payment information, passwords, and transaction history. Digital wallets are used to make and receive cryptocurrency payments.

Many criminals and fraudsters mistakenly believe that cryptocurrency transactions are entirely anonymous or untraceable; thus, they often use cryptocurrency for illicit transactions or to conceal the proceeds of crimes. Asset-hiding fraudsters often acquire cryptocurrency through the following methods:

- Receiving cryptocurrency as payment in either legal or illegal transactions
- Purchasing cryptocurrency through an internet-based cryptocurrency exchange
- Exchanging cash for cryptocurrency at a cryptocurrency automated teller machine (ATM)
- Exchanging fiat currency (currency backed by the government that issued it), such as the U.S. dollar or the euro, for cryptocurrency through informal, unrecorded person-to-person (P2P) transactions

While cryptocurrency transactions can be difficult and complicated to trace, most cryptocurrencies rely on public blockchains that provide visibility into every transaction that takes place. A *blockchain* is a digital ledger, or database, of transactions that allows data to be distributed and stored on multiple computer systems at once. Although blockchain entries do not include direct identifying information, they do contain users' cryptographic addresses for each transaction that is made. Therefore, by carefully examining blockchain data, fraud examiners can identify patterns that link certain users to criminal activity.

Additionally, many digital wallet providers now record identifying information about their clients that can be useful in tracing efforts. Due to money laundering risks associated with cryptocurrencies, most jurisdictions require cryptocurrency exchanges, digital wallet providers, and cryptocurrency ATM operators to comply with customer due diligence (CDD) or know-your-customer (KYC) regulations. These requirements generally involve recording personal information about clientele, such as name, date of birth, or address. If a subject's

digital wallet can be identified, the blockchain's public ledger can usually be used to uncover associated transactions and trace the funds. However, fraud examiners must go through appropriate legal channels to obtain access to such information.

Fraud examiners who believe a suspect might be hiding illicit proceeds through cryptocurrency ownership can potentially identify cryptocurrency assets held by subjects through analysis of bank statements that feature transactions involving cryptocurrency exchanges. Alternatively, statements made by investigation subjects on social media or in casual conversation with friends, family members, or colleagues could reveal ownership of cryptocurrency assets. Such statements can be discovered through open-source intelligence gathering or interviews. Fraud examiners might also be able to obtain information about cryptocurrency ownership or transactions through court orders targeting cryptocurrency exchanges, digital wallet providers, and cryptocurrency ATM operators. It should be noted, however, that obtaining information from such entities located in other jurisdictions can require law enforcement involvement, which can make the process more difficult and time-consuming.

A fraud examiner investigating a subject who claims to have excessive amounts of bitcoin on social media might confirm cryptocurrency ownership and trace transactions by any or all of the following methods:

- Seeking a court order to obtain the subject's bank records and looking for transactions involving cryptocurrency exchanges
- Observing the subject using a cryptocurrency ATM and seeking a court order to obtain information about the transaction from the ATM operator
- Targeting the subject's internet service provider (ISP) with a subpoena for internet traffic history to identify activity on cryptocurrency exchange sites
- Targeting a cryptocurrency exchange used by the subject with court orders to obtain information about accounts, digital wallets, and transactions related to the subject

Pay Down Debt

Often, fraudsters use illicit funds to pay the interest or repay the principal on their debt (e.g., mortgage loans, credit card debts, or personal loans).

Frequently, asset hidiers use illicit funds to pay the interest or repay the principal on mortgage loans, converting the illicit income into seemingly legitimate profits when the property is sold.

Also, asset hidiers might successfully shelter assets by using illicit funds to prepay a portion of their home mortgage in jurisdictions, such as Canada and parts of the United States, that offer a *homestead exemption*, which exempts some or all of the value of the owner's equity in the homestead from claims of unsecured creditors.

EXAMPLE

A former senior partner in a New York City law firm, which was forced into dissolution by its creditors, relocated to Florida because of the state's homestead exemption. The attorney sold his New Jersey home and used the proceeds to prepay a portion of his mortgage in a multimillion-dollar home in North Florida. Florida has one of the most generous homestead exemptions available to debtors. Absent any actual or constructive fraud, the home of a Florida resident cannot be reached by creditors. Despite Florida's robust homestead exemption, a court ruled that the attorney sought to defeat his creditors by converting non-exempt property (New Jersey home) into exempt property (Florida home), and thus, the court ruled the transaction was a fraudulent transfer. Accordingly, the attorney's creditors were able to collect against the Florida home.

Paying down mortgage loans is attractive to asset hidiers because mortgage payments raise less suspicion than other types of transfers (e.g., wire transfers or offshore transfers), but mortgage payments are easily traced. Often, when a subject uses illicit gains to pay down their mortgage, a fraud examiner can document the subject's mortgage payments to show that the subject has undisclosed or hidden income from other sources.

Other Assets and Collectibles

Individuals also might use their illicit funds to purchase other assets or collectibles, such as pieces of art, antiques, or expensive jewelry. Additionally, fraudsters often use illicit funds to pay for vices or to fund a lavish lifestyle.

Tax Havens

People commonly hide their assets offshore in *tax havens*—countries that offer favorable tax treatment to investments. The act of using tax havens to lower one's taxes might be legal or illegal, depending on the nationality and the residence of the individual and the tax code of the country where the activity takes place.

Secrecy Jurisdictions

Some people hide their assets offshore in secrecy jurisdictions, which are countries or territories that have laws that afford financial secrecy, such as Switzerland or the Cayman Islands. Such jurisdictions may provide financial secrecy through domestic bank secrecy laws that bar insight by outsiders or through blocking statutes that prevent the disclosure, copying, inspection, or removal of documents located in the host country. Moreover, many secrecy jurisdictions prohibit legal depositions in connection with judicial proceedings being undertaken abroad.

Trusts

Another method of hiding assets is to transfer them into trusts. A *trust* is a fiduciary relationship in which a person (the trustee) manages property for the benefit of another (the beneficiary).

A trust requires a settlor, a trustee, beneficiaries, and a trust agreement. The *settlor* is the person creating the trust. The *trustee* or *trustees* are responsible for administering and carrying out the terms of the trust. The *beneficiaries* are those who are entitled to trust income or principal either at the current time or in the future. The *trust agreement* is the written agreement between the settlor and the trustee, and it provides that the settlor will transfer certain assets to the trustee and the trustee will hold those assets in trust and administer them to the named beneficiaries.

Trusts offer several benefits that appeal to asset hidiers. They can be used to minimize or defer taxes, and they can ensure the smooth transfer of assets from generation to generation. Also, trusts can be designed to limit the interests of beneficiaries in a way that precludes creditors from collecting against the assets; a creditor's ability to access a trust is limited to the beneficiary's interest in the trust.

There are many types of trusts, but often, asset hidiers transfer their property into foreign trusts (asset protection trusts). A *foreign trust* is a trust formed under the laws of a foreign jurisdiction and controlled by foreign trustees without a local business presence. A number of jurisdictions (e.g., Cook Islands, Belize, Jersey, and the British Virgin Islands) have enacted laws to make their jurisdictions more attractive to settlors.

Assets transferred to foreign trusts generally are liquid (e.g., bank accounts or brokerage accounts), but they can include intellectual property and interests in legal entities. Moreover, assets transferred to foreign trusts can be located anywhere in the world.

Asset hidiers use foreign trusts for three primary reasons. First, by putting their assets in foreign trusts, they place their assets beyond the reach of local courts. Second, they can place their assets in foreign trusts located in favorable foreign jurisdictions that have relatively short statutes of limitations on fraudulent transfers. Third, the majority of plaintiffs and creditors do not pursue assets contained in foreign trusts because such structures make assets too difficult or expensive to reach.

Foreign trusts, however, are not immune from attack. If, for example, the settlor retains control over the appointment of the foreign trustee, a court may force either of these parties to dissolve the trust. Thus, foreign trusts are most effective for fraudsters when the settlor relinquishes all control over the foreign trust and the foreign trustee.

Insurance Products

Due to the recent growth in the financial products offered by insurance agents and brokers (including savings products, investment products, and tax-planning services), the insurance industry has become increasingly attractive to asset hidiers. This is because many insurance products contain features that make them vulnerable to exploitation by those who need to hide illegal funds.

Asset hiding in the insurance industry primarily involves life insurance policies (typically, those with a cash surrender value or investment features). For example, someone purchases single-premium insurance bonds—or insurance policies purchased with a single down payment—with illegal cash and then redeems the bonds at a discount. That is, dirty money is used to buy an insurance policy, and when the perpetrator cashes out, they receive a clean check from the insurer.

Under the terms of a whole life or universal life insurance policy, a borrower might make additional payments on the policy. These payments accrue at a high rate of interest and enhance the overall value of the insurance policy. A sophisticated hider might deposit substantial funds into an existing insurance policy thinking that an investigator will not look beyond the face value of the policy.

Furthermore, individuals can over-fund policies with illegal money and then receive clean disbursement checks from the insurer upon withdrawal. There is generally an early withdrawal penalty associated with this type of transaction, but, compared to the benefit of being able to hide illegal funds, it is usually considered an acceptable cost.

Also, asset hidiers can use illicit funds to purchase life insurance policies or other redeemable insurance contracts from other individuals. Often, such transactions are *viatical*—pertaining to the purchase of insurance policies from terminally ill policyholders. In a *viatical settlement*, a terminally ill insured sells the death benefit of their insurance policy at a discount to a third party. In this type of settlement, the owner of the insurance policy receives cash, and the buyer becomes the new owner, or beneficiary, of the life insurance policy. A *viatical investment* is an investment in which the investor purchases an interest in the death benefit of a life insurance policy.

Investments

Many asset hidiers invest their illegal proceeds in securities, real estate, insurance products, or some other type of investment. *Investments* refer to any use of capital with an expected return.

Businesses

An asset hider might choose to use a business to hide cash and other assets.

Individuals can use various bookkeeping schemes to conceal funds by filtering them through a legitimate business, otherwise known as a *front business*. Front companies are legitimate organizations that engage in legal commercial activity, but their funds are commingled with illegal money disguised as revenue.

Closely held businesses such as restaurants, retail stores, medical offices, construction companies, car dealerships, and law practices are prone to abuse. Most closely held businesses have finances that their owners can easily manipulate, which makes it easy to process illegal funds.

In addition, an asset hider might transfer their assets into certain types of corporate business structures to shield them from creditors and disguise the source of the funds.

In many jurisdictions, corporations are separate legal entities and are liable for any debts and obligations they incur. The shareholders, directors, and officers of a corporation are generally not personally liable for a corporation's debts and liabilities.

COMMON BUSINESS ENTITIES USED TO PROTECT ASSETS

Often, to protect their assets, fraudsters place them in various types of business structures to shield them from creditors and disguise the source of the funds, including:

- Limited partnerships (LPs) and international variations
- Corporations
- Limited liability companies (LLCs) and international equivalents

LIMITED PARTNERSHIPS

LPs are easy and inexpensive to set up. Generally, assets tied up in an LP are difficult to reach because the assets are not owned by the individual partners and the liability of a limited partner is restricted to the amount of their investment.

Numerous countries have variations on LPs, but local laws differ in scope and application.

In some countries (e.g., New Zealand and the United States), an LP comprises two types of partners: general partners and limited partners. General partners have management responsibility for the partnership, can incur obligations on behalf of the partnership, and have unlimited liability for the partnership's activities. A limited partner's liability, however, is restricted to the amount of their investment.

Also, in such countries, creditors cannot directly reach the limited partner's assets. Instead, they must obtain a charging order, which gives the creditor the right to receive any distributions made to the limited partner. The creditor cannot force the partnership to make distributions to that partner.

Other countries that have variations on LPs include:

- *United Kingdom*: In the United Kingdom, LPs are governed by the Limited Partnerships Act 1907.
- *Japan*: Historically, Japanese law has provided for two business forms similar to LPs: *goshi gaisha* and *tokumei kumiai*. The *goshi gaisha* is structured like LPs. In these structures, the limited partners do not share in management and are liable only to the amount of their contributions. The general partners have management responsibility and unlimited liability. The *tokumei kumiai* is a silent partnership in which a silent partner(s) contributes funds for the partnership's operation and operating partners manage the partnership.
- *New Zealand*: In New Zealand, LPs involve general partners and limited partners.

CORPORATIONS

A *corporation* is defined as a body of persons granted a charter legally recognizing them as a separate entity having its own rights, privileges, and liabilities distinct from those of its members. Therefore, a corporation's shareholders, directors, and officers generally are not personally liable for a corporation's debts and liabilities.

Asset hiders exploit this liability protection by transferring their assets into a corporate entity. In the event that the asset hider is sued by a creditor, their assets are shielded because they are legally owned by the corporation, not the asset hider; therefore, they are out of the reach of any judgment or court order directed against the asset hider as an individual.

LIMITED LIABILITY COMPANIES

An *LLC* and its international equivalents are non-corporate businesses that provide their owners (members) with limited liability and allow them to participate in the entity's management. LLCs generally shield members from the company's debts, obligations, and liabilities.

Much like corporations, LLCs are separate legal entities, but LLCs can be administered and maintained without the rigid requirements applied to corporations. LLC members are essentially free to manage the company and divide the profits in any manner, and this aspect of administrative freedom can be of great benefit to the asset hider.

LLCs also have advantages over LPs. LPs, for all their protections, still expose each partner to a degree of personal liability. An LLC, in contrast, provides its members with complete protection from all liabilities associated with the company. Theoretically, none of the members are personally responsible for any debts or claims against the LLC.

PIERCING (OR LIFTING) THE CORPORATE VEIL

Although limited partners, LLC members, and shareholders of corporations are generally free from personal liability for their entities' obligations, there are exceptions to this rule. A party may be able to access an owner's assets by piercing the veil of the corporate entity.

Under the doctrine of *piercing the veil of a corporate entity*, the separate personality of a corporation may be disregarded if it is used for fraudulent or illegal purposes or to escape the faithful compliance of an obligation. Although the doctrine was originally created as a

way to pierce the special protection afforded to corporate shareholders, it has been adapted and applied to pierce the veil of LLCs and impose liability on their members.

To pierce the corporate veil, the party bringing the action must convince the court that the corporation is not a truly separate entity; it is just a shell that has been established to control the private assets, debts, and interests of its owners. If the court determines that the corporation is a sham and has no true, separate existence from the wrongdoer, the court is justified in ruling that the corporation and the wrongdoer should be considered as one and the same “person” for purposes of determining liability to satisfy a judgment.

Prepaid Access Cards

Often, fraudsters purchase prepaid access cards with their illicit assets in an effort to hide their assets from creditors. Again, prepaid access cards are similar to debit and credit cards, but unlike debit and credit cards, prepaid cards do not require a checking or savings account or an extension of credit. They can be used anywhere credit and debit cards are accepted.

There are various types of prepaid access cards, including:

- Gift or debit cards
- Credit cards, which can also be found in cash management accounts (CMAs) offered by stock brokerage firms
- Insurance premiums
- Mobile phone accounts

Methods to Obtain Information for Locating Assets

This discussion looks at some common methods fraud examiners can use to obtain information that can be helpful in fraud examinations. Some possible methods include:

- Using commercial database vendors and investigative service providers
- Performing surveillance
- Conducting interviews
- Searching digital media
- Using online sources
- Using legal processes

Commercial Database Vendors and Investigative Service Providers

There are many commercial database providers and investigative service providers that offer various services and tools that fraud examiners can use to help find hidden assets. For more information on commercial database vendors, see the chapter on “Sources of Information” in this section of the *Fraud Examiners Manual*.

Surveillance

Surveillance—the covert observation of targets for information-gathering purposes—can be used to locate residences, businesses, or other places of interest to the investigation, and it can be used to produce important evidence concerning the scope and nature of a person’s activities.

Interviews

Asset examinations should involve *interviews*—question-and-answer sessions designed to elicit information—of those who might have relevant information concerning the matters at issue. Typical interviewees in asset investigations include the target; any complainants; business associates, ex-spouses, friends, relatives, neighbors, employees, or other associates of the target; business rivals; employees of financial institutions; people who have a stake in an asset at issue; and other individuals who have been in contact with the target.

When seeking information about unknown assets, a fraud examiner should determine how the subject is hiding assets, and they should ask interviewees for records or documents that might identify, trace, and locate assets or the methods used to hide them.

Digital Media

Today, information is typically created, stored, and disseminated electronically. Consequently, fraud examiners must understand that electronic devices might contain information about hidden assets, such as bank account numbers, the names of nominees, location of accounts, digital wallet information, the existence of shell companies, and so on.

Online Sources

When searching for information, fraud examiners should use online sources. Online sources include commercial databases, social media sites, and any other sites available online. Such sources offer a quick, easy, and cost-effective way to gather information, although fraud examiners should, when possible, make efforts to verify information from online sources with original documents. For more information, see the chapter on “Sources of Information” in this section of the *Fraud Examiners Manual*.

Legal Processes

If a legal action has been filed, information relevant to a search for hidden assets may be obtained by using some legal process, such as depositions, interrogations, and document requests.

In a civil case, nonpublic information, such as bank account records, brokerage account records, cryptocurrency exchange records, travel records, credit card records, records held by credit agencies, and telephone records, may be obtained through a subpoena or its equivalent. A *subpoena* is a legal order to produce documents, witnesses, or other things.

Law enforcement agencies may also subpoena records, of course, but usually, law enforcement will not disclose the contents of such records with the victim or third parties.

Some administrative agencies can access records through administrative subpoenas or interrogatories, and some agencies working overseas are able to access overseas records through written or verbal requests of bank officials. But, accessing records in countries with strict bank secrecy laws can be very difficult.

Locating Assets Stored Abroad

Often, international barriers hinder asset investigations. A fraudster can move their ill-gotten gains across borders, complicating the task of identifying the proceeds of crime.

This discussion provides guidance for fraud examiners seeking to find assets stored abroad by covering the following topics:

- Common challenges fraud examiners face when investigating abroad
- Legal avenues available for locating assets abroad in criminal investigations
- Legal avenues available for locating assets abroad in civil investigations
- Approach for finding assets located abroad

Challenges in Locating Assets Abroad

An investigation of assets stored abroad can be challenging due to obstacles in varying laws, language barriers, culture differences, and other things. Common challenges fraud examiners encounter when trying to find assets abroad include:

- Countries lack the resources or capacity to deal with the forfeiture of stolen assets
- Political influence and power of corrupt officials

- Financial secrecy through domestic bank secrecy laws that bar insight by outsiders or through blocking statutes that prevent the disclosure, copying, inspection, or removal of documents
- Language differences and communication barriers
- Differences in legal systems across jurisdictions where the crime occurs and where the funds are stored
- Different privacy standards and rules concerning the collection of personal data or its transmission to outside countries
- The high cost of investigative efforts abroad
- Physical security concerns associated with travel to some foreign jurisdictions

Legal Avenues Available in Asset Investigations

In addition to internet sources, commercial databases, and public records, there are numerous legal mechanisms available for finding and seizing assets stored abroad. The tools available to government investigators in criminal investigations, however, vary from those available to private parties in civil matters.

Common legal avenues for finding and seizing assets located abroad include:

- Discovery (or disclosure) in civil proceedings
- No-say orders
- Deposition by stipulation, notice, or commission
- Mutual legal assistance
- Letters rogatory
- Information exchanges under tax conventions

DISCOVERY (OR DISCLOSURE) IN CIVIL PROCEEDINGS

In civil proceedings, the parties generally are entitled to *discovery*, which refers to the formal process whereby the parties to litigation collect evidence and learn the details of the opposing side's case.

Also, during discovery, the parties can obtain documents from third parties by court order, including third parties located abroad.

NO-SAY ORDERS

If a plaintiff in a civil case seeks an order for disclosure by a third party, the court may impose a no-say or gag order to prevent the third party from informing the defendant that a disclosure order exists.

DEPOSITION BY STIPULATION, NOTICE, OR COMMISSION

Deposition by stipulation, notice, or commission are the three procedures by which a U.S. litigant can obtain a deposition of a foreign witness without assistance from foreign authorities. But to use these procedures, the witness must submit to the deposition voluntarily, and there can be no foreign laws that prohibit the deposition.

MUTUAL LEGAL ASSISTANCE

Mutual legal assistance (MLA) is a process by which countries request and provide assistance in law enforcement matters, such as gathering information, obtaining provisional remedies, and enforcing foreign orders and judgments. In most jurisdictions, however, MLA is available only in criminal investigations. Private parties do not have access to MLA.

Multilateral conventions, treaties, and agreements contain binding provisions in which countries agree to assist one another in criminal law enforcement matters. To obtain assistance from a foreign government, the government seeking assistance makes an MLA request. An *MLA request* is a written request to the government of a foreign country that is used to obtain assistance in law enforcement matters.

Generally, MLA can be used to obtain assistance in matters such as conducting searches, gathering evidence, compelling sworn testimony and the production of documents, issuing search warrants, issuing subpoenas, serving process, exchanging affidavits, obtaining provisional remedies, and providing assistance in forfeiture proceedings.

A government may request a wide variety of information when it makes an MLA request, including information on bank accounts and bank account documents.

Many countries that are bound to multilateral conventions, treaties, or agreements have a central MLA authority through which MLA requests are made. For example, in the United States, MLA requests are made through the U.S. Department of Justice's (DOJ) Office of International Affairs (OIA). Similarly, in the United Kingdom, the Home Office deals with most MLA requests in England, Wales, and Northern Ireland. In Australia, the International

Crime Cooperation Central Authority is responsible for mutual assistance. In certain circumstances, these MLA authorities can offer assistance to fraud examiners seeking to recover assets stored abroad.

MLA offers the following advantages:

- Available at the investigation stage
- Might not require dual criminality
- Allow for a wide range of assistance

A foreign jurisdiction, however, may refuse assistance. An MLA request may be refused for any of the following reasons:

- Request is for property that is of a *de minimis* value (i.e., so minor as to merit disregard)
- Assistance would prejudice the jurisdiction's essential interests (e.g., sovereignty, public order, security, and burden on resources)
- Assistance requested when there is no reasonable prospect of conviction
- Request involves a party that has already been convicted or acquitted of the same crime
- Request involves a party that is involved in ongoing proceedings or investigations involving the same conduct
- Target has immunity from prosecution

Many of the tools that can be used to trace assets stored abroad will require an MLA request, including:

- *Account monitoring orders*: Account monitoring orders, which might be available in criminal investigations, are ex parte orders (i.e., orders based on one party's request without hearing from the other side) by a court or, in some jurisdictions, the investigating magistrate that allow investigators to conduct real-time financial surveillance and require specified financial institutions to provide account information for the identified accounts.
- *Search warrants*: In criminal investigations, law enforcement officials of one country may request that the courts of a foreign country issue a *search warrant*—a court order that grants authorities the right to search a premises or property for information pertinent to the case—authorizing them to search for and obtain evidence from otherwise protected places, persons, and institutions.

- *Production orders*: A production order is a court order requiring that a specified person produce the evidence specified in the order. Production orders generally are used to obtain nonpublic information, including information held by banks, accounting firms, law firms, insurance companies, email service companies, ISPs, and so on.
- *Forfeiture orders*: A forfeiture order (or a confiscation order) is a court order authorizing a specified official to confiscate specified property obtained in connection to criminal activity.

LETTERS ROGATORY

If an MLA is not available, government officials may be authorized to make a formal government-to-government request for assistance, or letter rogatory, to obtain foreign evidence. These are the customary method that courts use to request assistance from their counterparts abroad in the absence of a treaty. That is, *letters rogatory* are formal requests that a court in one country makes to seek judicial assistance from a court in another country. Letters rogatory also permit formal communication between the judiciary, a prosecutor, or a law enforcement official of one country and their counterpart in another country.

The most common types of assistance sought by letters rogatory are service of process and taking of evidence.

Some countries, such as Australia, do not distinguish between MLA requests and letters rogatory.

Letters rogatory can be used in civil and criminal matters. In civil proceedings, letters rogatory can be issued only after a case has been initiated through the filing of a complaint, but in criminal proceedings, letters rogatory can be issued in support of a criminal investigation before charges are filed.

Typically, letters rogatory are handled through each country's respective ministry of justice (i.e., the agency charged with justice). In the United States, for example, letters are made through the DOJ's OIA. In Canada, requests are submitted through the International Assistance Group (IAG) at the Department of Justice.

Requests for foreign assistance under letters rogatory are usually slower and less efficient than MLA requests.

TAX INFORMATION EXCHANGE AGREEMENTS

In a tax information exchange agreement, two governments seek to prevent tax evasion by establishing an official system to provide for the exchange of information in tax matters between their respective tax authorities.

Generally, this avenue is available only to government investigators.

Approach to Finding Assets Stored Abroad

When searching for assets located abroad, the fraud examiner should take the following steps:

- Identify all jurisdictions where the subject's assets might be located.
- Establish contact with foreign counterparts and seek cooperation.
- Research the laws applicable to the foreign jurisdictions.
- Investigate by identifying and locating the proceeds of crime and collecting evidence of ownership.

IDENTIFY ALL JURISDICTIONS WHERE THE SUBJECT'S ASSETS MIGHT BE LOCATED

First, the fraud examiner should identify where the subject might have stored their assets, not only to secure assets that might become subject to a judgment, but also to assess potential obstacles that might arise in each foreign jurisdiction.

ESTABLISH CONTACT WITH FOREIGN COUNTERPARTS AND SEEK COOPERATION

Early on, contact foreign counterparts for help identifying and assessing potential issues, developing a strategy, gathering information, obtaining informal assistance, and creating goodwill. Establishing contact early gives the foreign jurisdiction an opportunity to prepare for its role in the investigation.

RESEARCH THE LAWS APPLICABLE TO THE FOREIGN JURISDICTIONS

Research and analyze the laws that apply to the jurisdictions where the subject might have stored their assets and examine how the laws might affect recovery. Among other things, the fraud examiner should determine whether the local laws they plan to use can be applied extraterritorially, and they should also identify and analyze the foreign laws that might affect the investigation (e.g., discovery restrictions, data privacy laws, human rights legislation).

INVESTIGATE

The investigative phase involves identifying and locating the proceeds of crime and collecting evidence of ownership. This phase involves the typical steps involved in an asset investigation, which were previously discussed. Fraud examiners might benefit from the enlistment of local investigators in cases involving the location of hidden assets.

Asset Recovery

Once fraud has been documented and the associated illicit transactions have been traced, victims might want to pursue recovery of assets. To successfully assist in the recovery of fraud damages or the proceeds of fraud, fraud examiners must have a basic understanding of legal theories of recovery and should recognize which theories fit the facts of a specific investigation. They must be able to choose not only the theories that are most applicable but also the theories that maximize their (or their employer's or client's) advantages and opportunities for a successful recovery.

Theoretically, any legal wrong that a victim can prove will entitle the victim to recovery from the perpetrator, but different choices can have different tactical and strategic purposes or consequences. For instance, one method of recovery might limit the available pretrial or judgment remedies; another method might limit the potential defendants. Another might dictate the court in which the case can be filed, and this, in turn, might affect the procedures and enforcement processes available.

It is also worth noting that many—although not all—of the remedies and procedures for recovering losses involve litigation or other legal processes. Therefore, in planning a fraud recovery, fraud examiners should consult with legal counsel, not just to prepare for litigation but to answer questions that arise and to help them make strategic and tactical decisions. A competent legal advisor with experience in the relevant jurisdictions will have a much broader knowledge and understanding about the rules and procedures in the applicable court than these materials can provide. Even so, fraud examiners can plan and pursue fraud recovery or forfeiture of assets in a process that generally involves five steps:

1. Evaluate the potential for recovery.
2. Commence legal processes.
3. Secure the assets.
4. Obtain a judgment.
5. Enforce the judgment.

Evaluate the Potential for Recovery

As an investigator or other nonlegal professional concerned with fraud detection and recovery, a fraud examiner must often be able to evaluate the potential for recovery. It is common for fraudsters to spend most, if not all, of their ill-gotten gains, leaving little to recover.

Accordingly, the following questions should be asked before commencing a legal action:

- Are nonlegal recovery methods or remedies available?
- Will the case be referred for criminal prosecution?
- Do one or more defendants have sufficient property or money to satisfy a money judgment?
- Can property be recovered from one or more defendants who are the subjects of a rescission, restitution, or forfeiture judgment?
- Are pretrial attachment procedures available, and should they be invoked to protect and ensure the plaintiff's ability to satisfy a money judgment at a later time?
- Could the assets be protected against enforcement of a judgment?

Commence Legal Processes

In many cases, to recover assets or prompt their forfeiture, criminal or civil legal proceedings must be commenced. The choice of which legal process to pursue will have the biggest impact of any step in the recovery process. The U.S. legal system, for example, allows the confiscation of assets that are determined to be the proceeds or instrumentalities of crime, and it provides for the forfeiture of substitute assets (i.e., permitting the government to forfeit untainted assets of equivalent value to assets that cannot be recovered due to the subject's actions).

In any case involving the recovery of fraud losses, the goal is to recover losses or the property in question, divest the criminal of the proceeds from their illegal activity, or both. This section covers the two primary methods by which these goals can be met: civil and criminal actions. It might be possible for both civil and criminal actions to be pursued in relation to the same fraudulent act.

Civil Action

A person, organization, or government agency that is a victim of fraud can bring a civil action against the responsible parties in courts at a local or national level, depending on the jurisdiction.

Generally, a *civil claim* is a lawsuit brought by one party against another party to recover compensation or enforce some private right. Civil claims can be based on common law,

statutory law, or administrative regulation. If the defendant in a civil case is found liable, the plaintiff is entitled to a remedy. Typically, the term *remedy* refers to any process, procedure, or consequence of a legal wrong by which a victim can be redressed for their loss.

If a defendant is found liable, the remedy to which the plaintiff is entitled, however, depends on a number of factors, such as the relief sought, the facts, and the authority given to the court to grant specific relief. Fraud victims and the fraud examiners working with them might be able to choose among different remedies.

Litigation-related remedies are determined based on the type of case. The law specifies which remedies apply to a cause of action. Likewise, the remedies available for actions based on statutory law are specified in the statute and may include measures of damages and other remedies that are unique and not generally available in common law (e.g., treble damages and recovery of attorneys' fees).

Criminal Action

Criminal actions are procedures based on breaches of criminal law, which deals with offenses of a public nature (i.e., doing something the government forbids). Most criminal offenses are codified in statutes or regulations, and they usually provide penalties, fines, or incarceration for their breach. Criminal actions are brought by the government acting through the prosecutor's office. In most jurisdictions, the prosecutor has almost unbridled discretion in such matters as whether to bring a criminal case, what charges to file, whom to charge, and whether to try the case or negotiate with the defendant to plead guilty in return for a lesser charge.

In general, criminal actions do not afford the fraud victim any direct remedy against the wrongdoer, but there are criminal mechanisms that can be used to recover a victim's fraud losses. Therefore, criminal actions are still relevant to professionals concerned with recovery.

Sometimes, the victim of a fraud can obtain compensation from the convicted defendant through the criminal process. The judge may require the convicted defendant to make restitution (i.e., money the court orders a guilty party to repay to a victim for financial losses).

Criminal mechanisms to recover assets, however, depend on a criminal conviction of the wrongdoer, either in the domestic courts of the wrongdoer or in the courts where the illicit assets are located.

Secure the Assets

When ill-gotten gains are identified, they must be secured by seizing or freezing them. A *freezing order* prohibits defendants from moving, hiding, or otherwise unjustifiably dissipating their assets to make themselves judgment-proof. Freezing orders are available only if litigation has commenced.

Obtain a Judgment

To recover losses from fraud, the party bringing the action needs to obtain a judgment against one or more defendants. Often, judgment is in the form of an order in which the court instructs the defendant to pay the plaintiff a specified amount of monetary damages.

Enforce the Judgment

Even if a party obtains a court order to recover assets, the process is not complete. Once an order is obtained, the recovering party must take steps to enforce the court order. If, for example, the assets are in a foreign jurisdiction, the recovering party might need to submit a mutual legal assistance (MLA) request. Once the MLA request is submitted, the court order may then be enforced by authorities in the foreign jurisdiction through various means. Similarly, if a party obtains a private civil judgment for damages or compensation, the party must enforce the judgment using some form of civil procedure.

REPORT WRITING

Writing effective reports is a critical skill for fraud examiners. A thorough investigation or keen analysis will often do little good if the fraud examiner cannot convey the information in a written format. Fraud examiners typically must be very flexible in their writing technique, because reports should generally be tailored to the situation, as well as to the needs of the party requesting the report. Even so, many aspects of good writing—such as accuracy, relevancy, and clarity—are universal to all reports.

Types of Reports

The two most common types of reports fraud examiners are engaged to create are fraud examination reports and expert reports.

Fraud Examination Reports

A *fraud examination report* documents the results of a fraud examination and is generally created by one or more critical members of the fraud examination team. Documenting results is a particularly important function in fraud examinations. The fraud examination report conveys all evidence necessary to evaluate the case, and it can be used to corroborate previously known facts. An accurate report will add credibility to the fraud examination and to the fraud examiner's work. Additionally, requiring a written report will force the fraud examiner to consider their actions during an investigation by ensuring that they document their process. And a well-written report will omit irrelevant information, thereby allowing pertinent facts to stand out. A first-rate fraud examination report is based on a first-rate fraud examination.

Expert Reports

Many fraud cases benefit from the assistance of an expert witness, who (unlike most witnesses) may provide technical opinions while testifying. Typically, fraud examiners who serve as expert witnesses in litigation are tasked with providing an *expert report*, which requires them to provide particular information about their qualifications, their opinions, the bases of those opinions, and various other pieces of information. The purpose of an expert report is to inform the parties, the judge, and the jury (if applicable) about the expert's opinion of the case, as well as the expert's credibility for commenting on such issues.

The content of the expert report is highly dependent on the needs of the situation. For example, the expert witness might provide an expert opinion on an organization's auditing

practices. If the expert used a fraud examination report as part of the basis of forming the opinion, the fraud examination report would likely need to be attached to the expert report. However, each report in this scenario is a separate document with its own structure. In some situations, the person who wrote the fraud examination report might also be called as an expert witness, so it is important to keep in mind the different purposes of each report.

Preparation

Fraud examiners must properly plan their written reports. Proper preparation entails analyzing what is to be expected as an end product. It should also involve having a good idea of what is to be learned from each witness.

Active listening is an essential function of effective report writing. The fraud examiner must have good listening skills so that the information is properly assimilated, evaluated, and communicated to others. Listening skills are learned. Listening involves perceiving what the respondent is actually communicating. To listen properly, the fraud examiner must set aside any preconceived notions and listen objectively, not only to what is being said, but to how it is said and why. The fraud examiner should withhold judgment until they have heard the entire message.

Active listening often involves participating with the respondent during the information-gathering process. Participation conveys interest in the subject and promotes rapport. Participation might require reacting openly to information communicated by verbal and nonverbal responses.

Additionally, during the planning phase of an engagement, the fraud examiner should discuss the anticipated scope of the engagement with the retaining party. The fraud examiner should identify the likely areas that will be addressed in the report based upon that scope and the requirements of the ACFE Code of Professional Ethics, including that “a Certified Fraud Examiner shall reveal all material matters discovered during the course of an examination, which, if omitted, could cause a distortion of the facts.” Based upon that paradigm, the fraud examiner should develop an understanding of the documentation and other evidence that typically would be available within the scope and purpose of the engagement.

After developing the initial engagement plan, the fraud examiner should prepare an estimated cost for the expected preliminary tasks. Obtaining the retaining parties’ approval of the cost

and overall procedures to be performed is an important step toward establishing an agreement about the areas to be addressed and the expectations of the parties.

While the fraud examiner can establish an initial work plan based on the expected engagement scope and purpose, no conclusions or opinions should be released until they have:

- Accumulated sufficient evidence to meet the applicable burden of proof (or established that doing so is not feasible)
- Thoroughly addressed, analyzed, and documented that all probable alternative explanations have been considered and excluded as likely explanations that would affect their conclusions or opinions
- Accumulated sufficient evidence to identify all material matters which, if omitted, could cause a distortion of the facts

An important guiding principle for preparing written reports is: “Would I be able to defend this report in a judicial proceeding?” Many fraud cases will not result in such proceedings, but the purpose of the report is to give an objective and reliable account and analysis of the facts of a case. A court or administrative hearing is the ultimate test of a report because the judge or the opposing parties will thoroughly scrutinize it. Therefore, even when litigation is unlikely, producing a written report that can withstand scrutiny in a judicial proceeding is the ideal goal. Fraud examiners should always know what reliable evidence is available to back up each statement expressed in the report and make sure that case analysis is of professional quality.

Characteristics of a Good Report

A well-written report contains the following four characteristics:

- Accuracy
- Clarity
- Impartiality and relevance
- Timeliness

Accuracy

Written reports must be accurate. Inaccuracies will affect the credibility of the report and the report’s author. Each contact a fraud examiner makes during the course of a fraud examination should be recorded on a timely basis in a separate memorandum that documents the details of the interview. Ordinarily, there is no need to recapitulate testimony word for

word, but the fraud examiner should include all facts of possible relevance for accuracy's sake. Sometimes, a verbatim quote regarding a witness's key words is critical. For example, a suspect might accurately use a technical word or phrase that implies knowledge of the relevant subject.

Fraud examiners should reconfirm dates and supporting information with the respondent. It is important to reconfirm the facts *before* the report is written, not after. Attachments to the report, if any, should be completely described. Inaccuracies and careless errors are inexcusable; they can harm the report's credibility and potentially jeopardize the entire examination.

Clarity

Reports must also show clarity. Investigative reports on fraud examinations should convey pertinent information in the clearest possible language. If necessary, quote the respondent directly (provided the quotation does not distort the context, or vice versa). Only convey objective facts (i.e., unbiased evidence that is not influenced by personal feelings, interpretations, or prejudice); do not editorialize or opine on guilt or innocence. The goal of the fraud examiner's written report and sworn testimony is to help the trier of fact to understand the evidence or to determine the fact at issue. Failure to meet this threshold might prevent the report or the sworn testimony from being admitted as evidence at trial. Also, try to avoid using jargon because the report might be read by people who are not familiar with esoteric or technical terminology. Use complex or technical terms in their proper contexts, and, where necessary, explain their meaning.

Impartiality and Relevance

Additionally, a written report must be impartial and relevant. Fraud examiners should report all relevant facts without bias, regardless of which side a particular fact favors or what it proves or disproves. In litigation, the judge rules on the relevance, in whole or in part, of a fraud examiner's written report and testimony. Sections deemed not relevant will not be allowed into evidence.

Also, at the outset of a fraud examination, the fraud examiner should carefully determine what information will be needed to accomplish the examination's objectives and attempt to include only this information. A report should include only those matters that are relevant to the examination. Fraud examiners should use their professional judgment to determine

whether something is likely relevant. However, because almost every investigation yields much information of which the relevance is not immediately known, in such cases it is best to opt for completeness.

In the context of expert reports, the purpose of such reports is not to “win” cases. The fraud examiner’s job in this capacity is to objectively assist the trier of fact by offering reliable and relevant expert conclusions and opinions (regardless of the consequences to any party in the matter) backed up by a thorough and supportive basis. The fraud examiner may be an advocate for the credibility and reliability of their expert conclusions and opinions and the related supportive basis in reporting or testifying; however, the fraud examiner must not become, or even appear to become, an advocate for one party or the other.

The relevance of an expert report depends on whether it is helpful to the trier of fact. If a layperson, such as a jury member, can perform the same procedures, such as simple calculations or a simple reiteration of the background of the facts of the case, then the expert’s specialized knowledge was not required in those portions of the report. The judge may rule that those portions of the expert report are not relevant and, therefore, not admissible.

Timeliness

Written reports must be timely. The timeliness of reports is extremely important because it tends to enhance the accuracy of witness testimony, as well as preserve the fraud examiner’s memory of the interview(s). Thus, all interviews should be documented in a memorandum of interview as soon as possible after the questioning—preferably on the same day of the interview.

In short, the fraud examiner should, upon completing the examination, prepare a final or interim report (whichever is appropriate) as soon as possible.

Common Reporting Mistakes

This discussion examines some common mistakes fraud examiners make when preparing a written report.

Conclusions and Opinions

Fraud examiners must be cautious about providing conclusions and stating their opinions. In a report-writing context, conclusions and opinions are similar, but not identical. *Conclusions* are based on observations of the evidence, whereas *opinions* call for an interpretation of the facts.

Conclusions

The fraud examiner must be very circumspect about drawing conclusions. In most situations, the conclusions from the examination should be self-evident and should not need to be pointed out in the report. If the conclusions are not obvious, the report might need to be clarified. The fraud examiner's job is to obtain sufficient relevant and reliable evidence to determine the facts with a reasonable degree of forensic certainty. Assuming facts without obtaining sufficient relevant and reliable evidence is generally inappropriate. In the case of expert reports, whether the witness has adequately accounted for alternative explanations demonstrates whether they have employed the same level of intellectual rigor that characterizes the practice of an expert in the relevant field.

Opinions

The fraud examiner must also avoid stating opinions regarding the guilt or innocence of any person or party involved. The ACFE Code of Professional Ethics specifically prohibits statements of opinions regarding guilt or innocence, as this is the job of the judge or jury (see the chapters on ethics and standards in the Fraud Prevention and Deterrence section of the *Fraud Examiners Manual*).

Similarly, the fraud examiner should be careful not to include any statement of opinion as to the integrity or veracity of any witness even if the fraud examiner is convinced that the witness is being untruthful. Truthfulness, or lack thereof, can be demonstrated through conflicting statements by the witness or suspect.

Opinions regarding technical matters, however, are permitted if the fraud examiner is qualified as an expert in the matter being considered. For example, a permissible expert opinion might address the relative adequacy of an entity's internal controls. Another opinion might discuss whether financial transactions conform to generally accepted accounting principles (GAAP). Recommended remedial measures to prevent future occurrences of similar frauds are also essentially opinions but are acceptable in fraud examination reports.

Conveying conclusions and limiting opinions to their proper scope can be challenging when the fraud examiner believes a fraud has been committed. To complicate matters, an employer or client will sometimes direct the fraud examiner to state whether fraud was committed in the report. The following are examples of proper and improper statements in fraud examination reports.

IMPROPER:

I interviewed the suspect on January 5, and he claimed to know nothing about the transactions at issue. However, I later learned that this claim was false. On February 11, I interviewed the suspect again and showed him fraudulent invoices of the transactions that he handwrote his initials on. The suspect initially lied, claiming that while the initials were his markings, he would not have approved the invoices if he knew about the nature of the purchases. However, after showing him additional evidence that he knew about the nature of the invoices, he confessed to the truth. His written confession is attached. It is my expert opinion that the suspect is culpable of a fraudulent crime.

PROPER:

I interviewed the suspect on January 5, and he stated that he had neither approved nor known about the transactions at issue. At a later interview on February 11, I showed the suspect invoices for the transactions, which each had three handwritten letters on them matching his initials. The suspect then stated that he had written his initials on each of the invoices, but that he would not have approved them if he knew about the nature of the purchases. After showing the suspect further evidence I had collected, the suspect confessed to approving the transactions, knowing at that time that they were improper. His written confession is attached.

The first example is improper for several reasons. The writer goes beyond relaying the basic facts discovered in the case by making interpretations about those facts that should be left to the reader of the report. The report should include that the suspect made these statements, but it does not need to (and should not) go on to explain that the suspect was lying or being dishonest. Even if the confession and the facts make it seem overwhelmingly likely that the suspect was lying, making that conclusion is ultimately speculative and not within the purpose of the report. The fraud examiner can point out the inconsistency and possible motive, but readers should be able to reach their own opinions as to the subject's veracity. Additionally, the first example is problematic because the fraud examiner states his opinion on the

suspect's culpability. Simply calling the claim an expert opinion does not make it acceptable; expert opinions should be reserved for technical matters where a layperson would have difficulty interpreting the information.

As seen in the second example, the writer points out the inconsistent statements and then stops short of interpreting them. Additionally, note how it does not assume facts that the first example did, such as whether the letters on the invoices were meant to be the suspect's initials. That information might seem apparent, but it is better to let the suspect's statement confirm that they are his initials than for the fraud examiner to make that assumption. When a suspect confesses to a crime, it is almost always the case that they are actually culpable, especially in a fraud case. Even so, the second example does not include the fraud examiner's opinion on the matter. If the fraud examiner is confident that a suspect would be found guilty if the case went to trial, the facts in the report should be accurate and substantial enough to demonstrate that likelihood.

Evidence

Legal standards provide guidelines for handling evidence and maintaining its integrity. The fraud examiner can avoid many problems of evidence maintenance by simply documenting—in memorandum form—the receipt or release of all evidence. The rules for handling and maintaining the integrity of evidence in criminal matters are often more rigid than the related rules in civil matters. The fraud examiner should seek guidance from the retaining counsel or, if necessary, from their personal counsel during the engagement-planning stage to be certain that their actions do not inadvertently prevent a critical document from being admissible.

Copy Documents

Most evidence in fraud cases will be in document form, and when reporting the results of a fraud examination, it is best to include copies (not originals) of important documents in the formal report or in the attached appendices. Also, when operating under a lawful court order that compels a custodian to furnish original documents, the fraud examiner should copy those documents (preferably in the presence of the custodian). Then, the fraud examiner should furnish the custodian with a receipt describing the documents copied or taken.

Safeguarding and Maintaining Documents

After the fraud examiner obtains documents, they should secure them for evidence. They must be sure that only those people with an absolute need for the documents can access them. For practical purposes, it is usually best to copy all documents (original documents are

usually not included in reports). The fraud examiner should mark all original documents in a unique manner, preferably by using initials and dates. To avoid defacing originals, they should use a small but distinctive tick mark or other form of identifier.

When documents are voluntarily furnished, the fraud examiner should leave the originals in place and work with the copies. If originals are later lost, stolen, or misplaced, the copies can normally be introduced in court under the *best-evidence* rule, which states that to prove the contents of a document, at least a fair copy of the original must be available for inspection (see the “Basic Principles of Evidence” chapter of the Law section of the *Fraud Examiners Manual*).

Documents might come to the fraud examiner from an attorney. In civil matters, the fraud examiner should request that all documents provided be sequentially numbered. It can be done manually or digitally through software.

Fraud examiners must avoid taking shortcuts with evidence, and they should not lose or misplace crucial documents. It is inexcusable for a fraud examiner to mishandle evidence; doing so will almost certainly compromise the case.

While digital storage has made documents harder to permanently destroy, it has also made them easier to proliferate. Data that is stored on unsecured or poorly secured networks can be breached by data thieves. Employees should be instructed to always secure their personal electronic devices when not using them. Moreover, many people who routinely work with sensitive data at both the office and at home can lose sight of security. For instance, during a business trip, a British Petroleum employee lost a laptop that contained the personal data of thirteen thousand individuals who were claimants affected by the Deepwater Horizon oil rig accident in the Gulf of Mexico. The information included the individuals’ government identification numbers, addresses, names, phone numbers, and dates of birth. Fraud examiners should not leave sensitive data open to any unintended parties. It should be under lock and key, password-protected, and encrypted, if necessary, while not in use.

Organization of Information

Because fraud examinations can involve large amounts of data, it is imperative that the fraud examiner properly organize the information. If circumstances permit, an information

database should be established early in the case. Information can be presented either in chronological order or by transaction when writing the fraud examination report. These two options are discussed here.

Chronological

Chronological organization presents facts in the order in which they were uncovered. For example, if an anonymous tip predicated the fraud examination, the information received would be presented first in the report. Thereafter, the reader would follow the development of each step as the case progressed.

Information from each witness should be presented in a chronological manner in the report. If interviewing an associate of the target, for example, relay the information in a fashion that begins at the point when the associate first met the target, and then proceed through the course of pertinent events that lead to the present.

It is important to distinguish chronological organization in the context of report writing versus evidence-gathering. During the evidence-gathering stage of an investigation, chronologically organizing the documents that will later be used in drafting the report is not recommended because it will make searching for relevant information more difficult. But in writing the report, it might make sense to present information chronologically.

By Transaction

Organization by transaction involves grouping information of the same or similar transactions together. If a multitude of documents support several instances of fraud, this information should be presented by separating individual transactions. For example, in a case of internal fraud involving six different instances of embezzlement, the documents and the related interviews might best be understood if presented as a group. Thereafter, detail the remaining transactions chronologically in the report.

Analyzing the Reader

When drafting a report, fraud examiners must consider who might end up reading it. Fraud examiners should keep in mind that the fraud examination report will likely be read by the general public and adverse parties. *Under no circumstances should the fraud examiner prepare a communication with the idea that the information will not be disclosed to adverse third parties.* Fraud

examiners should draft their reports with this caveat in mind. A fraud examination report should provide a full understanding of the investigation and its findings without the need for additional clarification.

In short, a fraud examination report should adequately answer the classic questions of who, what, when, where, why, and how, in a manner that is appropriate for the anticipated audience. And if the report is prepared properly, the reader should not have to refer to any other documents to understand the issues.

Types of Readers

There are many individuals and groups that might end up reading a fraud examination report, including the following parties.

Company Insiders

Managers, executives, and the major investors and owners of private entities will probably review reports of cases involving internal fraud and misdeeds. Because these documents will likely be reviewed by people outside the company as well, they should not address internal control deficiencies, management issues, or other sensitive company considerations. Instead, these matters should be dealt with in a separate letter or other form of communication as directed by counsel.

Attorneys

Reports will be read by attorneys within the organization and others who are outside the entity. In reports prepared at the request of counsel, mark each page “privileged and confidential.” This procedure will document any privilege claim (discussed later). Understand, however, that marking the report in such a manner will not necessarily ensure that the privilege will be sustained.

In adversarial proceedings, such as those in the United States and the United Kingdom, attorneys for the defendant(s) will likely gain access to a report during the discovery phase of civil litigation. Similarly, such information will likely be available to the judge and opposing counsel in inquisitorial judicial systems. These parties will scrutinize the report for errors, omissions, and misstatements. Fraud examiners should be certain that the report is accurate down to the most seemingly unimportant detail. Adverse parties will often cite a minor error

as evidence that the entire document is invalid. The preparer of the report should consider having the entire investigation team review the report before finalization to ensure the accuracy of all details.

In criminal cases, prosecuting attorneys and law enforcement personnel will also review written reports. These individuals will look primarily at evidence and witness statements that will best sustain a criminal prosecution.

Defendants and Witnesses

In either civil or criminal litigation, the defendants will eventually see most, if not all, of a report. If the case reaches court, the witnesses that the fraud examiner identified and interviewed will be provided with copies of their own statements, if not the entire report.

Media Outlets

In some instances, the media might gain access to a report. Report data might be obtained from information disclosed during litigation or, in some instances, from confidential sources. The media is particularly adept at uncovering mistakes and incorrect conclusions drawn by the fraud examiner.

Fraud examiners should assume that any report or affidavit they create, as well as any recorded depositions, are public information. Potential clients and attorneys might access such records to determine whether to retain the services of a particular fraud examiner. If testifying as an expert witness in a court proceeding, opposing counsel might use the information to challenge a fraud examiner's credibility during cross-examination.

Judges or Juries

When the case reaches trial, the fact finder (either a judge or jury, depending on the jurisdiction) will usually receive the fraud examiner's entire report for review and analysis. The fact finder might not have a background in business and accounting matters; therefore, *the report should be as simple and easy to understand as possible*. Of all the important individuals who will review the report, the fact finder in a judicial or administrative proceeding will be the most important by far.

Outlining

Outlines of reports and memoranda of interview can be helpful in long or complex fraud examinations. Report outlines can take many forms, depending on the type(s) of information one must relay.

In general, the outlining process can be divided into three steps. Although the following outlining technique is mechanical, it is easy to master and well suited to unraveling the complexities of large and difficult subjects. Also, most standard office software suites can be used to efficiently complete the outlining process.

Step One

Group naturally related items and write them down on note cards, and then determine whether they are exactly what is needed to meet the demands of the objective, the reader, and the scope of coverage. When they are grouped, arrange them in the proper order and label them with Roman numerals, letters, and numbers to show the level of information.

EXAMPLE

- I. First-level head
 - A. Second-level head
 - 1. Third-level head
 - a. Fourth-level head
 - (1) Fifth-level head

Step Two

Mark each of the note cards with the appropriate Roman numeral, letter, or number. Sort the note cards by major and minor headings. Transfer the notes to paper, converting them to complete sentences.

Step Three

Refine the rough outline. Check to ensure that the subordination of minor headings to major headings is logical and sequential. Check for unity. Stay within the established scope of coverage. Resist the temptation to report irrelevant facts. Check the outline for completeness; scan it to see whether more information is needed or any of the information is extraneous.

Grammatical Considerations

A report with grammatical errors will lead readers to question the overall quality—if the writer did not bother to check for typos and similar issues, then perhaps the facts of the case are in need of review as well. Consider the following issues when drafting and reviewing the fraud examination report.

Style

Write each report in a style that is clear, concise, and to the point. Poorly constructed or grammatically incorrect sentences can detract from an otherwise flawless fraud examination.

The purpose for writing a report is to convey information to a reader; therefore, it is the fraud examiner's responsibility to communicate effectively and efficiently. The two most common mistakes that prevent effective report writing are *vagueness* and *wordiness*. Common breaches of good writing include:

- Use of improperly placed or ambiguous modifiers (changes sentence context)
- Use of technical jargon, slang, idioms and/or colloquialisms (places the burden to understand on the reader)
- Use of unnecessary, pretentious verbiage (in an attempt to impress the reader)

Voice

In grammar, *voice* indicates the relation of the subject to the action of the verb. When the verb is in the active voice, the subject acts; when it is in the passive voice, the subject is acted upon.

EXAMPLE

John Doe *wrote* the report. (active)

OR

The report *was written* by John Doe. (passive)

In the above example, both of the sentences say the same thing, but each has a different *emphasis*. In the first sentence, emphasis is on the subject, *John Doe*, whereas in the second sentence, the focus is on the object, *the report*. Notice how much stronger and more forceful the active sentence is.

Always use the active voice unless there is good reason to use the passive. Because passive sentences can be wordy and indirect, they are often harder to understand.

EXAMPLE

Most instances of fraud *are reported* by coworkers. (passive)

OR

Coworkers *report* most instances of fraud. (active)

Person

Person indicates whether the written text refers to the writer (first person), to the reader or the person for whom the text was written (second person), or to an object or third party about whom the text was written (third person). Person is established through the use of personal pronouns.

EXAMPLE

First person: “*I* did not find a record of the deposit.”

Second person: “*You* did not find a record of the deposit.”

Third person: “*He/She* did not find a record of the deposit.”

Point of View

Point of view indicates the writer’s relation to the information presented, as reflected in the use of person. The writer usually expresses point of view in first-, second-, or third-person personal pronouns. The use of the first person indicates that the writer is a participant or observer (“This happened to me” or “I saw that”). The second and third person indicate that the writer is writing about other people (“This happened to you, to her, to them”). When writing a report, one should never use *the writer* to replace *I* or *me* in a mistaken attempt to sound formal or dignified.

CHANGE: *The writer* believes that this examination will be completed by the end of June.

TO: *I* believe that this examination will be completed by the end of June.

Constructing Clear Sentences

Sentences that make up a report should be simple and clear. Whenever possible, use uncomplicated sentences to state complex ideas. If readers must cope with a complicated sentence in addition to a complex idea, they are likely to become confused. Common sentence structure mistakes to avoid are discussed here.

Rambling Sentences

Sentences that contain more information than the reader can comfortably absorb are known as *rambling sentences*. The remedy for a rambling sentence is to divide it into two or more sentences. Put the main message of the rambling sentence into the first of the revised sentences.

CHANGE: The payment to which a subcontractor is entitled should be made promptly in order that in the event of a subsequent contractual dispute, the general contractors might not be held in default of contract by virtue of nonpayment.

TO: Pay subcontractors promptly. Then, if a contractual dispute should occur, the general contractor cannot be held in default for nonpayment.

Run-On Sentences

A *run-on sentence* is two or more sentences without proper punctuation to separate them. Run-on sentences can be corrected by creating two sentences or by joining the two clauses with a semicolon (if they are closely related).

CHANGE: The new manager instituted several new procedures some were impractical. (run-on sentence)

TO: The new manager instituted several new procedures. Some were impractical. (period)

OR

TO: The new manager instituted several new procedures; some were impractical. (semicolon)

Omitted Verbs

Do not omit a required verb.

CHANGE: I never and probably never will locate the missing file.

TO: I never *located* and probably never will locate the missing file.

Omitted Subjects

Do not omit a subject.

CHANGE: He regarded price fixing as wrong, but until abolished by law, he engaged in it, as did everyone else.

TO: He regarded price fixing as wrong, but until *it was* abolished by law, he engaged in it, as did everyone else.

Unnecessary Compound Sentences

Avoid compound sentences containing clauses that have little or no logical relationship.

CHANGE: The ledger contains several examples of altered data entries, *and it is usually stored in the company's safe.*

TO: The ledger contains several examples of altered data entries. It is usually stored in the company's safe.

Misplaced Modifiers

A modifier (a word, a phrase, or a clause) is misplaced when it modifies, or appears to modify, the wrong word or phrase.

CHANGE: I *almost* located all the missing files.

TO: I located *almost* all the missing files.

Possible confusion in sentences of this type can be avoided by placing the modifier immediately before the word it is intended to modify.

CHANGE: All businesspersons are *not* talented in mathematics. (The implication is that *no* businessperson is talented in mathematics.)

TO: *Not* all businesspersons are talented in mathematics.

Paragraph Structure

A paragraph consists of several sentences that are grouped together and discuss one main subject. The first sentence of a paragraph should state the paragraph's main point, and subsequent sentences should support and clarify that main point.

For the purposes of report writing, paragraphs should be short. Readers can be daunted by long, complicated paragraphs that contain multiple issues. (Note also that short paragraphs result in more white space on the page, making the document more readable.)

Report Structure

Reporting formats vary widely. Some organizations, especially governmental investigative bodies, use report forms so that case information is provided in a consistent manner.

Also, because all fraud examinations differ, no single format can cover every specific case, organization, or situation. Nevertheless, it can help to have a standard format from which to begin; a standard format can reduce the amount of time spent writing a report, while ensuring that all pertinent information is included.

Suggested Standard Format for Fraud Examination Reports

The following is a discussion of items the ACFE recommends that fraud examiners include in most fraud examination reports. Two sample reports are included in Appendix D.

Generally, the following sections should be included in fraud examination reports:

- Background
- Executive summary
- Scope
- Approach

- Findings
- Summary
- Impact
- Follow-up/recommendations

Background

Generally, a written report should contain a background section. The background section should usually be about two paragraphs. It should state very succinctly why the fraud examination was conducted (e.g., an anonymous tip was received, an anomaly was discovered during an audit, money or property was missing). The background section may also state who called for the examination and who assembled the examination team.

Executive Summary

A written report should also include an executive summary, which should provide the reader with an overview of what was done during the examination process. The executive summary should also summarize what actions were performed during the fraud examination, such as reviewing documents, interviewing witnesses, or conducting analyses or tests.

Additionally, the fraud examiner should summarize the outcome of the examination at the end of the executive summary. For example, “\$50,000 in checks was deposited into an account owned by Barbara Wilson. When confronted with this information, Wilson stated that she had only borrowed the money and meant to pay it back.”

For a simple fraud examination, the executive summary should be no more than four or five paragraphs. For a more complex case, the summary may reach a page or two in length.

Scope

Generally, a written report should include a section that identifies the examination’s scope. For example, “Determine whether inventory was misappropriated from the warehouse,” or “Determine why money is missing from the bank account.” The scope section should be no more than one paragraph.

Approach

Also, a written report should include a section about the approach used. This section gives a brief description of the following items:

- Fraud examination team members
- Procedures (generally, what documents were reviewed or what tests were conducted)
- Individuals interviewed

The approach provides a quick and useful reference regarding who was involved in the fraud examination, what the team reviewed, what tests or analyses were conducted, and what individuals the team interviewed.

Findings

Additionally, a written report should include a section that summarizes the team's findings. The findings section contains the details of the fraud examination and generally will consist of several pages.

In the findings section, the fraud examiner should describe what tasks were performed and what was found. The fraud examiner should provide enough detail so that the reader understands what occurred but not so much detail that the reader begins to lose interest or becomes overwhelmed. For instance, the reader wants to know how many invoices were forged, who was involved, how they did it, and what proof you have.

If the findings section is long, the fraud examiner may use subheadings for particular topics or individuals to make it easier for the reader to stay organized.

The information in the findings section can be presented either chronologically or by topic—whatever makes it easier for the reader to follow.

Summary

Furthermore, a written report should include a summary of the investigation. The summary should succinctly summarize the results of the fraud examination, and it should be one or two paragraphs long. The summary should be similar to the outcome stated at the end of the Executive Summary section.

Impact

A written report should also include a section addressing the impact of any misconduct identified during the investigation. The impact section should describe how the fraud affected

the victim organization. In this section, the fraud examiner can provide an estimate of the dollar losses or any other type of tangible or intangible damage already suffered or that might occur in the future.

Follow-Up/Recommendations

A follow-up/recommendations section is generally an optional part of a written fraud examination report. This section identifies any aspect of the investigation that remains outstanding, usually because it is outside the mandate of the investigator. This could include the recovery of property that is in the possession of third parties or the collection of information held by vendors or suppliers.

If requested, the fraud examiner might make recommendations related to procedures and controls; however, it is better for the fraud examiner to convey recommendations related to flawed internal controls and other organizational failings to management in person or in a separate document. If included in the primary report, this information could potentially be seized upon by defense attorneys at a trial or by representatives at an unemployment hearing to push blame away from the suspect's actions and toward the organization's shortcomings.

Follow-ups or recommendations should state what action is necessary or recommended, including remedial measures such as a review of internal controls, the introduction of a fraud hotline, or an increase in security.

Suggested Format for Expert Reports

The form and structure of expert reports is generally more strict than fraud examination reports due to the procedural rules at trial. The expert report format is also complicated by the fact that the requirements often change based on the type of case and the jurisdiction. Criminal and civil courts, different jurisdictions, and different causes of action might have different requirements concerning the timing, content, and even the necessity of a written report. In certain situations, such as when working as a court-appointed expert, the judge may direct the expert not to issue a written report until after they verbally present their findings in the court's chambers (i.e., not in open court and not on the written record) to only the judge and opposing parties. In some cases, the court might order the expert report to be sealed, which, for all practical purposes, means that it never existed and may not be disseminated by or to anyone.

Tailoring the report to the laws of the jurisdiction and any applicable court rules is essential. Due to the varying report requirements, fraud examiners serving as expert witnesses should work closely with the retaining party to make sure their expert reports are properly formatted and contain the necessary information. The following structure is a general recommendation, but fraud examiners should always defer to the rules of the relevant jurisdiction if there is a conflict in form, style, or content. A sample expert report can be referenced in Appendix E.

For additional information on the rules that govern expert reports in accordance with the laws of specific jurisdictions, see the content on “Suggested Format for Expert Reports” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Expert Reports in Civil Cases

The format and contents of expert reports in some jurisdictions are strictly proscribed, so it is important to create the report with any applicable requirements in mind. But generally, to be credible, a fraud examiner’s expert report must include:

- An explanation of exactly how the expert reached the conclusions and opinions
- Sufficient documents and other reliable evidence underlying and supporting the expert’s conclusions and opinions to convince the “reasonable juror” based upon the applicable evidentiary standards
- Evidence from peer-reviewed, generally accepted literature, such as this manual, and detailed analysis work demonstrating that only properly applied, generally accepted methodology was used to reach the fraud examiner’s conclusions and opinions and the related bases
- Discussion and analysis work demonstrating that all probable alternative explanations have been considered and excluded as likely explanations that would affect the fraud examiner’s conclusions and opinions
- Comprehensive discussion and analysis of all material matters which, if omitted could cause a distortion of facts

BACKGROUND

A written report may contain a background section, but some courts have ruled that a background that is nothing more than a recitation of the facts is not helpful to the trier of fact and excluded that section. The striking of even a portion of an expert’s report should be avoided if at all possible. The fraud examiner should discuss this issue with retaining counsel and, if necessary, a personal attorney.

The background section, if provided, should generally be about two paragraphs. It should identify the expert witness and state very succinctly the issues to which the expert's opinions and conclusions relate.

EXECUTIVE SUMMARY

As in fraud examination reports, an expert report should also include an executive summary, which should provide the reader with an overview of what was done during the witness's examination of the case. Courts greatly appreciate executive summaries even when they grow to ten or more pages, as long as the summaries provide a good initial grasp of the facts at issue from the expert's perspective.

SCOPE

The expert report should include a section that identifies the scope of the analyses conducted. For example, "Determine whether the financial statements complied with generally accepted accounting principles (GAAP)," or "Determine the amount of financial losses that the plaintiff sustained as a result of the defendant's actions." The scope section should generally be no more than one paragraph.

FACTS OR DATA CONSIDERED

In this section, the expert witness should list all information considered in forming the opinions. In significantly sized cases, the documents considered can include many tens of thousands of pages. Fraud examiners should consult with the retaining party on how to fulfill the requirements of this section. Generally, the expert should include:

- A list of any learned treatises, such as the *Fraud Examiners Manual*, that were consulted during the course of the engagement (whether supportive or not supportive of the methodology used)
- All sources, including articles, documents, and books, that the expert consulted
- Any codifications of standards, best practices, or generally accepted practices relevant to the circumstances
- A list of individuals interviewed
- Any generally accepted empirical studies used
- All case-related legal documents reviewed
- All deposition testimony transcripts reviewed
- All expert and non-retained expert reports reviewed

Some fraud examiners are so familiar with portions of codified standards or practices that they fail to consult the codification and fail to include it on this list. If there are any such issues in the case, the expert should review and list the codification and any commercially available guides reviewed that deal with the specific issues.

METHODOLOGY

Also, a written report should include a section about the methodology used that demonstrates that the methodology was properly applied to the facts to produce reliable opinions. The methodology section should:

- Explain the methodology used (as discussed in the “Opinions and Bases” section below).
- Explain how the expert properly applied the methodology in accordance with the steps documented in the peer-reviewed generally accepted literature.
- Include quotations from the peer-reviewed, generally accepted literature demonstrating that the methodology used was properly applied to reach the opinions offered by the expert (provide footnote citations to the full document quoted and reference to the location in the expert report’s appendices).
- Explain, based on the peer-reviewed generally accepted literature, that the methodology enjoys general acceptance in the particular field.
- Explain, based on the peer-reviewed generally accepted literature, that the use of the methodology demonstrates the same degree of intellectual rigor as that which characterizes the practice of an expert in the relevant field.
- Explain the existence of any standards controlling the operation of the techniques (methodologies) and how the expert’s use of the methodologies complied with the relevant standards.

OPINIONS AND BASES

Additionally, a written report should include a section that summarizes the fraud examiner’s opinions and the bases for those opinions. While the expert witness might have an entire team working to assist them in the matter, only the testifying expert can have any opinions. The individual who formed the opinion is the testifying expert.

In some jurisdictions, opposing counsel may attempt to subpoena and depose all staff working under the testifying expert. In those jurisdictions, it is common for fraud examination firms with teams of CFEs to not allow the staff to have any opinions. That way,

when deposed, the staff members' standard and true answer is that they do not have any opinions and that the testifying expert directs them to accumulate and summarize certain data for the testifying expert to examine.

The testifying expert forms opinions based upon all of the information examined. The opinions and bases section contains:

- A complete statement of all opinions the expert witness will express
- A complete statement of the underlying basis for each opinion
- A discussion and analysis of probable alternative explanations and the work performed by the fraud examiner to prove or disprove based on the applicable evidentiary standards
- A discussion and analysis if there is a known or potential error rate for the methodologies used, including the potential impact on the expert's opinions

EXHIBITS

If the fraud examiner will use any exhibits to summarize or support the expert opinions, they should be attached to the report. Failure to timely provide exhibits and analyses might result in them not being admissible later at trial. Additionally, the expert should include a notice of the potential exhibits in the report, such as the following:

“Attached are the detailed narrative report and the integral exhibits which, together, along with this summary page, constitute my opinions and the related bases. The entire detailed narrative report and the integral exhibits that are included in the attached appendices may be used as exhibits during trial.”

QUALIFICATIONS

The report should mention education, professional experience, research, relevant degrees or certifications, licenses, and any other experience that would tend to support the person's expertise, such as previous expert testimony or publications authored.

PREVIOUS EXPERT TESTIMONY

The expert should include a list of all other cases in which they have testified as an expert (either at trial or through a deposition) in the previous four years.

COMPENSATION

The disclosure should also include the compensation to be paid to the expert for studying the case and testifying.

Special Considerations for Expert Reports

Experts must give careful consideration when preparing the report, as the expert's reputation is at risk.

Keep the following six tips in mind when preparing an expert report:

- Be brief.
- Avoid ambiguity or inexact language.
- Avoid generalizations; be specific.
- Add charts or graphs where appropriate.
- Reference your work.
- Meticulously check the report for accuracy and neatness.

Sometimes cases involve thousands or even millions of documents, but someone must present a report on the review of those documents at trial. Such cases might make it impractical or impossible to timely analyze all of the documents. It is common for complex cases to require delegation of tasks to create a fraud examination report, such as subordinates searching for key documents and creating document summaries.

An important problem in the preparation of reports and accounting summaries arises from the delegation of tasks to subordinates. If the expert presenting evidence has not had direct knowledge of or has not examined the specific documents, it might be possible that the expert will be trapped under the hearsay rule (if applicable). Thus, if the tasks are delegated, it is important that the expert review the delegated work and compare all original work documentation, especially if the delegated tasks play an important role in the examination's findings.

It also is important to know the effect of other assumptions on the conclusion or opinion reached in the report. It often is possible to trap an expert into giving alternate opinions based upon assumptions that had not been considered. Generally, working papers and schedules supporting the report should not show contradictory conclusions because such contradictions may be produced in court. This is not to advocate that working papers should be deleted or amended; rather, it is a caution that these papers should be prepared with the precept that they could ultimately be submitted to the court. Thus, work papers should be appropriately prepared.

Once they accept a case, many experts immediately start assembling a narrative version of the events. A *narrative* is a detailed summary of the facts of the case, and it serves as the raw material for rendering an official opinion. When assembling a narrative, it is important that the text be written with care and professionalism because the text may (and probably will) be produced at trial.

If an expert report is required, include only what is necessary. Avoid gratuitous and unimportant comments.

Reporting Documents

There are a number of basic reporting documents, including:

- Memoranda
- Cover page or letter
- Exhibits, documents, or enclosures
- Forms
- Indexes
- Transmittal letter

In general, fraud examination reports can be in a long-form report or a short-form report. The long-form report will consist of copies of the documents listed above. The long-form report included in Appendix D illustrates this approach.

The heart of the documentation is the memorandum of interview, and one memorandum should be prepared for each official contact. Once all the memoranda of interviews are completed, they are typically assembled in chronological order and indexed.

Memoranda

Use memoranda to document all interviews and other pertinent information discovered during the examination. Each memorandum should contain the following information where appropriate:

- Heading
 - File number or control number
 - Name of person reporting
 - Case name or subject

- Subject of memorandum
- Date
- Details of facts
 - If the interview was voluntary
 - The fact that one provided one's identity
 - The witness was informed of the nature of the inquiry
 - Date of inquiry
 - How the interview was conducted (i.e., in person, by telephone, etc.)
 - If the interview was electronically recorded
 - Facts learned during inquiry

Cover Page or Letter

A *cover page* summarizes the examination's prominent points. The cover page should be direct and succinct. If a report is submitted to an outside agency (e.g., law enforcement or outside counsel), it should be accompanied by a cover letter. The cover letter should briefly summarize the information in the report and include the principal witnesses. It is not necessary to list all witnesses on the cover page, but the cover page should contain a list of the most valuable witnesses.

Exhibits, Documents, or Enclosures

As a general rule, copies of exhibits should be included in the report and not attached separately. However, bulky files (including working papers and similar exhibits) might be attached separately and referred to in the body of the report. The chain of custody should be maintained over original documents.

Forms

A complete fraud examination report must document every step of the information-gathering process. Because the orderly and legal presentation of evidence requires the fraud examiner to organize a great deal of information, the fraud examiner should use forms to facilitate this task. As a general rule, these forms are kept in the file and are not included in the report unless necessary. Samples of commonly used forms can be found in Appendix C and are described here.

For information on additional jurisdiction-specific forms that might be included in a fraud examination report file, see the content on "Forms as Reporting Documents" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

Consent to Search

A *consent to search* form requests a person's signature as an indication of agreement to a search.

Although such forms can vary significantly between jurisdictions, they typically:

- Document the fact that the subject has been informed of any applicable legal rights.
- State that the written permission is given voluntarily and not because of threat, duress, coercion, or promise to induce permission.
- Indicate that the subject can refuse to consent to such a search.
- Describe the area or items to be searched.
- Explain that signing the form indicates that the subject is giving written permission to search their person or the premises in issue.

The signatures on the bottom of the form (subjects and witnesses) indicate that the person is voluntarily giving the fraud examiner written permission to search the premises and to remove pertinent papers, documents, or other property.

Receipt for Property

A *receipt for property* form is a multipurpose document used to list items of evidence that have been received, returned, or released. This form includes the following information:

- Date of transfer
- Property owner's name
- Owner's address
- Description of item(s)
- Signature lines ("Received by" and "Received from")

Telephone Recording Consent

A *telephone recording consent* form stipulates where, when, and with whom telephone conversations can be recorded. This form states that the subject has granted permission without threats or promises of any kind, and it must be signed by the subject and witnesses. Be cautioned that the form alone does not make the conduct of recording a telephone conversation legal. Fraud examiners must verify the legality of this type of recording within the associated jurisdiction(s) prior to engaging in such activity.

Consent to Record

A *consent to record* form documents the fact that an individual has given the fraud examiner permission to record specific conversations. This form must be signed and witnessed.

It details:

- The name of the individual
- The individual's address
- The location of the conversation(s)
- Who might record the conversation(s)
- The name of the subject(s) with whom the individual might converse
- The date(s) of the conversation(s)

Customer Consent and Authorization for Access to Financial Records

This form authorizes a financial institution to disclose the customer's own records to the fraud examiner or other specifically listed individuals. It must be signed by the account holder.

Evidence Control Log

In cases where there are significant items of evidence, it might be advisable to prepare an evidence control log. The *evidence control log* is a form that documents:

- The evidence control center location
- The bank safe-deposit box location
- The location of other evidence
- The signature(s) of person(s) placing in or removing evidence from repository
- The reasons why evidence was moved
- The file case number
- The time(s) and date(s) when authorized individuals entered and departed the evidence repository

Indexes

The fraud examiner might decide to include an index in their report. The index should contain an alphabetical listing of names or topics and associated page numbers to where useful material relating to those names or topics can be found in the report.

Transmittal Letter

The fraud examiner might include a transmittal letter to provide the report's recipient with a specific context in which to place the report. Often, a transmittal letter will accompany a report to inform readers of the report's context, and this type of letter can serve as a permanent record of having sent the report.

Visual Aids

Occasionally, the fraud examiner might include visual aids prepared either as part of the report or to be used as exhibits at trial.

People generally only recall a small percentage of what they hear, but they recall a much larger percentage of what they both hear and see. In a trial setting, some people do not care as much about what comes out of witnesses' mouths; they want to understand the information themselves, and they want to understand it in a familiar way. Moreover, people tend to process information better when it is presented in a visual format than when it is presented in a verbal format. Thus, visual aids can assist expert witnesses in clearly communicating their findings.

Visual aids should be kept simple. Several different types of visual aids are discussed here.

Link-Network Diagrams

Link-network diagrams show the relationships between people, organizations, and events. In these diagrams, different symbols are used to represent different entities: a square can symbolize an organization; a circle, a person; a triangle, an event; and so forth. It does not matter which symbols are used as long as they are used consistently. In link-network diagrams, confirmed connections between entities can be represented by a solid line or enclosure within another symbol. Speculative or presumed relationships can be indicated by broken lines. To achieve its intended purpose, a graphic should always be clear. Therefore, these diagrams should not contain lines that are crossed, if possible.

EXAMPLE

Smith is vice president of the ABC Corporation and president of the DEF Corporation, a subsidiary of ABC. Jones is general partner in the First and Second Partnerships. Brown and Green are limited partners in the First Partnership. Brown and Black are limited partners in the Second Partnership. Black is also a general partner in the Third Partnership. Smith also might have an interest in the First Partnership.

**LINK-NETWORK DIAGRAM**

Matrices

A *matrix* is a type of visual aid in the form of a grid that shows the relationship (or points of contacts) between a number of entities. Known contacts can be differentiated from presumed contacts by means of a bullet or a circle.

A matrix can be used to identify the direction and frequency of telephone traffic between suspect parties.

This information can also be represented in chart form.

		Incoming					Total Outgoing Calls
		450-1011	550-2022	650-3033	750-4044	850-5055	
Outgoing	450-1011	X	1	3			4
	550-2022		X	2			2
	650-3033	8	7	X	8	9	32
	750-4044	1		1	X		2
	850-5055			8		X	8
Total Incoming Calls		9	8	14	8	9	

Time-Flow Diagrams

A *time-flow diagram* is a time-sequenced flowchart that represents a process showing the steps as boxes of various kinds.

The following chart shows the relationship of significant events, in the order in which they occurred.

Time-Series Analysis

A *time-series analysis*, which can be conveyed with bar graphs and line graphs, is a particularly useful tool when displaying patterns of activity over time (e.g., by month, quarter, or year). The following example, which involves Carlson's Department Store, displays the cyclical nature of the store's income by quarter, and it provides a comparison between similar quarters in 20X4 and 20X5. The bar graph also shows that each quarter of 20X5 produced less income than the same quarter in 20X4, resulting in an overall decrease in income.

Another example of a time-series analysis follows; it conveys Gerald Smith's personal banking account, by month and year. It illustrates that his account fluctuated between \$2,000 and \$5,000 each month.

Timelines

A *timeline* is a summary of the events that have occurred (i.e., they summarize key activities), arranged along a line in chronological order. Although timelines are not always simple—in fact, they can be quite complex—they must be brief, and they must include all relevant information. Timelines are especially helpful to witnesses who are presenting a case to a judge or jury. This is because, in addition to summarizing key activities, timelines allow the witness to tell the story of what occurred in a simple, yet complete, way.

Suitable material for timelines includes data that contain numerous dates and activities. Such material might include witness statements, financial transactions, corporate records, communications (e.g., emails or telephone calls), contracts, meeting minutes, and other information. If dates are not present, a timeline can still be created if the sequence of events is known.

Summaries of Witnesses' Statements

To identify inconsistent statements and permit quick review of voluminous witness testimony, fraud examiners can reduce witnesses' testimony and witnesses' statements to summary form. When summarizing witnesses' statements, fraud examiners should identify pertinent passages by briefly indicating the topic being covered at a given point. They should also provide a synopsis of the statement (see the following example).

Summary of Evidence Emily Watson		
PAGE	TOPIC	TESTIMONY
5	Watson hired on 05/23/XX	Personnel file
5	Watson promoted to purchaser on 09/08/XX	Personnel file
8	Watson and Harrison friends	Gupta interview
15	Checks to Oscar	Silas interview
30	Indebtedness of Watson	Public records

When summarizing, fraud examiners should keep the synopsis as succinct as possible. Too much detail will impair the summary's utility. The fraud examiner or someone familiar with the facts and issues in the case should prepare the summary; it should not be prepared by an assistant who does not know what might or might not be relevant.

A summary of witnesses' statements can also be useful as a basis for a chronology.

The fraud examiner typically will also prepare other written documents, including, but not limited to, engagement and advisory letters. For more information on engagement and advisory letters, see the "Planning and Conducting a Fraud Examination" chapter at the beginning of this section of the *Fraud Examiners Manual*.

Presenting the Case for Prosecution

If fraud is discovered, the fraud examiner might also have to discuss it with the relevant individuals and determine whether the case should be presented to law enforcement or government authorities for prosecution. Some jurisdictions require criminal reporting under certain circumstances, but victims often may choose whether to inform authorities.

Usually, the victim does not prosecute—or ultimately decide to prosecute—an offending individual. Instead, it is generally within the government's discretion to decide whether to bring criminal charges against a person, as well as with what crimes the individual will be charged. In some jurisdictions, private parties are allowed to commence criminal actions in limited circumstances.

Even though these decisions generally belong to the government, there are several reasons an entity might seek prosecution of an offending employee. For example, prosecution punishes the offender and, hopefully, will deter others from engaging in similar offenses. In addition, criminal charges brought against an employee might help an organization defray the losses suffered as a result of fraud. Similarly, prosecution might aid the victim in pursuing civil remedies against an offender. In some jurisdictions, private victims can join criminal proceedings to recover damages resulting from the crime.

Even if the fraud examination establishes a solid case against a suspect, government authorities might be reluctant to bring criminal charges in a fraud case because of the time and expense involved, lack of expertise, the high standard of proof required for conviction, and so on.

Nevertheless, there are a number of issues that fraud examiners should be aware of when presenting a case to law enforcement or government authorities for potential prosecution. For instance, before presenting a case to law enforcement or the prosecuting party, it will benefit the fraud examiner to develop a relationship with either or both, or at least to have enough knowledge about both entities to know whom to call so that any submission of a case is not lost in the administrative netherworld of bureaucracies.

It is important to note that attorneys will generally take cases that enhance their reputations and conviction rates. Government lawyers typically have high conviction rates in the cases they prosecute, and this is due in part to their reluctance to take cases they might lose. Therefore, a prosecutor will be more likely to pursue the case if the evidence is strong or if the case involves significant losses, deals with notorious or important defendants (e.g., prior criminal records), and does not appear to be unduly complex. Furthermore, prosecutors, like all professionals, are very busy, and many prosecutors have a limited background in financial matters.

Nevertheless, fraud examiners can do a number of things to aid the chances of their case's prosecution, and this discussion will provide some basic rules for dealing with prosecuting parties.

First, fraud examiners should generally not submit a case to government authorities with a suspicion, but little incriminating evidence, that a fraud has occurred. In general, a prosecutor will only take a case when they believe they have competent evidence to meet the burden to prove that the defendant is guilty in a judicial proceeding. (Note that the laws of evidence are

different from jurisdiction to jurisdiction—fraud examiners should have a fundamental familiarity with these laws prior to presentation of any case to the government authority.)

Second, fraud examiners should generally not submit the case to authorities unless their investigation is complete. Have all of the relevant documents been gathered? Has the fraud examiner made all of their observations? Has the fraud examiner interviewed all necessary witnesses? A case is more likely to be chosen for prosecution if the facts are fully developed.

Third, to get the full attention of the prosecutor or other government authorities, the fraud examiner must have their case ready to present in an organized and clear package. A fraud examiner might have done a great job in developing evidence, but that information must be communicated effectively to the government, which must be convinced that the case is worth the time and effort necessary to pursue legal action against the wrongdoer.

Moreover, fraud examiners can enhance their chances of prosecution if:

- They have obtained a legal and binding admission of guilt.
- They obtain a commitment from the outset for the government authority to consider pursuing the case based on the evidence obtained.
- They avail themselves to the government for aid in the prosecution.
- They follow up regularly with the person overseeing the investigation to ensure their case does not get forgotten or overlooked.

And if possible, the fraud examiner should present their case to a prosecutor or law enforcement agent who has:

- A successful track record in white-collar cases
- A reputation as a hard worker

For additional information regarding the right of prosecution in specific jurisdictions, see the content on “Discretion of Prosecution” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

APPENDIX A**ENGAGEMENT AND ADVISORY LETTERS****FRAUD POLICY REVIEW PROPOSAL
(FRAUD EXAMINATION ENGAGEMENT LETTER)**

[Date]

[Client Company's Contact Person]

[Department]

[Company Name]

[Address]

RE: Fraud Detection and Deterrence Review

Dear [Name of Client Company's Contact Person]:

Pursuant to our discussion, [fraud examiner's company name] is pleased to present this proposal to [prospective client's company name] (the company) to perform a review of the company's policies and procedures to detect and deter fraud.

This review is designed to assist in determining the company's procedures concerning adequate fraud detection and deterrence methods. This review cannot be relied upon to provide assurances that fraud does not or will not exist within the company. Rather, it is designed to highlight weaknesses, if any, in the existing system. A potential review by [fraud examiner's company name] would also provide management with recommendations for a proactive fraud deterrence program.

The fee for these services will be \$[full amount of services] plus expenses, which include, but are not limited to, travel expenses, telephone and photocopy charges, and charges for computerized research. One-half of the fee is due upon signing this letter and the other half upon delivery of the report. All expenses will be billed at the conclusion of each month and are due upon receipt. Any invoice remaining outstanding for more than thirty days will be subject to a rebilling charge.

Please review this proposal. If this proposal meets with your approval, please sign and return one copy along with your check for \$[half of the amount for services] in the enclosed envelope. If you have any questions, please do not hesitate to call. Thank you.

Yours sincerely,

[Signature, name, title, company name, and contact information of fraud examiner]

[Address]

RE: Fraud Examination

Dear [Name of Client's Legal Counsel or Representative]:

Pursuant to our discussion, [fraud examiner's company name] presents this proposal to [name of company receiving the proposal] (the company) to perform a fraud examination as a result of certain allegations that have come to the attention of the company.

Our examination will be conducted in accordance with lawful fraud examination techniques, which include, but are not limited to, examination of books and records, voluntary interviews of appropriate personnel, and other such evidence-gathering procedures as necessary under the circumstances. We cannot provide assurances that fraud, if it exists, will be uncovered as a result of our examination.

The fee for this examination will be \$[amount of service per hour] per hour plus expenses, which include, but are not limited to, travel expenses, telephone and photocopy charges, and charges for computerized research. A retainer of \$[cost of retainer] is due upon signing this letter. All expenses will be billed at the conclusion of each month and are due upon receipt. Any invoice remaining outstanding for more than thirty days will be subject to a rebilling charge. The hourly rate will be applied against the retainer. Once the retainer reaches a fully applied status, an additional retainer of \$[additional amount after retainer] will be required. We estimate the entire engagement will not be more than \$[estimated amount], excluding any testimonial requirements. Any depositions or court appearances will be billed at the rate of \$[hourly rate for depositions and court appearances] per hour. All outstanding invoices must be paid before any testimonial appearances.

Please review this proposal. If it meets with your approval, please sign and return one copy along with your check for \$[cost of retainer] in the enclosed envelope. If you have any questions, please do not hesitate to call. Thank you.

Yours sincerely,

[Signature, name, title, company name, and contact information of fraud examiner]

APPENDIX A**ENGAGEMENT AND ADVISORY LETTERS****FRAUD POLICY REVIEW
(FRAUD EXAMINATION ADVISORY LETTER)**

[Date]

RE: Fraud Detection and Deterrence Review

Dear [Client Company's Contact Person]:

Pursuant to your request, [fraud examiner's company name] has performed a review of the policies and procedures of [client's company] (the company) for the purpose of reviewing their adequacy to detect and deter fraud.

This review does not provide assurance that fraud does not or will not exist. Having completed the following steps, we have determined that in order to strengthen its fraud detection potential, the company's procedures need improvement in the areas outlined herein.

Part of the purpose of an internal control system is to ensure that the assets of the company are properly safeguarded from employee or outsider misapplication. In addition, an adequate system of internal control contains detection methods so that if misappropriation takes place, the irregularity will come to the attention of those who can remedy the situation and take suitable action against it. An adequate system of internal control is not designed to prevent or detect a collusive fraud scheme among employees and/or management. Our review included the following procedures:

[In this section, briefly describe the main procedures followed. For example:

- a. We read the company's anti-fraud policies and procedures.
- b. Through interviews with personnel key to the operations at the company, we determined if the existing policies and procedures were being followed.
- c. We charted the current flow of business transactions as they are being recorded at the company.
- d. We compared the flow of transaction approval and recording with the policies and procedures.]

APPENDIX A

ENGAGEMENT AND ADVISORY LETTERS

Page 2

The following discrepancies were noted in [client company's] system of internal control:

[In this section, briefly explain the differences between the established internal controls and those procedures followed by the company's personnel.]

Based on our review, we recommend the following changes be instituted in the company's internal control system:

[In this section, make your recommendations.]

In addition to the above recommendations, we suggest the company consider the following proactive approach to fraud deterrence:

[In this section, suggest proactive steps, such as:

- An internal audit structure reporting to the board of directors
- Active inquiry of fraudulent transactions
- Hotlines
- Annual conflict of interest statements
- Annual review of employee expense accounts, etc.]

This letter is not intended for general circulation or publication, nor is it to be reproduced for any purpose other than that outlined above. [Fraud examiner's company name] does not assume any responsibility or liability for losses occasioned to one or others as a result of the circulation, publication, reproduction, or use of our letter contrary to the conditions of this paragraph. The validity of our letter is predicated on the extent to which full, honest, and complete disclosure was made by all parties.

We will be in contact soon to discuss the details of this letter. In the meantime, please feel free to contact with questions.

Yours sincerely,

[Signature, name, title, company name, and contact information of fraud examiner]

RE: Fraud Examination

Dear [Name of Client's Legal Counsel or Representative]:

We have conducted a fraud examination concerning a possible [list fraud event(s), such as misappropriation of assets] of [Company Name]. This examination was predicated upon [list reasons why fraud examination was warranted, such as information resulting from a routine audit of the company's books by the company's internal auditors].

Our fraud examination was conducted in accordance with lawful fraud examination techniques, which included [description of techniques, which may include examination of books and records; voluntary interviews of appropriate personnel; and other such evidence-gathering procedures as necessary under the circumstances].

Because of the nature of fraud, no assurances can be given that fraud does not exist. However, based on the results of our examination, we have found no evidence to support the conclusion that [description of how fraud event did not occur, such as the assets in question were misappropriated].

Sincerely,

[Signature, name, title, company name, and contact information of fraud examiner]

SAMPLE FRAUD EXAMINATION REPORTS

Following are two forms of fraud examination reports.

The first is a *short-form report* that summarizes the issues presented, the steps taken, and the information found.

The second sample is a *long-form report* that contains the substantive work produced during the fraud examination, including copies of relevant documents and memoranda of witness interviews.

APPENDIX D**SAMPLE FRAUD EXAMINATION REPORTS****SHORT-FORM REPORT**

TO: HAL B. MARLOW
CHIEF EXECUTIVE OFFICER

FROM: LOREN D. BRIDGES
CERTIFIED FRAUD EXAMINER

RE: EXAMINATION OF POTENTIAL ASSET MISAPPROPRIATION

DATE: MAY 23, 2019

I. Background

On January 28, 2019, the fraud examination unit at Bailey Books received an anonymous telephone call on its fraud hotline from an unidentified man who claimed that he was a former supplier to Bailey. The caller alleged certain improprieties in the bidding and procurement process.

Based upon this initial predication, a fraud examination was conducted, which included reviews of relevant records and interviews of appropriate personnel.

II. Executive Summary

The fraud examination commenced when Loren D. Bridges, CFE, received a telephone call from an unidentified man who said that he had been a long-term supplier to Bailey for sundry office supplies and paper. The caller said that ever since Linda Reed Collins had taken over as Purchasing Manager, he had been gradually “squeezed out” from doing business with Bailey.

Linda Reed Collins has been employed in the purchasing department of Bailey Books since June 1, 2014. She was promoted to Purchasing Manager effective November 8, 2016.

The fraud examination team reviewed selected purchases from 2016 to 2018 and conducted interviews of key participants and Bailey employees who we believed may have information

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

regarding the misappropriation of assets. The team reviewed purchasing guidelines, personnel files of interviewees, and various financial documents relating to both Bailey Books and Linda Reed Collins.

After obtaining sufficient documentation, the team interviewed Linda Reed Collins, who gave a full signed confession to her misdeeds.

III. Scope

The objective of the fraud examination team was as follows:

- Determine the existence of a possible misappropriation of assets of Bailey Books, Incorporated. The examination is predicated upon an anonymous telephone call alleging improprieties on the part of Linda Reed Collins, Bailey's purchasing manager.

IV. Approach

Fraud Examination Team Members: Loren D. Bridges, CFE, Bailey Books; Tonya Vincent, CFE, Bailey Books

Procedures: As part of the examination of this matter, the team took the following actions:

- Obtained, reviewed, and analyzed memoranda pertaining to the anonymous call described previously.
- Obtained, reviewed, and analyzed Bailey Books' financial documentation, including purchase records, invoices, and canceled checks.
- Obtained, reviewed, and analyzed records from the St. Augustine County Courthouse regarding civil actions in which Edward J. Collins and Linda Reed Collins were named; records from the Florida Secretary of State's Office regarding Collins Marine Corporation; records of chattel mortgages held by Linda Reed Collins and Edward J. Collins; financial records from Dun & Bradstreet regarding Collins Marine Corporation; and public records regarding the financial condition of Linda Reed Collins and Edward J. Collins.
- Conducted surveillance activity in order to determine whether the two key individuals in the matter were involved in an illicit relationship.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

Individuals Interviewed: The following individuals were interviewed in person by members of the fraud examination team:

- Mark W. Steinberg, CPA (Chief Financial Officer, Bailey Books)
- Roger Donald McGuire (Purchasing Agent, Bailey Books)
- Mary Rodriguez De La Garza (Purchasing Agent, Bailey Books)
- Sara Louise Dawson (Former Employee, Bailey Books)
- Thomas C. Green (Attorney, Sharp, Green and Langfrom, P.A.)
- Lincoln S. Wyzokowski (General Counsel, Bailey Books)
- Becky Robinson (Accounts Payable Clerk, Bailey Books)
- Ernie Quincy (Warehouse Manager, Bailey Books)
- David Levey (Director of Sales, Jerrico International Paper Company)
- James R. Nagel (Sales Representative, Orion Corporation)
- Owen Stetford (Chief Financial Officer, Orion Corporation)
- Linda Reed Collins (Purchasing Manager, Bailey Books)

V. Findings

Based on the documents reviewed, information collected, and interviews conducted over the course of the fraud examination, the team finds as follows:

- Did the fraud examination team determine the existence of a possible misappropriation of assets of Bailey Books Incorporated?

Yes. The documents and information reviewed and interviews conducted by the fraud examination team during the course of the examination indicate that Linda Reed Collins, together with James R. Nagel, did knowingly embezzle approximately \$197,773 from Bailey Books over four years. During the fraud examination, the team analyzed financial documents and conducted interviews to corroborate the statements of an anonymous caller. The following is a summary of the evidence and information supporting the fraud examination team's findings:

On January 28, 2019, an anonymous call was received by the fraud hotline at Bailey Books, Incorporated, from a former supplier to Bailey Books. The caller alleged that after Linda Reed Collins took over as Purchasing Manager in 2016, she eliminated him as a supplier. A subsequent review of purchases made by Bailey Books from 2016 to 2018 showed that a

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

continuously increasing share of the company's paper business was being given to Orion Corp., even though Orion submitted written bids in only 63% of the cases.

On February 1, 2019, Mark W. Steinberg, CFO of Bailey Books, Inc., was interviewed. The purpose of the interview was to inform him of the proposed fraud examination, obtain his approval, and secure information from him regarding the purchasing process at Bailey Books. In addition to summarizing his responsibilities regarding purchasing at Bailey Books, Mr. Steinberg stated that in December 2016 he sent a memo to all the division heads at Bailey Books informing them that all purchases over \$50,000 would from then on require at least three written bids.

We next examined the personnel records. A review of Linda Reed Collins's file showed only that she had been consistently rated "exceptional" by her supervisors in annual reviews.

On February 4, 2019, an interview was conducted with Roger Donald McGuire, purchasing agent at Bailey Books. After summarizing the purchasing process at Bailey Books, he stated that he had no knowledge of any improprieties committed by Ms. Collins.

The next interview conducted was with Mary Rodriguez De La Garza, a coworker of Ms. Collins's in the Purchasing Department at Bailey Books. During the interview, Ms. De La Garza stated that, regarding the purchasing process, it is sometimes not practical to obtain bids, such as in emergency situations or when they are short on time. She went on to reveal that she had suspected Ms. Collins was having an affair with James R. Nagel, the salesperson for Orion Corp. In addition, Ms. De La Garza said she believed that Ms. Collins and her husband were having marital and financial problems. She also mentioned that Sara Louise Dawson, a former employee under Ms. Collins, had left on bad terms.

The next interview was with Sara Louise Dawson, who wanted to consult with her attorney before making an official statement. Ms. Dawson's attorney, Thomas C. Green, later contacted the fraud examination team to let them know that Ms. Dawson was interested in making a statement, but only in exchange for an indemnity against all claims arising out of her cooperation. After meeting with Mark Steinberg and Lincoln S. Wyzokowski, General Counsel at Bailey Books, Ms. Dawson and Mr. Green's proposal was accepted.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

On March 3, 2019, Ms. Dawson made her statement, which included the following:

- After Ms. Collins was promoted to Purchasing Manager, she began favoring Orion Corp. for paper purchases.
- On two occasions in 2018, Ms. Collins authorized prepayment on substantial purchases from Orion, even though Ms. Dawson had complained about Orion's poor quality and service. Later Ms. Dawson found out that the orders were never received.
- Other vendors had complained of being squeezed out of business with Bailey Books after Ms. Collins became manager.

Ms. Dawson referred the team to Becky Robinson in the Accounts Payable Department for further information about the orders. Ms. Robinson was interviewed and provided copies of the two prepaid invoices to Orion Corp., the amounts of which were \$102,136 and \$95,637. In addition, Ms. Robinson said that Ernie Quincy in the Receiving Department would be able to verify if the two shipments had ever been received.

On April 8, 2019, Ernie Quincy, the Warehouse Manager at Bailey Books, was interviewed and verified that the two shipments in question were never received. The next day, copies of the two checks given to Orion Corp. for payment of the goods that were never received were examined.

An interview with David Levey from Jerrico International Paper Company yielded the following information:

- At the time Levey began at Jerrico, Bailey Books was a major customer of theirs, but since then their sales to Bailey had dwindled.
- Levey attempted to revive business with Bailey Books, but by then rumors were circulating about an inappropriate relationship between Mr. Nagel of Orion Corp. and Ms. Collins.
- According to Levey, Mr. Nagel had a "bad reputation" in the industry.

Ms. De La Garza phoned the team on April 13, 2019, to let them know that Ms. Collins had plans to meet Mr. Nagel at the bar at the Hotel Atlantic that afternoon. The team set up surveillance of their meeting and reported that Ms. Collins and Mr. Nagel met at 5:55 p.m. and ordered drinks. They held hands under the table, kissed, and left the bar at 7:02 p.m. to go to room 652.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

A review of St. Augustine County records showed that Edward J. Collins (Ms. Collins's husband) was a defendant in three civil actions. The circumstances of the actions indicated that the Collinses were having financial troubles.

A review of the Florida Secretary of State's records showed that the Collinses were the incorporators of Collins Marine Corporation.

A review of UCC filings showed that the Collinses had three liens in their name.

A net-worth analysis was performed on the Collinses based on information assembled from public records. It showed unexplained income of \$31,632.

In an April 19, 2019 interview, Mr. Nagel stated that his relationship with Ms. Collins was purely professional and denied any improprieties regarding Orion's business with Bailey Books. Mr. Nagel also refused to provide any of Orion's financial information pertaining to the two invoices in question.

On April 21, 2019, Owen Stetford, the CFO of Orion Corp., was interviewed and stated he was unable to provide any copies of actual financial information, but that Orion had no record of any receipt of payment for the invoices in question, nor any record that such orders had been placed or shipped. In addition, Mr. Stetford said that Orion had no corporate accounts at Florida Marine National Bank, the bank at which the checks from Bailey Books were deposited. Mr. Stetford also stated that the correct corporate name is Orion Corporation, not Orion Paper Company, as the endorsements indicated.

On May 1, 2019, Mr. Nagel was again interviewed. After being confronted with questions and evidence regarding the two payments and the bank account to which they were deposited, Mr. Nagel voluntarily gave a statement attesting to his involvement with Ms. Collins in the embezzlement of funds from Bailey Books. He attested to the following:

- In 2018, Ms. Collins told Mr. Nagel that she would approve the payment of invoices to Orion Corp. for product that would not be delivered. Ms. Collins authorized the payment of two invoices in the amounts of \$102,136 and \$95,637, but no product was shipped on the invoices. Ms. Collins and Mr. Nagel established a bank account in the name of Orion Paper Company at Florida Marine National Bank and divided the proceeds of the invoices equally.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

On May 1, 2019, Ms. Collins voluntarily gave a statement, which included the following:

- Ms. Collins stated that, starting in 2017, she accepted money from Mr. Nagel to ensure that Orion Corp. received preferential treatment in supplying Bailey Books with stationery and paper products. On those occasions, she was aware that Bailey Books was not obtaining the best product at the lowest possible price from Orion; in other words, the price charged for the products was substantially higher than market value.
- Ms. Collins stated that on two occasions in 2018, she authorized the payment of invoices for \$102,136 and \$95,637 without any receipt of merchandise.
- Ms. Collins estimated that she received in excess of \$150,000 in connection with Mr. Nagel.

VI. Summary

This report reflects that Linda Reed Collins, a purchasing agent for Bailey Books, Inc., furnished a signed statement on May 1, 2019, indicating she had accepted at least \$197,773 in commercial bribes and other illicit income in a conspiracy with James R. Nagel, an account representative for Orion Corporation, St. Augustine, Florida.

The statements made by Collins are corroborated by the documentary evidence and the interviews of other witnesses as described herein.

VII. Impact to Bailey Books

Over the course of four years, Linda Reed Collins, in partnership with James R. Nagel, misappropriated an estimated \$197,773 from Bailey Books, Incorporated.

Additional amounts were lost due to Bailey's overpaying for merchandise sold to it by Nagel. Those amounts have not been calculated.

VIII. Recommendations

It is the policy of Bailey Books to report such matters to the appropriate authorities and to assist in criminal prosecution. A full review of internal controls should be conducted to determine how such incidents can be detected in the future.

St. Augustine, FL 32084

Re: Linda Reed Collins (File 08-4422)

Dear Lt. Fishbeck:

Attached is my report of a fraud examination dated May 23, 2019, with respect to the above captioned matter.

The report reflects that Collins, a purchasing agent for Bailey Books, Inc., furnished a signed statement on May 1, 2019, indicating she had accepted at least \$197,773 in commercial bribes and other illicit income in a conspiracy with James R. Nagel, an account representative for Orion Corporation, St. Augustine. Orion is a supplier of paper and related products to Bailey Books.

If proved in judicial proceedings, Collins and Nagel could be in violation of Title 7, Section 323A of the Florida Criminal Code (Commercial Bribery).

It is the policy of Bailey Books to report such matters to the appropriate authorities, and to assist in criminal prosecution. Accordingly, we would be willing to supply assistance, documentation, and expertise to your department in the resolution of this case.

If I might be of assistance, please do not hesitate to call.

Sincerely,

Loren D. Bridges
Certified Fraud Examiner

Re: Linda Reed Collins

Dear Mr. Marlow:

We have conducted a fraud examination concerning a possible misappropriation of assets of Bailey Books, Incorporated. This examination was predicated upon an anonymous telephone call alleging improprieties on the part of Linda Reed Collins, Bailey's purchasing manager.

Our examination was conducted in accordance with lawful fraud examination techniques, which include—but are not limited to—examination of books and records, voluntary interviews with appropriate personnel, and other such evidence-gathering procedures as necessary under the circumstances.

During the pendency of this examination, Ms. Collins and her confederate, James R. Nagel of Orion Corporation, voluntarily furnished signed statements indicating that they misappropriated at least \$197,773 to their personal benefit.

Based upon the results of our examination and the confessions of Ms. Collins and Mr. Nagel, these actions, if proved in a court of law, could constitute a violation of criminal and/or civil law.

Very truly yours,

Loren D. Bridges
Certified Fraud Examiner

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

Bailey Books, Incorporated

EXECUTIVE SUMMARY

CONFIDENTIAL

Linda Reed Collins has been employed in the Purchasing Department of Bailey Books since June 1, 2014. She was promoted to purchasing manager effective November 8, 2016.

On January 28, 2019, the fraud examination unit at Bailey Books received an anonymous telephone call from an unidentified man who claimed that he was a former supplier to Bailey. The caller alleged certain improprieties in the bidding and procurement process.

Based upon this initial predication, a fraud examination was conducted, which included reviews of relevant records and interviews of appropriate personnel. The fraud examination revealed multiple purchases by Bailey Books from Orion Corporation, the amount of which has increased significantly from 2016 to the present.

Interviews of Bailey personnel indicated that Ms. Collins might have a personal relationship with Mr. Nagel, an account representative of Orion Corporation. On May 1, 2019, Nagel and Collins were interviewed. Both furnished voluntary signed statements indicating that they had appropriated at least \$197,773 from Bailey by establishing a fictitious vendor to which Bailey's checks were directed. The checks purported to be for supplies purchased by Bailey when, in fact, no supplies or other items were purchased for this amount. Nagel and Collins used the proceeds for their personal benefit.

As reflected by the attached letter dated May 23, 2019, based on all the evidence, Collins and Nagel could be in violation of Florida criminal and/or civil laws.

MEMO OF PREDICATION

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: ANONYMOUS TELEPHONE CALL
DATE: JANUARY 28, 2019

On January 28, 2019, at approximately 10:12 a.m., I received a telephone call from an unidentified man who said that he had been a long-term supplier to Bailey for sundry office supplies and paper.

The caller—who refused to reveal his identity—said that ever since Linda Reed Collins had taken over as purchasing manager, he had been gradually “squeezed out” from doing business with Bailey. The caller declined to furnish additional information.

Based on the predication supplied above, a fraud examination is being commenced.

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: REVIEW OF SELECTED PURCHASES FROM 2016 TO 2018
DATE: JANUARY 30, 2019

Attached is a schedule of purchases prepared from individual vendor files. The purchases reflect that Orion Corp. has received an increasing share of the paper business from Bailey over the last several years, but has submitted written bids in only 63% of the cases over that period.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

Bailey Books, Incorporated**MEMORANDUM**

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: INTERVIEW OF MARK W. STEINBERG, CPA
CHIEF FINANCIAL OFFICER
DATE: FEBRUARY 1, 2019

Mark W. Steinberg, CPA, chief financial officer of Bailey Books, was interviewed in his office, Room 836, 6200 Bayshore, St. Augustine, Florida. The purpose of the meeting was to advise Mr. Steinberg of the proposed fraud examination, to obtain his approval of the proposed plan, and to secure basic information from him on the purchasing function.

Mr. Steinberg was advised of the nature of the anonymous allegations and the result of our initial vendor review. He was also informed of our plan to review personnel files and other internal company documents and to discreetly interview selected company personnel. He agreed to the above, asking that we conduct our examination quickly and in the least disruptive manner possible. He agreed that Ms. Collins and the Purchasing Department would not be notified of the examination until decided otherwise.

Mr. Steinberg has been with Bailey Books, Incorporated since 2001. Previously, he was assistant vice president for financial affairs from 2001 to 2009. He reports directly to Mr. Hal B. Marlow, president of the company.

As CFO, all operating divisions, including purchasing, report to him. It is his responsibility to establish and supervise the monitoring of internal controls within the operating divisions. In general, Bailey follows the policy of obtaining bids on as many purchases as possible. He pointed out that the competitive nature of the retail book industry requires constantly obtaining the maximum product for the minimum cost. He has reiterated to managers on many occasions the necessity of cutting costs.

Guidelines for purchasing procedures are set forth in Mr. Steinberg's memorandum to all division heads and supervisors dated December 12, 2016. The memo calls for purchasers to obtain bids on all purchases of more than \$50,000. However, purchases of more than \$10,000 generally are expected to be bid unless a justifiable reason not to exists. A copy of the memo was provided by Mr. Steinberg and is attached. The copy provided has been initialed and dated and is maintained in the evidence file, Room 874, Bailey Books.

(Page 4)

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

Bailey Books, Incorporated

MEMORANDUM

TO: LINDA REED COLLINS, PURCHASING MANAGER
FROM: MARK W. STEINBERG, CHIEF FINANCIAL OFFICER
SUBJECT: PURCHASING GUIDELINES
DATE: DECEMBER 12, 2016

The purpose of this memo is to establish guidelines for major purchases.

Effective at once, purchasing will obtain at least three written bids for items of more than \$50,000, in all cases. Bids should also be obtained for purchase amounts of \$10,000 and above, where practical.

These bids should be maintained in the file for documentation purposes.

If the lowest bid is not selected, a memo of justification should be prepared and approved by me before any purchase is made. You are to be especially concerned with miscellaneous and sundry items, because these items are not price competitive.

Any deviations from the above-stated policy must be approved by me.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

Bailey Books, Incorporated**MEMORANDUM**

TO: FILE (11-4422)
 FROM: LOREN D. BRIDGES, CFE
 SUBJECT: REVIEW OF PERSONNEL FILES
 DATE: FEBRUARY 4, 2019

Francis Morris, personnel manager, provided the personnel files of Linda Reed Collins, Mary Rodriguez De La Garza, and Roger McGuire for review. Pertinent data included:

Mary Rodriguez De La Garza:

Sept. 15, 2014 Mary Rodriguez De La Garza hired as administrative assistant at annual salary of \$20,000
 Sept. 14, 2015 Merit salary increase to \$22,000 annual
 Sept. 17, 2016 Merit salary increase to \$24,500 annual
 Aug. 2, 2017 Transferred and promoted to purchasing agent at salary of \$27,000
 Aug. 4, 2018 Merit salary increase to \$30,000 annual

Roger McGuire:

Feb. 20, 2015 Roger Donald McGuire hired as purchasing agent at salary of \$28,000
 Feb. 22, 2017 Merit salary increase to \$31,000 annual

Linda Reed Collins:

June 1, 2014 Linda Reed Collins hired as purchasing agent at salary of \$28,500
 June 3, 2015 Merit salary increase to \$31,250 plus participation in incentive plan
 Nov. 8, 2016 Promoted to purchasing manager, salary increase to \$36,000 annual, plus incentives
 Nov. 10, 2017 Merit salary to \$39,500 annual plus incentives
 Nov. 11, 2018 Merit salary to \$43,000 annual plus incentives

The personnel file reflected that Ms. Collins was consistently rated as “exceptional” by her supervisors in annual reviews. She has executed annual Conflict of Interest Questionnaires for 2014 through 2018 indicating that she and her spouse, Edward Collins, had no outside employment, investments, or interests with companies doing business with Bailey Books.

The file contained a copy of IRS form 668-W, Notice of Levy on Wages, Salary, and Other Income, dated June 2015, indicating that Ms. Collins and her spouse owed federal taxes of \$53,219.09. An IRS Release of Levy, indicating that the amount due had been paid in full, was filed December 18, 2018.

(Page 6)

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: INTERVIEW OF ROGER DONALD MCGUIRE
DATE: FEBRUARY 4, 2019

Roger Donald McGuire, purchasing agent, Bailey Books, was interviewed at his office, Room 537, 6200 Bayshore, St. Augustine, Florida. After being advised of the identity of the interviewer and the nature of the inquiry, McGuire voluntarily provided the following information.

He has been employed by Bailey Books since 2015. He is a purchasing agent whose function is to purchase the book inventory. Purchasing policy guidelines require him to obtain bids for all purchases of more than \$50,000. He said that bids are submitted in substantially all of his purchases of books, and that he estimates somewhere between 80–90% of his purchases are preceded by bids.

Whenever he deviates from selecting the low bidder for a product, he writes a memo of justification to the file with approval from his manager. This does not happen on many occasions. The reasons for not obtaining bids for products include (1) emergency purchases; (2) sole-source purchases; and (3) time pressures. McGuire is aware that the other purchases, made by Mary Rodriguez De La Garza and Linda Reed Collins, are made under the same guidelines.

He is not aware of favoritism regarding vendors. McGuire has received pressure from various vendors from time to time. Examples include “the hard sell” that many vendors try with purchasing agents and occasional efforts by the vendors to get paid early so they can earn and collect their commissions. Every now and then, a vendor will attempt to give him a gratuity, such as a free case of liquor or a small gift. However, McGuire says he avoids any ties to the vendor, as such are prohibited by Bailey’s employee guidelines.

He is unaware of any other purchasing employees making any exceptions to purchasing policy. McGuire thinks a great deal of his coworkers Mary Rodriguez De La Garza and Linda Reed Collins. He does not know whether they have accepted gifts or gratuities from vendors. McGuire thinks it is somewhat unusual that Ms. Collins reserves purchasing functions for herself, since hers is primarily a management function. He cannot explain why she has reserved this duty. He once volunteered to take over her accounts, but she said she would prefer to handle some of the purchasing function herself, to “keep her hand in the business.”

(Page 7)

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: INTERVIEW OF MARY RODRIGUEZ DE LA GARZA
DATE: FEBRUARY 5, 2019

Ms. De La Garza was interviewed at her office in Room 436, Bailey Building, 6200 Bayshore, St. Augustine, Florida. After being advised of the identity of the interviewer and the nature of the inquiry, Ms. De La Garza voluntarily provided the following information.

She has been employed at Bailey Books since 2014. In 2017, she was promoted and transferred to the Purchasing Department. Ms. De La Garza's function is to oversee the purchase of magazines and periodicals. She reports directly to Linda Reed Collins, the purchasing manager. The other employee in the department is Roger Donald McGuire.

Ms. De La Garza said that she is familiar with operating guidelines of the purchasing function. She is required to get bids for all purchases of more than \$50,000, and, whenever possible, for purchases for less than that amount. As a rule, the purchases are bid for all items \$10,000 and more.

In some instances, it is not practical or possible to obtain bids; this is especially the case with sundry purchases. In addition, whenever shortages of merchandise occur and time is of the essence, bids are not sought. For approximately the last year, she has observed that Orion Corporation, a supplier of paper to Bailey Books, has received most, if not all, of the paper business. The salesperson for Orion, Jim Nagel, seems to be very persuasive in dealing with Linda Reed Collins, Ms. De La Garza's boss.

When asked if there were any vendors who received preferential treatment, Ms. De La Garza hesitated. She finally said that something was bothering her, and she did not know how to discuss it.

When asked to explain, Ms. De La Garza said that she was concerned that any information she would offer might get back to Ms. Collins, and that she did not want to bring up false accusations. She said that there were several things that do not seem right.

(Page 8)

APPENDIX D**SAMPLE FRAUD EXAMINATION REPORTS**

First, she said that Ms. Collins and her husband, Edward, had not been getting along for the past year or two. Edward has a charter boat business that has experienced serious financial problems, and she knew that Ms. Collins and he had been arguing over money.

She has seen Ms. Collins come to work several mornings in the last few months with red eyes, and it appeared that she had been crying. On one or two occasions, when Ms. Collins has arrived upset, she had telephoned Mr. Nagel, and Ms. De La Garza thinks Mr. Nagel comforted her.

Ms. De La Garza is not sure about the relationship between Mr. Nagel and Ms. Collins, but she does know that they are good friends. She is fairly certain that they have had lunch together on numerous occasions. Their friendship has been the subject of gossip and speculation; the office thinks that they are having an affair.

Ms. De La Garza knows that Mr. Nagel has received favored treatment as a vendor. Several months ago (exact date not recalled), she heard Ms. Collins call accounts payable and chew someone out who did not want to hand-cut a check for Mr. Nagel. She does not remember the exact circumstances, but she said that during the time she has worked at Bailey, Ms. Collins has never hurried up a payment for a vendor, with the exception of Mr. Nagel.

Ms. De La Garza does not believe Ms. Collins is doing anything illegal; she thinks, however, that Ms. Collins' judgment might be clouded by Mr. Nagel, whom she describes as a very good-looking and charming man.

When asked if anyone else had any knowledge of the business or personal relationship between Ms. Collins and Mr. Nagel, Ms. De La Garza replied that Sara Louise Dawson had worked on the Orion account before she left Bailey Books within the last several months. She believes Ms. Dawson had a falling out with Ms. Collins, which prompted her to quit.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: INTERVIEW OF SARA LOUISE DAWSON
DATE: FEBRUARY 5, 2019

Sara Louise Dawson was interviewed at her residence, 2051 Wisconsin Ave., Apt. 16, St. Augustine, Florida, on a confidential basis. After being advised of the identity of the interviewer and the nature of the inquiry, she voluntarily provided the following information.

Ms. Dawson advised that she did not wish to answer any questions. She said that her employment at Bailey Books was a “closed chapter” in her life, which she did not wish to reopen. She described her relationship with Linda Reed Collins as “strained.” She said that she wished she could be of assistance because “certain things at Bailey just weren’t right,” but she had “to get on with her life.”

After further discussion with Ms. Dawson, in which the importance of her cooperation was emphasized, she agreed to speak to her brother-in-law, an attorney, about whether she should provide any information. She insisted that any communication with her, including this interview, be kept strictly confidential.

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: MEETING WITH MARK W. STEINBERG, CFO, AND
LINCOLN S. WYZOKOWSKI, GENERAL COUNSEL
DATE: FEBRUARY 6, 2019

After discussing the facts, Mr. Steinberg and Mr. Wyzokowski agreed to provide an indemnity agreement to Sara Louise Dawson for her cooperation in the fraud examination regarding the purchasing function of Bailey Books, Incorporated. Wyzokowski agreed to prepare the indemnity agreement and to set up the interview of Ms. Dawson through her attorney.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
TONYA VINCENT, CFE
SUBJECT: INTERVIEW OF SARA L. DAWSON
DATE: MARCH 3, 2019

Sara Louise Dawson was interviewed at the office of her attorney, Thomas C. Green, at Suite 400, 6600 Bayshore Parkway, St. Augustine. Mr. Green was present for the entire interview. After preliminary discussions about the nature of the inquiry, Ms. Dawson voluntarily provided the following information.

Ms. Dawson was employed at Bailey Books Incorporated in the Purchasing Department from February 2015 through January 2019. Her duties included the purchase of magazines and periodicals as well as sundries and paper products. In that capacity, she worked for Linda Reed Collins from November 2015 until Ms. Dawson left the company.

After Ms. Collins's promotion, she began to favor Orion in paper purchases. Orion's prices were high and the quality of service was marginal. Deliveries often were late or incomplete, requiring Ms. Dawson to expend considerable time and effort in follow-up calls and correspondence.

On two occasions near the end of 2018, Ms. Collins directed her to make substantial purchases from Orion and to authorize prepayment. The orders were not bid, and prices quoted were higher than available from other, more reliable suppliers. Bailey Books also had a policy against prepayment of orders.

Ms. Dawson complained to Ms. Collins about Orion's past performance and suggested that other vendors be allowed to bid. Ms. Collins responded that the paper was needed now, that there was no time for bids, and that the price differential was insignificant. Ms. Collins also said that prepayment was necessary so that Orion could rush the order.

Ms. Dawson said that, in fact, there was no urgent need for the paper, but that, based on past experience with Ms. Collins, she believed it was fruitless to resist, and she complied with her instructions.

APPENDIX D**SAMPLE FRAUD EXAMINATION REPORTS**

Shortly thereafter, she checked with the receiving department and learned that the order had not been received. She advised Ms. Collins, who seemed unconcerned. Ms. Dawson then prepared a letter for Ms. Collins's signature requesting immediate shipment of the order. Ms. Collins declined to send the letter, saying it was not necessary, as Orion had assured her the shipment would be received shortly.

A few weeks later, Ms. Collins stopped by Ms. Dawson's office and closed the door. Ms. Collins told her that, because of Orion's "excellent service" and "loyalty" to Bailey Books, she wanted future purchases from them to be on a no-bid basis. Ms. Collins also instructed Ms. Dawson to prepay another order, in excess of \$100,000 from Orion.

Ms. Dawson does not remember the exact dates or amounts, but suggested Becky Robinson in the Accounts Payable Department might be able to provide more information.

Ms. Dawson knew that the previous Orion order had not yet been shipped and informed Ms. Collins. Ms. Collins became "nervous and jittery" and insisted she was mistaken. She again instructed Ms. Dawson to place the order; Ms. Dawson said she would need approval from higher up and an argument ensued. She did not place the order or talk to Ms. Collins again. At that time, Ms. Dawson said she decided to look for new employment because her job had become too stressful.

Ms. Dawson also advised that other vendors, including Jerrico, had complained about being "squeezed" out by Bailey Books. Ms. Dawson thought that Jerrico's prices and service were superior to Orion's, but Ms. Collins would not take their product. Ms. Dawson, through Mr. Green, agreed to further interviews, as necessary.

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: INTERVIEW OF BECKY ROBINSON
DATE: APRIL 8, 2019

Becky Robinson, accounts payable clerk, Bailey Books, Incorporated, was interviewed at her office, Room 513, Bailey Building, 6200 Bayshore, St. Augustine, Florida. After being advised of the identity of the interviewer and the nature of the inquiry, she voluntarily provided the following information.

She has been employed by Bailey Books, Incorporated, since January 2013, and has always worked in the Accounts Payable Department. Her job is to review invoices for processing before payment. She checks the invoice mathematics and extensions, sees whether merchandise has been received, and verifies that the invoice has been approved for payment by the department head.

Ms. Robinson maintains the invoices. Canceled checks are maintained by the Treasury Office (she thinks in Ms. Deborah Roth's office). She provided copies of two invoices paid to Orion Corporation. The documents provided by her were initialed, dated, and secured in the evidence file maintained in Room 874, Bailey Books Corporation. Copies of the above-referenced documents are attached hereto.

A review of the invoices provided reflect a notation on invoices dated November 16, 2018 and December 5, 2018—in the amounts of \$102,136, and \$95,637, respectively—that payment was made before the merchandise was received. Ms. Robinson recalls that Ms. Collins called her on two occasions and said that Orion was experiencing cash flow problems, and to keep them as a vendor, it would be necessary to give them the money up front.

When Ms. Robinson told Linda Reed Collins that she was not supposed to approve payment before the merchandise had been received, Ms. Collins became agitated and told Ms. Robinson, "I am the senior purchasing official, and I am telling you to do what I say." Ms. Robinson did as she was instructed but did not follow up to see if the paper had been received. Ms. Robinson did not report these incidents.

Ms. Robinson said that Ernie Quincy in the Receiving Department would be able to tell whether the two shipments above had been received.

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: INTERVIEW OF ERNIE QUINCY
DATE: APRIL 8, 2019

Mr. Ernie Quincy, warehouse manager of Bailey Books, was interviewed at his office, Room 114, Bailey Building, 6200 Bayshore, St. Augustine, Florida. After being advised of the identity of the interviewer and the nature of the inquiry, Mr. Quincy voluntarily furnished the following information.

A review of his outstanding invoices shows that two Orion invoices—dated November 16 and December 5, 2018—have not been received in the warehouse. He remembers that shortly after receiving the invoices in 2018, he called Ms. Robinson, who referred him to Linda Reed Collins. Mr. Quincy then called Ms. Collins about not having received the paper, and she told him not to worry about it; that they had an understanding with the supplier that the paper would be delivered later.

Mr. Quincy thought that this situation was unusual since no other shipments had been paid for in advance. He has been Bailey Books' warehouse manager for 12 years.

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: INTERVIEW OF DAVID LEVEY,
JERRICO INTERNATIONAL PAPER COMPANY
DATE: APRIL 9, 2019

David Levey, director of sales, Jerrico International Paper Company, 2901 Island Ave., Philadelphia, PA 19530, was interviewed by telephone at his office. After being advised of the identity of the interviewer, he provided the following information on a voluntary basis.

Mr. Levey assumed his present position in 2012. At that time Bailey Books, Incorporated, was a major customer, with sales in excess of \$500,000 annually. Since then, the volume has consistently dwindled.

In January 2018, Mr. Levey met with Carl Sanderson, the owner of Jerrico, and discussed how to revive the Bailey Books account. Both Mr. Levey and Mr. Sanderson had heard “rumors” in the industry that Jim Nagel of Orion Corporation was “taking care of” Linda Reed Collins, Bailey’s purchasing manager. Mr. Nagel has a very poor reputation in the industry and was caught “paying off” on another account several years ago. Mr. Levey declined to provide any further details or to identify the source of his information.

As a result of their meeting, Mr. Sanderson and Mr. Levey “decided to test the waters” at Bailey Books by submitting a bid at cost for a substantial quantity of Deluxe Bond and Standard White to see “if we could open the doors.” The offer was made at the end of January 2018 and was not accepted. Since then, Jerrico does not even bother to bid and expects no further significant sales to Bailey Books.

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: INTERVIEW OF MARY RODRIGUEZ DE LA GARZA
DATE: APRIL 13, 2019

Ms. Mary Rodriguez De La Garza phoned and said that she had overheard a telephone conversation between Ms. Collins and Mr. Nagel. She heard Ms. Collins arrange to meet Mr. Nagel for drinks this afternoon after work. Collins is supposed to meet Nagel at the bar at the Hotel Atlantic in St. Augustine. Accordingly, a physical surveillance was established, as set forth in the following log.

APPENDIX D

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: SURVEILLANCE LOG
DATE: APRIL 13, 2019

On April 13, 2019, commencing at 4:50 p.m., surveillance was established at the Hotel Atlantic, 6583 Bayshore, St. Augustine, Florida. The results of the surveillance are as follows.

<u>Time</u>	<u>Event</u>
4:50 p.m.	Established surveillance in lounge.
5:55 p.m.	Linda Reed Collins and white male arrive at lounge and order drinks. Collins and unidentified male hold hands at table.
6:20 p.m.	Collins and unidentified male order another drink.
6:27 p.m.	Unidentified male and Collins kiss at the table.
6:40 p.m.	Break—surveillance terminated.
6:44 p.m.	Surveillance reinstituted. Twosome still at bar.
7:02 p.m.	Observed white male paying for drinks in cash. Twosome leaves, holding hands, and proceeds to Room 652 at Hotel Atlantic. Both enter.
9:32 p.m.	Collins and male leave Room 652. Male gets into a late model Chevrolet, silver in color, Florida license MNX-782, and departs. Collins gets into a Nissan Z, license NRC-130, and departs.
9:35 p.m.	Surveillance terminated.

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
 FROM: LOREN D. BRIDGES, CFE
 SUBJECT: ANONYMOUS TELEPHONE CALL
 DATE: APRIL 16, 2019

A telephone call was received advising that Edward J. Collins and his wife, Linda Reed Collins, had the following debts with the establishments listed below as of March 14, 2019.

<u>Account</u>	<u>Total Balance</u>	<u>Monthly Payments</u>
St. Augustine Bank	\$46,482	\$2,361
Sears	\$2,378	\$281
Marine Savings	\$110,232	\$1,377
Bailey Credit Union	\$14,826	\$787
MasterCard	\$10,041	\$397
American Express	\$5,990	Balance
Norwood Corporation	\$3,892	\$461
Bally Fashions	\$1,436	<u>\$124</u>
	Total Fixed Payments	\$5,788

The caller advised that Edward J. and Linda Reed Collins had held a joint checking account since 2008 at Sunshine Federal Bank. The account had an average balance of less than \$1,000, and it was frequently overdrawn. No other accounts were located.

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
SUBJECT: REVIEW OF RECORDS
ST. AUGUSTINE COUNTY COURTHOUSE
DATE: APRIL 17, 2019

Records of the St. Augustine County Courthouse reflected the following information regarding Edward J. Collins and Linda Reed Collins as of April 11, 2019.

1. Edward J. Collins is a defendant in three civil actions as follows:

- a. *Bertram Yachts, Incorporated v. Edward J. Collins and Collins Marine Corporation*, Case Number 00-4435. Bertram sued Collins individually and the corporation for nonpayment of \$13,874 plus interest and attorney fees. The suit was filed April 23, 2017, and alleges that Collins took delivery of a marine winch on March 4, 2016, and that the amount is unpaid. The suit is still pending. Attorney for the plaintiff is Sherry T. Marshall, Cummins and Marshall, Vero Beach, Florida.
- b. *Bradford L. Jenkins v. Edward J. Collins et al*, Case Number 01-0964. This suit alleges that on June 27, 2018, Jenkins paid a deposit for Collins's charter boat, the Mistress, and canceled within the period provided by the contract. Collins's check refunding the \$3,500 was returned for insufficient funds. Collins did not make good on the check.
- c. *Bayview Bank v. Edward J. Collins and Collins Marine Corporation*, Case Number 01-5412. Collins was sued on April 21, 2018, for nonpayment of a working capital note with a current balance off \$31,423. The note is unpaid.

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
TONYA VINCENT, CFE
SUBJECT: INTERVIEW OF JAMES R. NAGEL
DATE: APRIL 19, 2019

James R. Nagel, sales representative, Orion Corporation, was interviewed at his office, Room 5214, 2600 Industrial Drive, St. Augustine, Florida. After being advised of the identity of the interviewers and of the nature of the inquiry, Mr. Nagel voluntarily provided the following information.

He has been a salesperson for Orion since October 2008. He sells stationery and paper stock to a variety of business enterprises, including Bailey Books, Incorporated. Bailey is not his largest account.

Mr. Nagel acknowledges that he knows Linda Reed Collins. He says their relationship is purely professional, and he has never socialized with her. He emphatically denies any improprieties of any kind and says he has never offered any gratuities or kickbacks to Ms. Collins.

Mr. Nagel claims the prices he charges Bailey are competitive, and that if Bailey is paying higher prices, it is because they are getting better products. He was presented with two invoices, dated 11/16/18 and 12/5/18, which reflect the payments for products that were not received. Nagel claims he does not know anything about any missing products, and that Bailey's records were in error. He denies asking for payment in advance to help the cash flow of Orion Corporation.

Mr. Nagel denied our request to review Orion's books and records pertaining to the 11/16/18 and 12/5/18 invoices, saying the information was "none of your business" and "proprietary." He refused to answer any further questions without his legal counsel being present.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
TONYA VINCENT, CFE
SUBJECT: INTERVIEW OF OWEN STETFORD
DATE: APRIL 21, 2019

Owen Stetford, chief financial officer, Orion Corporation, was interviewed in his office at 2600 Industrial Drive, St. Augustine, Florida. Clifford Karchmer, Orion's general counsel, also attended the meeting.

We advised Mr. Stetford and Mr. Karchmer of the nature of our inquiry and requested their cooperation. We had earlier asked Mr. Stetford to produce copies of Orion's records pertaining to sales to Bailey Books when we telephoned to set up the interview.

Mr. Stetford said that Orion Corporation was formed in 1981 by his grandfather and that the company is closely held. Mr. Stetford further stated that Orion is committed to the highest level of business integrity, that Bailey Books is a valued customer, and that he is anxious to cooperate as far as permitted by company counsel.

Regarding our request to review Orion's records pertaining to sales to Bailey Books, and in particular the invoices dated November 16 and December 5, 2018, Mr. Stetford said that he would be unable to provide us with access to the original records on the advice of counsel. However, he said he personally reviewed the records and told us that Orion had no record of any receipt of payment for the above invoices, nor any record that such an order had been placed or shipped.

Mr. Stetford further advised, after reviewing our copies of the canceled Bailey Books checks payable to Orion for the above invoices, that Orion does not maintain any corporate accounts at Florida Marine National Bank. Furthermore, the correct corporate name is Orion Corporation, not Orion Paper Company, as the endorsements indicate.

Mr. Stetford emphatically stated that neither he nor any other corporate officer was aware of or condoned any improper activities regarding their sales. He said that he would direct Mr. Nagel to answer any questions regarding sales to Bailey Books Incorporated.

In this regard, we again asked for permission to examine Orion's records, particularly the account receivable records for the period November 2016 through March 2019. Mr. Karchmer said that he would take our request under advisement.

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
TONYA VINCENT, CFE
SUBJECT: INTERVIEW OF JAMES R. NAGEL
DATE: MAY 1, 2019

James R. Nagel was interviewed at the office of his attorney, Conrad Vance, of the law firm Vance, Selig and Reisman, Suite 1000, 1601 Harbor Drive, St. Augustine, Florida. Mr. Nagel was presented with copies of the checks endorsed "Orion Paper Company," and asked about the bank account to which they were deposited. After hesitating for several moments, he quietly admitted to conspiring with Linda Reed Collins to have Bailey Books pay the fake invoices. At the conclusion of the interview, Mr. Nagel voluntarily executed the attached statement. The original of this statement has been witnessed by Bridges and Vincent, and is maintained in the evidence file, Room 874, Bailey Books Corporation, 6200 Bayshore, St. Augustine, Florida 32082.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

St. Augustine, Florida
May 1, 2019

I, James R. Nagel, furnish the following free and voluntary statement to Loren D. Bridges and Tonya Vincent of Bailey Books, Incorporated. No threats or promises of any kind have been used to induce this statement.

Since 2008, I have been a sales representative employed by Orion Corporation. Since 2010, I have been responsible for paper sales to Bailey Books, Incorporated.

In or about January 2017, Linda Reed Collins, manager of purchasing, told me that she would require a “commission” on all sales to Bailey Books by Orion. I advised my boss, Donald L. Marsh, sales manager, of Ms. Collins’s demand. Mr. Marsh and I reluctantly agreed to make the payments because we believed that it would otherwise be impossible to make any sales to Bailey Books. No other person at Orion was informed of Ms. Collins’s demand.

The payments to Ms. Collins began about February 2017. Ms. Collins told me that she would inflate the prices paid to Orion in order to cover the kickbacks. Thereafter, approximately \$51,000 was paid to Ms. Collins by Orion Corporation checks, payable to Market Research, Inc. Ms. Collins told me that Market Research, Inc., was a company she had established. The checks were recorded on Orion’s books as consulting fees, and they were approved by Mr. Marsh and me.

In about October 2018, Ms. Collins told me that she would approve the payment of invoices to Orion for product that would not have to be delivered. Ms. Collins thereafter authorized the payment of two invoices in the amounts of \$102,136 and \$95,637, which were paid by Bailey Books, Incorporated, in November and December, 2018. No product was shipped on these invoices. Ms. Collins and I established a bank account in the name of Orion Paper Company at Florida Marine National Bank and equally divided the proceeds of the above-mentioned invoices. Ms. Collins prepared my checks, which were then deposited to my personal checking account at Flagler National Bank in St. Augustine. I spent the proceeds on bills. Neither Mr. Marsh nor any other person at Orion was aware of the above activity.

I make this statement in order to express my regret for having engaged in the aforementioned conduct and promise to make restitution to the extent possible. I knew my conduct was wrong, but I felt it was justifiable at the time. I will try to pay any losses that have occurred as a result of my activities.

I have read this statement, consisting of this page. I now sign my name below in the presence of the undersigned witnesses because the statement is true and correct to the best of my knowledge.

Bailey Books, Incorporated

MEMORANDUM

TO: FILE (11-4422)
FROM: LOREN D. BRIDGES, CFE
TONYA VINCENT, CFE
SUBJECT: INTERVIEW OF LINDA REED COLLINS
DATE: MAY 1, 2019

Ms. Linda Reed Collins was interviewed on May 1, 2019, by Loren D. Bridges and Tonya Vincent. She voluntarily provided the attached signed statement. The original of this statement has been witnessed by Bridges and Vincent, and is maintained in the evidence file, Room 874, Bailey Books Corporation, 6200 Bayshore, St. Augustine, Florida 32082.

APPENDIX D

SAMPLE FRAUD EXAMINATION REPORTS

St. Augustine, Florida
May 1, 2019

I, Linda Reed Collins, furnish the following free and voluntary statement to Loren D. Bridges and Tonya Vincent of Bailey Books, Incorporated. No threats or promises of any kind have been used to induce this statement.

I am senior purchasing agent for Bailey Books, Incorporated, and have been employed by Bailey Books since 2014. My job is to oversee the purchase of merchandise and other supplies for Bailey Books, Incorporated. As part of my job, I am to ensure that Bailey Books, Incorporated, receives the highest quality products at the lowest possible cost.

Commencing in approximately February 2017, and continuing through the current time, I have accepted money from James Nagel, sales representative for Orion Corporation, St. Augustine, Florida. Nagel offered me money to ensure that his company received preferential treatment in supplying Bailey Books with stationery and paper products.

On those occasions that I accepted money, I was aware that Bailey Books, Incorporated, was not obtaining the best product at the lowest possible price. The price charged for products delivered during the time I accepted money was substantially higher than market value.

In November and December 2018, I authorized the payment of invoices of \$102,136 and \$95,637, respectively. These invoices were paid without the receipt of any merchandise. Nagel and I subsequently split the proceeds of these invoices equally between us.

I estimate that I have received in excess of \$150,000 in connection with Mr. Nagel. I am not sure that anyone at Orion Corporation knew of our arrangement. No one at Bailey Books had knowledge of, or participated in, my scheme.

I am aware that my conduct is illegal and violated Bailey Books' policies. I participated in this scheme because my husband and I were having severe financial problems due to his business. We used the proceeds of my conduct to pay off several personal and business-related debts that were past due. I am truly sorry for my conduct, and I promise to repay any resulting damages.

I have read this statement consisting of this page. I now sign my name below because this statement is true and correct to the best of my knowledge.

ACRONYMS AND ABBREVIATIONS

1. Throughout this report, I refer to Chris A. Paulson as “Mr. Paulson.”
2. I refer to CA Paulson Bail Bonding Agency as “Paulson Bail Bonding.”
3. I refer to the Summary of Income Deposits as “Prosecution’s Summary Report.”
4. I refer to the Internal Revenue Service as “IRS.”

INTRODUCTION AND ASSIGNMENT

I, James M. Young, CPA, CFE, President, Smith and Associates, Inc., prepared this report. I have compiled the information and formulated the opinions contained in this report at the request of Sally Robinson on behalf of Chris A. Paulson, in connection with the United States District Court for the Middle District of Texas CR, No. 01-234. Specifically, I was asked by counsel to review documents, accounting records, and pleadings in the case at hand and offer my opinions on the following items:

1. Analyze the Prosecution’s Summary Report in this case and express my opinion about the government’s choice to use the bank deposit method to determine Mr. Paulson’s income; and
2. Analyze the Prosecution’s Summary Report and offer my opinion as to whether the government correctly applied the bank deposit method in the case at hand.

QUALIFICATIONS AND PREVIOUS TESTIMONY

I have been practicing as a Certified Public Accountant since 1998 and as a Certified Fraud Examiner since 2004. I am the president at Smith and Associates, Inc., in Aurora, Texas. I have a bachelor of science degree from the University of Texas at Austin, McCombs School of Business. My curriculum vitae, including a list of publications in the past ten years, is presented in Appendix A.

I established the forensic accounting and fraud investigation firm of Smith and Associates, Inc., in 2007. In my position, I specialize in forensic accounting and fraud examination. I have provided services for both plaintiffs and defendants in civil, criminal, domestic, and bankruptcy proceedings.

Examples of matters I have worked on include shareholder disputes, lost profits, lost wages, calculation of financial damages, divorce, fraud examination and consulting, and bankruptcy and reorganization. A listing of my deposition and trial testimony over the past four years is presented in Appendix B.

APPENDIX E**SAMPLE EXPERT WITNESS REPORT****MATERIALS REVIEWED**

To render opinions on the questions asked of me, I reviewed the following documents.

1. Superseding Indictment, in the above-referenced case
2. Chris A. Paulson, Summary of Income Deposits, 2006–2009, and attached graph (Document Nos. 00000001–00000002)
3. Summary of 2007 and 2008 Bank Deposits, American Bank, Paulson’s Used Cars, Account No. 0000000001, Account Open Date: 10/23/07
4. Chris A. Paulson, Summary of 2005–2006 Check Expenditures, American Bank, Paulson’s Used Cars, Account No. 0000000002, Account Open Date: 10/23/07 (Document Nos. 00000003–00000004)
5. Signature cards and bank statements for the period December 24, 2005 through December 27, 2008, American Bank (formerly Southern Bank) Account No. 0000000004, held in the name Chris A. Paulson, Account Open Date: 03/31/04 (Document Nos. 458–521)
6. Signature cards and bank statements for the period January 1, 2006 through December 31, 2008, American Bank (formerly Southern Bank) Account No. 0000000005 (formerly Account No. 1258483210), held in the name CA Paulson Bail Bonding Agency, Account Open Date: 05/28/04 (Document Nos. 358–547)
7. Signature card and bank statements for the period April 4, 2008 through December 31, 2008, American Bank Account No. 0000000006, held in the name CA Paulson Bail Bonding Agency Trust Account, Account Open Date: 04/04/08 (Document Nos. 429–545)
8. Signature cards and bank statements for the period December 17, 2005 through March 6, 2008, American Bank (formerly Southern Bank) Account No. 0019501269 (formerly Account No. 1290128547), held in the name Jason K. King, Account Open Date: 12/17/05 (Document Nos. 439–475)
9. Bank statements for the period October 23, 2007 through December 31, 2008, American Bank Account No. 0085478344, held in the name Paulson’s Used Cars, Account Open Date: 10/23/07 (Document Nos. 358–373)
10. Copies of imaged cleared items from Paulson’s Used Cars Account No. 0086946344 (Document Nos. 782–864), and Compass/Paulson’s Used Cars 000065403–000985479
11. Copies of imaged cleared items from CA Paulson Bail Bonding Agency Account No. 012586542/125961410 (Document Nos. 611–781, 865–1239, and 2785–3148)

APPENDIX E

SAMPLE EXPERT WITNESS REPORT

12. Property information, summary from Federal Bureau of Investigation, and copies of various deed and mortgage filings (Document Nos. 1547–1678)
13. Receipt activity on open cases by case number for Underwriter 8 (CA Paulson Bonding), dated 05/12/2009
14. Bernalillo County Metropolitan Court, CA Paulson Bail Bonding, paid forfeitures from 2002 through 2009, with certification from court accountant, dated January 7, 2008
15. Bernalillo County Metropolitan Court, CA Paulson Bail Bonding, activity from 2004 through 2009, including annual bond posting summaries for 2004 through 2009, with certification from court accountant, dated January 5, 2010
16. Annual listings of bonds on cases for CA Paulson Bail Bonding, posted 1/1/2004 to 12/31/2009 (Document Nos. 000009854–000054123)
17. Various loan documents from American Bank (Document Nos. 2765–2784, 3169, and additional pages with unreadable document numbers)
18. Various financial statements for Adam C. Paulson (Document Nos. 3149–3161)
19. 2005 Form 1040 for Adam C. Paulson, signed and dated February 1, 2007 (Document Nos. 3162–3163), and 2005 Form 1099-MISC, showing \$40,000 of other income received by Adam C. Paulson, from CA Paulson Bail Bonding Agency (Document No. 3164)
20. Currency Transaction Report by Casino from Palms Casino (Document Nos. 1355–1365 and 1395–1409)
21. Logs from Red Radio Casino (Document Nos. 2648–2659, 4370–4381, 7354–7365, and 7612–7623)
22. Various documents regarding markers between Chris A. Paulson and Red Radio Casino (Document Nos. 1412, 1503–1526, and 1543–1544)
23. Casino information for various players (Document Nos. 1249–1254, 1300–1301, 1432–1436, 1531, 1545–1546)

STANDARDS OF REVIEW

In my analysis, I have complied with standards and used methodologies applicable to a Certified Public Accountant and a Certified Fraud Examiner. These standards and methodologies are generally accepted in my profession and are subject to peer review and analysis.

EXECUTIVE SUMMARY

The bank deposit method, which the government used in this case, is not the appropriate method for determining Mr. Paulson's unreported income. The bank deposit method should only be used when assets and liabilities are constant from year to year. Mr. Paulson's assets and liabilities fluctuated from year to year. In addition, extravagant expenditures must be absent for the bank deposit method to be acceptable. Yet, gambling at Mr. Paulson's level is an extravagant expenditure. Therefore, the government improperly determined Mr. Paulson's income.

Even if the bank deposit method were appropriate, the government did not properly apply it. The government did not include any analysis of any type of transfer between accounts or redeposit, and it did not account for any proceeds Mr. Paulson received from loans and markers. Thus, the government did not properly apply the bank deposit method.

BACKGROUND

On June 25, 2014, the prosecution indicted Mr. Paulson for money laundering and other counts (Exhibit 2). Prior to his indictment, Mr. Paulson operated Paulson Bail Bonding and Paulson's Used Cars, a used car sales lot, and gambled primarily at both Special Casino in Albuquerque, New Mexico, and the Red Radio Casino in Las Vegas, Nevada (Exhibit 2).

APPENDIX E

SAMPLE EXPERT WITNESS REPORT

As part of the prosecution's case, it has prepared a document titled "Summary of Income Deposits," which purports to show that Mr. Paulson's deposits exceed income by the total of \$466,139.11 over the four-year period starting in 2010 and ending in 2014 (Exhibit 1). To determine these numbers, the government used the bank deposit method for determining funds from unknown sources (Exhibit 1).

THE BANK DEPOSIT METHOD OF ANALYSIS

The Prosecution's Summary Report attached for reference as Exhibit 1, follows the bank deposit method for determining the existence of unreported income. It is one of the methods accepted by the Internal Revenue Service (IRS) for determining funds from unreported income through an analysis of the taxpayer's bank deposits. This method is based on the theory that if a person receives money, only two things can be done with the money: (1) It can be deposited; or (2) it can be spent in the form of cash. Using these assumptions, income is proved through an analysis of bank deposits, canceled checks, and currency transactions.

The bank deposit method is detailed in *Financial Investigations: A Financial Approach to Detecting and Resolving Crimes*, Department of the Treasury, Internal Revenue Service, Publication 1714 (6-93), U.S. Government Printing Office (2002) [*Financial Investigations*]. As set out in this manual, the method applies the following formula:

	Total deposits to all accounts
Minus:	<u>Transfers and redeposits</u>
Equals:	Net deposits to all accounts
Plus:	<u>Cash expenditures</u>
Equals:	Total receipts for all sources
Minus:	<u>Funds from known sources</u>
Equals:	<u>Funds from unknown sources</u>

Financial Investigations states that: "The bank deposit method is applied in situations where assets and liabilities are constant from year to year and indications of extravagant expenditures are nonexistent, but investigative findings reveal that the suspect's known sources of income are being deposited into financial institutions" (page 209). Further, *Financial Investigations* notes on page 210 that:

APPENDIX E

SAMPLE EXPERT WITNESS REPORT

The transfer of funds between a suspect's bank accounts (i.e., taking money from a checking account and depositing it into a savings account), and funds that are withdrawn and then redeposited (i.e., a "non-sufficient funds" check) must be considered in the bank deposit formula. These represent duplicate items for analysis purposes and must be subtracted from total deposits to arrive at the net deposits to all accounts [emphasis in original].

ANALYSIS AND OPINIONS

1. **Analyze the Prosecution's Summary Report in this case and express my opinion about the government's choice to use the bank deposit method to determine Mr. Paulson's income.**

Opinion 1: The bank deposit method used by the government in this case is not the appropriate method for determining Mr. Paulson's income.

Appropriateness of Using the Bank Deposit Method Analysis

To calculate Mr. Paulson's income deposits, the government used the bank deposit method.

Financial Investigations indicates the bank deposit method should only be used when "assets and liabilities are constant from year to year" (page 209). However, the documents I reviewed indicate that Mr. Paulson's assets and liabilities fluctuated from year to year. Thus, the government's use of the bank deposit method was inappropriate in this case.

In addition, the bank deposit method was improper because Mr. Paulson gambles at a high level. According to the IRS, Mr. Paulson's gambling is classified as an extravagant expenditure. The IRS Manual also states that extravagant expenditures cannot be present for the bank deposit method to be acceptable. Therefore, the government improperly used the bank deposit method to determine Mr. Paulson's income.

2. **Analyze the Prosecution's Summary Report and offer my opinion as to whether the government correctly applied the bank deposit method in the case at hand.**

Opinion 2: The government incorrectly applied the bank deposit method to the case at hand.

APPENDIX E

SAMPLE EXPERT WITNESS REPORT

Transfer of Funds Between Bank Accounts and Redeposited Funds Analysis

According to *Financial Investigations*, transfers of funds between accounts and redeposited funds are not income and therefore must be subtracted from total deposits to effectively determine sources of unreported income. As a result, the bank deposit method requires an analysis of whether any deposits, canceled checks, or other currency transactions were non-income items through transfers between accounts or redeposits. The Prosecution's Summary Report, attached as Exhibit 1, shows that the government omitted this step in its analysis when determining Mr. Paulson's net deposits to all accounts.

First, the government did not determine whether there were any transfers between Mr. Paulson's accounts. In my review of Mr. Paulson's bank statements, I found that he did transfer funds between his bail bond business and his used car business. According to the bank deposit formula, these transfers must be subtracted from total deposits from all accounts to accurately determine net deposits to all accounts. However, the government failed to perform this calculation.

Second, the government did not determine whether any amounts were redeposited. Yet, I found several instances where Mr. Paulson's accounts were overdrawn, resulting in redeposited "non-sufficient fund." According to the bank deposit theory, these redeposits must be subtracted from total deposits to all accounts. Since, the government failed to perform this calculation, it incorrectly applied the bank deposit method in the case at hand.

Funds from Known Sources Analysis

According to its formula, an accurate bank deposit method analysis requires that funds from known sources be subtracted from total receipts for all sources. According to the Prosecution's Summary Report, the government failed to do this in its calculation of Mr. Paulson's sources of unreported income.

Funds from known sources include loans, which are classified as non-income items. My review of Mr. Paulson's financial loan information showed that he secured several loans with American Bank during the period analyzed by the government for the Prosecution's Summary Report. However, the Prosecution's Summary Report does not account for any proceeds received from these loans. As a result, the government did not correctly apply the bank deposit method.

APPENDIX E**SAMPLE EXPERT WITNESS REPORT****CONCLUSION**

For the reasons set forth above, the bank deposit method used by the government in this case is not the appropriate method for determining Mr. Paulson's unreported income. Even if the bank deposit method were appropriate, the government did not properly apply this method to the case at hand.

ADDITIONAL ANALYSIS

I reserve the right to amend this report based on information received after the issuance of the same. Finally, I expect to testify and to use certain exhibits at trial and understand that I may be asked to express opinions in rebuttal of matters that are raised at trial.

COMPENSATION

I am billing Robinson Law Firm, LLC in this matter at our usual and customary rate of \$185 per hour, with staff billing rates from \$65 per hour to \$255 per hour, plus costs incurred.

SIGNATURE

I certify that the above is a true and correct copy of my expert report required by Rule 26(a)(2)(B) of the Federal Rules of Civil Procedure to be presented to the United States District Court for the Middle District of Texas. Signed and dated the 8th day of January, 2019:

James M. Young, CPA, CFE

UNDERSTANDING CRIMINAL BEHAVIOR

Much of our understanding of criminal behavior can be attributed to B. F. Skinner, described by many as one of the greatest social scientists of the 20th century. Skinner promised that he would revolutionize not just psychology, but all of human society with his theories of behaviorism. According to Skinner, human behavior should be approached scientifically. By analyzing people's actions, the behaviorist hoped to alter or direct behavior for the greater good of society. Criminal behavior could be modified into productive action, and rearing a family would cease to be a continual matter of trial and error—the pitfalls would be replaced by basic behavioral principles.

Skinner's accomplishments might have fallen short of this lofty goal. But while he's not as widely recognized as Sigmund Freud, Skinner's influence permeates many areas, often without being overtly attributed to the methods he proposed in *Walden Two* (1948) and *Science and Human Behavior* (1953). When lawyers argue the mitigating or exonerating circumstances of a client's case, they often use behaviorist ideas. Entire theories of management rest on the assumption that *incentives* and *promotions* are the best ways to motivate and retain employees.

Behavioral Analysis and the Prevention of Fraud

When a detective searches for a suspect's motive, the detective is using behaviorist methods of analysis. The detective assumes that the suspect was stimulated by a confluence of factors. Many courses in criminology are built around the fundamental premise that crimes are particular sorts of behavior and best understood as the product of operant conditioning. Fraud examiners often use the same methods in approaching a case. When money is missing, the fraud examiner traces the known flow of funds and then asks, "Who had the opportunity and the motive to get at this money?" This type of question represents a behaviorist analysis of the crime.

Ultimately, the question of fraud and behavior comes down to this—*what can we do about it?* We know that people commit these crimes at an alarming rate. Incidents range from the clerk who skims a few hundred dollars off a business's daily deposits, to multimillion-dollar scam artists who destroy entire organizations. There's a world of difference between the skimming clerk and the scamming financial executive—so can we even analyze the two people within the same system of fraud?

A fraud examiner working with behaviorist principles knows that the difference between crimes lies in the different behaviors. The person who plays million-dollar games with other people's money is stimulated and reinforced by a distinct set of factors, and so, too, is the clerk who builds a savings for their family from their three-figure thefts. So when a fraud examiner is asked to go beyond crime-solving and to consult on fraud prevention, the job demands a thorough analysis of behavior.

It is important to think of employment as a system of behavior because so much fraud occurs in workplace environments, which highlights the connection between economics and people's actions. For both the criminal and the dedicated worker, money exerts a powerful influence. The resourceful employer, then, should consider the best way to establish a positive set of relations between employees and the funds flowing through the company. The more rigorously we understand *how* people behave, the better equipped we are to change *the way* they behave.

Behavioral studies, such as those conducted by Skinner, show that punishment is the least effective method of changing behavior. According to Skinner, punishment brings a temporary suppression of the behavior but only with constant supervision and application. In repeated experiments, Skinner found that punishment—either applying a negative stimulus or taking away a positive one—effectively extinguished a subject's behavior, but the behavior returned when the punishment was discontinued. In other words, the subject would suppress the behavior as long as the punishment was applied directly and continually, but, as soon as the punishment was withdrawn for a while, the behavior was attempted again; if there was no punishment following the attempt, the subject began to behave as before.

Reinforcement and Punishment

Reinforcement and punishment of behavior are distinguished by the way that positive and negative forces are applied. A *positive reinforcement* presents a positive stimulus in exchange for the desired response. For example, a parent might say to a child, "You've cleaned your room. Good. Here's the key to the car." The behavior (cleaning) is reinforced by the awarding of the positive stimulus (the car key). In contrast, a *negative reinforcement* withdraws a negative stimulus in exchange for the desired response. Continuing the example, the parent might say, "I'll stop hassling you if you clean this room." The negative stimulus (hassling) is withdrawn when the appropriate behavior is performed.

In an act of *punishment*, the punisher applies a negative stimulus when faced with an undesired behavior. A father, hearing his son use profanity, puts a bar of soap into the boy's mouth. Punishment may also be administered by withdrawing a positive stimulus, such as, "Your room is still filthy, so you can't use the car."

The following chart summarizes the applications of each approach:

Approach	Applications
Reinforcement	• Presents positive stimuli • Withdraws negative stimuli
Punishment	• Presents negative stimuli • Withdraws positive stimuli

Punishment is ineffective in manipulating behavior because it works by providing negative consequences—administering penalties and taking away desirables. Access to the car or the thrill of a racy story doesn't become less attractive for its use in punishment; its power to stimulate is simply squelched. Conversely, reinforcement proceeds to accentuate the positive. Skinner concludes that behavior is most effectively modified by managing and modifying desires through reinforcement—that is, by replacing destructive behaviors with productive ones instead of trying to punish an already existing impulse.

Alternatives to Punishment

Behaviorism points toward a number of alternatives to punishment. Chief among these is to *modify the circumstances* surrounding the act. If an employee is experiencing financial problems, there might be ways a company can help alleviate pressures. For example, the company could offer financial counseling, pay advances, or low-interest loans, thereby alleviating financial difficulties without the employee having to resort to fraud. In other instances, employees engage in fraud because they feel underpaid or unappreciated.

Emotions, according to Skinner, are a predisposition for people's actions. Anger is not a behavior, but a state of being that predisposes people to do things like yell or fight. Anger is a part of a person's response, to the extent that an angry person is more likely to get in a shouting match with their friends. Since the emotional associations of any event are important factors in conditioning behavior, the associations can be manipulated in conditioning the behavior. That's why advertisers use cute babies to sell toilet paper—the image associates the toilet paper with

the emotions evoked by the baby. A company portrays its founder as a father figure for a similar reason. When managers are faced with disgruntled employees, they can modify these emotional circumstances with adequate compensation and recognition of workers' accomplishments. Incentive programs and task-related bonuses follow this principle, assuming that employees who feel challenged and rewarded by their jobs will produce more work at a higher quality and are less likely to violate the law.

Another non-punitive approach diminishes the undesirable behavior by preventing the expected response. This is a specialized version of modifying the circumstances. Business managers perform an extinction strategy by implementing a system of internal controls. In requiring several signatures for a transaction, for example, a bank's procedures prevent any one employee from gaining access to money. This approach doesn't involve reinforcements or punitive measures; it simply modifies the structure in which acts take place. The perception of internal controls provides a particularly strong deterrent to fraud because it obstructs the operant behavior that has, heretofore, been linked with positive reinforcement. We prevent the act by blocking the expected response. Criminal behavior is discouraged because crime doesn't pay.

A related strategy overcomes improper behavior by encouraging the behavior's opposite. Skinner says that we can *condition incompatible behavior* that interferes with the person's usual acts. Instead of punishing a child's emotional tantrums, for example, the behaviorist rewards the child for controlling emotional outbursts; we drive the tantrums into extinction by not responding and reinforce the stoical behavior. A destructive behavior is offset by an incompatible productive one. Since fraud involves dishonesty, secrecy, and antagonistic behaviors, the astute manager finds ways to reward the opposite behaviors—honesty, openness, and cooperation.

Of course, it's easier to list these strategies in a few paragraphs than it is to implement them. Even the most seemingly simple acts can become tangled as people and circumstances interact. A perfectly sound theoretical reinforcement—an employee incentive program, perhaps—might be viewed with suspicion by disgruntled workers. Behavioral modification is never easy, Skinner says; reinforcements “must be sensitive and complex” because people's lives are complicated and their behaviors sensitized. For example, people in groups often interact in alarming and unstable ways. Skinner demonstrates this tendency with the example of a whipping-boy game played by eighteenth-century sailors. The sailors tied up a group of young boys in a straight line, restraining each boy's left hand and placing a whip in the right

hand. The first boy in line was given a light blow on the back and told to do the same to the person immediately in front of him. Each boy hit the next in line, and each one was hit in turn. As Skinner reports, “It was clearly in the interest of the group that all blows be gentle, [but] the inevitable result was a furious lashing.”¹ Each boy in the line hit a little harder than he had been hit himself; after a few cycles, the last blows would, in fact, be furious (especially since each swing was preceded by pain, creating an emotional disposition of anger and anxiety). Whipping sessions are not likely happening in most companies, but people often exhibit a similar inclination toward catalyzed reactions: whispering sessions gradually evolve into full-blown discussions that echo into the hallways; minor financial indiscretions grow into large-scale larceny.

Ideally, behavioral managers could anticipate this catalyzing and redirect the energies, but this is not always an option. Though the dollar amounts (and the audacity) of some white-collar crimes might surprise people, the crime remains the result of individual actions. A perpetrator might be described as “obsessive” and “megalomaniacal,” but their behavior is still subject to operant conditioning.

The monetary amounts are, in fact, misleading. Once the stakes reach a certain level, it’s not even plausible to look for explanations involving a lack of respect or appreciation. High-dollar criminals describe their machinations as a kick or thrill; they feel like they’re playing a game, and it’s the game of their lives. Behaviorists agree. Money is a “generalized reinforcer,” directly linked with many positive factors and often taking on a symbolic power of its own, thereby yielding a condition of strength. Skinner says, “We are automatically reinforced, apart from any particular deprivation, when we successfully control the physical world.”² So, we need not be starving in order to act, especially with the sense of control—symbolic and literal—gained by acquiring money. Game-playing exerts something similar on its participants; someone who manipulates a chessboard or a deck of cards successfully gains a sense of strength over external events. We can play the game “for its own sake” because it yields the impression of strength. Imagine, then, the behavioral stroke that happens when the game’s power is combined with the power of money as a generalized reinforcer, and both of these factors are played out with real people and settings. The dealmaker is racing through a thicket of reinforcements, and the greater the risk—financial, legal, or personal—the greater the thrill. The stimulus isn’t the money as a thing in itself, any more than money for its own

¹ B. F. Skinner, *Science and Human Behavior* (New York: Macmillan Publishing, 1953), page 309.

² Ibid., page 77.

sake prompts the miser. In either case, the condition of strength (we might even call it “power”) feeds the behaving person; money just happens to be the most effective reinforcer for many individuals.

Dealing with high-stakes criminals will remain difficult, despite our understanding of their behavior. Not just because the amounts of money and the networks of action are so complex, but because the conditioning is so intense. How, for example, can you replace the thrill of scoring \$35 million in a three-day scam? Can a career con be prompted to give up the deceitful practices that have marked their experience? Finding genuine and specific answers might be delayed for some time, but they will likely follow the same pattern we’ve discussed with other crimes, such as:

- Modifying the circumstances of the behavior by, for example, making legitimate businesses a more opportune place for daring and innovative techniques
- Extinguishing the criminal behavior by preventing its success using regulation, controls, and supervision
- Encouraging behaviors incompatible with criminal activity via educational practices and the demonstration of values that call the criminal lifestyle, however flashy, into question

The specific measures will be particular to the crime. The actions dictate the response. But whether we’re dealing with a working mother’s credit card fraud, or Bernie Madoff’s palatial schemes, our methods can be behavioral. Fraud examiners might never eradicate crime completely, but by approaching criminal acts scientifically, we can become more successful in anticipating and preventing the acts.

Applying Behavioral Analysis to Fraud Prevention

To successfully recognize, detect, and prevent fraud, the fraud examiner has to take into account as many variables as possible and has to learn a lot about how human beings—as individuals and in groups—behave. In *Walden Two*, the founder of Skinner’s utopian community admits that there is only so much that can be done by cultural design:

*You can’t foresee all future circumstances, and you can’t specify adequate future conduct. You don’t know what will be required. Instead, you have to set up certain behavioral processes which will lead the individual to design his own “good” conduct when the time comes. We call that sort of thing “self-control.”*³

³ B. F. Skinner, *Walden Two* (Indianapolis, IN: Hackett Publishing Company, 1948), page 96.

No substitute exists for the conscious individual making a choice to act. And no science can predict or shape behavior with pure accuracy. There are just too many factors at work in the network of actions. However, self-control is a behavior that is guided by conditioning in the same way any other act would be.

It does little good, for example, to tell an alcoholic, “Stop drinking; control yourself.” The command alone has little force, even if they want to stop drinking. Family members can suggest that the alcoholic simply throw away their bottles, but “the principal problem,” Skinner interjects, “is to get [them] to do it.”⁴ Family members can, however, help condition the alcoholic’s self-control by registering disapproval of drinking, reinforcing their successful resistance to drink, and encouraging the person to do things that are incompatible with a life of drinking. They can’t follow the alcoholic through every step of their life; the alcoholic has to resist the impulse to sneak a sip on their own. But the behavior of resistance is strengthened by their family members’ intervention. “Self-control” as a behavior is shaped by “variables in the environment and the history of the individual.”⁵

Understanding why people do certain things allows us to go beyond a simplistic insistence that criminals “control themselves.” We will instead have to consider how this control can be conditioned, preventing the behavior directly when possible, but ultimately relying on each individual having adequately learned the principles of self-control.

Why People Obey the Law

With a general understanding of some of the reasons why humans behave the way they do, another important matter involves why people obey (and contrarily break) the law. In his book *Why People Obey the Law*, Tom Tyler studies the two principal types of law-abiding people.⁶

Obviously, some people choose to obey the law, while others choose to break it. Many otherwise law-abiding members of society evade taxes, occasionally use a controlled substance, commit fraud, or even drive under the influence of alcohol. According to studies by Tyler, the instrumental and the normative perspectives attempt to explain why some people strictly adhere to the law while others obey selectively.

⁴ B. F. Skinner, *Science and Human Behavior* (New York: Macmillan Publishing, 1953), page 240.

⁵ Ibid.

⁶ Tom R. Tyler, *Why People Obey the Law* (New Haven: Yale University Press, 1990).

Instrumental Perspective

According to the instrumental perspective, people weigh the pros and cons of compliance with the law and act accordingly. In other words, they choose to obey the law because they fear punishment for noncompliance.

A person exemplifying the instrumental perspective might exceed the speed limit, thinking that the benefit of saved time outweighs the risk of the potential speeding ticket. These types of individuals are unlikely to rob a bank, though, considering that success is doubtful and the penalty is steep.

Normative Perspective

The focus of the normative perspective is what one considers just and moral. When people believe compliance is their moral obligation, commitment to the law is voluntary, regardless of fear of punishment.

People of this belief might indulge in illegal drugs but refrain from stealing—one being morally acceptable in their view and the other not. Others might obey all laws out of the belief that the authorities are just. In any case, compliance is unforced and voluntary.

Naturally, the authorities prefer voluntary compliance. From their perspective, the normative is preferable to the instrumental perspective since the former does not require enforcement. If the public already believes in the government's moral right to govern, the authorities' job is made much easier.

Another significant difference between the instrumental and the normative perspectives is whether one focuses on procedures rather than results. Those adhering to the normative perspective will, for example, be more concerned with being treated justly in court rather than with winning or losing their case. They will contentedly await judgment if dealt with fairly. People of this opinion are interested in neutrality, lack of bias, honesty, politeness, and respect for one's rights. The "due process," then, is most effective in promoting compliance to those of this view. Alternately, the instrumentalist focuses on the outcome of their case and is less concerned with procedures. In their mind, a procedure is fair if it is favorable.

Legitimacy and Compliance

Legitimacy

Legitimacy is regarded as the essential ingredient in what gives governments and leaders authority. The idea is that if the authorities have legitimacy, the public will obey the law.

By definition, effective leadership must produce compliance with a leader's decisions. However, when new legislation or policies are introduced, public support and compliance do not always occur. Court decisions or legislative decrees do not necessarily produce general public acceptance of or adherence to policy. Likewise, if a company introduces a new policy that no employee may take a gift (no matter how small) from a potential vendor, some employees might continue to take small gifts anyway.

Altering citizens' behavior by manipulating access to valued resources or threatening to impose sanctions is known as *social control*. Once again, the concept is that reward and punishment are what cause people to obey the law. People maximize their personal gain and comply based on deterrence. Of course, life is more complicated than reward and punishment. Otherwise, the job of law enforcement would be easy. But social control appeals to authorities. The public understands deterrence, rewards, and punishment. In contrast, emphasizing the normative approach places power not with authorities, but with the people whose voluntary compliance is sought.

In studying general compliance with the law, sociologists have found that the instrumental perspective does not fully explain why people obey the law. Citizens choose to obey the law when the chances of being caught violating it are virtually zero, as when one might come upon a stop sign in a deserted street. Almost all citizens pay their income taxes in a voluntary system, even though the chances of being caught shaming taxes owed are small. Yet some citizens break the law when it is risky to do so, as when they buy illegal drugs or embezzle thousands of dollars from their company.

In a democracy, the legal system cannot function if it can influence people only by manipulating rewards and costs. The resources required to enforce such a regime are too high. Deterrence is expensive to enforce and does not guarantee an adequate level of obedience. Drunk driving is a good example. Studies show that an extremely high investment of resources is needed to convince people that the likelihood of being caught and punished for driving drunk is high. Public campaigns against drunk driving tend to temporarily reduce the number of individuals caught driving under the influence. As long as citizens think the

chances of being caught are rising, the incidences of drunk driving remain lower. However, as soon as public perception of increased vigilance against drunk driving lessens, the number of arrests goes up again. Likewise, as is discussed later in the “Fraud Prevention Programs” chapter, increasing the perception of detection is a powerful anti-fraud program. If employees think that their company is not paying attention to occupational fraud, then they are more likely to engage in it.

Consider the use of marijuana. Even in many jurisdictions where it is illegal, the drug is still popular. If the reason people in these jurisdictions abstain from using this drug is that they believe in complying with the law, then obviously the authorities have legitimacy in their eyes. However, if they forgo marijuana use because it violates their moral values, then it is their convictions that are the deciding factor. If fear of legal punishment stops them, then deterrence carries greater weight with them. And if they refrain out of fear of social ostracism, then the social group’s influence prevails.

People’s own normative values have a significant influence over their behavior. Unlike the reward and punishment approach, an individual’s own values are what produce compliance or noncompliance with the law in the end. Psychologists refer to this as “internalized obligations,” for which citizens take personal responsibility.

Voluntary Compliance

Voluntary compliance matters only to the extent to which it produces obedience that goes beyond self-interest, which is commonly measured by reward and punishment. A normative driver, for instance, will accept being a few minutes late to their appointment in order to obey the speed limit, thus making the roads safer for everyone. A normative employee will accept a salary freeze and not steal from the company to make up for the raise they were promised. In other words, these people will act against their own best interests if they feel compliance with the rule is of greater moral import.

Of course, effective authorities recognize that without the goodwill of those they serve, they could not function. Consequently, their aim must be to maximize compliance and minimize hostility toward laws and rules while gaining legitimacy from the public. To effectively govern, a leader must be considered legitimate by the public. The same is true for employers, managers, teachers, and army sergeants. Otherwise, compliance will not occur.

Due to its significant social impact, social scientists and politicians have found legitimacy to be an issue of major concern. It is seen as a source of loyalty that leaders can rely upon when needed. Opinion polls on the public's attitude toward the law and the government are really about public confidence in the government's legitimacy. If the public does not have confidence in the legal system, obedience to laws is unlikely.

Studies show that both children and adults feel a strong obligation to obey the law. Whether we can attribute this to their normative values or the legitimacy of the authorities is the real question. Naturally, those who view the authorities as legitimate are more likely to comply. This leads to the conclusion that normative support of the system results in compliant behavior.

Measuring Legitimacy and Compliance

Tyler conducted a study (called the "Chicago Study") to test the concept that if authorities have legitimacy, the public will obey the law. The study focused on six laws people deal with on a daily basis: disturbing the peace, littering, driving while intoxicated, speeding, shoplifting, and parking illegally. Participants were asked how often they had broken these laws in the past year. Most admitted to parking illegally (51%) and speeding (62%), but very few admitted to shoplifting (3%). Of those participants, 27% confessed to disturbing the peace, 25% to littering, and 19% admitted to having driven while under the influence.

The second wave of interviews, in which participants were asked about a shorter time frame, produced similar results. To measure fear of punishment, respondents were asked how likely they thought it was that they would be arrested or issued a citation if they violated these six laws; 83% of respondents thought it was likely that they would be caught driving drunk; 78% thought the same for parking violations and shoplifting; 72% for speeding; 35% for disturbing the peace; and 31% for littering.

Participants were then gauged for peer approval. For shoplifting, 89% said that they thought that the five adults they know best would disapprove, and 86% said the same for drunk driving, as did 51% for littering, 52% for speeding, 44% for illegal parking, and 53% for disturbing the peace.

The next question was designed to measure respondents' morality. They were asked whether each offense was "wrong." Almost every one of the participants felt that any violations of the six laws were wrong. Speeding came out as the least immoral and shoplifting the most, with 99% of participants considering it morally objectionable.

One sees that citizens seem to view the breaking of laws as a violation of their personal morality. Interestingly, most believe the chances of getting caught are high. Since peer disapproval levels are relatively light, one can gather that, in this particular study, the social group is the source of the least amount of pressure to obey laws.

More than four out of five participants thought a person should obey the law “even if it goes against what they think is right.” Almost as many respondents felt that disobeying the law is seldom justified and that obedience and respect for authority are the most important virtues children should learn.

The study did show that legitimacy is related to compliance. Participants who attributed greater legitimacy to authorities were more likely to obey the law, for instance. This does not prove a causal relationship, though. The results of the study were analyzed to account for demographic and sociological factors. This “regression analysis” suggests that legitimacy has a significant effect on compliance, regardless of the other factors.

Certainly, legitimacy’s impact on a person is influenced by that individual’s personal experiences with police and courts. A person who feels mistreated by the authorities might be less likely to have confidence in their legitimacy and, therefore, could view some laws with more skepticism. In such cases, peer approval seems to take on greater importance in those people’s thinking.

Implications of the Chicago Study

Authorities do not take compliance with the law for granted. They often find that occasional noncompliance must be tolerated. Sometimes noncompliance is so widespread that it creates doubt regarding the effectiveness and validity of the law itself. Prohibition, for example, was widely and often openly violated before its repeal. The results of the Chicago Study suggest that normative values are more influential upon compliance than the reward and punishment approach. This is consistent with Skinner’s behavioral theories.

The Chicago Study shows that people have a high level of normative commitment to abide by the law. Most participants felt that breaking the law was morally wrong and that laws should be obeyed even when one does not agree with them. Authorities who understand this mindset and encourage those views will inspire compliance. Similarly, employees who have a strong sense of loyalty to their employer will not violate company policies because such acts would be a betrayal to the company.

THE PSYCHOLOGICAL VARIABLES

The Chicago Study was designed to gauge the difference between citizens' concerns for favorable outcomes and procedural fairness. It also measures the extent to which fairness influences reactions to experience. The experience in question is of the everyday, average-citizen variety—the type of encounter most of us have with authorities over relatively minor matters. Participants reported calling the police for a number of reasons: accidents, disturbances, suspicious activities, and crimes against property or violent crimes. The majority of callers felt it was important for the police to solve their problem, whether it was serious or not.

Police response time was satisfactory to most respondents. Only 15% felt that the police did not respond quickly enough. Nearly 70% knew what actions the police had taken to solve the problem, and almost two-thirds of those said that the police settled the situation. The 43% who said that the police failed to solve their problem admitted that the police did everything they could. In total, 71% said they were satisfied with the outcome of their call. Most respondents also felt that they were treated quite well by the police; 86% expressed overall satisfaction with their politeness, concern for their rights, propriety, attentiveness, honesty, and willingness to consider their opinions.

Respondents who were stopped by the police had less magnanimous feelings toward them. Still, 73% of those who received tickets for minor offenses considered the outcome fair, acknowledging that the ticket was deserved.

Satisfaction levels of participants who had to go to court were similarly high: 80% considered their treatment fair; however, 36% stated that they believed the judge could have reached a better outcome.

LEGITIMACY AND EXPERIENCE

People are more likely to accept unfavorable rulings if they believe their case was handled fairly. Thus, fair procedures can lessen the severity of an outcome that is to one's disadvantage, without damaging the authorities' legitimacy. Of course, fair procedures can only go so far. If fair procedures consistently produce unfavorable results, the fairness of the procedures will come into question.

People typically place importance on procedure for several reasons. The first is simplicity. Often, the result itself is difficult to classify as fair or unfair. People, therefore, focus on the

steps that lead up to the outcome. The second is that people do not always concur on what is fair. Although most people might not necessarily agree upon the outcome, they are usually more in agreeance when regarding the justice of the procedures.

The procedural aspects of the law and how the public perceives them must be of great importance to authorities. Policymakers must have a good idea of what the public considers fair. If members of the public perceive a court's legal actions as just, they are more likely to support the outcome even if it is to their detriment. For example, in jurisdictions that offer plea bargaining, the practice of negotiating a deal with a criminal defendant is often justified based on outcome. But if the inconsistency in plea agreements is seen as unfair, support for the legal system will weaken.

The same is true in the corporate environment. Employees are more likely to accept unpopular company policies if the employees feel that the policy is applied "fairly." For instance, employees might be upset that the company provides only three paid sick days, but if the rule is applied to all employees in an equal manner, most employees will live with the policy. However, if some employees are allowed additional sick days and others are not, employees are likely to resent the policy and the company. In other words, these employees feel they are being treated unfairly.

THE MEANING OF PROCEDURAL JUSTICE

Another important issue is how people evaluate procedures for fairness. Previous efforts to study this question have focused on control. Two areas of control with which people are generally concerned are *decision control* (control over the actual decisions made) and *process control* (control over the opportunity to state one's case).

To better illustrate, consider an attorney representing a client in court. While the client surrenders control of the case to their attorney, they might still attempt to maintain it by controlling the process. According to the instrumental perspective, they will value the opportunity to testify only insofar as it helps to achieve a beneficial outcome to their case. Studies show, however, that most of us appreciate the chance to express our views, regardless of whether it influences the outcome or not. From this, one can conclude that process control has an independent impact on how one perceives fairness and whether one is satisfied with the outcome (one's satisfaction with the outcome and one's opinion of fair procedures depends largely on one's degree of control).

Again, one must ask what criteria people use to decide whether a procedure is fair. G. S. Leventhal proposed six standards for evaluating the fairness of a procedure:⁷

- Representativeness
- Consistency
- Suppression of bias
- Accuracy
- Correctability
- Ethicality

Representativeness relates to those parties whose concerns are affected throughout the allocation process. *Consistency* refers to the uniform and unbiased treatment of all of the affected parties. *Suppression of bias* guarantees that those involved with the outcome have no personal, vested interest in the case. This also prohibits a participant's reliance on previously formed opinions rather than just the evidence at hand, as when a juror votes guilty because they believe that criminal defendants are always guilty. *Accuracy* refers to objective high quality. *Correctability* involves the checks and balances provided in the system, which allow unfair decisions to be corrected, such as the appeals process. *Ethicality*, of course, involves the degree to which procedures meet generally held ethical standards of fairness and morality. Torture, for instance, is a violation of ethicality, as it is a breach of basic moral codes.

Studies measuring the importance of Leventhal's six criteria show that people place the most importance on consistency. Accuracy, representativeness, and suppressing bias are also highly valued.

Based on Tyler's Chicago Study, it appears likely that, in encounters with the police, people are more concerned with fairness than with the police officer's adherence to formal issues of rights (i.e., ethicality). In the courtroom, however, ethical standards and rights receive greater emphasis.

People's views on procedural fairness are affected by two factors: background characteristics and prior views. Race, education, income, sex, age, and political views are the most important background characteristics. However, prior views, generally formed by an individual's

⁷ G. S. Leventhal, "What Should Be Done with Equity Theory? New Approaches to the Study of Fairness in Social Relationships." In K. Gergen, M. Greenberg, and R. Willis, eds., *Social Exchanges: Advances in Theory and Research* (New York: Plenum, 1980), pages 27–55.

personal experiences, have more significance than background characteristics. Any background characteristic is certain to be overridden by one's prior views on a subject.

INFLUENCE OF CONTROL ON THE MEANING OF PROCEDURAL JUSTICE

The Chicago Study assessed process control by questioning respondents about how much opportunity they had to state their case or present their problem. Decision control was measured by asking how much influence participants had over the determinations made by the third party in control. Most participants felt they had a high (43%) to moderate (20%) level of process control. In contrast, a number of participants felt they had little decision control (about half said "not much at all").

The Chicago Study indicates that process control judgments are the deciding factor when assessing procedural justice in terms of control. Process control judgments are also important in assessing how experience affects people's evaluation of procedural justice. Consequently, respondents are more concerned with their opportunities to speak out rather than their influence over the outcome. The belief of citizens that their views are being weighed and considered by the authorities and that the authorities are dealing fairly with them reinforces their belief in their own process and decision control.

In the employment context, the Chicago Study tends to support the idea that employees should be involved in the development of policies and procedures. Instead of just distributing a fraud policy or an ethics policy, management should solicit ideas and input from employees. If employees feel they have some control over the rules, they will be more likely to obey and follow them.

Theories of Crime Causation

Understanding human behavior and why people obey the law helps explain some of the reasons people commit fraud. However, there have been a number of theorists who have attempted to explain specifically why people commit crimes. In more sophisticated sciences, such as chemistry and physics, theories build on one another as new facts emerge from studies prompted by the reigning theories. In criminology (as in virtually all the social sciences), differing theories compete for acceptance and are often reevaluated and challenged by new developments.

The following sections summarize some of the better-known criminological theories, both past and present.

Classical Criminology

Classical criminology, based on the philosophical principle of *utilitarianism*, is founded in the belief that human beings are rational and calculating creatures and, therefore, do things in order to avoid pain and produce pleasure. Some of the components of classical criminological theory are:

- People have free will, which they can use to engage in either criminal or noncriminal behavior.
- Criminal behavior will be more attractive if the gains are estimated to be greater than the losses.
- The more certain, severe, and swift the reaction to crime, the more likely it is that the penalties will control the behavior.

Two theorists' names are most frequently associated with classical criminology: the Italian Cesare Beccaria and the Englishman Jeremy Bentham. (Bentham, marvelously eccentric, willed that his body be preserved and placed in the entryway of University College London. His wishes were carried out; the body can still be seen today by anyone visiting the university.)

The policy implications of classical criminological thought, which are prominent today in theories grouped under the heading of "rational choice," are that penalties should be established that make the anticipated results of criminal behavior less appealing than the prospects of the losses, such as the loss of freedom. The theory also has a benevolent component in that it suggests that penalties that are too severe serve no purpose, since they are needlessly excessive for the deterrence they seek to achieve.

Utilitarianism remains a favored approach to understanding criminality, with its assumption that offenders will calculate potential gains and losses before they decide to disobey the law. Organizational sentencing guidelines, for example, are sometimes based on the teachings of classical criminology, mandating that monetary penalties be calculated at a level that will induce companies to conclude that breaking the law is not fiscally appealing.

There are several major difficulties inherent in the theory, though. The first is that many people do not stop and add up the gains and losses of lawbreaking before they engage in it. Second, the impact of penalties can be very different for different people; the thought of a week in

prison might be terrifying to one person, but it could be nothing more than an inconvenience to someone else. Third, it is very difficult to know whether the penalty will, in fact, result from the behavior; most offenders optimistically assume that they will not be caught.

Rational Choice Theory

Rational choice theory, based on the tenets of classical criminology, is the theory that the decision to commit a crime is a rational and careful choice on the perpetrator's part with the goal of some intended benefit. This theory states that specific crimes are chosen and committed for specific reasons. Before committing a crime, the offender performs a *cost-benefit analysis* that "weighs the chances of getting caught, the severity of the expected penalty and the value to be gained by committing the act."⁸ Under this theory, the decision to commit a crime is influenced by characteristics of both the offender and the offense. Criminal activity will only occur when the opportunity to engage in it is present. Offenders will gravitate toward targets that are readily available to them, such as their employer.

Based on this theory, the best way to reduce crime is by making it more difficult to commit. Removing individuals' opportunities to commit crime should lessen its occurrence. This idea is strongly supported by deterrence methods in the form of target hardening and punishment. *Target hardening* refers to preventive controls that aim to reduce or avoid the likelihood of a crime occurring. Examples include locking doors, separating duties, physically safeguarding assets, and using online two-factor authentication. Deterrence theory states that punishment should be swift, certain, and severe for it to be an effective deterrent. Thus, if someone in an organization commits fraud and their swift, certain, and severe punishment is made apparent, the rest of the organization will be deterred against committing that crime. Rational choice theory presents crime as a conscious choice that must be met with reduced opportunities for criminal activity and increased personal risk in order for deterrence methods to be successful.

Routine Activities Theory

Routine activities theory, a variation of classical theory, holds that both the motivation to commit crime and the supply of offenders is constant. There will always be a certain number of people, motivated by greed, lust, and other forces, who are inclined toward lawbreaking. The determining factor, particularly in predatory crimes, such as those involving violence and theft, are the activities of potential victims. There are three important elements that influence crime:

⁸ Scot Wortley et al., "The Root Causes of Youth Violence: A Review of Major Theoretical Perspectives," *The Review of the Roots of Youth Violence* (July 2008), volume 5, page 42, www.children.gov.on.ca/htdocs/english/documents/youthandthelaw/rootsof youthviolence-vol5.pdf.

- The availability of suitable targets, such as companies and individuals
- The absence of capable guardians, such as auditors and security personnel
- The presence of motivated offenders, such as unhappy or financially challenged employees

Routine activities theory states that crime occurs in specific instances where these three elements come together. For example, it predicts that crime is likely to occur when an employee (i.e., the motivated offender) has access to a company's payroll (i.e., the suitable target) and there are few controls (i.e., capable guardians) to prevent the employee from embezzling money. Similar to other classical theories, routine activities theory emphasizes the premeditated thoughts that exist prior to making the decision to commit crime. If someone thinks it is likely that they will be caught or there is not a suitable target, then they are less likely to commit a crime.

Biological Theories

Biological theories maintain that criminal behavior is not the result of choice (the calculation of benefits and potential losses), but rather is caused by the physical traits of those who commit crime. The foundations of biological theory were laid by Cesare Lombroso, an Italian doctor, who insisted that there were born criminals—people who were atavistic, or a throwback to more primitive human types. Lombroso spent his career measuring the bodies of offenders and concluded that they were significantly asymmetrical, with such things as sloping foreheads and other “anomalies.” Later critics would point out that Lombroso used no control group—that is, he did not measure people who were not criminals. If he had done so, he would have found that non-criminals possessed the same physical traits that Lombroso presumed were indicative of criminal propensities.

Unsurprisingly, Lombroso's view and others like it have been roundly discredited. However, more nuanced scientific studies have impacted criminological research. These studies generally focus on certain biological aspects that can affect an individual's behavior. For example, testosterone and adrenaline are generally associated with aggression, and high testosterone or adrenaline levels might make a person more aggressive and more likely to commit crime. Additionally, the excessive consumption of alcohol can lower blood sugar levels, which has also been linked to an increase in aggression.

Of course, these studies are limited in scope and do not imply, for example, that a person who has high testosterone levels is more likely to commit crime; these kinds of studies simply suggest that there are certain biological factors that can influence an individual's behavior.

Culture and Crime

Cultural theories view crime as the product of a culture or subculture to which an individual belongs. Beginning at childhood, culture shapes the set of values, beliefs, and actions that are learned through interactions with others. Transmitted through intimate peer groups and across familial generations, cultural ideas provide support toward behavior that is deemed acceptable and valued in the greater society. Under cultural frameworks, crime rates will differ globally due to the prioritization of individual and group needs, economic models, and the importance of other social institutions in a specific country.

Individualism Versus Collectivism

In countries where an *individualistic culture* is present, the needs of the individual are stressed over those of society. Behaviors tend to be dictated by individuals' attitudes and preferences, and importance is placed on qualities such as independence, self-reliance, and assertiveness. Conversely, *collectivistic cultures* emphasize the needs and goals of all members over those of the individual. In this type of culture, relationships with other members of the group and the interconnectedness that results play a central role in forming personal identities. Qualities viewed as favorable in collectivistic cultures include generosity, helpfulness, and harmony with others.

The relationship between individualistic and collectivistic cultures has been used to explain the difference in crime rates across countries. In countries where individualistic characteristics govern the norms of society, crime rates tend to be higher. Due to success being measured by one's own personal achievements, more people will commit crime to align their outcomes with what is expected of them. In collectivistic cultures, where more importance is placed on social groups, individuals are less likely to commit crime for fear of being ostracized. Individualistic ideals generally support increasing the power given to law enforcement and the court system, combined with stronger punishment, as a way to deter future crime. Collectivistic cultures place more focus on improving social conditions and creating a more equal society to make crime less appealing.

Psychological Theories

Theories rooted in psychology are based on the view that criminal behavior is the product of mental processes. The psychoanalytical ideas of Sigmund Freud focus on early childhood development and on unconscious motivations—that is, motivations of which the offenders themselves are not aware. Freud identified a three-part structure to human personality: the *id* (the drive for food, sex, and other life-sustaining things), the *superego* (the conscience that develops when learned values become incorporated into a person's behavior), and the *ego* (the “I,” or the product of the interaction between what a person wants and what their conscience will allow them to do to achieve what they want).

Cognitive and Personality Theories

Cognitive theories stress inadequate moral and intellectual development as the foundation of criminal acts. There are also *personality theories*, which support the belief that traits such as extroversion are responsible for a significant amount of crime.

Integrated Theories

Integrated theories draw from choice theory, biological theory, and psychological theory. These theories often acknowledge that, while criminal activity is a choice, this choice is heavily influenced by biological, psychological, and social factors.

Conditioning Theory

H. J. Eysenck, working with what he calls *conditioning theory*, argues that the failure of a person to incorporate the rules of society satisfactorily represents the major explanation for subsequent criminal behavior. Eysenck maintains that extroverted persons, both normal and neurotic, are more difficult to condition—that is, to train—than introverted persons, and that extroverts, therefore, get into more trouble than introverts.

Another psychological theme is that frustration is the precursor of aggression. The theory suggests that the expression of aggression, such as a fraud perpetrator retaliating against their employer, will alleviate the frustration and allow the organism to return to a more satisfactory state.

Social Structure Theories

These theories concentrate on the kinds of societies that generate particular levels of crime. Why is the crime rate in Japan so much lower than in the United States? Why do many

Central American countries have high rates of homicide while Hong Kong's homicide rate is notably low? There are various kinds of sociological theories, all based on similar premises but with differing emphases.

Social structure theories address the relationships between individuals and large-scale social arrangements, such as class structure and the economy. Social structure theories treat crime as the result of social progress, economic injustice, or the disconnect between the goals that a society favors (e.g., wealth and power) and the means by which those goals are achievable. To explain crime, these theories tend to focus on poverty, poor education, the presence of neighborhood subcultures (e.g., gangs), a lack of employment opportunities, and the pressure to be materially successful.

Theory of Anomie

Strain theories are a branch of the social structure theory. Strain theorists view crime as a direct result of the frustration and anger people experience over their inability to achieve the social and financial success they desire. The best-known strain theory is Robert Merton's *theory of anomie*. Robert Merton, a Columbia University sociologist, maintained that the discrepancy between what people are indoctrinated into desiring and the ways that are available to them to achieve such ends is the cornerstone for explaining criminal behavior.

Merton's theory of anomie (that is, normlessness) was derived from the work of Émile Durkheim, a French sociologist who contextualized the term in his effort to explain suicide rates among different social groups. Merton's theory characterizes the discord between goals and the legitimate means available to achieve them as anomie. Strain theory argues that this disconnect inevitably leads to crime, as individuals struggle to fulfill their desires.

Under Merton's theory, the *strain* experienced by people can be either structural or individual. *Structural strain* refers to societal-level processes, such as the way the government or economy functions, that gradually affect individuals. These structures might affect individuals' opportunities and their general perceptions of society. Conversely, *individual strain* refers to the stress people feel and the difficulties they face when attempting to satisfy their own needs and wants.

INSTITUTIONAL-ANOMIE THEORY

An extension of anomie theory, specifically building on Robert Merton's idea of structural strain, is the *institutional-anomie theory* (IAT). This theory attempts to explain differences in

cross-cultural crime by the way a particular culture behaves economically, the expected behavior of its citizens, and the “opportunities [the culture provides] for its citizens to reach those expectations.”⁹ According to this theory, more crime occurs in countries where the economy takes precedence over other social institutions and the government fails to provide legal means for all its citizens to obtain the same level of financial success.

According to IAT, there are four fundamental cultural values that determine crime rates across different cultures:¹⁰

- *Achievement*: the way that a culture views success and how it measures the value of an individual
- *Individualism*: how individuals compete against each other to gain success
- *Monetary fetishism*: the use of money as a measure of success, rather than by the means in which it was acquired
- *Universalism*: the general understanding of these values by all members of a society

These fundamental cultural values interact with four basic social institutions: the economy, the family, the educational system, and social policies. These four institutions serve as checks and balances for each other, and when the economy begins to overpower the rest, the noneconomic social institutions will have weakened control. Based on this theory, the intersection of cultural values, priorities, and institutional power dictates the rate of crime in a society.

Social Process Theories

Not all sociologists believe that a person’s social structure alone controls the direction of their values, attitudes, and behavior. After all, most people who reside in even the most deteriorated urban areas are law-abiding citizens. *Social process theories* hold that criminality is a function of individual socialization and the social-psychological interactions people have with the various organizations, institutions, and processes of society.

Though they differ in many respects, the various social process theories all share one basic concept: All people, regardless of their race, class, or gender, have the potential to become criminals.

¹⁰ Ibid.

Social Learning Theories

Social learning theories hold that criminal behavior is a function of the way people absorb information, viewpoints, and motivations from others, most notably from those with whom they are close, such as members of their peer group. Social learning theorists believe that all people have the potential to commit crime if they are exposed to certain kinds of circumstances. For example, if an accountant works in an environment where manipulating financial statements is treated as a normal, expected behavior, then that accountant might be more likely to participate in this illegal conduct.

Social learning theory also incorporates the idea of differential reinforcement, in which a particular behavior is encouraged and rewarded. *Differential reinforcement* is a learning technique used to distinguish acceptable behavior from unacceptable behavior by rewarding the desired behavior, thus reinforcing it. In terms of social learning theory, differential reinforcement helps explain why individuals might act criminally.

For example, the organization in the previous example might reward the accountant for manipulating financial statements. Likewise, an employee who chooses to follow the law might be punished by the organization. As a result, people learn to break the law because they are rewarded for doing so.

Theory of Differential Association

Many social learning theories are often indebted to the theory of differential association. This theory first appeared as a systematic formulation in 1939 in the third edition of Edwin H. Sutherland's *Principles of Criminology*. Later, Sutherland would make his best-known contribution to criminology by coining the phrase *white-collar crime* and writing a monograph on the subject. Sutherland was particularly interested in fraud committed by the elite upper-world business executive, either against shareholders or the public. Sutherland said:

*General Motors does not have an inferiority complex, United States Steel does not suffer from an unresolved Oedipus problem, and the DuPonts do not desire to return to the womb. The assumption that an offender may have such pathological distortion of the intellect or the emotions seems to me absurd, and if it is absurd regarding the crimes of businessmen, it is equally absurd regarding the crimes of persons in the economic lower classes.*¹¹

¹¹ Gilbert Geis, *On White-collar Crime* (Lexington: Lexington Books, 1982).

Sutherland's theory includes the following key points: (1) criminal behavior is learned; (2) it is learned from other people in a process of communication; (3) criminal behavior is acquired through participation with intimate personal groups; (4) the learning process includes the shaping of motives, drives, rationalizations, and attitudes; (5) the directions of motives are learned from the favorable or unfavorable interpretations of applicable laws; (6) a person becomes a criminal because of an excess of conclusions favorable to violation of the law over conclusions unfavorable to violation of the law; (7) differential association may vary in frequency, duration, priority, and intensity; (8) learning criminal behavior involves all the mechanisms of other learning; (9) learning differs from pure imitation; and (10) while criminal behavior is an expression of general needs and values, it is not explained by these needs and values.

Social Control Theory

Developed in the mid-20th century, *social control theory* is premised on the idea that people's personal relationships, values, beliefs, and commitments can encourage them to obey the law. This theory focuses on the ways in which a society can build institutions (e.g., schools, local governments, community centers, religious organizations) that can help control crime and socialize people so that they are less likely to engage in crime.

Social control theory takes its cue from a classic of sociology, Émile Durkheim's *Suicide*, in which the French theoretician wrote:

*The more weakened the groups to which [the individual belongs], the less he depends on them, the more he consequently depends on himself and recognizes no other rules of conduct than what are founded on his private interests.*¹²

Essentially, social control theory argues that the institutions of the social system train and press those with whom they are in contact into patterns of conformity. Schools train for adjustment in society; peers press the ethos of success and conventional behavior; and parents strive to instill law-abiding habits in their children—even parents who themselves sometimes violate the rules. The theory suggests that if a person fails to become attached to the variety of control agencies of the society, that person's chances of violating the law increase.

¹² Émile Durkheim, *Suicide: A Study in Sociology*, translated by John A. Spaulding and George Simpson (New York: The Free Press, 1951), page 209.

Four aspects of affiliation are addressed by the theory:

- Attachment
- Commitment
- Involvement
- Belief

Attachment refers primarily to affection-type ties with people such as parents, teachers, and peers. *Commitment* refers to cost factors involved in criminal activity. People are committed to conventional behavior and probably have invested something—fiscally and emotionally—in their ultimate success—an investment that they are wary of risking by means of a criminal act. Commitment might involve things such as obtaining a better job or seeing one's children succeed. *Involvement* concerns matters such as time spent on the job—that is, participation in activities related to future goals and objectives. *Belief* refers to a conviction about the legitimacy of conventional values, such as the law in general and criminal justice prescriptions in particular.

Sociologist Travis Hirschi was instrumental in the development of social control theory. His account insists that there is no important relationship between social class and delinquency and crime; thus, a person in any class—lower, middle, or upper—who defaults on liaisons with the important formative agencies in our society will be more apt to end up on a path that leads to crime. Among the important considerations is that social control theory “assumes the bond of affection for conventional persons is a major deterrent to crime. The stronger this bond, the more likely the person is to take it into account when and if he contemplates a criminal act.”¹³ What essentially happens, the theory suggests, is that people confronted with the possibility of violating a law are likely to ask themselves questions such as, “What will my spouse—or my mother and father—think if they find out?” To the extent that individuals believe that other people whose opinions are important to them will be disappointed or ashamed, and to the extent that they care deeply that these people will feel this way, they will be deterred from committing a criminal act.

Differential Reinforcement Theory

Differential reinforcement theory is another attempt to explain crime as a type of learned behavior. It is a revision of Sutherland's work that incorporates elements of the

¹³ Travis Hirschi, *Causes of Delinquency* (Piscataway, NJ: Transaction Publishers, 2002), page 83.

psychological learning theory popularized by B. F. Skinner and the social learning theory discussed previously. The theory was summarized by Ronald Akers in his 1977 work, *Deviant Behavior: A Social Learning Approach*.

According to this theory, people learn social behavior by *operant conditioning*—behavior controlled by stimuli that occur after the behavior. Behavior is reinforced when positive rewards are gained (positive reinforcement) or punishment is avoided (negative reinforcement). It is weakened by negative stimuli (punishment) and loss of reward (negative punishment). Whether deviant or criminal behavior begins or persists depends on the degree to which it has been rewarded or punished, as well as the rewards or punishments attached to its alternatives.

WHITE-COLLAR CRIME

Part of the study of criminology involves exploring the differences in various categories of crimes and the individuals who commit them. Understanding what makes fraud and other white-collar crimes different from other types of criminal acts can be extremely helpful in designing systems to prevent and detect them, as can recognizing the characteristics of the people who perpetrate these schemes.

What Is White-Collar Crime?

Since the term was first used, there have been constant disputes regarding what is (or should be) the definition of *white-collar crime*. The designation was coined by Edwin H. Sutherland in December 1939 during his presidential address in Philadelphia to the American Sociological Society. Ten years later, Sutherland published *White Collar Crime*, in which he offered an arguable, vague definition of the concept in a footnote: White-collar crime was said to be “Crime in the upper, white-collar class, which is composed of respectable, or at least respected, business, and professional men.” These crimes were confined to acts performed by white-collar persons in occupational roles, thereby excluding “most of their cases of murder, adultery, and intoxication, since these are not customarily a part of their occupational procedures.”¹

A few pages after this definitional foray, Sutherland illustrated white-collar crime through examples of thefts by chain-store employees and overcharges by garage mechanics and watch repairers. There was little consistency between his definition and his illustrations of what might fall within it.

Nonetheless, the term *white-collar crime* has been widely incorporated into popular and scholarly language throughout the world, though the designation *economic crime* is sometimes used as well. The difficulty with *economic crime* is that so many illegal acts, including murder, are often committed in order to achieve economic gain. Other terms, such as *abuse of power*, *upperworld crime*, *crimes by the powerful*, *avocational crime*, *crime in the suites*, and *organizational crime*, are used throughout the world to designate—more or less—the same phenomena as white-collar crime.

A major difficulty with the concept as formulated by Sutherland is that he is designating an offense category that has no equivalent in the law. Certain statutory offenses can be identified

¹ Edwin H. Sutherland, *White Collar Crime* (New York: Dryden Press, 1949), page 9.

as those that, by and large, will be committed by persons in the elite classes—offenses such as antitrust violations and insider trading—but what is to be done definitionally with, say, the proofreader, who is paid little more than minimum wage and learns from information that they are working on of a merger between the company and one of its strong competitors? They buy stock and reap a considerable profit but are then caught and prosecuted for insider trading. Is this person to be regarded as a white-collar criminal?

The *Dictionary of Criminal Justice Data Terminology*, published by the U.S. Bureau of Justice Statistics (BJS), defines *white-collar crime* as:

*Nonviolent crime for financial gain committed by means of deception by persons whose occupational status is entrepreneurial, professional, or semi-professional and utilizing their special occupational skills and opportunities; also nonviolent crime for financial gain utilizing deception and committed by anyone having special technical and professional knowledge of business and government, irrespective of the person's occupation.*²

This definition certainly includes a variety of wrongdoers. But critics fault it for its explicit omission of violent offenses. What about a doctor who knowingly performs unnecessary surgery in order to collect a large fee and ends up causing the patient to die? Or how about the numerous deaths and injuries from toxic wastes, polluted air, and violations of health and safety regulations? Are these not the products of white-collar crime?

Although there is no formal consensus within the scholarly community, another definition of *white-collar crime* proposed by Albert J. Reiss, Jr., and Albert Biderman is more all-encompassing:

*White-collar crime violations are those violations of law ... that involve the use of a violator's position of economic power, influence, or trust in the legitimate economic or political institutional order for the purpose of illegal gain, or to commit an illegal act for personal or organizational gain.*³

Opportunity is an important ingredient of white-collar crime. An unemployed youth needing funds might turn to armed robbery or burglary. They are in no position to violate the

² U.S. Department of Justice, Bureau of Justice Statistics, *Dictionary of Criminal Justice Data Terminology* (Washington, DC: National Institute of Justice, U.S. Department of Justice, 1981), page 215.

³ Albert J. Reiss, Jr., and Albert Biderman, *Data Sources on White-Collar Law-Breaking* (Washington, DC: National Institute of Justice, U.S. Department of Justice, 1980).

antitrust laws, but doing so might well provide them with a great deal more funds and lesser likelihood of being caught. The bank president or the company chief executive, for their part, can deal with a personal cash shortage through a variety of illegal tactics that are tied to their business position. Criminals will often commit offenses in ways with which they are most familiar, can most easily accomplish, and have the lowest likelihood of dire consequences. An often-unheralded bonus of social status is access to opportunities for less dirty, “more decent” kinds of crime.

Crimes of the Middle Classes—A Look at White-Collar Crime

Many surveys on the public perception of white-collar crime provide essentially the same result—that the public, as a whole, regards white-collar offenses as serious matters. The difficulty with such surveys, however, is that they fail to convey in any effective manner the complexity of the white-collar offenses and the status of the offenders. It is one thing for a respondent to say that they regard toxic waste offenses that produce death as very serious violations, but it is quite another thing for that person to regard the corporate executive responsible for such matters as an “evil” person. Because of this, white-collar offenders receive much less severe penalties than the average citizens who commit the offenses that the public generally regards to be as serious as theirs.

The debate over what constitutes a white-collar crime, and what drives the white-collar criminal, has been raging ever since Sutherland’s seminal work. The authors of *Crimes of the Middle Classes* offer a contribution that, for the most part, avoids theory-building, offering instead a statistical report of offenders convicted in federal court.⁴

Using U.S. federal court records, and an unprecedented access to probation officers’ presentence investigation reports (PSIRs), the authors determined that most people convicted of white-collar crimes are not upper class; that social status has only an indirect significance; and that, once a conviction is attained, higher status often means a stiffer sentence. White-collar crime does have a unique place in criminology, but the split is not between an underworld of the desperate poor and an elite universe of high-stakes fraudsters. White-collar crime has some relation to both of these mythological worlds, but

⁴ David Weisburd et al., *Crimes of the Middle Classes. White-Collar Offenders in the Federal Courts* (New Haven: Yale University Press, 1991).

is largely the province of the middle classes, where organizational position is more important than social or professional status, and personal situations are more forceful than sociological trends.

Profiles of Offenders

The variety of crimes called “white collar”—from antitrust and securities violations to bank embezzlement and credit fraud—makes assembling a profile of the typical offender difficult, but not impossible. Most defendants are white males with a moderate social status. They are slightly more likely than the general population to have a high school diploma (78% versus 69%) or a college degree (24.7% versus 19% for the general public). The majority, then, are not highly educated and, in at least one category, owning a home, the offenders fall behind the average citizen: While 55% of Americans own their homes, only 45.3% of the offenders do. Social status is a factor in white-collar criminality, but, as the authors point out, “The position conferred by status, rather than status itself, empowers the offender.”⁵ So, a corporate manager who was promoted from inside the company with only a ninth-grade education and who doesn’t own their home is not as unusual an offender as some might think. The key is that, by their position in the company, they have the opportunity and means to commit a crime.

Cressey Study

In his 1953 study of embezzlers, Donald R. Cressey found that most of those he examined “had lived beyond their means for some time before deciding to embezzle.”⁶ *Crimes of the Middle Classes* later extended this statement more generally, remarking, “The most interesting fact about the white-collar offenders’ aggregate financial status is not the value of their assets but the extent of their liabilities.” Offenders often “have the material goods associated with successful people, but may barely be holding their financial selves together.”⁷ These people have assembled a structure of respectability, but it is often built on a foundation of debt. The Cressey Study is discussed in more detail later in this chapter, in the section on “Occupational Fraud.”

⁵ Ibid., page 61.

⁶ Ibid., page 65.

⁷ Ibid., page 65.

Effect of Status

What is loosely called “class” or “social status” does have an effect on crimes. For example, one defendant used his position as chair of a local bank board to set up loans for his ailing wood chip company. The loans would never have been approved without the chair’s influence, and he never reported them in his proxy statement to the bank’s shareholders. Ultimately, the bank lost close to \$6 million. In this case, the chair’s status made a difference. His scheme is characteristic of the documented knowledge that officers and managers commit the business crimes with the widest impact (in terms of monetary amounts and victimization), while owners and workers generally commit narrower schemes.

Organizational Opportunity

Of all factors, organizational opportunity remains the determinant aspect of white-collar crime. Against Sutherland’s emphasis on an elite group running high-class sting operations, *Crimes of the Middle Classes* shows that organization and complexity make a larger difference than the offender’s social status. In a fascinating case that occurred in the United States, a church group used its daycare center to defraud the U.S. federal government of approximately \$1 million. Their arrangement with the U.S. Department of Agriculture (USDA) required the daycare’s administrators to submit monthly vouchers reporting the number of meals they had served and the cost of food and labor. When auditors descended upon the scam, they found that, for about \$79,000 in actual expenses, the administrators had submitted almost \$1 million in food costs and \$400,000 for labor. Teachers said they sometimes brought food to the center themselves because the children weren’t being fed properly. There were also reports that “morning snacks were never served unless the government inspectors were expected, that the same children were run through serving lines twice when inspectors were present, and that some children were bused in from other daycare centers on inspection days.”⁸ The example shows, according to the authors, that a criminal’s position in an organization and their ability to organize the scam have far more bearing on the crime than social status or class alone.

The Middle Class

People of moderate social standing are, in fact, more likely than members of the upper class to commit highly organized crimes from within a corporate structure. Some offenders do fit the stereotype of “respectability and high social status” in white-collar crime, but most of them are solidly middle class. According to *Crimes of the Middle Classes*, “they appear to

⁸ Ibid., page 94.

represent the very broad middle of the society, much above the poverty line but for the most part far from elite social status ... the offenders are mostly commonplace, not unlike the average [citizen] in most respects, though perhaps more often with personal lives that are in some state of disarray. The single quality that distinguishes them from other[s] is that they have been convicted of a federal crime.”⁹

Methodology

All the conclusions in the *Crimes of the Middle Classes* are qualified. The authors and researchers drew from the federal court records of seven districts in the United States and obtained access to the PSIRs prepared by probation officers. PSIRs had never been available to researchers before, and the close reading of these documents formed a central part of the project. Admittedly, the crimes and specific cases studied were selected, not drawn from a random sample. Eight crimes were targeted as “white collar”: securities violations, antitrust suits, bribery and influence-peddling, embezzlement, mail or wire fraud, tax fraud, false claims and statements (in official documents), and credit fraud. Certain violations—such as charges against organized crime and breaking importation laws—were excluded because it was determined that they were not characteristic of what most people think of as white-collar activity.

Even within their eight categories, the authors didn’t examine every single case, deciding to focus on no more than thirty cases within each category in order to facilitate the close reading of PSIRs. They warn that their findings were taken from studying people actually convicted, so the results don’t take into account how often charges are actually filed and followed up by prosecution. By dealing with the convicted, they focused on the treatment of people already inside the federal system.

Finally, the long-range nature of the project meant that the study’s sample years (1976–1978) were considerably past before the findings were published in 1991 and, during the interim, several notable legal developments had occurred.

The U.S. Federal Sentencing Guidelines, created by the U.S. Sentencing Commission (USSC) in 1987 as a result of the Comprehensive Crime Control Act of 1984, made some of the material that judges previously considered at their discretion (like the monetary amount of a

⁹ Ibid., page 73.

crime) a *mandatory* element of sentencing. At the same time, the Act systematically *excluded* judgments based on a defendant's moral character, which had previously been a standard in sentencing assessments.

With these qualifications in mind, it remains useful to consider the findings of the research presented in *Crimes of the Middle Classes*. The following chart summarizes the ranking of offenders by social status and in respect to certain demographic features.

Offenders Ranked by Status, with Selected Demographic Information	
<u>High</u> • <i>Antitrust</i> • <i>Securities</i>	These offenders committed the crimes with the largest dollar impact and the widest geographic scope. They were overwhelmingly white (over 99%) and male (99.1% for antitrust, 97.8% for securities). The two groups were equally likely to hold a college degree (40.9% in either case), and their frauds were usually occupational in nature. There are revealing contrasts when these two types of offenders are compared: (1) Almost 97% of antitrust offenders had been steadily employed in the years preceding their crime, while only about 60% of the securities offenders had continually held a job. (2) The antitrusters had a median ratio of assets to liabilities of \$200,000 (assets) to \$40,000 (liabilities); the securities offenders held a median \$57,500 in assets with \$54,000 in liabilities. (3) Antitrust violators were more likely to own their own home (73.5% versus 58.2%) and to be married (95.7% versus 80.7%) than securities offenders.
<u>Middle</u> • <i>Tax fraud</i> • <i>Bribery</i>	These offenders were mainly white males, around 45 years old. Their crimes were not usually occupational—just 15% for tax fraud and less than 18% for bribery. Roughly 57% of offenders owned their own homes, and about 28% held a college degree. Their median assets ranged from \$45,000–\$49,500; median liabilities were between \$19,000 and \$23,500. The authors remark that, although tax fraud is a typical white-collar crime, “two-thirds of the tax offenders work in the manufacturing or nonprofessional service sectors.”
<u>Low</u> • <i>Credit fraud</i> • <i>Mail fraud</i> • <i>False claims</i>	This group was not as likely to be white—71.5% for credit fraud, 76.8% for mail fraud, 61.8% for false claims—or male—84.8% for credit fraud, 82.1% for mail fraud, 84.7% for false claims. They were generally younger than the other category offenders (less than 40 years old); less likely to be married (about 50%); and less likely to own their own home (roughly 34–45% across the three crime types). Their net worth, as per the ratio of assets to liabilities, was remarkably low: \$7,000/\$7,000 for credit fraud; \$2,000/\$3,500 for mail fraud; \$4,000/\$5,000 for false claims.
<u>Outside Hierarchy</u> • <i>Bank embezzlement</i>	These offenders were placed outside the rankings because they were dramatically younger (a mean age of 31) and more likely to be female (44.8% female/55.2% male) than the other groups. While nearly 25% of the low-status group was unemployed at the time of their crime, only 3% of embezzlers were without a job (just slightly above the 2.8% rate for high-status offenders). They were the group least likely to have a college degree (12.9%) or to own their own home (28.4%). Their median net worth was \$2,000 in assets with \$3,000 in liabilities. Male embezzlers were usually managers of a local banking operation, while females were most often tellers or clerical workers.

However difficult it might be to sort out the demography of *Crimes of the Middle Classes*, the strength of the analysis lies in its tracing of the path of criminals through the federal system. Following their core group from offense to conviction, the authors report on general trends in the treatment and sentencing of white-collar criminals. The most surprising conclusion states that once convicted, people of higher social status are more likely than similar offenders to receive prison time and to be fined.

Cooperating Defendants

Some standard assumptions still apply. For example, informing on one's cohorts does help. *Crimes of the Middle Classes* found that more than 42% of cooperating defendants were charged with a single violation, while only 30% of uncooperative defendants were so lucky. Also, white-collar defendants receive bail rather easily: Just one person in eight spends any time incarcerated before trial and, for the generally high-status antitrust defendants, the number is fewer than one in twenty. By comparison, in a control group of "common criminals" (i.e., people convicted of the "nonviolent economic crimes" of postal theft or postal fraud), at least one-third of the defendants spent time in jail before going to trial.

Pleas by White-Collar Defendants

White-collar defendants are more likely to insist on a trial than other offenders. In at least 90% of criminal cases, defendants will plead guilty, avoiding the expense and effort of a trial. But, more than 18% of defendants in the *Crimes of the Middle Classes* sample (as opposed to the usual 10%) pleaded not guilty. In cases like bank embezzlement, usually "simple cases with clear evidence," plea bargains are easily negotiated and "prosecutors may actively seek guilty pleas."¹⁰ The decision on how to plead varies with the offender as much as the offense. For example, female bank tellers were especially prone to plead guilty, while many of the male embezzlers—generally "higher-level officials involved in more complex crimes"—proceeded to trial. Of all white-collar defendants, securities offenders are the ones most likely to insist on their day in court. Evidently, both the government and the defendants in these cases feel more strongly about their chances to win.

Judgments

Judgments against white-collar defendants often involve an assessment of personal suffering. It is widely held that, when convicted of a crime, these people suffer greater personal and

¹⁰ Ibid., page 114.

professional harm than street criminals. Many observers think that this suffering should be acknowledged when assessing a sentence. One federal judge is quoted as saying:

*The white-collar criminal by virtue of his conviction has suffered a loss of position, usually loss of employment, sometimes status in his profession, other times the ability to ever find employment in anything requiring a fidelity bond or what have you. Whereas the common street criminal hasn't had a career loss of a similar nature; indeed, in some areas the conviction of a crime is some sort of a badge of maturity.*¹¹

Personal Suffering

Examining PSIRs, the authors found that, in about 65% of the cases overall, personal suffering was said to have played an overwhelming role in the defendant's case. Securities offenders and embezzlers topped the list with seventy, and 87% of these people (respectively) reporting some hardship. Of course, the reports involved statements by the defendants or their families, which could be self-serving.

In looking at objective material—such as the loss of employment, marital separations and divorce, or mental health problems—the authors found the results “ambiguous.” Credit fraud perpetrators, for example, seldom reported any suffering, but they had a 20% divorce rate during the time of their prosecution, the highest in the study. And there were often large gaps between different types of crimes. Compared to the securities offenders, with a 70% rate of suffering, only about 24% of antitrust offenders had similar complaints. The discrepancy might lie in how different crimes are viewed. “Antitrust violators, who steal *for* their companies and actually provide the services they say they do,” aren't seen as harshly as “those who steal *from* their companies.”¹² Securities offenders are stigmatized “because their crimes are often against their own clients,” while bank embezzlers (with over 87% reported suffering) are judged with particular strictness “because they steal from their employers.”¹³

In summary, the authors believe that the extra-legal suffering of white-collar defendants has some validity, but it's not always possible to be sure that prosecution alone caused the hardship. The contradictory images of these criminals as both exceptionally privileged and especially harassed “overstate their real experience in the legal system.” Neither factor is as great as the standard rhetoric might suggest.

¹¹ Ibid., page 116.

¹² Ibid., page 124.

¹³ Ibid., page 125.

Imprisonment

Crimes of the Middle Classes does find that the highest status group—antitrust violators—were the least likely to receive prison time (about one in five) and to draw the shortest sentence (1.8 months). Securities fraud led the group, with more than 67% doing time, followed by tax fraud (58.9%) and mail fraud (55.1%). But in considering all offenders in all groups, the authors discovered that the higher an individual's status, the more likely the person was to be imprisoned: "All else being equal, doctors will have about a 30% greater likelihood of being imprisoned [for a white-collar crime] than truck drivers and almost a 13% greater likelihood than managers."¹⁴ Judges seem to find people of higher prestige more blameworthy in the commission of their crimes.

More often than prison, the punishment of choice for white-collar criminals is the imposition of fines. Whereas 6% of the "common criminals" in the survey received fines, all of the antitrust violators received fines; embezzlers were the least likely group to be fined, but even so, their 15% rate far exceeded the norm. For fines as well as imprisonment, higher status usually meant a higher penalty. Analysis showed that "white defendants, those with more impeccable records, and those who have higher class positions are more likely to be fined."¹⁵ But while the decision to fine seems based on status, the actual levies are often comparatively low. For antitrust suits, the average fine was \$9,808; for embezzlement, it was just \$1,397. Even well-off offenders were not harshly punished: a man convicted of fixing the price of candy bars, with a net worth exceeding \$190,000, was fined \$3,500; another defendant, whose net worth approached \$1.4 million, was fined \$5,000 for credit fraud. Only 4% of offenders were ever given the statute's maximum penalty.

Obviously, most white-collar crimes do not even approach the billion-dollar levels of the stereotype. An accurate depiction actually looks rather mundane. "For every truly complicated and rarified offense," according to Wheeler and his colleagues, "there are many others that are simple and could be carried out by almost anyone who can read, write, and give an outward appearance of stability."¹⁶ More than anything else—more than status, or class position, or heritage—the white-collar criminal needs an opportunity and some sort of organization.

¹⁴ Ibid., page 143.

¹⁵ Ibid., page 157.

¹⁶ Ibid., page 171.

Contributing Factors

The authors propose several factors that have contributed to the rising problem of economic crime:

- The economy increasingly runs on credit, which often means rising personal debt. The offenders in the sample often showed serious discrepancies “between their resources and their commitments.”¹⁷
- New information technologies mean that the opportunity for wrongdoing is growing, and many of the techniques are not widely comprehended by businesses or individuals.
- Government programs distributing large amounts of money make an enticing target for embezzlement.
- The importance of credentials in a professionalized society may influence individuals “to inflate the credentials, or to make them up when they do not exist.”¹⁸ This tendency involves everything from cheating on school entrance exams to falsifying credit applications.
- Most broadly, the authors observe an overarching culture based on affluence and ever-higher levels of success. Television, and advertising in general, promises that no one has to settle for second best, prompting those who find themselves running behind to make an attempt to conceal the difference, crossing ethical and sometimes legal lines.

Conclusion

Curbing this detrimental trend will not be easy, but there are ways. Since organizational opportunity determines so much criminal activity, the foremost deterrent is to pay heightened attention to “where the money is and how it flows” within any group. Obviously, most businesses have some system of financial control, but the authors say that “organizational intelligence” is often less than stellar. Offenders are not usually “the highly sophisticated swindlers” from the mass media, just “average people in a financial jam who see a way out through fraud.”¹⁹

Furthermore, like many analysts these days, the *Crimes of the Middle Classes* team believes it is far too easy to acquire money and goods on credit. Tightening the restrictions on credit cards and loans would directly address the role that debt plays in many schemes.

¹⁷ Ibid., page 183.

¹⁸ Ibid.

¹⁹ Ibid., page 190.

Finally, these authors center the problem of white-collar crime on values. As long as the places where citizens learn their priorities—schools, families, neighborhoods, mass media—emphasize high-pressure risk-taking and material affluence over “honesty and moral integrity,” many people will strive for the highest reward, even if they have to steal it. It will never be easy, they acknowledge, to balance a market-based economy, which requires competition, with an equal insistence on forthrightness and fair play.

Referring White-Collar Criminals to Law Enforcement

Once a fraud has been detected, investigated, and substantiated, organizations must decide what to do with the offender(s). Research shows that many organizations choose to deal with fraud cases internally rather than involve law enforcement. As a result, many white-collar criminals are able to avoid being prosecuted in the criminal justice system for their behavior.

According to the 2020 *Report to the Nations*, the ACFE’s global study on occupational fraud and abuse (covered in detail later in this chapter), 59% of occupational fraud cases were referred to law enforcement for prosecution. Of those that were prosecuted, the majority (56%) pleaded guilty or no contest, and another 23% were convicted at trial. As the data show, most fraud cases brought to a court of law generally result in an unfavorable outcome for the offender.

The *Report to the Nations* also found that 80% of fraud cases in the study resulted in some form of internal punishment for the perpetrator in response to the fraud. Of those that were disciplined internally, 66% were terminated, 10% were permitted or required to resign, and 9% were either placed on probation or suspended. Although terminating an employee who commits fraud does not increase the chances that the organization will recover the funds it lost, it ensures that the individual will not be able to abuse their position in the company to perpetrate fraud again in the future. This does, however, leave the fraudster capable of committing fraud at other organizations where they might later become employed.

Once a fraud has been discovered, there are various reasons why organizations choose to handle cases internally versus referring them to law enforcement for prosecution. As shown in Figure 45, 46% of companies declined to refer cases to law enforcement because they believed their organization’s internal discipline mechanisms were sufficient. Another reason organizations prefer to handle fraud incidents internally is a fear of negative publicity; 32% of

respondents cited this as their primary reason for not referring the case for potential prosecution. A fraud allegation, even if ultimately found to be untrue, could damage an organization's ability to retain customers and generate revenue in the future.

Many organizations are concerned about recovering the financial losses they suffer from fraud. Civil suits (6%) and private settlements (27%) in fraud cases are being increasingly used as organizations seek recourse after becoming victims of fraud. Most civil fraud cases are initiated by the victim organization with the hope that it will be financially compensated for the losses caused by an individual. Other desired outcomes from bringing a civil fraud case against a perpetrator might include equitable remedies or declaratory judgments that deliver legally binding decisions on the rights and responsibilities of each party in the case.

FIG. 45 Why do organizations decline to refer cases to law enforcement?

Organizational Crime

Most criminologists have adopted the distinction first made by Marshall B. Clinard (a recipient of the ACFE's Cressey Award) and Richard Quinney between *occupational crime* and *organizational crime*. Organizational crime is that which is committed by businesses, particularly corporations, and the government. Occupational crime involves legal offenses committed by individuals in the course of their occupation. An antitrust offense, such as bid rigging or price fixing, would be an organizational crime; accepting or offering bribes is an occupational offense.

Organizational crime occurs in the context of complex relationships and expectations among boards of directors, executives, and managers on the one hand, and among parent corporations, corporate divisions, and subsidiaries on the other. White-collar crime is distinguished from lower socioeconomic crimes in terms of the structure of the violation and the fact that administrative and civil penalties are more likely to be used as punishment than are criminal penalties.

While corporations cannot be jailed, they may be confined. Most corporate lawbreakers are handled by government regulatory agencies. Enforcement measures might include warning letters, consent agreements or decrees not to repeat the violation; orders of regulatory agencies to compel compliance, seizure, or recall of goods; administrative or civil monetary penalties; and court injunctions to refrain from further violations.

Corporate crime is not limited to certain geographic locations, although some regions might have more high-profile cases than others. Clinard and Yeager say it appears to be extensive in Europe, Japan, Australia, and other areas. For example, French multinationals might transfer profits from one subsidiary to another located in a country that has a more lenient tax system or presents a tax haven, or they might falsify their bookkeeping to avoid payment of industrial and commercial taxes. In Japan, the Diet (legislature) passed a law for the punishment of crimes "relating to environmental pollution that adversely affects the health of persons." Under this law, intentional or negligent emission of a substance that causes danger to human life or health by industries is to be punished with imprisonment or fines. Additionally, the Swiss banking system has often been accused of offering a hiding place for stolen or looted money, providing a screen for stock manipulations and disreputable promoters, and helping tax evaders conceal both income and assets. Deposits in Swiss banks are often laundered to obscure their illegal origins, and then the money is made legal through new commercial transactions and is therefore concealed from tax authorities.

Corporate Organization and Criminal Behavior

Corporate offenses take place in a context of complex relationships and expectations in an organizational setting. It is often difficult to distinguish which corporate participants ought to be held personally responsible for the wrongdoing. Many offenses are the result of myriad decisions that are made by different individuals and passed through a chain of command. Not uncommonly, when corporate acts are contrary to the law, upper-level executives take proactive steps to avoid learning what is going on to escape responsibility if a scheme is uncovered. In some corporations, there is one well-paid executive who is somewhat jokingly referred to as the “vice president in charge of going to jail.”

In most jurisdictions, the law largely treats corporations as people. They make more inviting prosecutory targets than individuals, most notably because they have deeper pockets and can be heavily fined to repay losses that have been inflicted on individuals or on the society in general.

Government regulatory agencies oversee corporate performance in areas assigned to them by legislation. Typically, the lawmakers enact a statute that is deliberately vague, allowing the enforcement agency to develop its own enforcement guidelines within the boundaries of the legislative authorization. The agencies will sometimes seek to expand the reach of the law by selecting notably egregious cases for litigation and appeal, thereby anticipating a favorable ruling on what is fundamentally a somewhat novel interpretation of their mandate.

The Image of the Corporation

Large corporations have contributed significantly to industrial and commercial development throughout the world. Their size and resources enable them to organize and coordinate production and distribution. The capital resources of a large corporation provide it with the ability to develop, adopt, and alter technology on a large scale. A considerable portion of the population has been accorded a high standard of living because of corporate activity.

At the same time, large corporations have the power to influence the manner in which laws are written and to commit acts that can inflict serious harm upon the population. They can hire lobbyists and lawyers who manipulate definitions of wrongdoing in the corporations’ interests.

The largeness and remoteness of the corporation from most of the population is part of the reason that many individuals traditionally have a love-hate attitude toward such organizations. They admire and desire corporations’ products but are uneasy about their power—a power that tends to be used single-mindedly in the pursuit of profits. Thomas Hobbes, a 17th

century English political philosopher, was particularly scornful of corporations, comparing them to ascarides—worms that eat at the entrails of what Hobbes called “natural man.”²⁰ Centuries later, Robert Heilbroner, an economist, would criticize “the corporation with its wealth-seeking, its dehumanizing calculus of plus and minus, its careful inculcation of impulses and goals that should at most be tolerated.”²¹

Clinard and Yeager

In a comprehensive study of corporate law-breaking, Marshall Clinard and Peter Yeager examined the records of 562 companies (477 of which were on the *Fortune 500* list) over a two-year period and found that 1,553 white-collar crime cases had been filed against them. Some 60% of the firms had at least one case against them; for those companies, the average number of violations was 4.4. The oil, pharmaceutical, and motor vehicle industries were the most likely to be charged for wrongdoing, a matter that might be a function of enforcement priorities or a true reflection of their activities.

The costs of corporate crimes not only include financial losses, but also injuries, deaths, and health hazards. Such crimes destroy public confidence in businesses and hurt the image of corporations. Clinard and Yeager say price-fixing offenses victimize the consumer and government, while income tax crimes deprive the government and those dependent on it of needed revenue.

Clinard and Yeager believe that corporate violations are increasingly difficult to discover, investigate, or prosecute successfully because of their growing complexity and intricacy. This is particularly true, they believe, of antitrust cases, foreign payoffs, computer fraud, and illegal political contributions. In the last category, some corporations pay bonuses to their executives, with the understanding that part of that reward will be turned over to the coffers of a candidate who the corporation favors.²²

Criminal activities involving corporations often originate from organizational subcultures and values and are developed over time. While individuals still carry out the criminal enterprise, their attitudes and characteristics are of little importance, as an organization will replace those employees unwilling to participate in a criminal activity. A particularly

comprehensive examination of how matters of life and death become embedded in routine decision making and ultimately can lead to tragedy is provided in a book titled *The Challenger Space Shuttle Disaster* by Diane Vaughan, another Cressey Award winner.²³

Legal responses have been slow and ineffectual when dealing with economic organizational change. The law has emphasized the role of the individual actor in criminality, but it has not examined the role of the organization in crime.

Opportunities for Unlawful Organizational Behavior

Organizational Structure

Complex companies provide a structure that can foster misbehavior. They provide many settings where misconduct is possible. They isolate those settings in departments and in locations around a city, the country, or the world. This isolation, in turn, means that information about what one part of a company is doing might be unknown in another part. All this reduces the risk that misbehavior will be detected and punished. The larger a company grows, the more specialized its subunits tend to become, and this specialization thereby breeds a higher risk of fraud. An internally diversified company might have few employees who fully understand the detailed workings.

Specialized departments in a large firm compete for resources not only with other firms, but with departments in their own firm. The need to outperform both other businesses and internal units can generate sufficient pressure to lead to misconduct. Vaughan notes that departments often have survival concerns that conflict with the larger interests of an organization. When given a chance to make decisions, she writes, lower-level managers will tend to act not in the interest of the firm, but in the interests of their departments.

Specialization also hides illegal activities, especially where a firm's tasks are kept separate and unrelated. Employees cannot garner knowledge about all the particulars of how a firm works. This protects a company from the effects of personnel turnover and leaks of information because no employee knows all the intricacies of the company. The same secrecy, however, raises the chances for misconduct.

²³ Diane Vaughan, *The Challenger Launch Decision: Risky Technology, Culture, and Deviance at NASA* (Chicago: University of Chicago Press, 1996).

Companies spell out rules in a common language to decide how tasks will be performed and to create common bonds that will facilitate decision making. But a company's ability to coordinate all its activities varies considerably. Vaughan writes that organizational growth naturally leads to a progressive loss of control over departments. Executives cannot hope to keep track of all the units in a huge company and must rely on subordinates to carry out policy. Vaughan states that when the distance between top executives and subordinate units grows to a sufficient level, "authority leakage" results. Such leakage means the company has become too unwieldy for an executive to enforce rules at all levels. "The organization, in short," Vaughan writes, "can diversify beyond the capability of those at the top to master it."

Such leakage allows subsidiaries, company researchers, accountants, or other departments to engage in misconduct without any assurance that internal controls will check the behavior. In some cases, as with computer crime, detecting misconduct might be beyond the ability of most employees. Conversely, authority leakage and specialization can also lead an organization to comply with societal rules even when the organizational pressures lean toward misconduct.

Does the existence of authority leakage and specialization imply a loss of company control? While a company that cannot steer its employees' behavior might be viewed as irrational or incompetent, the ability to control information flow from top to bottom might not be possible. Research and theory suggest, to the contrary, that information is processed selectively through a company in ways that tend to protect the interests of departments and to promote efficiency.

Sometimes censorship of information promotes a company's interests. In other cases, "need to know" policies or ignorance of rules that are irrelevant to a department leads to inefficiencies. All these tendencies restrict information flow and create opportunities for one unit in a company to act outside the knowledge of other units. Censorship policies might originate in any part of a company and hide matters throughout the organization.

The tiered structure of most organizations obscures personal responsibility and tends to spread it throughout the company. Thus, determining where a decision to engage in misconduct originated can be difficult. *Criminology* author John E. Conklin put it this way: "The delegation of responsibility and unwritten orders keep those at the top of the corporate structure remote from the consequences of their decisions and orders, much as the heads of organized crime families remain 'untouchable' by law."

Criminogenic Organizational Structures

Sociologist Edward Gross asserted that all organizations are inherently “criminogenic” (i.e., prone to committing crime), but they are not necessarily criminal.²⁴ Gross makes this assertion because of the reliance on “the bottom line.” Without necessarily meaning to, organizations can invite fraud as a means of obtaining goals. Economist Oliver Williamson noted that, because of a department’s concern with reaching its goals, managers might well tend to maximize their department’s own interests to the detriment of the organization.

Organizations can also be criminogenic because they encourage loyalty. According to Diane Vaughan, the reasons are that:

- The organization tends to recruit and attract similar individuals.
- Rewards are given out to those who display characteristics of the “company man.”
- Long-term loyalty is encouraged through company retirement and benefits.
- Loyalty is encouraged through social interaction, such as company parties and social functions.
- Frequent transfers and long working hours encourage isolation from other groups.
- Specialized job skills can discourage personnel from seeking employment elsewhere.²⁵

This, in turn, causes company personnel to sometimes perceive that the organization might be worth committing crime to maintain and further its goals. The use of formal and informal rewards and punishments, plus social activities and pressures to participate, link an employee’s needs and goals to the company’s success. Society places value on the reputation of the company for which one works, reinforcing the link between an individual and corporate goals. When a company achieves its goals, its employees prosper. This is to mean that the interests of an organization and its employees coincide, which might cause unlawful conduct to be committed by individuals on the organization’s behalf.

Vaughan writes that organizational processes create “an internal moral and intellectual world” that causes individuals to identify with organizational goals. Company survival comes to mean individual survival and, when resources become scarce, the incentive to misbehave increases. Of course, not all agents will act unlawfully on a company’s behalf, and how any employee behaves will be linked to factors that might not be related to the world of the organization.

²⁴ Edward Gross, “Organizational Structure and Organizational Crime,” in *White-Collar Crime: Theory and Research*, Gilbert Geis and Ezra Stotland, eds. (Beverly Hills: Sage, 1980), pages 53–76.

²⁵ Diane Vaughan, “Transaction Systems and Unlawful Organizational Behavior,” *Social Problems* 29 (April 1982), pages 373–380.

When the structural pressure to commit fraud exists, a firm often cannot unite its agents in such activities. At least three factors prevent such unity. First, the pressure to commit fraud might not affect departments in a company equally. A sales department that must meet certain goals to generate profits will feel different competitive pressure than a product development department in the same company that is running smoothly. Some parts of companies might never experience pressure to cheat, and members of those departments will have no motivation to engage in misconduct on a firm's behalf.

Second, even in high-pressure departments, some employees will not have knowledge of the difficulty of obtaining needed resources. An employee will have no motivation to commit fraud unless they have full information about an organization's goals and how the department can achieve them. In other words, an employee usually needs a high degree of responsibility for a company's success, as well as the ability to bring about those goals, before a chance to engage in misbehavior can occur.

Third, outside societal behavior can produce values that conflict with those learned in an organizational environment. For example, fraternal or professional associations impart their own values to employees that might not coincide with a specific corporate code of honor. When faced with conflicting norms, Vaughan writes, employees will make their choices based on the rewards and punishments they perceive to accompany the alternatives. Where misbehavior is seen as too costly, it will not occur. When an organization provides sufficient rewards to overcome the fear of punishment, misbehavior might occur despite competing norms. The amount of information an employee has will affect the decision on which way to go, as will an individual's financial and social dependence on the firm.

The mere fact that corporate and individual goals are often joined in organizations does not necessarily create a climate for illegal actions. As with any major decision, complexities often become factors. Temptations vary not only among departments, but within them. The availability of information and individual risk-reward assessments might generate lawful behavior that resists organizational pressures to violate the law, as well as unlawful behavior in the face of organizational pressures to comply. Put plainly, the likelihood that organizational processes will generate misbehavior is highly variable and cannot currently be measured with any degree of precision.

The findings of many criminologists help explain how individuals become corporate offenders. In describing how employees are taught to make decisions that are correct from a

corporation's standpoint, Drucker said a natural tendency exists in every large-scale organization to discourage initiative and encourage conformity. Madden and Margolis say corporations lead new managers through an initiation period designed to weaken their ties with external groups, including their own families, and encourage a feeling of dependence on and attachment to the corporation.

Geis found that individuals are often trained in illegal behavior as part of their occupational roles. Schrager and Short say criminal behavior stems more from the roles an employee is expected to fulfill than from individual pathology. Many executives know their behavior is illegal but tend to justify their actions as simply common practice in the business world. Clinard and Yeager believed that, in rationalizing their behavior, corporations follow a general tendency to obey laws selectively (i.e., obeying according to situational needs and determined by factors like social class and occupation).

Sutherland demonstrated that corporate executives are insulated from those who might disagree with their beliefs because they associate almost exclusively with people who are pro-business, politically conservative, and generally opposed to government regulation. And Silk and Vogel found that certain beliefs about government intervention in business are used throughout the business world to justify illegal activity by corporations.

A common problem in many large corporations with intricate hierarchical structures tends to be a split between what the upper levels believe is going on below and the actual procedures being carried out. Clinard and Yeager say that the chief executive officer of a corporation is often isolated and, thus, messages transmitted down the line tend to become distorted. Clinard and Yeager found that all levels of the corporation might often agree to perpetuate the lack of full information, for the key to any successful conspiracy to violate the law probably lies in the fact that the higher-ups do not inquire about what is going on and the lower levels do not tell them.

Often, in corporations, no single individual at the highest levels may make a decision alone to market a faulty product or take shortcuts on product testing, Clinard and Yeager say. Instead, decisions are made in small steps at each level, possibly without any awareness of the illegal and potentially dangerous result.

Criminologist Charles McCaghy says profit pressure is "the single most compelling factor behind deviance by industry, whether it be price fixing, the destruction of competition, or the

misrepresentation of a product,”²⁶ such as making a poor-quality product that will wear out and need to be replaced. Clinard and Yeager say certain industries, such as the drug and chemical businesses, have such severe competition and strong profit drives due to demands for continual development of new products that they might feel pressured to falsify test data, market new products before their full effects are known, or engage in unethical sales techniques that can have disastrous effects on humans and the environment.

Organizations also display criminogenic tendencies due to their reinforcement of obedience to authority figures. Human beings have an innate instinct to do as they are told. Although individuals generally have an internal balance that gives equal weight to obeying authority and adhering to one’s own personal conscience and understanding of right and wrong, certain situations might arise in the workplace that cause obedience to be perceived as the more favorable action. For example, employees might receive a command from someone who they view as an authority figure that might cause them to take a potentially bad or harmful course of action in order to comply with the command. Thus, individuals who are otherwise ethical might commit wrongdoing as a way to please management or another figure of authority because they feel they have no other choice.

Dr. Stanley Milgram, a social psychologist, conducted an experiment to understand why people follow certain orders when doing so conflicts with their personal values, morals, and ethics. Dr. Milgram’s experiment involved a “teacher” (a volunteer subject) and a “learner” (an actor who the teacher believed to be an actual participant) who was seated in a chair containing an electric shock generator.

When placed in separate rooms, the teacher was instructed to ask the learner a series of questions and told to administer an electric shock to the learner, increasing in 15-volt increments, for each incorrect answer. As the shocks grew more intense, the learner’s distress became increasingly louder. The teacher was urged to continue even when they expressed reluctance in continuing to administer shocks after hearing the learner’s audible pain.

Dr. Milgram conducted the experiment numerous times with different populations. He concluded that the most fundamental lesson in his study was that “Ordinary people, simply doing their jobs, and without any particular hostility on their part, can become agents in a

²⁶ C. H. McCaghy, *Deviant Behavior: Crime, Conflict, and Interest Groups* (New York: Macmillan, 1976), page 218.

terrible, destructive process. Moreover, even when the results of their work become patently clear, and they are asked to carry out actions incompatible with fundamental standards of morality, relatively few people have the resources needed to resist authority.”²⁷

In hierarchal organizations that encourage obedience and engage in fraudulent behavior at the highest levels, lower-level staff members’ resistance to disobey authority figures can result in them feeling like they must take part in the fraudulent behavior, even when such behavior is inconsistent with their personal moral code. If over 60% of people will shock another person when pushed to do so by an authority figure, as was found in Dr. Milgram’s experiment, it is reasonable to expect that a similar percentage of people will commit fraud when ordered to do so by their superiors in the workplace.

The use of formal and informal rewards and punishments in an organization also fosters a criminological nature. While most organizations use performance-based rewards with the intention of driving employee productivity and success, in some circumstances, their use could inadvertently promote criminal behavior. When faced with managerial pressure, some employees might take shortcuts, override controls, or engage in other types of unethical conduct to reach their goals. Likewise, when organizations only prioritize results, without giving attention to the means by which they are obtained, employees might have an easier time rationalizing misconduct in the pursuit of success.

Corporate Executives and Criminal Liability

Many of the ethical and legal problems of a corporation result from the corporate structure that separates ownership from management. Typical large corporations are administered by a group of salaried managers, with the board of directors exercising little direct power other than hiring or firing the managers; thus, corporate managers have great autonomy over decisions regarding production, investment, pricing, and marketing.

Executives tend to believe that their jobs are at risk if they cannot show a profit to higher management or the board of directors, and, often, they are. Clinard and Yeager hold that if goals for managers are set too high, the employee then confronts a hard choice of risking being thought incompetent or taking unethical or even illegal shortcuts.

²⁷ Stanley Milgram, *Obedience to Authority: An Experimental View* (London: Tavistock Publications, 1974).

According to Clinard and Yeager, corporations often try to protect their executives from liability by agreeing to pay fines, court costs, and attorney's fees with corporate funds; bonuses, raises, or liability insurance might offer protection to officers or directors. Generally, executive compensation and tenure remain untouched. There is much difficulty in criminal prosecution of executives because corporate violations are usually far more complex than conventional crimes. Also, the complexity of the legal proof required allows businessmen to test the limits of the law.

Businessmen might have sought legal advice on loopholes in the law before committing the offense, Clinard and Yeager say, which may be cited as evidence that the executives thought they were in legal compliance. Businessmen can hire highly skilled lawyers who present arguments as to the client's lack of previous convictions or unlikelihood of becoming a repeat offender, as well as being able to cite numerous precedents where businessmen were charged but not imprisoned for similar violations.

Corporate offenders are not usually imprisoned with ordinary criminals but are usually incarcerated in institutions designed for low-risk inmates with short sentences, presumably for the corporate offender's own physical safety. Justifications used in arguing against a prison sentence for corporate offenders include:

- Age and poor health
- Personal and family reasons
- Extent of punishment already suffered by virtue of being indicted
- Offense was not immoral
- Defendant has no prior record, is not a threat to society, and has been a prominent citizen active in community affairs
- Incarceration would accomplish nothing (no benefit to society)
- Defendant is repentant
- Victimization of corporate executives solely because of their position

Some corporate offenders are given community service as punishment, such as giving speeches about their offenses to businesses and civic groups, working in programs designed to aid the poor, or helping former ordinary criminal offenders secure job pledges from businesses.

Management Behavior

In their study on business ethics, Brenner and Molander found that superiors are the primary influence in unethical decision making. Therefore, the use of sanctions to accomplish

compliance with the law is only one of the various forces operating within a corporation encouraging or opposing violations of law. Similarly, Stone found that the success of law enforcement “ultimately depends upon its consistency with and reinforcement of the organization’s rules for advancement and reward, its customs, conventions, and morals.” He maintains that if the law is in disagreement with the corporation’s “culture,” employees will tend to cover up their tracks rather than change their behavior.²⁸

Some corporations might also argue that regulation is faulty because most government regulations are incomprehensible and too complex. Conklin found that antitrust laws are seen as inconsistent, hypocritical, poorly defined, and rarely enforced. Therefore, most regulations must be written in detail to cover as many contingencies as possible.

Silk and Vogel found several other actions used by businesses to rationalize conduct:

- Government regulations are unjustified because the additional costs of regulations and bureaucratic procedures cut heavily into profits.
- Regulation is unnecessary because the matters being regulated are unimportant.
- Although some corporate violations involve large sums of money, the damage is so diffused among a large number of consumers that, individually, there is little loss.
- Violations are caused by economic necessity; they aim to protect the value of stock, to ensure an adequate return for stockholders, and to protect the job security of employees by ensuring the financial stability of the corporation.

John Braithwaite (past recipient of the ACFE Cressey Award for his research in international white-collar crime issues) views white-collar crime as a product of the corporate subculture. In Braithwaite’s view, corporations will turn to crime as a result of “blocked opportunities.”

Because white-collar crime can exist only in secrecy, deviant subcultures develop (e.g., conspiracy among executives), lines of communication are not allowed to develop, and people operate within spheres of responsibility.

Effects of White-Collar Crime

While the financial losses resulting from fraud can be estimated somewhat reliably, measuring the indirect cost of fraud is impossible. In its 2020 Global Economic Crime and Fraud

²⁸ Christopher Stone, *Where the Law Ends: The Social Control of Corporate Behavior* (New York: Harper & Row, 1975).

Survey,²⁹ PwC (PricewaterhouseCoopers) discussed how fraud losses are complex in nature. PwC states that “Some costs can be tallied: direct financial loss or costs due to fines, penalties, responses and remediation. But some costs are not easily quantified—including brand damage, loss of market position, employee morale, and lost future opportunities.” Although fraud can result in staggering financial loss, the indirect costs that victim organizations face after a fraud has been detected can be just as devastating.

The direct cost of fraud relates to the amount of financial damages and losses resulting from a fraud scheme. Crowe, a global accounting, consulting, and technology firm, found the direct cost of fraud to be \$5.127 trillion worldwide in 2019.³⁰ Most of the time, organizations recover little, if any, of these stolen funds. The ACFE 2020 *Report to the Nations* concluded that 54% of victim organizations did not recover any fraud losses. Fraud has the potential to affect nearly every operational process within an organization directly. Cash flow might be affected once a fraudster starts funneling company funds into their personal bank account. Financial statements might be affected by inflated or non-existent line items created by a fraudster, which, in turn, can result in possible regulatory sanctions. Organizations might also find it difficult to pay back their loans or lines of credit when their assets and other resources have been depleted by theft.

While organizations are able to calculate fraud losses directly, it is much more difficult to estimate the indirect costs associated with fraud. One of the biggest indirect consequences an organization might experience after a fraud occurs is damage to its reputation. With the ability of information to spread quickly over the internet and social media sites, all it takes is a rumor of misconduct within an organization for reputational harm to occur. Businesses that enjoyed a competitive advantage in a certain industry might lose their leverage over other competitors in the market. In addition, employees might lose confidence in the security of their jobs in the aftermath of a fraud, leading to a loss of productivity within an organization. Since it is impossible to monetize these indirect costs or determine how long the ramifications will linger, indirect costs can be a large detriment to victim organizations’ future success.

Controlling Organizational Crime

Clinard and Yeager believe corporations that do violate acceptable conduct and those that do not are distinguished by “corporate cultures” or ethical climates, which are the degree to which a corporation has made the choice to be unethical, to disregard the interests of the consumer and the public, and to disobey the laws that regulate its specific industry.

Efforts to control corporate crime follow three approaches: voluntary change in corporate attitudes and structure; strong intervention by the government to force changes in corporate structure, accompanied by legal measures to deter or punish; or consumer action. Voluntary changes would involve the development of stronger business ethics and certain corporate organizational reforms; government controls might involve corporate chartering, deconcentration and divestiture, larger and more effective enforcement staffs, stiffer penalties, wider use of publicity as a sanction, and possibly the nationalization of corporations; and consumer group pressures may be exerted through lobbying, selective buying, boycotts, and the establishment of large consumer cooperatives.

Clinard and Yeager suggest that a wide, comprehensive industrial code of ethics, which many businessmen favor, would be of great help if a businessman refused an unethical request. This would help more clearly define the limits of acceptable or ethical conduct, improve the ethical climate of the industry, and serve to reduce deceitful practices where competition is intense. Greater stockholder involvement might enable greater corporate compliance with the law, but, in actuality, it is the management staff that runs the company and makes the decisions; the stockholders are primarily concerned with stock growth and dividends.

In some cases, critical information dealing with possible law violations simply fails to reach the board of directors. New board members are usually nominated by the board and routinely approved by stockholders, making boards self-perpetuating. Board members are often drawn from management. Many corporations now employ outside directors and/or representatives of the public interest, much like the practice abroad of naming union representatives to boards. These public members represent the public and consumer concerns, ascertain whether the corporation is complying with the law, assist and maintain corporate public responsibility, help monitor the internal management system to discover faulty workmanship and report it to the board, serve as liaisons with government agencies with respect to legislation or standards, and serve as a hotline to receive information about deviance.

Clinard and Yeager found that mass-media publicity about law violations probably represents the most feared consequence of sanctions imposed on a corporation. Publicity can also inform the public about the operation of regulatory controls and can enable people to understand the purposes of the controls. Informal publicity is ordinarily carried as news items from the media, while formal publicity is a requirement that a corporation must, as part of an enforcement action, publish an advertisement or some other statement acknowledging a violation and that corrective measures are being taken.

If illegal behavior consistently resulted in decreased patronage or even consumer boycotts, consumer pressure would be an effective tool in the control of illegal corporate behavior. However, say Clinard and Yeager, it appears to not be very effective. Consumers are often unaware when a corporation's products are unsafe or when it has been violating antitrust laws or polluting the environment. Without organized behavior, a consumer's withdrawal of individual patronage is generally ineffective.

Many corporations settle charges without admitting or denying guilt by consenting to either an administrative or a court-ordered decree banning future violations. In a consent agreement, the corporation reaches an understanding with the government agency not to violate the regulation again. In a decree, the agreement is ratified by the court. A problem with consent orders is that, frequently, no one follows up to find out whether the terms imposed are being met.

Criminal fines and civil and administrative penalties against corporations are forms of monetary penalties. For completion, criminal cases average about one year from indictment to conviction, civil actions about two years, and administrative cases about four months. Criminal action against corporations is difficult to initiate because, generally, government agencies are dependent on the records of the corporation and its ability or willingness to furnish needed information.

Not all experts agree that monetary penalties are appropriate. Some argue that these sanctions are limited to a person's own worth and, therefore, have limited utility. For example, a \$25 million fine to a pauper would have no effect. One novel approach to punishing corporations involves intentional stock dilution. Under this approach, the convicted corporation would issue additional shares of stock to the state equal to the cash value of a fine. The state could then sell the shares, trade them, or keep them for their earnings power.

Some of the criteria considered when deciding to bring criminal action against a corporation are the degree of loss to the public, the duration of the violation, the level of complicity by high corporate managers, the frequency of the violation, evidence of intent to violate, evidence of extortion, the degree of notoriety endangered by the media, precedent in law, a history of serious violations by the corporation, deterrence potential, and the degree of cooperation demonstrated by the corporation.

In many jurisdictions, the rules governing industry often have been initiated by parts of the industry itself. Industries might also attempt to gain influence over agencies by creating a business-oriented atmosphere between regulators and regulates, which can cause the regulators to feel unwarranted confidence in the possibility of voluntary compliance by corporations.

For country-specific information regarding efforts to control organizational crime, see the content on “Controlling Organizational Crime” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

The Enforcement Effort: Preventing and Reducing Fraud

While the issues involved in the enforcement effort provide a context in which to assess the efforts to control white-collar crime, actual techniques of prevention need to be discussed. There are many theories about enforcement, sanctions, and punishments that are a part of controlling white-collar crime.

Enforcement strategies include two main theories: compliance and deterrence.

COMPLIANCE

Compliance is designed to achieve conformity to the law without having to detect, process, or penalize violators. Compliance systems provide economic incentives for voluntary compliance to the laws and use administrative efforts to control violations before they occur.

Many countries have a host of administrative mechanisms to encourage voluntary compliance with their rules, and regulatory bodies in many other jurisdictions take other similar approaches. In a compliance system, an offense is often called a “technical violation.”

Compliance strategies have been criticized by some criminologists. These experts believe that such strategies have little effect, as sanctions are imposed after the infraction occurs. Since economic penalties are common punishments for violators, these penalties are of little consequence in the case of large, wealthy corporations.

DETERRENCE

As a strategy to control crime, *deterrence* is designed to detect law violations, determine who is responsible, and penalize offenders to deter future violations. Deterrence systems try to control the immediate behavior of individuals, not the long-term behaviors targeted by compliance systems.

Deterrence theory assumes that humans are rational in their behavioral patterns. Humans seek profit and pleasure while they try to avoid pain. Deterrence assumes that an individual's propensity toward lawbreaking is in inverse proportion to the perceived probability of negative consequences.

INCREASED ENFORCEMENT

Formal levels of current enforcement in white-collar crime are, by all measures, extremely low. One view holds that increased enforcement can only come with a complete and total revision of the criminal justice system. Currently, people have little fear of detection because they know that the police and courts cannot keep up with the pace of criminal offenses. It is not necessary or even desirable to advocate longer prison sentences for offenders because we do not have the courts and jails to accommodate them. Perhaps a better plan would be to sacrifice the severity of punishment for certainty. Until potential offenders have the perception that they will be caught and punished, we cannot expect a reversal of the crime trend.

Fraud Prevention Programs

Although the government can provide incentives for organizations to prevent fraud, ultimately, it is up to management to institute prevention programs. The "Fraud Prevention Programs" chapter describes methods whereby management can institute policies and procedures to help detect and prevent fraud.

Occupational Fraud

Occupational fraud is committed largely by individuals or small groups of individuals in connection with their occupation. It can include violations of law by businessmen, politicians, labor union leaders, lawyers, doctors, pharmacists, and employees who embezzle money from their employers or steal merchandise and tools.

Gary Green, in honing the white-collar crime concept, uses the term *occupational crime*, which he defines as “any act punishable by law which is committed through opportunity created in the course of an occupation which is legal.” Green further delineates occupational crime into four categories:

- Crimes for the benefit of an employing organization (organizational occupational crime)
- Crimes by officials through exercise of their government-based authority (government authority occupational crime)
- Crimes by professionals in their capacity as professionals (professional occupational crime)
- Crimes by individuals as individuals

Some scholars debate whether individuals should be held responsible for crimes committed on behalf of their organizations. Although the perpetrator acquires some direct benefit, the benefit acquired by the organization is far greater. Regardless of whether the organization is held liable, the fraud is a direct result of some human action or interaction.

Research in Occupational Fraud and Abuse

Edwin H. Sutherland

Relatively little research has been done on the subject of occupational fraud and abuse. Much of the current literature is based on the early works of Edwin H. Sutherland. As previously discussed in the “Understanding Criminal Behavior” chapter, Sutherland believed that the learning of criminal behavior occurs with other persons in a process of communication. Therefore, he reasoned, criminality cannot occur without the assistance of other people. Sutherland further theorized that the learning of criminal activity usually occurred within intimate personal groups. This explains, in his view, how a dysfunctional parent is more likely to produce dysfunctional offspring. Sutherland believed that the learning process involves two specific areas: the techniques to commit the crime, and the attitudes, drives, rationalizations, and motives of the criminal mind. One can see how Sutherland’s differential association theory

fits with occupational offenders. Organizations that have dishonest employees will eventually infect a portion of honest ones. It also goes the other way: honest employees will eventually have an influence on some of those who are dishonest.

Donald R. Cressey

During the 1940s at Indiana University, one of Sutherland's brightest students was Donald R. Cressey (1919–1987). While much of Sutherland's research concentrated on upperworld criminality, Cressey took his own studies in a different direction. Working on his Ph.D. in criminology, he decided his dissertation would focus on embezzlers. To serve as a basis for his research, Cressey interviewed about two hundred people who had been incarcerated for embezzling funds.

Cressey's Hypothesis

Cressey was intrigued by embezzlers, whom he called "trust violators." He was especially interested in the circumstances that led them to be overcome by temptation. For that reason, he excluded from his research those employees who took their jobs for the purpose of stealing—a relatively minor number of offenders at that time. Upon completion of his interviews, he developed what still remains the classic model for the occupational offender. His research was published in *Other People's Money: A Study in the Social Psychology of Embezzlement*.

Cressey's final hypothesis was:

Trusted persons become trust violators when they conceive of themselves as having a financial problem which is non-shareable, are aware this problem can be secretly resolved by violation of the position of financial trust, and are able to apply to their own conduct in that situation verbalizations which enable them to adjust their conceptions of themselves as trusted persons with their conceptions of themselves as users of the entrusted funds or property.³¹

Over the years, the hypothesis has become better known as the *Fraud Triangle*. One leg of the triangle represents a *perceived non-shareable financial need*. The second leg represents *perceived opportunity*, and the final leg stands for *rationalization*. The role of the *non-shareable* problem is important. According to Cressey, "When the trust violators were asked to explain why they refrained from violation of other positions of trust they might have held at previous times, or why they had not violated the subject position at an earlier time, those who had an opinion

³¹ Donald R. Cressey, *Other People's Money* (Montclair: Patterson Smith, 1973), page 30.

expressed the equivalent of one or more of the following quotations: (a) ‘There was no need for it like there was this time.’ (b) ‘The idea never entered my head.’ (c) ‘I thought it was dishonest then, but this time it did not seem dishonest at first.’ ”³²

“In all cases of trust violation encountered, the violator considered that a financial problem which confronted him could not be shared with persons who, from a more objective point of view, probably could have aided in the solution of the problem.”³³

Non-Shareable Financial Problems

That which is considered “non-shareable” is wholly in the eyes of the potential occupational offender, Cressey said.

*Thus a man could lose considerable money at the race track daily but the loss, even if it construed a problem for the individual, might not constitute a non-shareable problem for him. Another man might define the problem as one which must be kept secret and private, that is, as one which is non-shareable. Similarly, a failing bank or business might be considered by one person as presenting problems which must be shared with business associates and members of the community, while another person might conceive these problems as non-shareable.*³⁴

³² Ibid., page 33.

³³ Ibid., page 34.

³⁴ Ibid., page 35.

In addition to being non-shareable, the problem that drives the fraudster is described as “financial” because these are problems that can generally be solved by the theft of cash or other assets. A person with large gambling debts, for instance, would need cash to pay those debts. Cressey did note, however, that there are some nonfinancial problems that could be solved by misappropriating funds through a violation of trust. For example, a person who embezzles in order to get revenge on his employer for perceived unfair treatment uses financial means to solve what is essentially a nonfinancial problem.

Through his research, Cressey also found that the non-shareable problems encountered by the people he interviewed arose from situations that could be divided into six basic categories: violation of ascribed obligations, problems resulting from personal failure, business reversals, physical isolation, status gaining, and employer-employee relations. All of these situations in some way dealt with status-seeking or status-maintaining activities by the subjects. In other words, the non-shareable problems threatened the status of the subjects, or threatened to prevent them from achieving a higher status than the one they occupied at the time of their violation.

THE IMPORTANCE OF SOLVING THE PROBLEM IN SECRET

Since Cressey’s study was done in the early 1950s, the workforce was obviously different from today’s workforce. But the employee faced with an immediate, non-shareable financial need hasn’t changed much over the years. That employee still must find a way to relieve the financial pressure that bears down upon them. Simply stealing money, however, is not enough; Cressey found it was crucial that the employee be able to resolve the financial problem in *secret*.

As discussed, the non-shareable financial problems identified by Cressey all dealt in some way with questions of status; the trust violators were afraid of losing the approval of those around them and, so, were unable to tell others about their financial problems. If they could not share the fact that they were under financial pressure, it follows that they would not be able to share the fact that they were resorting to illegal means to relieve that pressure. To do so would be to admit that the problems existed in the first place.

An interesting thing to note is that it is not the embezzlement that creates the need for secrecy in the perpetrator’s mind; it is the circumstances that led to the embezzlement (e.g., a violation of incurred obligation, a business reversal). Cressey said:

In all cases [in the study] there was a distinct feeling that, because of activity prior to the defalcation, the approval of groups important to the trusted person had been lost, or a distinct feeling that present group approval would be lost if certain activity were revealed [the non-shareable financial problem], with the result that the trusted person was effectively isolated from persons who could assist him in solving problems arising from that activity.

Although the clear conception of a financial problem as non-shareable does not invariably result in trust violation, it does establish in trusted persons a desire for a specific kind of solution to their problems. The results desired in the cases encountered were uniform: the solution or partial solution of the problem by the use of funds which can be obtained in an independent, relatively secret, safe, and sure method in keeping with the 'rationalizations' available to the person at the time.³⁵ (emphasis added)

Perceived Opportunity

According to the Fraud Triangle model, the presence of a non-shareable financial problem alone will not lead an employee to commit fraud. The key to understanding Cressey's hypothesis is to remember that all three elements must be present for a trust violation to occur. The non-shareable financial problem creates the motive for the crime to be committed, but the employee must also perceive that they have an opportunity to commit the crime without being caught. This *perceived opportunity* constitutes the second element.

In Cressey's view, there were two components of the perceived opportunity to commit a trust violation: general information and technical skill. *General information* is simply the knowledge that the employee's position of trust could be violated. This knowledge might come from hearing of other embezzlements, from seeing dishonest behavior by other employees, or just from generally being aware of the fact that the employee is in a position where they could take advantage of their employer's faith in them. *Technical skill* refers to the abilities needed to commit the violation. These are usually the same abilities that the employee needs to have in order to obtain and keep their position in the first place. Cressey noted that most embezzlers adhere to their occupational routines (and their job skills) in order to perpetrate their crimes.³⁶ In essence, the perpetrator's job will tend to define the type of fraud they will commit.

³⁵ Ibid., pages 66–67.

³⁶ Ibid., page 84.

“Accountants use checks which they have been entrusted to dispose of, sales clerks withhold receipts, bankers manipulate seldom-used accounts or withhold deposits, real estate men use deposits entrusted to them, and so on.”³⁷

Obviously, the general information and technical skill that Cressey identified are not unique to occupational offenders; most, if not all, employees have these same characteristics. But because trusted persons possess this information and skill, when they face a non-shareable financial problem, they see it as something that they have the power to correct. They apply their understanding of the *possibility* for trust violation to the specific crises they are faced with. Cressey observed, “It is the next step which is significant to violation: the application of the general information to the specific situation, and conjointly, the perception of the fact that in addition to having general possibilities for violation, a specific position of trust can be used for the specific purpose of solving a non-shareable problem.”³⁸

Rationalization

The third and final factor in the Fraud Triangle is the *rationalization*. Cressey pointed out that rationalization is not an ex post facto means of justifying a theft that has already occurred. Significantly, rationalization is a necessary component of the crime *before* it takes place; in fact, it is a part of the motivation for the crime. Because embezzlers do not view themselves as criminals, they must justify their misdeeds before they ever commit them. The rationalization is necessary so that perpetrators can make their illegal behavior intelligible to themselves and maintain their concept of themselves as trusted individuals.³⁹

After the criminal act has taken place, the rationalization will often be abandoned. That is, of course, because the first time most of us do something contrary to our morals, it bothers us. As we repeat the act, it becomes easier. One characteristic of occupational fraud and abuse offenders is that once the wrongdoing has been committed, the illegal act becomes more or less continuous. So, an occupational fraudster might begin stealing with the thought that “I’ll pay the money back,” but after the initial theft is successful, they will usually continue to steal more funds than they can possibly repay.

Cressey found that the embezzlers he studied generally rationalized their crimes by viewing them as (1) essentially non-criminal, (2) justified, or (3) part of a general irresponsibility for

³⁷ Ibid., page 84.

³⁸ Ibid., page 85.

³⁹ Ibid., pages 94–95.

which they were not completely accountable.⁴⁰ He also found that the rationalizations used by trust violators tended to be linked to their positions and to the manner in which they committed their violations. He examined this by dividing the subjects of his study into three categories: independent businessmen, long-term violators, and absconders. He discovered that each group had its own types of rationalizations.

INDEPENDENT BUSINESSMEN

The *independent businessmen* in Cressey's study were people who were in business for themselves and who converted "deposits" that had been entrusted to them.⁴¹ Perpetrators in this category tended to use one of two common excuses: (1) they were "borrowing" the money they converted or (2) the funds entrusted to them were really theirs—you can't steal from yourself. Cressey found the "borrowing" rationalization was the one most frequently used. These perpetrators also tended to believe the idea that "everyone" in business misdirects deposits in some way, which, therefore, made their own misconduct less wrong than "stealing."⁴² Also, the independent businessmen almost universally felt their illegal actions were predicated by an "unusual situation," which Cressey concluded was in reality a non-shareable financial problem.

LONG-TERM VIOLATORS

Cressey defined *long-term violators* as individuals who converted their employer's funds, or funds belonging to their employer's clients, by taking relatively small amounts over a period of time.⁴³ Similar to independent businessmen, the long-term violators generally preferred the "borrowing" rationalization. Other rationalizations of long-term violators were described, too, but they almost always were used in connection with the "borrowing" theme: (1) They were embezzling to keep their families from shame, disgrace, or poverty; (2) theirs was a case of "necessity"; their employers were cheating them financially; and (3) their employers were dishonest toward others and deserved to be defrauded. Some even pointed out that it was more difficult to return the funds than to steal them in the first place, and they claimed that they did not pay back their "borrowings" because they feared that doing so would lead to the detection of their thefts. A few in the study actually kept track of their thefts, but most only did so at first. Later, as the embezzlements escalated, it is assumed that the offender would rather not know the extent of their "borrowings."

⁴⁰ Ibid., page 93.

⁴¹ Ibid., pages 101–102.

⁴² Ibid., page 102.

⁴³ Ibid., page 102.

All of the long-term violators in the study expressed a feeling that they would like to eventually “clean the slate” and repay their debt. This feeling usually arose even before the perpetrators perceived that they might be caught. Cressey pointed out that, at this point, whatever fear the perpetrators felt in relation to their crimes was related to losing their social status by the exposure of their non-shareable *problem*, not the exposure of the theft itself or the possibility of punishment or imprisonment. This is because their rationalizations still prevented them from perceiving their misconduct as criminal. “The trust violator cannot fear the treatment usually accorded to criminals until he comes to look upon himself as a criminal.”⁴⁴

Eventually, most of the long-term violators finally realized they were “in too deep.” It is at this point that the embezzler faces a crisis. While maintaining the borrowing rationalization (or other rationalizations, for that matter), the trust violator is able to maintain their self-image as a law-abiding citizen; but when the level of theft escalates to a certain point, the perpetrator is confronted with the idea that they are behaving in a criminal manner. This is contrary to their personal values and the values of the social groups to which they belong. This conflict creates a great deal of anxiety for the perpetrator. A number of offenders described themselves as extremely nervous and upset, tense, and unhappy.⁴⁵

Without the rationalization that they were borrowing, long-term offenders in the study found it difficult to reconcile converting money, while at the same time seeing themselves as honest and trustworthy. In this situation, they have two options: (1) they can readopt the attitudes of the (law-abiding) social group with which they identified before the thefts began, or (2) they can adopt the attitudes of the new category of persons (criminals) with whom they now identify.⁴⁶ From his study, Cressey was able to cite examples of each type of behavior. Those who sought to readopt the attitudes of their law-abiding social groups “may report their behavior to the police or to their employer, quit taking funds or resolve to quit taking funds, speculate or gamble wildly in order to regain the amounts taken, or ‘leave the field’ by absconding or committing suicide.”⁴⁷ On the other hand, those who adopt the attitudes of the group of criminals to which they now belong “may become reckless in their defalcations, taking larger amounts than formerly with [fewer] attempts to avoid detection and with no notion of repayment.”⁴⁸

⁴⁴ Ibid., pages 120–121.

⁴⁵ Ibid., page 121.

⁴⁶ Ibid., page 122.

⁴⁷ Ibid., page 121.

⁴⁸ Ibid., page 122.

ABSCONDERS

The third group of offenders Cressey discussed was *absconders*—people who take the money and run. Cressey found that the non-shareable problems for absconders usually resulted from physical isolation. He observed that these people, “usually are unmarried or separated from their spouses, live in hotels or rooming houses, have few primary group associations of any sort, and own little property. Only one of the absconders interviewed had held a higher status position of trust, such as an accountant, business executive, or bookkeeper.”⁴⁹ He also found that the absconders tended to have lower occupational and socio-economic status than the members of the other two categories.

Because absconders tended to lack strong social ties, Cressey found that almost any financial problem could be defined as non-shareable for these persons, and also that rationalizations were easily adopted because the persons only had to sever a minimum of social ties when they absconded.⁵⁰ The absconders rationalized their conduct by noting that their attempts to live honest lives had been futile (hence their low status). They also adopted an attitude of not caring what happened to them and a belief that they could not help themselves because they were predisposed to criminal behavior. The latter two rationalizations, which were adopted by every absconder in Cressey’s study, allowed them to remove almost all personal accountability from their conduct.⁵¹

In the 1950s, when these data were gathered by Cressey, embezzlers were considered persons of higher socioeconomic status who took funds over a limited period of time because of some personal problem such as drinking or gambling, while “thieves” were considered persons of lower status who took whatever funds were at hand. Cressey noted:

*Since most absconders identify with the lower status group, they look upon themselves as belonging to a special class of thieves rather than trust violators. Just as long-term violators and independent businessmen do not at first consider the possibility of absconding with the funds, absconders do not consider the possibility of taking relatively small amounts of money over a period of time.*⁵²

⁴⁹ Ibid., page 128.

⁵⁰ Ibid., page 129.

⁵¹ Ibid., pages 128–129.

⁵² Ibid., page 133.

Conjuncture of Events

Perhaps the most important conclusion to be drawn from the Cressey study was that it took all three elements—perceived non-shareable financial problem, perceived opportunity, and the ability to rationalize—for the trust violation to occur.

*The three events make up the conditions under which trust violation occurs and the term cause may be applied to their conjuncture since trust violation is dependent on that conjuncture. Whenever the conjuncture of events occurs, trust violation results, and if the conjuncture does not take place there is no trust violation.*⁵³

Conclusions

Cressey's classic Fraud Triangle helps explain the nature of many—but not all—occupational offenders. For example, although academicians have tested his model, it has still not fully found its way into practice in terms of developing fraud prevention programs. Our sense tells us that one model—even Cressey's—will not fit all situations. Additionally, the study is nearly half a century old. There has been considerable social change in the interim. And now, many anti-fraud professionals believe there is a new breed of occupational offender—one who simply lacks a conscience sufficient to overcome temptation.

Dr. Steve Albrecht

The Albrecht Study

Another pioneering researcher in occupational fraud and abuse is Dr. Steve Albrecht of Brigham Young University. Albrecht and two of his colleagues, Keith R. Howe and Marshall B. Romney, conducted an analysis of 212 frauds in the early 1980s under a grant from the Institute of Internal Auditors Research Foundation (IIARF), leading to their book titled *Detering Fraud: The Internal Auditor's Perspective*.⁵⁴ The study's methodology involved obtaining demographics and background information on the frauds through the use of extensive questionnaires. The participants in the survey were internal auditors of companies that had experienced frauds.

Albrecht's research included an examination of comprehensive data sources to assemble a complete list of pressure, opportunity, and integrity variables, resulting in a set of fifty possible red flags or indicators of occupational fraud and abuse. These variables fell into two

⁵³ Ibid., page 139.

⁵⁴ Steve Albrecht, Keith R. Howe, and Marshall B. Romney, *Detering Fraud: The Internal Auditor's Perspective* (Institute of Internal Auditor's Research Foundation, 1984).

principal categories: perpetrator characteristics and organizational environment. The purpose of the study was to determine which of the red flags were most important to the commission (and therefore to the detection and prevention) of fraud. The red flags ranged from unusually high personal debts to belief that one's job is in jeopardy, from no separation of asset-custodial procedures to not adequately checking a potential employee's background.⁵⁵

The researchers gave participants both sets of 25 motivating factors and asked which factors were present in the frauds they had dealt with. Participants were asked to rank these factors on a seven-point scale indicating the degree to which each factor existed in their specific frauds. The ten most highly ranked factors from the list of personal characteristics, based on this study, were:

1. Living beyond their means
2. An overwhelming desire for personal gain
3. High personal debt
4. A close association with customers
5. Feeling pay was not commensurate with responsibility
6. A wheeler-dealer (scheming) attitude
7. Strong challenge to beat the system (i.e., successfully evade the rules)
8. Excessive gambling habits
9. Undue family or peer pressure
10. No recognition for job performance⁵⁶

These motivators are very similar to the non-shareable financial problems Cressey identified.

The ten most highly ranked factors from the list dealing with organizational environment were:

1. Placing too much trust in key employees
2. Lack of proper procedures for authorization of transactions
3. Inadequate disclosures of personal investments and incomes
4. No separation of authorization of transactions from the custody of related assets
5. Lack of independent checks on performance

⁵⁵ While such red flags may be present in many occupational fraud cases, one must re-emphasize Albrecht's caution that the perpetrators are hard to profile and fraud is difficult to predict. To underscore this point, Albrecht's research does not address—and no current research has been done to determine—if nonoffenders have many of the same characteristics. If so, then the list might not be discriminating enough to be useful. In short, while one should be mindful of potential red flags, they should not receive undue attention absent other compelling circumstances.

⁵⁶ Albrecht, Howe, and Romney, page 32.

6. Inadequate attention to details
7. No separation of custody of assets from the accounting for those assets
8. No separation of duties between accounting functions
9. Lack of clear lines of authority and responsibility
10. Department that is not frequently reviewed by internal auditors⁵⁷

All of the factors on this list affect employees' opportunity to commit fraud without being caught. Opportunity, as you will recall, was the second factor identified in Cressey's Fraud Triangle. In many ways, the study by Albrecht, et al., supported Cressey's model. Like Cressey's study, the Albrecht study suggests there are three factors involved in occupational frauds:

It appears that three elements must be present for a fraud to be committed: a situational pressure (non-shareable financial pressure), a perceived opportunity to commit and conceal the dishonest act (a way to secretly resolve the dishonest act or the lack of deterrence by management), and some way to rationalize (verbalize) the act as either being inconsistent with one's personal level of integrity or justifiable.⁵⁸

The Fraud Scale⁵⁹

To illustrate the concept, Albrecht developed the Fraud Scale, which included the components of situational pressures, perceived opportunities, and personal integrity. When situational pressures and perceived opportunities are high and personal integrity is low, occupational fraud is much more likely to occur than when the opposite is true.⁶⁰

Albrecht, Howe, Romney, "Deterring Fraud: The Internal Auditor's Perspective," p6

⁵⁷ Ibid., page 39.

⁵⁸ Ibid., page 5.

⁵⁹ Ibid., page 5.

⁶⁰ Ibid., page 6.

Albrecht describes situational pressures as “the immediate problems individuals experience within their environments, the most overwhelming of which are probably high personal debts or financial losses.”⁶¹ Opportunities to commit fraud, Albrecht says, may be created by individuals, or by deficient or missing internal controls. Personal integrity “refers to the personal code of ethical behavior each person adopts. While this factor appears to be a straightforward determination of whether the person is honest or dishonest, moral development research indicates that the issue is more complex.”⁶²

In addition to its findings on motivating factors of occupational fraud, the Albrecht study also disclosed several interesting relationships between the perpetrators and the frauds they committed. For example, perpetrators of large frauds used the proceeds to purchase new homes and expensive automobiles, invest in recreation property, and go on expensive vacations, as well as to support extramarital relationships and make risky investments. Those committing small frauds did not.⁶³ Perpetrators who were interested primarily in “beating the system” committed larger frauds. However, perpetrators who believed their pay was not adequate committed primarily small frauds. Lack of separation of responsibilities, placing undeserved trust in key employees, imposing unrealistic goals, and operating on a crisis basis were all pressures or weaknesses associated with large frauds. College graduates were less likely to spend their illegal income on extravagant vacations, recreational property, extramarital relationships, and expensive automobiles. Finally, those with lower salaries were more likely to have a prior criminal record.⁶⁴

ACFE 2020 Report to the Nations

Occupational fraud and abuse is a widespread problem that affects practically every organization, regardless of size, location, or industry. In 1996, the ACFE released the first *Report to the Nation on Occupational Fraud and Abuse*, which was intended to shed light on the immense and largely undefined costs that occupational fraud imposes on organizations. The stated goals of the first report were to:

- Summarize the opinions of experts on the percentage and amount of organizational revenue lost to all forms of occupational fraud and abuse.
- Examine the characteristics of the employees who commit occupational fraud and abuse.

⁶¹ Ibid., page 5.

⁶² Ibid., page 6.

⁶³ Ibid., page 42.

⁶⁴ Ibid., xiv.

- Determine what kinds of organizations are victims of occupational fraud and abuse.
- Categorize the ways in which serious fraud and abuse occurs.

All of the enumerated goals of the first report fell under one larger and more all-encompassing mission: to better educate the public and anti-fraud professionals about the threat of occupational fraud. Since the initial report, and each subsequent edition, this has remained the ACFE's primary goal.

Since 2002, the ACFE has released updated editions of the report every two years, with the latest report published in 2020. Like the first study, each subsequent edition has been based on detailed case information about specific frauds provided by the CFEs who investigated those cases. Each report has been structured along the same lines, focusing on the methods used by employees, managers, and executives to defraud their organizations; the losses caused by those frauds; and the characteristics of both the perpetrators and the victims of these crimes.

The 2020 *Report to the Nations* is based on 2,504 actual cases of occupational fraud that occurred within 125 countries throughout the world. Consequently, the 2020 report provides a view into the truly global nature of occupational fraud, as well as the severity and impact of these crimes.

The following is an excerpt containing some of the more significant findings from the 2020 report. Copies of the entire *Report to the Nations* can be downloaded or viewed at [ACFE.com/RTTN](https://www.acfe.com/RTTN).

The Cost of Occupational Fraud

Anti-fraud professionals know just how devastating a fraud can be to its victims. But they are not the only ones who benefit from insight into the amount of damage that fraud causes organizations and their stakeholders. Business leaders need to understand how much is at stake as they assess their risks and make resource-allocation decisions. Regulators need to determine where to focus their anti-fraud enforcement efforts. Investors and customers need to make informed decisions about where to direct their money. And the media desires context and direction in helping raise awareness of the issue to the general public.

Accordingly, providing a measure of the cost of fraud is an incredibly important endeavor, but it is also an immensely difficult one, given the number of unknown factors required to make such an estimate. No one knows the amount of frauds that go undetected or

unreported, and, even for those frauds that do come to light, the full amount of loss might never be calculated. Such limitations mean that any attempts to quantify the global amount of fraud would be imperfect.

PROJECTING TOTAL FRAUD LOSSES BASED ON IMPERFECT DATA

Even with these limitations on projecting the total amounts lost to fraud, the ACFE knows that such a projection has an important place in the fight against fraud. Consequently, the ACFE asked survey participants, based on their professional experience, what percentage of revenues they believe a typical organization loses to fraud each year. The median response provided by these CFEs is that organizations lose 5% of their annual revenues to fraud. While this percentage is only a general estimate based on the opinions of the CFEs who took part in the study, it represents the collective observations of more than two thousand anti-fraud experts who collectively have investigated hundreds of thousands of fraud cases.

To place their estimation in context, if the estimated 5% loss were applied to the 2019 gross world product, it would result in a projected global fraud loss of more than \$4.5 trillion.⁶⁵ To be clear, this number is only an estimate, and, given the limitations described above, it is unlikely the true cost of fraud will ever be able to be calculated on a global scale. The amount of damage is abundant, and this estimation, provided by anti-fraud professionals who work to prevent and detect fraud on a daily basis, helps give some insight into just how big the problem might be.

THE FRAUD COSTS WE KNOW

Determining total fraud losses—whether globally, regionally, by industry, or within a specific organization—is outside the primary scope of the ACFE’s study. Instead, the focus is on analyzing known data to better understand the risks posed by occupational fraud. To that end, the ACFE examined the losses incurred in the actual cases of fraud reported to them to learn about how fraud affects its victims.

⁶⁵ International Monetary Fund, World Economic Outlook (April 2020): Gross Domestic Product, www.imf.org/external/datamapper/datasets/WEO/1.

The total loss caused by the cases in the study exceeded \$3.6 billion.⁶⁶ While the total number of cases of fraud that occurred globally during the study is unknown, it is safe to assume that the 2,504 cases included in the study represent only a small fraction of the frauds committed against organizations throughout the world during that time. Thus, the \$3.6 billion in known losses—while staggering on its own—does not come close to representing the total amount lost to fraud. It is likely that the true global cost of fraud is magnitudes higher, especially when factoring in the indirect costs, such as reputational harm and loss of business during the aftermath of a scandal.

The mean, or average, loss due to the frauds in the study was more than \$1.5 million,⁶⁷ which is also a significant amount when considering how much damage such a loss represents to most organizations. However, due to the presence of several large frauds in the data, this amount likely does not illustrate the typical fraud case. Consequently, median loss calculations are used throughout this report, rather than mean, to provide a more accurate representation of how fraud typically affects organizations. The median loss for all cases in the study was \$125,000.

How Occupational Fraud Is Committed

One of the goals of the first *Report to the Nations* was to examine the methods by which fraudsters commit their schemes, and the ACFE has continued this line of study in every subsequent report. Over the last two decades, even with tremendous technological development and numerous changes in the global business and regulatory environments, the ACFE's research shows that occupational fraud falls into several time-tested categories. The taxonomy of these categories is illustrated in the *Occupational Fraud and Abuse Classification System*, also known as the *Fraud Tree*, which can be viewed in the "Financial Statement Fraud" chapter in the Financial Transactions and Fraud Schemes section of the *Fraud Examiners Manual*.

CATEGORIES OF OCCUPATIONAL FRAUD

Of the three primary categories of occupational fraud, asset misappropriation is by far the most common, occurring in 86% of the cases in the ACFE's study, as shown in Figure 2.

⁶⁶ The total losses represented in the ACFE's study were actually significantly higher than \$3.6 billion. However, the survey results included a few cases with losses so large that including them in the total loss figure might have enabled them to be identified. To avoid compromising the confidentiality of the survey participants, the ACFE winsorized the top and bottom 5% of the data used in this total loss calculation (i.e., assigned all cases in the top 2.5% and bottom 2.5% the same value as the 97.5th percentile and 2.5th percentile, respectively). While including those cases would increase the total loss amount figure substantially, the ACFE believes it prudent to both ensure those cases remain unidentified and conservatively report loss amounts.

⁶⁷ As with the total loss figure, the top and bottom 5% of the data were winsorized for purposes of the average loss calculation.

However, asset misappropriation is also the least costly, causing a median loss of \$100,000. Corruption schemes are the next most common form of occupational fraud, with 43% of the cases in the study involving some form of corrupt act. These schemes resulted in a median loss to the victim organizations of \$200,000. The least common and most costly form of occupational fraud is financial statement fraud, which occurred in 10% of the cases and caused a median loss of \$954,000.

FIG. 2 How is occupational fraud committed?

ASSET MISAPPROPRIATION SUB-SCHEMES

Within the category of asset misappropriation, the ACFE's research shows that there are several distinct subcategories of schemes. The heat map in Figure 5 illustrates the relative frequency and cost of each of these scheme types. The schemes that fall in the darkest area of the heat map—check and payment tampering,⁶⁸ billing, and theft of noncash assets—rank among the most common and costliest scheme types and thus typically pose the greatest risk to organizations.

FIG. 5 What asset misappropriation schemes present the greatest risk?

⁶⁸ In previous reports, this category was referred to simply as *check tampering*. However, to better reflect the increasing shift toward electronic payment methods, the ACFE has changed the category title to *check and payment tampering*.

DURATION OF FRAUD SCHEMES

Examining how long frauds tend to last can also provide insight into how they affect their victims. The median duration for all of the fraud cases in the ACFE's study was 14 months. However, it stands to reason that the longer a fraud goes undetected, the larger the scheme will grow. Figure 6 shows that frauds that last over sixty months are nearly 15 times as costly as those that are caught in the first six months. The data also indicate that fraudsters tend to start small and increase their frauds rapidly over the first three years. Thus, it is incredibly important for organizations to implement proactive fraud detection mechanisms to catch frauds quickly and minimize their damage.

FIG. 6 How does the duration of a fraud relate to median loss?

The ACFE also examined the duration of the cases reported to us based on the type of scheme involved. Figure 7 shows the result of this analysis. Several occupational fraud schemes, such as payroll, check and payment tampering, and register disbursements, tended to last the longest, with a median duration of 24 months, while schemes involving noncash assets were typically uncovered a little over one year after they began.

FIG. 7 How long do different occupational fraud schemes last?

Detection of Fraud Schemes

Understanding the methods by which occupational frauds are detected is critical for both investigating schemes and implementing effective prevention strategies. The ACFE asked survey participants to disclose how the frauds they investigated were initially detected, which helps to understand how organizations are most likely to discover frauds in the future. These data also show how organizations can take steps to detect fraud proactively, rather than passively.

INITIAL DETECTION OF OCCUPATIONAL FRAUDS

Figure 9 shows that the leading detection methods are tips, internal audit, and management review. This finding is not surprising, as these have been the three most common means of detecting occupational fraud in every edition of the report since 2010. Collectively, these three detection methods were cited in 70% of the cases in the ACFE's most recent study. Tips were by far the most common means of detection at 43% of cases—more than internal audit (15%) and management review (12%) combined.

FIG. 9 How is occupational fraud initially detected?

SOURCE OF TIPS

Since tips are the most common detection method, it is important to understand where those tips come from. Figure 10 shows that half of all tips (50%) were provided by employees of the victim organizations. Meanwhile, more than one-third (35%) of the tips that led to fraud detection came from people outside the organization: customers, vendors, and competitors. Active cultivation of tips and complaints, such as the promotion of fraud hotlines, is often geared primarily toward employees, but these data suggest organizations should also consider promoting reporting mechanisms to outside parties, especially customers and vendors. Additionally, 15% of tips came from an anonymous source, demonstrating that a significant portion of those who reported fraud did not want their identities known. Whistleblowers often have a fear of being identified or retaliated against, which is why it is important that they be able to make reports anonymously where such practice is legally permissible.

FIG. 10 Who reports occupational fraud?

MEDIAN LOSS AND MEDIAN DURATION BY DETECTION METHOD

In addition to determining the most common methods of detection, the ACFE also analyzed the median loss and duration of fraud schemes based on how they were uncovered. The results indicate that there is a correlation between the way in which occupational fraud schemes are detected and the severity of the fraud. More importantly, these data point to steps organizations can take to detect fraud proactively and, in doing so, mitigate losses.

Figure 11 portrays the median loss and median duration for all cases, based on the method by which they were detected. Detection methods were grouped into three categories: active, passive, or potentially active or passive. Active detection methods (shaded blue) involve a deliberate search for misconduct from someone within the organization or an internal control designed to detect fraud. Passive detection methods (shaded red) refer to cases in which the organization discovers the fraud by accident, confession, or unsolicited notification by another party. Tips and external audits were classified as potentially active or passive detection methods because those mechanisms might or might not involve proactive efforts specifically to identify fraud, depending on the circumstances.

The findings show that median duration and median loss were relatively low in frauds that were detected by active methods. Frauds detected passively tended to last much longer and have larger median losses. For instance, frauds detected actively by IT controls tended to last six months and cause a median loss of \$80,000, compared to schemes detected passively through notification from law enforcement, which tended to last two years and cause a median loss of almost \$900,000. The key takeaway from these data is that organizations can reduce the impact of fraud by pursuing internal controls and policies that actively detect fraud, such as thorough management review, account reconciliation, and surveillance/monitoring. Organizations that do not actively seek out fraud are likely to experience schemes that continue for much longer and at a higher cost.

FIG. 11 How does detection method relate to fraud duration and loss?

Victims of Occupational Fraud

To better understand the victim organizations from the ACFE study, participants were asked to provide information about the organizations' type, size, and industry, as well as the mechanisms that the organizations had in place to prevent and detect fraud at the time the scheme occurred.

TYPE OF VICTIM ORGANIZATION

As shown in Figure 14, 70% of the frauds in the study occurred at for-profit organizations, with 44% of the victim organizations being private companies and 26% being public companies. The private companies in the study suffered the greatest median loss, at \$150,000. Not-for-profit organizations were the victim in only 9% of frauds and had the smallest median loss of \$75,000; however, for many not-for-profit entities, financial resources are extremely limited and a loss of \$75,000 can be particularly devastating.

FIG. 14 What types of organizations are victimized by occupational fraud?

**SIZE OF VICTIM ORGANIZATION**

The size of an organization's staff can directly affect both the opportunity for fraud and the ability to enact certain anti-fraud mechanisms. Larger entities typically have more resources to invest in their anti-fraud programs, as well as a greater ability to separate duties among staff members to help prevent fraud; however, the large staff size can also mean more potentially dishonest employees who might attempt schemes and more complex processes and transactions, which can increase the risk of fraud.

To provide some insight into the relative risks of fraud for organizations of various sizes, cases were analyzed based on the number of employees at the victim organization. Figure 16 shows that mid-sized organizations (those with 1,000–9,999 employees) experienced the greatest percentage of cases in the study (27%) and small organizations (those with fewer than 100 employees) suffered the largest median loss (\$150,000).

FIG. 16 How does an organization's size relate to its occupational fraud risk?

INDUSTRY OF VICTIM ORGANIZATIONS

In addition, reported cases were examined based on the industry of the victim organization. Figure 19 provides a breakdown of the extent to which industries were affected by occupational fraud. The greatest number of cases in the study occurred in the banking and financial services, manufacturing, and government and public administration sectors. It should be noted that these data likely represent the industries that most often employ CFEs, rather than the industries that are most susceptible to fraud. However, information about occupational fraud in various industries can be useful for benchmarking purposes.

FIG. 19 How does occupational fraud affect organizations in different industries?

ANTI-FRAUD CONTROLS AT THE VICTIM ORGANIZATION

The presence of a robust system of anti-fraud controls can be a powerful deterrent, as well as a proactive prevention and detection mechanism, in the fight against fraud. Thus, organizations can benefit from knowing which anti-fraud controls are commonly used by their peers, as well as which tend to be the most effective. To help explore this information, survey respondents were provided with a list of 18 entity-level, anti-fraud controls and asked which, if any, were present at the victim organization at the time the fraud occurred. As noted in Figure 21, 83% of the organizations underwent external financial statement audits, while 81% had a code of conduct in place. On the other end of the spectrum, 23% of organizations had policies requiring job rotation or mandatory vacation, and only 13% provided rewards for whistleblowers.

FIG. 21 What anti-fraud controls are most common?

EFFECTIVENESS OF ANTI-FRAUD CONTROLS

Demonstrating the return on investment in anti-fraud initiatives can be a difficult task, as it is nearly impossible to measure the amount of fraud prevented by a specific control. However, many anti-fraud professionals find themselves needing to make a business case to justify additional fraud prevention and detection initiatives. To provide some visibility into the relative effectiveness of various anti-fraud controls, the ACFE compared the losses experienced by the victim organizations that had specific controls in place against the losses experienced by those that had not implemented each control. The results of this analysis are provided in Figure 22. Interestingly, the presence of every control analyzed was correlated with lower fraud losses. For example, having codes of conduct and an internal audit department was associated with a reduction of 51% and 50% in fraud losses, respectively.

The ACFE similarly analyzed the duration of fraud schemes based on the presence or absence of each anti-fraud control (see Figure 23). Codes of conduct, job rotation or mandatory vacation policies, internal audit departments, management certification of financial statements, and management review were associated with the most significant reductions in fraud duration. As codes of conduct and internal audit departments were also associated with some of the largest loss reductions, the data indicate that they are among the most useful tools in the fight against fraud.

FIG. 22 How does the presence of anti-fraud controls relate to median loss?

Control	Percent of cases	Control in place	Control not in place	Percent reduction
Code of conduct	81%	\$100,000	\$205,000	51%
Internal audit department	74%	\$100,000	\$200,000	50%
Management certification of financial statements	73%	\$100,000	\$200,000	50%
External audit of internal controls over financial reporting	68%	\$100,000	\$200,000	50%
Management review	65%	\$100,000	\$200,000	50%
Hotline	64%	\$100,000	\$198,000	49%
External audit of financial statements	83%	\$110,000	\$204,000	46%
Fraud training for employees	55%	\$100,000	\$160,000	38%
Anti-fraud policy	56%	\$100,000	\$150,000	33%
Proactive data monitoring/analysis	38%	\$100,000	\$150,000	33%
Surprise audits	38%	\$100,000	\$150,000	33%
Formal fraud risk assessments	41%	\$100,000	\$150,000	33%
Employee support programs	55%	\$100,000	\$150,000	33%
Fraud training for managers/executives	55%	\$100,000	\$150,000	33%
Independent audit committee	62%	\$100,000	\$150,000	33%
Dedicated fraud department, function, or team	44%	\$100,000	\$145,000	31%
Job rotation/mandatory vacation	23%	\$100,000	\$130,000	23%
Rewards for whistleblowers	13%	\$120,000	\$122,000	2%

FIG. 23 How does the presence of anti-fraud controls relate to the duration of fraud?

Control	Percent of cases	Control in place	Control not in place	Percent reduction
Code of conduct	81%	12 months	24 months	50%
Job rotation/mandatory vacation	23%	9 months	18 months	50%
Internal audit department	74%	12 months	24 months	50%
Management certification of financial statements	73%	12 months	24 months	50%
Management review	65%	12 months	24 months	50%
External audit of financial statements	83%	13 months	24 months	46%
Surprise audits	38%	11 months	18 months	39%
External audit of internal controls over financial reporting	68%	12 months	19 months	37%
Proactive data monitoring/analysis	38%	12 months	18 months	33%
Hotline	64%	12 months	18 months	33%
Formal fraud risk assessments	41%	12 months	18 months	33%
Anti-fraud policy	56%	12 months	18 months	33%
Fraud training for employees	55%	12 months	18 months	33%
Fraud training for managers/executives	55%	12 months	18 months	33%
Independent audit committee	62%	12 months	18 months	33%
Dedicated fraud department, function, or team	44%	12 months	18 months	33%
Rewards for whistleblowers	13%	11 months	16 months	31%
Employee support programs	55%	12 months	16 months	25%

The Perpetrators

Survey respondents were asked to provide a broad range of information about the fraud perpetrators they investigated, including the offenders' conditions of employment, basic demographics, prior misconduct, and behavior that might have been warning signs of fraudulent activity. The ACFE's goal is to identify common characteristics and risk profiles for those who commit occupational fraud, which can help organizations better recognize fraud perpetrators or those at risk for engaging in fraudulent activity.

PERPETRATOR'S POSITION

As seen in Figure 27, there is a strong correlation between the fraud perpetrator's level of authority and the size of the fraud. While owners/executives only committed 20% of the frauds in the study, the schemes committed by these individuals resulted in a median loss of \$600,000, which was four times larger than the median loss caused by managers and ten times larger than the median loss caused by low-level employees. A significant correlation between authority and fraud loss has been found in every edition of the report dating back to 1996. This correlation likely reflects the fact that high-level fraudsters tend to have greater access to an organization's assets than low-level personnel. They might also have greater technical ability to commit and conceal fraud, and they may be able to use their authority to override or conceal their crimes in ways that low-level employees cannot.

FIG. 27 How does the perpetrator's level of authority relate to occupational fraud?

PERPETRATOR'S DEPARTMENT

Figure 31 shows the frequency and median loss in fraud cases based on where the fraudster worked within the victim organization. This heat map provides a visual representation of the relative fraud risks posed by various departments. For example, it is shown that accounting and operations were each responsible for 14% and 15% of the frauds in the study, but the median loss caused by those in the accounting department (\$200,000) was significantly larger than the median loss from operations (\$72,000). Frauds committed by those in executive or upper-management roles were slightly less common but much costlier.

FIG. 31 What departments pose the greatest risk for occupational fraud?

Department*	Number of cases	Percent of cases	Median loss
Operations	288	15%	\$72,000
Accounting	277	14%	\$200,000
Executive/upper management	234	12%	\$596,000
Sales	225	11%	\$94,000
Customer service	175	9%	\$86,000
Administrative support	116	6%	\$76,000
Finance	101	5%	\$100,000
Purchasing	96	5%	\$200,000
Information technology	69	3%	\$200,000
Facilities and maintenance	60	3%	\$100,000
Warehousing/inventory	60	3%	\$85,000
Board of directors	45	2%	\$750,000
Marketing/public relations	40	2%	\$100,000
Manufacturing and production	35	2%	\$275,000
Human resources	27	1%	\$40,000
Research and development	14	1%	\$350,000
Legal	13	1%	\$195,000

*Departments with fewer than 10 cases were omitted

PERPETRATOR'S GENDER

Figure 33 shows that a sizeable majority of the fraudsters in the study (72%) were males. Men also caused much larger median losses (\$150,000) than females (\$85,000). This remains fairly consistent with the ACFE's past studies, which have shown males to be responsible for between 65% and 70% of frauds along with a significant disparity in fraud loss.

FIG. 33 How does the perpetrator's gender relate to occupational fraud?

**PERPETRATOR'S AGE**

The age distribution of occupational fraudsters is roughly bell-shaped, as seen in Figure 36. Losses, however, tend to rise with the age of the fraudster. The largest median losses in the study were caused by fraudsters in the oldest age range (over 60), while those who were thirty or younger caused a much smaller amount of damage.

FIG. 36 How does the perpetrator's age relate to occupational fraud?

PERPETRATOR'S CRIMINAL BACKGROUND

The vast majority of occupational fraudsters have no prior history of criminal fraud convictions, as shown in Figure 39. Only 4% of the perpetrators in the 2020 study had previously been convicted of a fraud-related offense, which is consistent with the findings in every study dating back to 1996. This suggests that most occupational fraudsters are first-time offenders. However, between 41% and 69% of occupational fraud cases in past studies were never referred to law enforcement, which indicates that the actual number of repeat offenders is probably higher than what can be identified through conviction records.

FIG. 39 Do perpetrators tend to have prior fraud convictions?

**PERPETRATOR'S EMPLOYMENT HISTORY**

Figure 40 shows that 86% of occupational fraud perpetrators had never been punished or terminated for fraud-related conduct prior to the crimes in this study. This also tends to indicate that most occupational fraudsters are first-time offenders, but, as with criminal conviction data, these data might understate the real number of repeat offenders. Per the study, 26% of fraudsters either received no punishment from their employers, were permitted or required to resign, or entered into private settlement agreements (which are typically confidential). Therefore, the true number of repeat offenders might be higher than what is indicated by employment background checks.

FIG. 40 Do perpetrators tend to have prior employment-related disciplinary actions for fraud?

BEHAVIORAL RED FLAGS DISPLAYED BY PERPETRATORS

Individuals who are engaged in occupational fraud schemes often exhibit certain behavioral traits or warning signs associated with their illegal activity. Survey respondents were presented with a list of 17 common behavioral red flags, and they were asked to report on which, if any, of these red flags had been displayed by the perpetrator before the fraud was discovered.

Figure 41 shows the frequency of behavioral red flags in the 2020 cases. The six most common behavioral indicators of occupational fraud were: (1) living beyond means; (2) financial difficulties; (3) unusually close association with a vendor or customer; (4) control issues or an unwillingness to share duties; (5) irritability, suspiciousness, or defensiveness; and (6) a general “wheeler-dealer” attitude (i.e., a person, normally in business or politics, who might work in a dishonest or unfair manner to get what they want). The majority of the aforementioned red flags have been the most common behavioral indicators in every report since the ACFE began tracking these data in 2008.

FIG. 41 How often do perpetrators exhibit behavioral red flags?

CORPORATE GOVERNANCE

The term corporate governance refers to a corporation's government; the term is broadly used to describe the oversight responsibilities of different parties for an organization's direction, operations, and performance. More specifically, the Organisation for Economic Co-operation and Development's (OECD) "Glossary of Statistical Terms" defines *corporate governance* as:

[The] procedures and processes according to which an organisation is directed and controlled. The corporate governance structure specifies the distribution of rights and responsibilities among the different participants in the organisation—such as the board, managers, shareholders and other stakeholders—and lays down the rules and procedures for decision-making.¹

Sir Adrian Cadbury, chairman of the committee that developed the foundational corporate governance guidance, *The Cadbury Report*, stated that the purpose of corporate governance is "to encourage the efficient use of resources and equally to require accountability for the stewardship of those resources. The aim is to align as nearly as possible the interests of individuals, corporations, and society."²

An organization's corporate governance structure provides the lines of accountability and reporting, defines the relationships and expectations of the parties involved, and sets the rules and practices that these parties must follow in executing their responsibilities. The checks-and-balances system of corporate governance ensures that no single party is capable of making all the business decisions without the influence, input, or approval of other parties. Solid corporate governance practices are most necessary in organizations in which a company's owners are not also the individuals responsible for setting its strategy and executing its business activities (e.g., in publicly traded companies).

Who Is Involved in Corporate Governance?

Historically, the concept of corporate governance has centered primarily on the activities of the board of directors. In recent years, however, the concept has expanded to include the rights and responsibilities of all parties across the entire business. Typical parties now considered to be included in the corporate governance structure are:

¹ OECD, "Glossary of Statistical Terms," July 2005. <https://stats.oecd.org/glossary/detail.asp?ID=6778>.

² Sir Adrian Cadbury, *Corporate Governance: A Framework for Implementation* (Foreword), World Bank, 2000.

- The board of directors and its sub-committees
- Management
- Shareholders

Board of Directors

The board is made up of individuals—or directors—who are generally elected by the entity's voting members (e.g., shareholders in the case of a corporation or members in the case of an association). Depending on an organization's structure, type, and location, this body might also be called the board of governors, board of regents, or board of trustees.

Elected directors might be major shareholders or executives of the organization (often referred to as *inside directors*), or they might be completely independent of the organization aside from their role on the board (often referred to as *independent directors* or *outside directors*). The directors represent the intermediaries between the corporation's owners (i.e., shareholders) and those executing its activities (i.e., management), and they act as guardians of the organization's resources and assets. As such, the board oversees business operations by assessing the strategy and underlying purpose of management's decisions and actions.

Board Structure

Board structures vary across countries. Some countries, such as the United States, have a one-tier board system in which the independent and non-independent directors form a single board, the board of directors. In such structures, the board is responsible for all organizational oversight, including strategy and policy formation, management supervision, regulatory compliance, and alignment of shareholder and organizational interests.

Other countries, such as many in the European Union (EU) and Asia, have a two-tier board system. This system features two separate boards—an *executive/management board* and a *supervisory board*—with no common membership permitted between the two. The executive/management board is typically headed by the company chief executive officer (CEO) and composed of company executives and other non-independent directors; this board is responsible for overseeing the company's day-to-day business operations. In contrast, the supervisory board is headed by the chairman and consists solely of independent non-executive directors who are elected by the shareholders. This board performs the monitoring function; it oversees the executive board, as well as management's performance and execution of company policy. The two boards often work together to determine organizational strategy.

Board Selection

Theoretically, the shareholders choose who sits on a board. Shareholders typically submit their votes for directors either at the general shareholder meeting or by proxy statement. Potential board members are primarily nominated by the board as a whole or by its nominating committee; in many jurisdictions, shareholders are also permitted to submit nominees, though there are often restrictions to doing so.

Independent nomination of board members is critical to ensure there are no conflicts of interest, to prevent instances of collusion between board members and management, and to make certain that board members have shareholders' best interests in mind.

CEO as Chairman

Public companies are required to have someone serve as chairman of the board. In some jurisdictions that use the one-tier board system, the norm has been for companies to combine the position of CEO and board chairman (CEO duality). However, concern that this arrangement leads to an inherent conflict of interest has driven many companies to reconsider this dual role.

CEO duality concentrates significant power in the hands of one person by allowing the CEO to undertake the two most important functions of corporate governance—management and oversight. In essence, the CEO is empowered to manage the company's operations while also overseeing the board.

Ideally, two qualified individuals with knowledge of the organization's industry should serve in these roles independently. The advantages of separating these roles include:

- Better alignment with corporate governance best practices
- Improvement of CEO's accountability
- Reduction in CEO's potential conflicts of interest
- More effective board oversight

Board Committees

To aid in oversight of specific issues, the board might delegate members to focused subcommittees. It is considered a best practice for public companies to form at least the following three board committees:

- Audit committee
- Compensation committee
- Nominating committee

Many private companies and nonprofit organizations elect to have these committees as well. Additionally, some boards delegate other committees, such as a governance committee or a risk committee.

AUDIT COMMITTEE

The presence of an audit committee gives stakeholders comfort that an independent body is ensuring the financial statements' integrity. Audit committees are intended to protect investors' interests by taking the lead on oversight responsibilities in the areas of internal controls, financial reporting, audit activities, and compliance. They must meet regularly with key internal parties, such as the chief audit executive (CAE), to discuss identified fraud risks and the steps taken to prevent fraud.

Responsibilities of the audit committee include, but are not limited to:

- Appointing, compensating, and overseeing external auditors
- Reviewing financial reports
- Overseeing the effectiveness of both the design and operation of the company's internal control structure
- Reviewing management's and auditors' reports on internal controls over financial reporting
- Overseeing the company's whistleblower policy and being available to receive tips from potential whistleblowers
- Overseeing the establishment and implementation of the ethical code of conduct
- Evaluating and communicating any possible instances of fraud to the company's legal counsel

To fulfill these responsibilities, it is essential for the audit committee to meet regularly with internal and external auditors. These groups share a common function: assessing and managing fraud risks while maintaining independence from management. During these meetings, the audit committee must engage in candid and open conversations with the external auditors about any known or suspected fraud.

AUDIT COMMITTEE BEST PRACTICES—THE TREADWAY COMMISSION

The National Commission on Fraudulent Financial Reporting (the Treadway Commission) was formed in the United States in 1985 with the purpose of defining the auditor's responsibility in preventing and detecting fraud. Five predominant professional accounting organizations at the time—the American Institute of Certified Public Accountants (AICPA), The Institute of Internal Auditors (IIA), the American Accounting Association (AAA), Financial Executives International (FEI), and the Institute of Management Accountants (IMA)—established the Treadway Commission to underwrite a study and make recommendations.

In an effort to curb fraudulent financial reporting, the Treadway Commission offered the following four recommendations for the audit committee that, in combination with other measures, are designed to reduce the probability of fraud in financial reports:

- *Mandatory independent audit committee*—The Treadway Commission recommended that each board of directors have an audit committee composed of outside directors.
- *Written audit committee charter*—The Treadway Commission also suggested that companies develop a written charter that sets the audit committee's duties and responsibilities. The board of directors should periodically review, modify, and approve this written charter.
- *Adequate audit committee resources and authority*—According to the Treadway Commission, the existence of an audit committee and a written charter is not enough. The committee must also have adequate resources and authority to execute its responsibilities.
- *Informed, vigilant, and effective audit committee members*—The audit committee should be composed of members who are informed, vigilant, and effective.

The principles behind these recommendations have been incorporated into the corporate governance requirements for public companies in many jurisdictions, including the United States; however, these recommendations are foundational best practices for all organizations.

COMPENSATION COMMITTEE

A compensation committee is responsible for determining the compensation and benefits of directors and executives. To be effective, this committee should be composed of independent, outside directors with human resources experience in compensation. Also, the committee should hire compensation consultants who report directly to and are compensated by the committee itself to ensure independence from management.

NOMINATING COMMITTEE

The nominating committee is responsible for identifying, evaluating, and nominating new directors to the board. It also facilitates the election of the new directors by shareholders.

Although management nominates board members as well, an effective nominating committee will take charge in selecting new members to ensure independence.

Responsibilities of the nominating committee include, but are not limited to:

- Reviewing current directors' performance
- Assessing the need for new directors
- Having an objective nominating process for qualified candidates to the board
- Communicating any issues regarding board candidates with shareholders

Management

An organization's management team leads the organization and its employees. Management is responsible for making the day-to-day decisions that affect company performance and, ultimately, shareholder wealth.

The management team is typically led by the CEO and the chief financial officer (CFO). There are often other senior executives as well, such as a chief operating officer (COO), chief information officer (CIO), and a CAE, but these positions differ depending on the organization.

Management's roles pertaining to corporate governance include:

- Establishing strategic goals and operating objectives under the board's oversight
- Directing employees to execute business activities and managing their performance of those tasks
- Determining the use and allocation of company resources and assets
- Evaluating the organization's successes or failures and recalibrating the strategic approach accordingly
- Holding responsibility for the design and operation of the organization's internal controls
- Setting the organization's true ethical tone

Shareholders

Shareholders are the owners of corporations; they can be individual investors or institutional investors, such as pension funds, mutual fund groups, investment trusts, or insurance

companies. Such parties are primarily concerned with maximizing the return on their investment. To that end, shareholders have a responsibility to be actively involved in the corporate governance process. This can include the following:

- Remaining informed on company operations and performance
- Reading annual reports and other communications from management to the shareholders
- Attending shareholder meetings
- Electing capable individuals to serve as board directors
- Holding the board of directors accountable for proper governance and oversight
- Appointing or ratifying the audit committee's appointment of the organization's independent auditors
- Voting on other significant issues, such as specific changes relating to business operations, the company's corporate governance framework, and the rights and responsibilities of the board of directors and executive managers

The Role of Corporate Governance in Fighting Fraud

Effectively fighting fraud requires dedicated, deliberate focus and consideration, including a formal process for oversight by directors and active participation by other stakeholders. As stated in *Fraud Risk Management Guide*, a joint publication by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) and the ACFE, fraud risk governance is one of the principles of effective fraud risk management, and “the board of directors and senior management provide a solid foundation of fraud risk management.”³ *Managing the Business Risk of Fraud: A Practical Guide*, the predecessor to *Fraud Risk Management Guide*, expands this point, noting, “effective governance processes are the foundation of fraud risk management. Lack of effective corporate governance seriously undermines any fraud risk management program.”⁴

The importance of active and committed board participation in the fraud risk management process cannot be overstated. Dedicated and observable fraud risk oversight activities by the board not only set the stage for an internal anti-fraud culture, but they also serve to increase confidence among various stakeholders and to enhance the organization's ethical reputation.

³ The Committee of Sponsoring Organizations of the Treadway Commission (COSO) and the Association of Certified Fraud Examiners (ACFE), *Fraud Risk Management Guide*, September 2016, page 10.
[ACFE.com/fraudrisktools/guide.aspx](https://www.acfe.com/fraudrisktools/guide.aspx).

⁴ The Institute of Internal Auditors, American Institute of Certified Public Accountants, and the Association of Certified Fraud Examiners, *Managing the Business Risk of Fraud: A Practical Guide*, April 28, 2008, page 7.
[ACFE.com/uploadedFiles/ACFE_Website/Content/documents/managing-business-risk.pdf](https://www.acfe.com/uploadedFiles/ACFE_Website/Content/documents/managing-business-risk.pdf).

Such oversight can be delegated to a specific committee, such as the audit committee; however, discussions of the fraud risk management program's design, components, and effectiveness should be formally incorporated into the board or committee's agenda to ensure adequate and purposeful attention is given to this risk. As stated in *Fraud Risk Management Guide*, the committee charged with fraud risk oversight should meet "frequently enough, for long enough periods, and with sufficient preparation, to adequately assess and respond to the risk of fraud, especially management fraud, because such fraud typically involves override of the organization's internal controls."⁵

The crux of fraud prevention rests in the programs, activities, controls, and tone established by management and interpreted and carried out by employees. The board of directors oversees these components and evaluates their holistic effectiveness, and it is up to shareholders to ensure that the board is competent and effectual in exercising this oversight. This interdependence of parties underscores the role of sound corporate governance practices as a necessary groundwork for effective fraud risk management.

Principles of Corporate Governance

Most systems of corporate governance are focused on several core principles or values, which include:

- Accountability
- Transparency
- Fairness
- Responsibility

Accountability

The ownership and reporting structures within an organization set the stage for the involved parties' accountability. In most corporations, the owners (i.e., shareholders) are separate from the decision-makers (i.e., management) and overseers (i.e., board of directors). To make sure that the organization operates effectively and efficiently, there must be mechanisms in place to ensure that management is accountable to the board and that the board is accountable to the shareholders.

⁵ COSO and the ACFE, *Fraud Risk Management Guide*, page 74.

Transparency

Transparency in the context of corporate governance generally refers to the clarity, accuracy, completeness, and timeliness of the financial statements and other information provided by management to shareholders. The organization's governance processes must include policies and procedures designed to ensure transparent disclosure of all material matters that the shareholders need to make timely and informed decisions regarding their investment in the company. An independent audit of the financial statements is one such mechanism that helps meet this objective.

Fairness

Sound corporate governance practices ensure that all stakeholders (e.g., shareholders, creditors, employees, management, and others) are treated equitably and given just and appropriate consideration. In a system where the owners of the company are separate from those employing the owners' investments to conduct business operations, there is an inherently lopsided balance of power. Consequently, corporate governance processes work to eliminate any resulting bias toward any party. For example, minority shareholders, including those owning just a single share of stock, must receive the same rights—including equal protection of those rights, and equal remedies for violations of those rights—as majority shareholders, such as institutional investors.

Responsibility

Responsibility, as it pertains to corporate governance, applies both to the duty of internal parties (e.g., employees, managers, directors, and owners) to act in the best interest of the organization and to the duty of the organization as a whole to act in society's best interest. Both of these considerations include acting within legal, regulatory, and ethical bounds. Responsible corporate governance is reflected in the concepts of corporate ethics and corporate citizenship. These ideas have garnered increased attention in recent years, as evidenced by the growing number of investors focused on socially responsible investing and by the increasing popularity of mutual funds that specialize in *green companies*.

G20/OECD Principles of Corporate Governance

G20/OECD Principles of Corporate Governance (the Principles), a publication by the Organisation for Economic Co-operation and Development (OECD), is regarded as one of the hallmark sources of guidance for corporate governance practices for organizations throughout the world. According to the OECD, the Principles “are intended to help policymakers evaluate and improve the legal, regulatory, and institutional framework for corporate governance with

a view to support economic efficiency, sustainable growth, and financial stability.”⁶ Indeed, policymakers in many countries have used these Principles as a basis for legislative and regulatory corporate governance initiatives.

It is important to note that the Principles are nonbinding, as their implementation must be adapted to different legal, economic, and cultural circumstances. This is a key strength of the Principles that makes them a useful tool worldwide, both in developed economies and in emerging markets. Governments and regulators also need to find a balance between rules and regulations and flexibility. By agreeing on the Principles, OECD governments have established a benchmark for high standards of corporate governance. The legislation needed to enforce these standards is the responsibility of individual governments.

The Principles cover six main areas, which are divided into chapters. The Principles:

- Request that governments have in place an effective legal, regulatory, and institutional framework to support good corporate governance practices (Chapter I).
- Call for a corporate governance framework that protects the exercise of shareholders’ rights and supports the equal treatment of all shareholders, including minority and foreign shareholders (Chapter II).
- Address the effect of institutional investors and other intermediaries in stock markets and the resulting corporate governance implications (Chapter III).
- Recognize the importance of the role of stakeholders in corporate governance (Chapter IV).
- Examine the importance of timely, accurate, and transparent disclosure mechanisms (Chapter V).
- Address board structures, responsibilities, and procedures (Chapter VI).

The following are the main provisions of the Principles.⁷

I. Ensuring the Basis for an Effective Corporate Governance Framework

The corporate governance framework should promote transparent and fair markets and the efficient allocation of resources. It should be consistent with the rule of law and support effective supervision and enforcement.

⁶ Organisation for Economic Co-operation and Development, *G20/OECD Principles of Corporate Governance* (2015). www.oecd.org/corporate/principles-corporate-governance.

⁷ See preceding note.

- A. The corporate governance framework should be developed with a view to its impact on overall economic performance, market integrity, and the incentives it creates for market participants and the promotion of transparent and well-functioning markets.*
- B. The legal and regulatory requirements that affect corporate governance practices should be consistent with the rule of law, transparent, and enforceable.*
- C. The division of responsibilities among different authorities should be clearly articulated and designed to serve the public interest.*
- D. Stock market regulation should support effective corporate governance.*
- E. Supervisory, regulatory, and enforcement authorities should have the authority, integrity, and resources to fulfill their duties in a professional and objective manner. Moreover, their rulings should be timely, transparent, and fully explained.*
- F. Cross-border cooperation should be enhanced, including through bilateral and multilateral arrangements for exchange of information.*

Effective corporate governance requires a sound legal, regulatory, and institutional framework that market participants can rely on when they establish their private contractual relations. This corporate governance framework typically comprises elements of legislation, regulation, self-regulatory arrangements, voluntary commitments, and business practices that are the result of a country's specific circumstances, history, and tradition. The desirable mix between legislation, regulation, self-regulation, voluntary standards, and business practices in this area will therefore vary from country to country.

The corporate governance framework's legislative and regulatory elements can usefully be complemented by soft law elements based on the "comply or explain" principle, such as corporate governance codes, in order to allow for flexibility and address specificities of individual companies. What works well in one company for one investor or a particular stakeholder may not necessarily be generally applicable to corporations, investors, and stakeholders that operate in another context and under different circumstances. As new experiences accrue and business circumstances change, the different provisions of the corporate governance framework should be reviewed and, when necessary, adjusted.

Countries seeking to implement the Principles should monitor their corporate governance framework, including regulatory and listing requirements and business practices, with the objective of maintaining and strengthening their contribution to market integrity and economic performance. As part of this, it is important to take into account the interactions and complementarities between different elements of the corporate governance framework

and its overall ability to promote ethical, responsible, and transparent corporate governance practices. Such analysis should be viewed as an important tool in the process of developing an effective corporate governance framework. To this end, effective and continuous consultation with the public is an essential element. In some jurisdictions, this may need to be complemented by initiatives to inform companies and their stakeholders about the benefits of implementing sound corporate governance practices. Moreover, in developing a corporate governance framework in each jurisdiction, national legislators and regulators should duly consider the need for, and the results from, effective international dialogue and cooperation. If these conditions are met, the corporate governance framework is more likely to avoid over-regulation, support the exercise of entrepreneurship, and limit the risks of damaging conflicts of interest in both the private sector and in public institutions.

II. The Rights and Equitable Treatment of Shareholders and Key Ownership Functions

The corporate governance framework should protect and facilitate the exercise of shareholders' rights and ensure the equitable treatment of all shareholders, including minority and foreign shareholders. All shareholders should have the opportunity to obtain effective redress for violation of their rights.

- A. Basic shareholder rights should include the right to: (1) secure methods of ownership registration; (2) convey or transfer shares; (3) obtain relevant and material information on the corporation on a timely and regular basis; (4) participate and vote in general shareholder meetings; (5) elect and remove members of the board; and (6) share in the profits of the corporation.*
- B. Shareholders should be sufficiently informed about, and have the right to approve or participate in, decisions concerning fundamental corporate changes such as: (1) amendments to the statutes, or articles of incorporation or similar governing documents of the company; (2) the authorization of additional shares; and (3) extraordinary transactions, including the transfer of all or substantially all assets, that in effect result in the sale of the company.*
- C. Shareholders should have the opportunity to participate effectively and vote in general shareholder meetings and should be informed of the rules, including voting procedures, that govern general shareholder meetings:*
 - 1. Shareholders should be furnished with sufficient and timely information concerning the date, location and agenda of general meetings, as well as full and timely information regarding the issues to be decided at the meeting.*
 - 2. Processes and procedures for general shareholder meetings should allow for equitable treatment of all shareholders. Company procedures should not make it unduly difficult or expensive to cast votes.*
 - 3. Shareholders should have the opportunity to ask questions to the board, including questions relating to the annual external audit, to place items on the agenda of general meetings, and to propose resolutions, subject to reasonable limitations.*

4. *Effective shareholder participation in key corporate governance decisions, such as the nomination and election of board members, should be facilitated. Shareholders should be able to make their views known, including through votes at shareholder meetings, on the remuneration of board members and/or key executives, as applicable. The equity component of compensation schemes for board members and employees should be subject to shareholder approval.*
5. *Shareholders should be able to vote in person or in absentia, and equal effect should be given to votes whether cast in person or in absentia.*
6. *Impediments to cross-border voting should be eliminated.*
- D. *Shareholders, including institutional shareholders, should be allowed to consult with each other on issues concerning their basic shareholder rights as defined in the Principles, subject to exceptions to prevent abuse.*
- E. *All shareholders of the same series of a class should be treated equally. Capital structures and arrangements that enable certain shareholders to obtain a degree of influence or control disproportionate to their equity ownership should be disclosed.*
 1. *Within any series of a class, all shares should carry the same rights. All investors should be able to obtain information about the rights attached to all series and classes of shares before they purchase them. Any changes in economic or voting rights should be subject to approval by those classes of shares which are negatively affected.*
 2. *The disclosure of capital structures and control arrangements should be required.*
- F. *Related-party transactions should be approved and conducted in a manner that ensures proper management of conflicts of interest and protects the interest of the company and its shareholders.*
 1. *Conflicts of interest inherent in related-party transactions should be addressed.*
 2. *Members of the board and key executives should be required to disclose to the board whether they, directly, indirectly or on behalf of third parties, have a material interest in any transaction or matter directly affecting the corporation.*
- G. *Minority shareholders should be protected from abusive actions by, or in the interest of, controlling shareholders acting either directly or indirectly, and should have effective means of redress. Abusive self-dealing should be prohibited.*
- H. *Markets for corporate control should be allowed to function in an efficient and transparent manner.*
 1. *The rules and procedures governing the acquisition of corporate control in the capital markets, extraordinary transactions such as mergers, and sales of substantial portions of corporate assets should be clearly articulated and disclosed so that investors understand their rights and recourse. Transactions should occur at transparent prices and under fair conditions that protect the rights of all shareholders according to their class.*
 2. *Anti-take-over devices should not be used to shield management and the board from accountability.*

Equity investors have certain property rights. For example, an equity share in a publicly traded company can be bought, sold, or transferred. An equity share also entitles the investor to participate in the profits of the corporation, with liability limited to the amount of the investment. In addition, ownership of an equity share provides a right to information about the corporation and a right to influence the corporation, primarily by participation in general shareholder meetings and by voting.

As a practical matter, however, the corporation cannot be managed by shareholder referendum. The shareholding body is made up of individuals and institutions whose interests, goals, investment horizons, and capabilities vary. Moreover, the corporation's management must be able to take business decisions rapidly. In light of these realities and the complexity of managing the corporation's affairs in fast-moving and ever-changing markets, shareholders are not expected to assume responsibility for managing corporate activities. The responsibility for corporate strategy and operations is typically placed in the hands of the board and a management team that is selected, motivated, and, when necessary, replaced by the board.

Shareholders' rights to influence the corporation center on certain fundamental issues, such as the election of board members, or other means of influencing the board's composition, amendments to the company's organic documents, approval of extraordinary transactions, and other basic issues as specified in company law and internal company statutes. This Section can be seen as a statement of the most basic rights of shareholders, which are recognized by law in most countries. Additional rights such as the approval or election of auditors, direct nomination of board members, the ability to pledge shares, the approval of distributions of profits, shareholder ability to vote on board member and/or key executive compensation, approval of material related-party transactions, and others have also been established in various jurisdictions.

Investors' confidence that the capital they provide will be protected from misuse or misappropriation by corporate managers, board members, or controlling shareholders is an important factor in the development and proper functioning of capital markets. Corporate boards, managers, and controlling shareholders may have the opportunity to engage in activities that may advance their own interests at the expense of non-controlling shareholders. In providing protection to investors, a distinction can usefully be made between ex-ante and ex-post shareholder rights. *Ex-ante rights* are, for example, pre-emptive rights and qualified majorities for certain decisions. *Ex-post rights* allow the seeking of redress once rights have been violated. In jurisdictions where the enforcement of the legal and regulatory framework is weak,

it can be desirable to strengthen the ex-ante rights of shareholders such as by establishing low share ownership thresholds for placing items on the agenda of the shareholders meeting or by requiring a supermajority of shareholders for certain important decisions. The Principles support equal treatment for foreign and domestic shareholders in corporate governance. They do not address government policies to regulate foreign direct investment.

One of the ways in which shareholders can enforce their rights is to be able to initiate legal and administrative proceedings against management and board members. Experience has shown that an important determinant of the degree to which shareholder rights are protected is whether effective methods exist to obtain redress for grievances at a reasonable cost and without excessive delay. The confidence of minority investors is enhanced when the legal system provides mechanisms for minority shareholders to bring lawsuits when they have reasonable grounds to believe that their rights have been violated. The provision of such enforcement mechanisms is a key responsibility of legislators and regulators.

There is some risk that a legal system which enables any investor to challenge corporate activity in the courts can become prone to excessive litigation. Thus, many legal systems have introduced provisions to protect management and board members against litigation abuse in the form of tests for the sufficiency of shareholder complaints, so-called safe harbors for management and board member actions (such as the business judgment rule), as well as safe harbors for the disclosure of information. In the end, a balance must be struck between allowing investors to seek remedies for infringement of ownership rights and avoiding excessive litigation. Many countries have found that alternative adjudication procedures, such as administrative hearings or arbitration procedures organized by the securities regulators or other regulatory bodies, are an efficient method for dispute settlement, at least at the first instance level. Specialized court procedures can also be a practical instrument to obtain timely injunctions, and ultimately facilitate the rapid settlement of disputes.

III. Institutional Investors, Stock Markets, and Other Intermediaries

The corporate governance framework should provide sound incentives throughout the investment chain and provide for stock markets to function in a way that contributes to good corporate governance.

- A. Institutional investors acting in a fiduciary capacity should disclose their corporate governance and voting policies with respect to their investments, including the procedures that they have in place for deciding on the use of their voting rights.*

- B. Votes should be cast by custodians or nominees in line with the directions of the beneficial owner of the shares.*
- C. Institutional investors acting in a fiduciary capacity should disclose how they manage material conflicts of interest that may affect the exercise of key ownership rights regarding their investments.*
- D. The corporate governance framework should require that proxy advisors, analysts, brokers, rating agencies, and others that provide analysis or advice relevant to decisions by investors, disclose and minimize conflicts of interest that might compromise the integrity of their analysis or advice.*
- E. Insider trading and market manipulation should be prohibited and the applicable rules enforced.*
- F. For companies that are listed in a jurisdiction other than their jurisdiction of incorporation, the applicable corporate governance laws and regulations should be clearly disclosed. In the case of cross-listings, the criteria and procedure for recognizing the listing requirements of the primary listing should be transparent and documented.*
- G. Stock markets should provide fair and efficient price discovery as a means to help promote effective corporate governance.*

To be effective, the legal and regulatory framework for corporate governance must be developed with a view to the economic reality in which it is to be implemented. In many jurisdictions, the real world of corporate governance and ownership is no longer characterized by a straight and uncompromised relationship between the company's performance and the income of the ultimate beneficiaries of shareholdings. In reality, the investment chain is often long and complex, with numerous intermediaries that stand between the ultimate beneficiary and the company. The presence of intermediaries acting as independent decision-makers influences the incentives and the ability to engage in corporate governance.

The share of equity investments held by institutional investors such as mutual funds, pension funds, insurance companies, and hedge funds has increased significantly, and many of their assets are managed by specialized asset managers. The ability and interest of institutional investors and asset managers to engage in corporate governance varies widely. For some, engagement in corporate governance, including the exercise of voting rights, is a natural part of their business model. Others may offer their beneficiaries and clients a business model and investment strategy that does not include or motivate spending resources on active shareholder engagement. If shareholder engagement is not part of the institution's business model and investment strategy, mandatory requirements to engage, for example through voting, may be ineffective and lead to a box-ticking approach.

The Principles recommend that institutional investors disclose their policies with respect to corporate governance. Voting at shareholder meetings is, however, only one channel for shareholder engagement. Direct contact and dialogue with the board and management represent other forms of shareholder engagement that are frequently used. In recent years, some countries have begun to consider adoption of codes on shareholder engagement (“stewardship codes”) that institutional investors are invited to sign up to on a voluntary basis.

IV. The Role of Stakeholders in Corporate Governance

The corporate governance framework should recognize the rights of stakeholders established by law or through mutual agreements and encourage active cooperation between corporations and stakeholders in creating wealth, jobs, and the sustainability of financially sound enterprises.

- A. The rights of stakeholders that are established by law or through mutual agreements are to be respected.*
- B. Where stakeholder interests are protected by law, stakeholders should have the opportunity to obtain effective redress for violation of their rights.*
- C. Mechanisms for employee participation should be permitted to develop.*
- D. Where stakeholders participate in the corporate governance process, they should have access to relevant, sufficient, and reliable information on a timely and regular basis.*
- E. Stakeholders, including individual employees and their representative bodies, should be able to freely communicate their concerns about illegal or unethical practices to the board and to the competent public authorities, and their rights should not be compromised for doing this.*
- F. The corporate governance framework should be complemented by an effective, efficient insolvency framework and by effective enforcement of creditor rights.*

A key aspect of corporate governance is concerned with ensuring the flow of external capital to companies both in the form of equity and credit. Corporate governance is also concerned with finding ways to encourage the various stakeholders in the firm to undertake economically optimal levels of investment in firm-specific human and physical capital. The competitiveness and ultimate success of a corporation is the result of teamwork that embodies contributions from a range of different resource providers, including investors, employees, creditors, customers, suppliers, and other stakeholders. Corporations should recognize that the contributions of stakeholders constitute a valuable resource for building competitive and profitable companies. It is, therefore, in the long-term interest of corporations to foster wealth-creating cooperation among stakeholders. The governance framework should recognize the interests of stakeholders and their contribution to the long-term success of the corporation.

V. Disclosure and Transparency

The corporate governance framework should ensure that timely and accurate disclosure is made on all material matters regarding the corporation, including the financial situation, performance, ownership, and governance of the company.

- A. Disclosure should include, but not be limited to, material information on:*
 - 1. The financial and operating results of the company.*
 - 2. Company objectives and nonfinancial information.*
 - 3. Major share ownership, including beneficial owners, and voting rights.*
 - 4. Remuneration of members of the board and key executives.*
 - 5. Information about board members, including their qualifications, the selection process, other company directorships, and whether they are regarded as independent by the board.*
 - 6. Related-party transactions.*
 - 7. Foreseeable risk factors.*
 - 8. Issues regarding employees and other stakeholders.*
 - 9. Governance structures and policies, including the content of any corporate governance code or policy and the process by which it is implemented.*
- B. Information should be prepared and disclosed in accordance with high-quality standards of accounting and financial and nonfinancial disclosure.*
- C. An annual audit should be conducted by an independent, competent, and qualified auditor in accordance with high-quality auditing standards in order to provide an external and objective assurance to the board and shareholders that the financial statements fairly represent the financial position and performance of the company in all material respects.*
- D. External auditors should be accountable to the shareholders and owe a duty to the company to exercise due professional care in the conduct of the audit.*
- E. Channels for disseminating information should provide for equal, timely, and cost-efficient access to relevant information by users.*

In most countries, a large amount of information, both mandatory and voluntary, is compiled on publicly traded and large unlisted enterprises, and subsequently disseminated to a broad range of users. Public disclosure is typically required, at a minimum, on an annual basis, though some countries require periodic disclosure on a semi-annual or quarterly basis, or even more frequently in the case of material developments affecting the company. Companies often make voluntary disclosures that go beyond minimum disclosure requirements in response to market demand.

The Principles support timely disclosure of all material developments that arise between regular reports. They also support simultaneous reporting of material or required information to all shareholders to ensure their equitable treatment. In maintaining close relations with investors and market participants, companies must be careful not to violate this fundamental principle of equitable treatment.

Disclosure requirements are not expected to place unreasonable administrative or cost burdens on enterprises. Nor are companies expected to disclose information that may endanger their competitive position unless disclosure is necessary to fully inform the investment decision and to avoid misleading the investor. To determine what information should be disclosed at a minimum, many countries apply the concept of materiality. *Material information* can be defined as information whose omission or misstatement could influence the economic decisions taken by users of that information. Material information can also be defined as information that a reasonable investor would consider important in making an investment or voting decision.

A strong disclosure regime that promotes real transparency is a pivotal feature of market-based monitoring of companies and is central to shareholders' ability to exercise their ownership rights on an informed basis. Experience shows that disclosure can also be a powerful tool for influencing the behavior of companies and for protecting investors. A strong disclosure regime can help to attract capital and maintain confidence in the capital markets. By contrast, weak disclosure and non-transparent practices can contribute to unethical behavior and to a loss of market integrity at great cost, not just to the company and its shareholders, but also to the economy as a whole. Shareholders and potential investors require access to regular, reliable, and comparable information in sufficient detail for them to assess the stewardship of management and make informed decisions about the valuation, ownership, and voting of shares. Insufficient or unclear information may hamper the ability of the markets to function, increase the cost of capital, and result in a poor allocation of resources.

Disclosure also helps improve public understanding of the structure and activities of enterprises, corporate policies, and performance with respect to environmental and ethical standards, and companies' relationships with the communities in which they operate. The *OECD Guidelines for Multinational Enterprises* (OECD Guidelines) may be relevant for multinational enterprises in many jurisdictions.

VI. The Responsibilities of the Board

The corporate governance framework should ensure the strategic guidance of the company, the effective monitoring of management by the board, and the board's accountability to the company and the shareholders.

- A. Board members should act on a fully informed basis, in good faith, with due diligence and care, and in the best interest of the company and the shareholders.*
- B. Where board decisions may affect different shareholder groups differently, the board should treat all shareholders fairly.*
- C. The board should apply high ethical standards. It should take into account the interests of stakeholders.*
- D. The board should fulfil certain key functions, including:*
 - 1. Reviewing and guiding corporate strategy, major plans of action, risk management policies and procedures, annual budgets, and business plans; setting performance objectives; monitoring implementation and corporate performance; and overseeing major capital expenditures, acquisitions, and divestitures.*
 - 2. Monitoring the effectiveness of the company's governance practices and making changes as needed.*
 - 3. Selecting, compensating, monitoring, and, when necessary, replacing key executives and overseeing succession planning.*
 - 4. Aligning key executive and board remuneration with the longer-term interests of the company and its shareholders.*
 - 5. Ensuring a formal and transparent board nomination and election process.*
 - 6. Monitoring and managing potential conflicts of interest of management, board members, and shareholders, including misuse of corporate assets and abuse in related-party transactions.*
 - 7. Ensuring the integrity of the corporation's accounting and financial reporting systems, including the independent audit, and that appropriate systems of control are in place, in particular, systems for risk management, financial and operational control, and compliance with the law and relevant standards.*
 - 8. Overseeing the process of disclosure and communications.*
- E. The board should be able to exercise objective independent judgment on corporate affairs.*
 - 1. Boards should consider assigning a sufficient number of non-executive board members capable of exercising independent judgment to tasks where there is a potential for conflict of interest. Examples of such key responsibilities are ensuring the integrity of financial and nonfinancial reporting, the review of related-party transactions, nomination of board members and key executives, and board remuneration.*
 - 2. Boards should consider setting up specialized committees to support the full board in performing its functions, particularly in respect to audit, and, depending upon the company's size and risk profile, also in respect to risk management and remuneration. When committees of the board are established, their mandate, composition, and working procedures should be well defined and disclosed by the board.*

3. *Board members should be able to commit themselves effectively to their responsibilities.*
 4. *Boards should regularly carry out evaluations to appraise their performance and assess whether they possess the right mix of background and competences.*
- F. *In order to fulfil their responsibilities, board members should have access to accurate, relevant, and timely information.*
- G. *When employee representation on the board is mandated, mechanisms should be developed to facilitate access to information and training for employee representatives, so that this representation is exercised effectively and best contributes to the enhancement of board skills, information, and independence.*

Board structures and procedures vary both within and among countries. Some countries have two-tier boards that separate the supervisory function and the management function into different bodies. Such systems typically have a *supervisory board* that is composed of non-executive board members and a *management board* that is composed entirely of executives. Other countries have *unitary boards*, which bring together executive and non-executive board members. In some countries there is also an additional statutory body for audit purposes. The Principles are intended to apply to whatever board structure is charged with the functions of governing the enterprise and monitoring management.

Together with guiding corporate strategy, the board is chiefly responsible for monitoring managerial performance and achieving an adequate return for shareholders, while preventing conflicts of interest and balancing competing demands on the corporation. In order for boards to effectively fulfill their responsibilities, they must be able to exercise objective and independent judgment. Another important board responsibility is to oversee the risk management system and systems designed to ensure that the corporation obeys applicable laws, including tax, competition, labor, environmental, equal opportunity, health, and safety laws. In some countries, companies have found it useful to explicitly articulate the responsibilities that the board assumes and those for which management is accountable.

The board is not only accountable to the company and its shareholders but also has a duty to act in their best interests. In addition, boards are expected to take due regard of, and deal fairly with, other stakeholder interests including those of employees, creditors, customers, suppliers, and local communities. Observance of environmental and social standards is relevant in this context.

Establishing a Corporate Governance Framework

In its *G20/OECD Principles of Corporate Governance* (the Principles), the Organisation for Economic Co-operation and Development (OECD) states that “there is no single model of good corporate governance.”⁸ Consequently, corporate governance structure and practices vary widely and should be determined based on each organization’s specific needs.

In developing a corporate governance framework for an organization, directors and management must consider the legal, regulatory, institutional, and ethical environments in which the company operates. Additionally, good corporate governance is fluid—that is, it maintains the ability to find a different course when its current direction runs into barriers, such as changes in the corporate landscape, new regulations or legal requirements, or shifts in organizational strategy.

Even while remaining adaptable, sound corporate governance is based on established best practices. As increased attention has been provided to the need for strong corporate governance, several models have been produced to outline such best practices and to provide guidance for directors, managers, and other stakeholders in establishing sound governance policies and practices for their organizations. Such models generally take a country- or region-specific approach to reflect the differing regulatory, legal, and institutional realities of various operating environments.

Sources of Corporate Governance Guidance

Although there is not a universal law or set of rules for corporate governance, legislators, regulators, and other bodies around the world have issued guidance that provides best practices and requirements that organizations should enact as appropriate.

General Guidelines and Best Practices

For organizations seeking to implement, improve, or benchmark their own corporate governance approaches, several sources of guidance provide best practices in this area. As discussed earlier in the chapter, *G20/OECD Principles of Corporate Governance* (the Principles) provides a nonbinding foundational corporate governance framework for organizations throughout the world. In addition, the International Organization for Standardization

⁸ Organisation for Economic Co-operation and Development, *G20/OECD Principles of Corporate Governance* (2015), page 10.

(ISO)—a global leader in issuing standards—is in the process of developing a new standard, *ISO 37000: Guidance for the Governance of Organizations*, that will provide “key principles, relevant practices, and a framework” for the governance of organizations of all types and sizes.⁹

Other bodies have also issued nonbinding guidance to help companies formulate a sound corporate governance framework and strategy. Some of these include:

- The International Corporate Governance Network’s *Global Governance Principles* (www.icgn.org/policy)
- The Business Roundtable’s *Principles of Corporate Governance* (www.businessroundtable.org/policy-perspectives/corporate-governance)
- The Conference Board’s *Commission on Public Trust and Private Enterprise* (www.conference-board.org/pdf_free/SR-03-04-ES.pdf)

Country-Specific Corporate Governance Requirements and Guidelines

In many jurisdictions, organizations—particularly those that are publicly traded—are subject to specific corporate governance requirements. These requirements might take the form of legislation (e.g., the U.S. Sarbanes-Oxley Act of 2002 [SOX] and similar legislation in Japan, Canada, Turkey, and other countries) or as conditions set for companies listed on stock exchanges (e.g., the New York Stock Exchange [NYSE] Listed Company Manual, the UK Corporate Governance Code, and the King Code in South Africa). Therefore, companies should be familiar with the existing guidance specific to all the regions in which they operate, and those charged with governance should ensure compliance with the laws and regulations governing their organization.

The European Corporate Governance Institute (ECGI) provides a comprehensive index of corporate governance codes by country, which can be extremely helpful in identifying the pertinent governance guidelines. This index is available at the following website:

<https://ecgi.global/content/codes>. Additionally, the Organisation for Economic Co-operation and Development (OECD) has published *Corporate Governance Factbook*, which outlines the legal and regulatory frameworks for corporate governance in the 49 countries that are OECD, G20, and Financial Stability Board members. The factbook can be found at the following website: www.oecd.org/corporate/Corporate-Governance-Factbook.pdf.

⁹ *ISO 37000: Guidance for the Governance of Organizations* is expected to be released in Q2 2021. More information on this standard is available at <https://committee.iso.org/sites/tc309/home/projects/ongoing/ongoing-1.html>.

For additional information regarding specific corporate governance requirements and guidance in the United States, see the content on “Corporate Governance Codes and Guidance” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

MANAGEMENT'S FRAUD-RELATED RESPONSIBILITIES

While many parties—including the board of directors, internal auditors, and external auditors—have an important role in combatting fraud, management is ultimately responsible for the prevention and detection of fraud within an organization. This means that it is management who holds the primary responsibility for:

- Designing, implementing, overseeing, and ensuring the effectiveness of the anti-fraud program
- Setting the organization's ethical tone and reinforcing an anti-fraud culture
- Demonstrating that fraud will not be tolerated at any level
- Responding appropriately to instances of fraud

This chapter explores management's specific requirements in carrying out these responsibilities. (Further details regarding the implementation and components of fraud prevention programs are discussed in the "Fraud Prevention Programs" chapter in this section of the *Fraud Examiners Manual*.)

Some additional country-specific information that might not pertain to a global audience can be found in the "Supplemental Regional Information" section of this chapter located on fraudexaminersmanual.com.

The Legal Foundation for Management's Fraud-Related Responsibilities

Vicarious or Imputed Liability

Corporations and other organizations can be held liable for criminal acts committed as a matter of organizational policy. Fortunately, most organizations do not expressly set out to break the law. The specific legal terms and extent of the organization's liability vary by jurisdiction; however, corporations and other organizations might also be held liable for the criminal acts of their employees if those acts are *done in the course and scope of their employment* and *for the ostensible purpose of benefiting the corporation*. An employee's acts are generally considered to be in the course and scope of employment if the employee has *actual authority* or *apparent authority* to engage in those acts. *Apparent authority* means that a third party would reasonably believe the employee is authorized to perform the act on behalf of the company. Therefore, an organization could be held liable for something an employee does on behalf of the organization even if the employee is not authorized to perform that act.

An organization will not be vicariously liable for the acts of an employee unless the employee acted for the ostensible purpose of benefiting the corporation. This does not mean that the corporation has to receive an actual benefit from the illegal acts of its employee. All that is required is that the employee *intended* to benefit the corporation.

A company cannot seek to avoid vicarious liability for the acts of its employees by simply claiming that it did not know what was going on. Legally speaking, an organization is deemed to have knowledge of all facts known by its officers and employees. That is, if the government can prove that an officer or employee knew of conduct that raised a question as to the company's liability, and the government can show that the company willfully failed to act to correct the situation, then the company may be held liable even if senior management had no knowledge or suspicion of the wrongdoing.

In addition, the evolving legal principle of *conscious avoidance* allows the government to prove the employer had knowledge of a particular fact, which establishes liability by showing that the employer knew there was a high probability the fact existed and consciously avoided confirming the fact. Employers cannot simply pretend not to notice when there is reason to believe that there might be criminal conduct within the organization. If steps are not taken to deter the activity, the company itself may be found liable.

The corporation can generally be held criminally responsible *even if those in management had no knowledge of or participation in* the underlying criminal events and even if there were specific policies or instructions prohibiting the activity undertaken by the employees. The acts of any employee, from the lowest clerk to the chief executive officer (CEO), can impute liability upon a corporation. In fact, in many jurisdictions, a corporation can be criminally responsible for the *collective knowledge* of several of its employees even if no single employee intended to commit an offense.

Management's Responsibility for Internal Controls

It is management's job to ensure that proper internal controls are in place to prevent fraud, as well as to detect it. Although management might not execute all of the controls—as the performance of internal control functions are generally spread across individuals throughout the entire organization, including individual contributors, management, and even the board of directors—management is also responsible for monitoring and remediating internal controls to ensure they are effectively designed and operating to prevent and detect fraud.

COSO *Internal Control—Integrated Framework*

The National Commission on Fraudulent Financial Reporting (the Treadway Commission) was established in 1985 with the purpose of defining the responsibility of the auditor in preventing and detecting fraud. The commission was formed and sponsored by five predominant professional auditing organizations at the time—the American Institute of Certified Public Accountants (AICPA), The Institute of Internal Auditors (IIA), the American Accounting Association (AAA), Financial Executives International (FEI), and the Institute of Management Accountants (IMA).

In 1987, the Treadway Commission recommended that the five professional accounting organizations sponsoring the commission work together to provide guidance for organizations' internal controls. The Committee of Sponsoring Organizations of the Treadway Commission (COSO) was formed to actualize the Treadway Commission's recommendation, and, in 1992, COSO issued its *Internal Control—Integrated Framework* (the Framework). The Framework, which is meant to apply to all entities—public and private, regardless of size—was revisited and amended in 2012, and an updated Framework was released in 2013. The following section provides an overview of the Framework as provided in COSO's executive summary.¹

According to the Framework, "Internal control is a process, effected by an entity's board of directors, management, and other personnel, designed to provide reasonable assurance regarding the achievement of objectives relating to operations, reporting, and compliance." As noted in this definition, internal controls should be designed to assist management in meeting the following three categories of objectives:

- *Operations objectives*, which pertain to the effectiveness and efficiency of the organization's operations
- *Reporting objectives*, which pertain to the reporting of financial and nonfinancial information to internal and external parties
- *Compliance objectives*, which pertain to the organization's adherence to the laws and the regulations to which it is subject

To meet these objectives, the Framework identifies five interrelated components of internal control: control environment, risk assessment, control activities, information and communication, and monitoring. Across the five integrated components are seventeen

¹ Available at www.coso.org/Documents/990025P-Executive-Summary-final-may20.pdf.

principles that encompass fundamental concepts involved in an effective system of internal control. Consequently, the effectiveness of internal controls can be determined from an assessment of whether (1) each of these five components is in place and functioning effectively and (2) the five components are operating together in an integrated manner.

Control Environment

The *control environment* provides the foundation for the internal control system throughout the entire organization. Established by the directors and senior management, it sets the moral and ethical tone of an organization, which reinforces the importance of internal controls and expected standards of conduct.

COSO provides five principles supporting the design and implementation of an effective control environment:

1. Personnel at all levels demonstrate a commitment to integrity and ethical values.
2. The board of directors is independent from management and oversees the development and performance of internal control.
3. With board oversight, management establishes the structures, reporting lines, and appropriate authorities and responsibilities in the pursuit of organizational objectives.
4. The organization demonstrates a commitment to attract, develop, and retain competent individuals in alignment with objectives.
5. The organization holds individuals accountable for their internal control responsibilities in the pursuit of objectives.

Risk Assessment

According to the COSO Framework, "Every entity faces a variety of risks from external and internal sources. *Risk* is defined as the possibility that an event will occur and adversely affect the achievement of objectives." *Risk assessment* involves the identification and assessment of the risks the entity faces in achieving its organizational objectives. This process is dynamic and iterative, and it forms the basis for determining how risks will be managed.

According to COSO, the risk assessment involves the following principles:

1. The organization sets sufficiently clear objectives to enable the identification and assessment of risks relating to the objectives.
2. The organization identifies risks to the achievement of its objectives across the entity and analyzes these risks as a basis for determining how the risks should be managed.

3. The organization considers the potential for fraud in assessing risks to the achievement of objectives.
4. The organization identifies and assesses changes that could significantly impact the system of internal control.

Control Activities

Control activities are the policies and procedures that enforce management's directives intended to mitigate risk. These actions are performed at all levels of the organization, at all stages of business processes, and through both manual and automated procedures. They can be designed to prevent the occurrence of risks, detect the occurrence of risks, or both.

The following principles pertain to an organization's control activities:

1. The organization selects and develops control activities that mitigate risks to the achievement of objectives to acceptable levels.
2. The organization selects and develops general control activities over technology to support the achievement of objectives.
3. The organization deploys control activities through policies that establish what is expected and procedures that put policies into action.

Information and Communication

The *information and communication* component relates to the exchange of information in a way that allows employees to carry out their internal control responsibilities and achieve the organization's objectives. According to COSO, the following principles pertain to this component:

1. The organization obtains or generates and uses relevant, quality information to support the functioning of internal control.
2. The organization internally communicates information—including objectives and responsibilities for internal control—necessary to support the functioning of internal control.
3. The organization communicates with external parties regarding matters affecting the functioning of internal control.

Monitoring

Monitoring is the process that assesses the effectiveness of a control system over time. This component should include both ongoing, automated evaluations and periodic, separate evaluations, the findings of which should be evaluated against predefined criteria. The following are the Framework principles supporting this component:

1. The organization selects, develops, and performs ongoing and/or separate evaluations to ascertain whether the components of internal control are present and functioning.
2. The organization evaluates and communicates internal control deficiencies in a timely manner to those parties responsible for taking corrective action, including senior management and the board of directors, as appropriate.

More information on the COSO reports and guidance can be found at www.coso.org.

Management's Responsibility for an Effective Compliance and Ethics Program

The U.S. Sentencing Commission (USSC) began a study of sanctions for corporate wrongdoing and the disparities that existed for punishing organizations. The findings promulgated a new chapter in the already existing *Guidelines Manual* that specifically applied to the sentencing of organizational offenders; the U.S. Sentencing Guidelines (USSG) for organizations (the Organizational Guidelines) have been included in the *Guidelines Manual* since 1991.

The Organizational Guidelines are designed to provide incentives for organizations to maintain internal mechanisms for preventing, detecting, and reporting criminal conduct. Specifically, under the Organizational Guidelines, if a convicted organization has an effective compliance program in place at the time of the offense, the sentencing judge will consider the organization's acts of due diligence in trying to prevent the illegality when deciding whether to increase or mitigate the sentence. The Organizational Guidelines define an *effective compliance program* as one that is reasonably designed, implemented, and enforced so that it generally will be effective in preventing and detecting criminal conduct. However, the Organizational Guidelines also provide that the failure to prevent or detect the offense in question does not necessarily mean that the program is ineffective.

Corporations in the United States that wish to take advantage of the mitigation provisions of the Organizational Guidelines must implement a *corporate compliance program*. While the Organizational Guidelines do not apply to non-U.S. organizations, many governments and agencies in other countries recommend that corporations use this model when developing their own compliance programs.

As provided by the Organizational Guidelines, to have an "effective compliance and ethics program," the organization shall:

- Exercise due diligence to prevent and detect criminal conduct.
- Otherwise promote an organizational culture that encourages ethical conduct and a commitment to compliance with the law.

In designing such a program, certain factors must be considered by each organization:

- *Applicable industry size and practice*—An organization's failure to incorporate and follow industry practice or the standards called for by any applicable government regulation adversely affects a finding that the program is effective.
- *Size of the organization*—Large organizations are expected to devote more formal operations and greater resources to meeting the requirements than small organizations. For example, smaller organizations may use available personnel rather than employ separate staff to carry out ethics and compliance.
- *Recurrence of similar misconduct*—The recurrence of a similar event creates doubt as to whether the organization took reasonable steps to meet the requirements.

To meet the two requirements of due diligence and promotion of an ethical culture, the Organizational Guidelines set forth seven factors that are minimally required for such a program to be considered effective:

1. The organization must have established standards and procedures to prevent and detect criminal conduct.
2. Item 2 has three specific subparts:
 - a. The organization's governing authority shall be knowledgeable about the content and operation of the compliance and ethics program and shall exercise reasonable oversight with respect to implementation and effectiveness of the compliance and ethics program.
 - b. High-level personnel shall ensure that the organization has an effective compliance and ethics program, and specific individual(s) within the organization shall be assigned overall responsibility for the compliance and ethics program.
 - c. Specific individual(s) within the organization shall be delegated day-to-day operational responsibility for the compliance and ethics program. These individuals shall report periodically to high-level personnel and, as appropriate, to the governing authority (or a subgroup thereof) on the effectiveness of the program. It is also required that these specific individuals be given adequate resources and authority to accomplish their responsibilities and be given direct access to the governing authority.

3. The organization shall use reasonable efforts not to include within the substantial authority personnel any individual whom the organization knew, or should have known, has engaged in illegal activities or other conducts inconsistent with an effective compliance and ethics program.
4. Item 4 has two subparts:
 - a. The organization shall take reasonable steps to communicate periodically and in a practical manner its standards and procedures, and other aspects of the compliance and ethics program, to the individuals referred to in subpart (b) below by conducting effective training programs and otherwise disseminating information appropriate to such individuals' respective roles and responsibilities.
 - b. The individuals referred to in subpart (a) above are the members of the governing authority, high-level personnel, substantial authority personnel, the organization's employees, and, as appropriate, the organization's agents.
5. The organization shall take reasonable steps to accomplish the following:
 - a. Ensure that the organization's compliance and ethics program is followed, including monitoring and auditing to detect criminal conduct.
 - b. Evaluate periodically the effectiveness of the organization's compliance and ethics program.
 - c. Have and publicize a system, which may include mechanisms that allow for anonymity or confidentiality, whereby the organization's employees and agents may report or seek guidance regarding potential or actual criminal conduct without fear of retaliation.
6. The organization's compliance and ethics program shall be promoted and enforced consistently throughout the organization through (1) appropriate incentives to perform in accordance with the program and (2) appropriate disciplinary measures for engaging in criminal conduct and for failing to take reasonable steps to prevent or detect criminal conduct.
7. After criminal conduct has been detected, the organization shall take reasonable steps to respond appropriately to the criminal conduct and to prevent further similar criminal conduct, including making any necessary modifications to the organization's compliance and ethics program.

The following are some tips and suggestions for developing a compliance and ethics program that complies with these seven requirements.

Establishing Standards

The first step is to establish standards and procedures that are reasonably capable of preventing and detecting criminal conduct. One should start by producing a clear statement of management philosophy. This statement will serve as the foundation of all compliance procedures. This is similar to the Committee of Sponsoring Organizations of the Treadway Commission's (COSO) requirement that management must set the ethical tone for the organization.

Organizations should draft clear, concise compliance standards that are consistent with management's ethics policy and are relevant to business operations.

Assigning Responsibility

The Organizational Guidelines require that the company's governing authority be knowledgeable about the content and operation of the compliance and ethics program and exercise reasonable oversight with respect to the program's implementation and effectiveness. *Governing authority* is defined as the board of directors or, if the organization does not have a board of directors, the organization's highest-level governing body.

It is also required that *high-level personnel* shall ensure that the company has an effective program and that specific individuals within this group be assigned the overall responsibility for the program.

High-level personnel are those who have "substantial control over the organization or who have a substantial role in the making of policy within the organization." Specific examples of high-level personnel include:

- Directors
- Executive officers
- Individuals in charge of major business or functional units of the organization
- Individuals with substantial ownership interests in the organization

Audit Committees

If a board of directors exists, such as in a public company, the board must be knowledgeable about the content and operation of the compliance program and oversee its implementation. Accordingly, it is preferable for the board of directors or one of the board's committees to control the organization's compliance program. For instance, many companies place their

compliance programs under the control of audit committees. There are four principal benefits to this practice:

- The involvement of the board of directors provides a sense of authority to the compliance program. It clearly identifies the program as a matter of company policy.
- The involvement of a board committee provides oversight to the operation of the program by personnel who are not involved in the program's day-to-day operation.
- Efforts to implement an effective compliance program can be documented in the committee's meeting minutes. This documentation can prove useful if the company ever has to defend its actions and seek mitigation of a criminal fine.
- The involvement of those board members who are on the audit committee will help ensure that the board is knowledgeable about the content and operation of the compliance program.

Although the board and the officers may delegate the day-to-day operational responsibility for the program to other individuals (e.g., a compliance officer and their staff), these individuals must report periodically to the board or other high-level personnel regarding the effectiveness of the program. They must also have sufficient authority to ensure that compliance standards are strictly adhered to, as well as adequate resources to implement and monitor the program.

Due Diligence in Hiring

The USSG require that the organization “use reasonable efforts not to include within the substantial authority personnel of the organization any individual whom the organization knew, or should have known through the exercise of due diligence, has engaged in illegal activities or other conduct inconsistent with an effective compliance and ethics program.”

Substantial authority personnel is defined as “individuals who exercise a substantial measure of discretion in acting on behalf of an organization.” The term includes high-level personnel of the organization, individuals who exercise substantial supervisory authority (e.g., a plant manager or a sales manager), and any other individuals who, although not a part of an organization's management, nevertheless exercise substantial discretion when acting within the scope of their authority (e.g., an individual with authority in an organization to negotiate or set price levels or an individual authorized to negotiate or approve significant contracts). Whether an individual falls within this category must be determined on a case-by-case basis.

Like COSO, the USSG require that organizations hire ethical employees. This requires careful screening of applicants, thorough background checks (where permitted by law), and effective monitoring of the performance of current employees. Although the USSG only require such screening for “substantial authority personnel,” it is recommended that such screening be adopted for all employees.

Communicating the Policy

The corporate compliance policy should be communicated to everyone who can potentially bind a corporation through their own misconduct. This includes the following:

- Board of directors
- Executive officers
- Managers and supervisors
- Low-level employees
- Independent contractors

Note in particular that organizations can be held liable for the acts of independent contractors if the contractor is acting for the benefit of the organization. It is therefore important to distribute copies of the compliance program to contractors as well as employees.

Training Employees

Organizations must conduct “effective training programs.” This includes periodically and appropriately communicating the program’s compliance requirements and procedures to all employees affected by the program, including upper-level personnel. These programs should be designed to inform employees about the company’s stance on corporate compliance. They should also inform employees about what kinds of acts and omissions are prohibited by law and by the organization. The training should be designed to help employees identify and avoid situations that could lead to criminal conduct. Common training techniques include:

- Lectures
- Training films
- Interactive workshops
- Computer-based courses

Employees should be trained to understand the organization’s ethical policy. They should also be trained to identify potentially compromising situations and learn how to avoid them. This training should be tailored to the nature of the organization’s business, taking into account

the external and internal risks that are inherent in that business. Training should also include a review of statutes and regulations that are particularly applicable to the organization.

Training should not be a one-time event. Simply handing out a copy of the company's compliance policy at the beginning of an employee's tenure is insufficient. Organizations should stress compliance by regularly emphasizing their standards to all personnel. For example, many companies disseminate a copy of their ethics policies every six months along with employee paychecks.

Achieving Compliance

An organization is required to take reasonable measures to ensure program compliance through monitoring, auditing, periodically evaluating the program's effectiveness, and having a publicized reporting system whereby employees and agents may retain anonymity or confidentiality when reporting or seeking guidance regarding actual or potential illegal conduct without fear of retribution. These include such things as proactive fraud detection and hotlines, which are discussed in more detail in the "Fraud Prevention Programs" chapter.

Disciplinary Action

Enforcing a compliance program means adhering to a system of disciplinary actions for rule breakers. Employees must know that if they violate the company's compliance policy, they will be punished. The opportunity to commit fraud is psychologically more acceptable when employees believe fraud normally goes undetected and unprosecuted. New employees should be advised of the compliance program at the time of hire and should sign an annual statement acknowledging their understanding of it. The range of possible punishments for violations of the policy should be spelled out. These may include:

- Reprimand
- Probation
- Suspension
- Reduction in salary
- Demotion
- Reimbursement of losses or damages
- Dismissal
- Referral for criminal prosecution or civil action
- A combination of the above

In addition, the USSC guidelines recommend the discipline of individuals who are responsible for failing to detect offenses.

The primary purpose of any compliance program is to prevent criminal conduct. Additionally, in many jurisdictions, there is also a secondary purpose: to mitigate potential fines for criminal conduct by showing that the organization is dedicated to preventing illegal activity. If an organization does not enforce its compliance program, it will have little chance of mitigating fines. Therefore, organizations should adhere to well-defined procedures when investigating potential violations and when disciplining individuals for offenses. The organization's efforts should be documented so that it can prove that it made every effort to enforce compliance. For every allegation of an offense, the company should maintain:

- An account of the alleged offense
- A description of the steps taken to investigate the allegation
- A description of the actions taken by the organization in response to the violation

Members of management should promote their organization's compliance and ethics program through appropriate incentives that encourage employees to perform in accordance with the program. Such incentives can include rewards for reporting ethical concerns or misconduct, or rewards for ideas for new or innovative detection and monitoring methods.

Appropriate Responses

After detection of an offense, the organization must take all reasonable steps to appropriately respond to this offense and to prevent further similar offenses—including modifying its program and administering appropriate discipline for the individuals responsible for the offense and those who failed to detect it. When a control failure is identified, changes might be necessary. Both COSO and the USSG require organizations to identify the weakness in the control system and make modifications to prevent similar failures in the future. The USSG require that organizations explain the modifications they have made and demonstrate why they will be effective.

As part of its response to an offense, the organization should consider the following steps:

- Provide restitution to identified victims or otherwise remedy the harm resulting from the criminal conduct.
- Self-report the violation to and cooperate with relevant authorities.
- Appraise and, if needed, alter its compliance program to be more effective, including potentially retaining an autonomous monitor to guarantee sufficient appraisal and application of these changes.

Periodic Assessment

Organizations must also periodically assess the risk that criminal conduct will occur and modify its actions and its compliance and ethics program accordingly. In doing so, the organization should assess the following:

- The nature and seriousness of criminal conduct that could occur
- The likelihood that certain criminal conduct might occur because of the nature of the organization's business
- The prior history of the organization, which might indicate the types of criminal conduct that the company should be trying to prevent

As part of this periodic assessment, the organization should also monitor the nature and operations of its ethics and compliance functions.²

Relation of COSO and the United States Sentencing Guidelines

The USSG and COSO focus on the development of a stronger control system. The USSG contain explicit requirements for an effective control program. COSO does not mandate specific actions. It only provides illustrations of what constitutes a strong control system. The seven minimum requirements of the USSG are covered within the COSO system. The following table summarizes the relation between the components of the two pronouncements.

² Sentencing Guidelines for U.S. Courts, 75 FR 3535.

Components	COSO <i>Internal Control—Integrated Framework</i>	U.S. Sentencing Guidelines
Control Environment	• Ethical tone at the top • Organizational structure, including key areas of authority and reporting lines • Policies—both formal and informal—to reward ethical conduct and punish unethical actions • Mechanism and support for employee reporting • HR policies to ensure hiring and promotion of those who demonstrate integrity • Consistent and appropriate discipline	• Code of conduct • Promote a culture that encourages ethical conduct and compliance • Knowledgeable governing authority with reasonable oversight • High-level personnel assigned overall responsibility for the program • Incentives to promote proper conduct and discourage improper conduct • Reporting mechanisms for employees and agents • Prohibit retaliation against those who make good faith reports of suspected violations • Due diligence to avoid delegation of authority to those with criminal tendencies • Consistent and appropriate discipline
Risk Assessment	• Identification and analysis of risks related to operations, financial reporting, and compliance • A strategy to manage risks • Tailoring ethics and compliance programs to the specifics of the organization	• Develop compliance standards and procedures using risk assessment • Periodic assessments of compliance and ethics risk • Incentives to maintain internal controls • Identification of industry-specific compliance risks
Control Activities	• Policies and procedures to help ensure that management's directives are followed • Activities to ensure fraud risks are addressed	• Standards and procedures capable of reducing the prospect of criminal conduct • Determination of modifications needed to prevent future problems

Information and Communication	• Methods used to identify, capture, classify, and report pertinent information in an appropriate format and time frame • Communication of roles and responsibilities pertaining to internal control	• Effective communication of standards and procedures to all employees and other agents • Required participation in compliance and ethics training programs • Compliance and ethics training and communications that are ongoing, updated, and appropriate to each group of employees
Monitoring	• Ongoing assessment of the internal control system • Actions to correct and remediate any deficiencies	• Use of monitoring and auditing systems designed to detect criminal conduct • Periodic evaluation of program effectiveness • After discovering misconduct, take reasonable steps to remedy the harm caused (e.g., provide restitution to victims and self-reporting and cooperation with authorities) • Respond to identified offenses by assessing the compliance program and making necessary modifications to prevent future problems

Document Retention Policies

An organization's management should ensure that the organization has a proper and effective document retention policy (DRP) in place. When establishing a DRP, it is imperative that the organization consider all applicable laws and regulations regarding recordkeeping requirements. In many jurisdictions, industries such as health care, banking, and auditing contain trade-specific rules for documenting and retaining records. Furthermore, companies should continuously check for legal updates concerning these requirements. To have a DRP that ignores pertinent recordkeeping requirements could lead to statutory violations.

An effective DRP requires that a company (1) establish retention protocols before it foresees litigation or official investigation; (2) develop, review, and/or amend a policy for compliance with the applicable laws and regulations; (3) ensure the reasonableness of the policy according to the company's business practices; (4) provide a concise explanation of

what is to be destroyed and when; (5) provide adequate protocols for management of electronic documents; and (6) clearly set forth when the policy should be immobilized due to a pending investigation or foreseeable litigation.

Because industries vary significantly in the types of documents produced, received, and distributed, courts often lean toward a subjective “reasonableness” standard in determining whether a particular policy is adequate. Thus, each company must develop a policy that is specifically tailored to its business practices. A company may find it helpful to refer to retention policies of other companies for guidance, but it should avoid duplicating such policies. By establishing individual business policies and compartmentalizing low-value and high-value documents, companies can gain quick access to internal documents. A properly planned and executed DRP will do little good if individuals within the company are unaware of it. Not only must employees be aware of the policy, they must also understand what is to be destroyed and when.

It is vital that companies include protocols for preserving and destroying electronic documents. Companies should work with their IT departments to develop procedures for handling electronic data. Company counsel, executives, and managers should be aware of how electronic data are stored and destroyed. For example, an email deleted by an employee may remain in the company's computer system until an administrator permanently deletes it. Such situations must be recognized and addressed when designing a DRP.

What Documents Should Be Kept?

Obviously, one of the first steps must be to identify the types of documents that need to be retained or destroyed. It is important to remember that every organization is different; thus, an organization may require the retention of documents that are not provided for in this text. All types of documents produced by an organization must be initially accounted for. This includes tangible and electronic documents and is never limited to financial documents. Accounting records, corporate tax records, bank records, employment records, various workplace records (including in-house emails and client correspondence), and legal records must be considered when constructing a DRP for a particular organization.

Other factors to consider in identifying documents include stakeholders' expectations, tax regulations, and internal factors (such as changes in the Board of Directors, Board resolutions, patents, or copyrights).

Records typically generated by a company that reflect or materially relate to professional services must also be identified in the DRP. For example, accounting and auditing firms should mention the retention and destruction of documents that make up client files, such as client billing and payment records, correspondence, and time records.

Document Storage

Whether stored on electronic media or in file cabinets, and whether stored in-house or with a document storage company, documents must remain safe (for confidentiality and destruction purposes) and be easily accessible in the event of potential litigation and legal requests for documents.

Document Destruction

An organization must cease destruction of documents when faced with potential litigation or when a legal document request is pending or imminent. Destruction under a valid DRP will be ineffective if documents were not actually destroyed before a potential litigation trigger occurs. Thus, it is imperative that the DRP provides for complete destruction of documents that can be validly destroyed during the proper periods under the policy. Documents should be destroyed by shredding or by some other means that will render them unreadable. Similarly, a protocol for the destruction of electronic data should be in place to ensure that documents to be destroyed are actually destroyed. The deletion of emails or other files on one's computer does not mean that such records are removed from evidence.

DRP Managers

Finally, in order to properly execute a DRP, someone with detailed knowledge of the DRP should be in charge of the policy and should ensure that employees understand and follow it as designed. This individual should be a senior-level employee with the power to enforce the policy. A DRP manager is responsible for:

- Implementing the DRP
- Ensuring that employees understand and follow the DRP's purpose
- Providing oversight on actual retention and destruction of documents
- Ensuring proper storage of documents
- Periodically following up with counsel to ensure proper retention periods are in place
- Suspending the destruction of documents upon foreseeable litigation
- Informing corporate officers, directors, and employees of changes in relation to the DRP

AUDITORS' FRAUD-RELATED RESPONSIBILITIES

Auditors have specific responsibilities with respect to the prevention and detection of fraud. However, auditors' fraud-related responsibilities can differ depending on the type of engagement they are performing and the professional roles of the people performing the audit. This chapter of the *Fraud Examiners Manual* describes the regulations, professional standards, and best practices guidance that govern auditors in different capacities when executing their anti-fraud responsibilities.

Some additional country-specific information that might not pertain to a global audience can be found in the "Supplemental Regional Information" section of this chapter located on fraudexaminersmanual.com.

External Auditors' Fraud-Related Responsibilities

The purpose of an external audit of an organization's financial statements is to attest to whether, in the auditor's opinion, the statements provide a fair and true representation of the organization's financial situation. Thus, while the external auditor must consider whether and how fraud might affect the financial statements, the main goal of an independent, external audit is not specifically to detect fraud that might be occurring within the organization being audited.

External auditors must adhere to specific auditing standards when conducting their audit engagements. While there is no one single set of global auditing standards, the International Federation of Accountants (IFAC) has created the International Auditing and Assurance Standards Board (IAASB) to promulgate a set of international auditing standards and promote the convergence of auditing standards throughout the world. As of 2020, professional accountancy organizations from 130 countries and jurisdictions are members of IFAC, with more than 90% of these members using the IAASB's International Standards on Auditing (ISAs). Consequently, the ISAs put forth by the IAASB have become the global standard and foundational source for high-quality auditing standards throughout the world.

International Standard on Auditing 240, *The Auditor's Responsibilities Relating to Fraud in an Audit of Financial Statements*¹

In 2006, the IAASB redrafted ISA 240 under a project to apply certain clarity conventions to all ISAs. ISA 240, *The Auditor's Responsibilities Relating to Fraud in an Audit of Financial Statements*, requires the auditor to focus on areas where there is a risk of material misstatement due to fraud, including management fraud.

The standard emphasizes the need for the auditor to maintain an attitude of professional skepticism throughout the audit, notwithstanding the auditor's past experience about the honesty and integrity of management and those charged with governance. The standard became effective for audits of financial statements for financial periods beginning on or after December 15, 2009.

Purpose of the Standard

The purpose of ISA 240 is to establish standards and provide guidance on the auditor's responsibility to consider fraud in an audit of financial statements. ISA 240 also expands on how the standards and guidance in ISA 315 (Revised), *Identifying and Assessing the Risks of Material Misstatement*, and ISA 330, *The Auditor's Responses to Assessed Risks*, are to be applied in relation to the risks of material misstatement due to fraud. The standards and guidance in ISA 240 are intended to be integrated into the overall audit process.

Characteristics of Fraud

Misstatements in the financial statements can arise from error or fraud. The distinguishing factor between error and fraud is whether the underlying action that results in the misstatement of the financial statements is intentional or unintentional.

Although fraud is a broad legal concept, for the purposes of the ISAs, the auditor is concerned with fraud that causes a material misstatement in the financial statements. Two types of intentional misstatements are relevant to the auditor: misstatements resulting from fraudulent financial reporting and misstatements resulting from misappropriation of assets. Although the auditor might suspect or, in rare cases, identify the occurrence of fraud, the auditor does not make legal determinations of whether fraud has actually occurred.

¹ The material in this section is compiled from materials and resources issued by the IAASB. For more information about this organization, please see www.ifac.org.

Fraud, whether fraudulent financial reporting or misappropriation of assets, involves incentive or pressure to commit fraud, a perceived opportunity to do so, and some rationalization of the act. For example:

- Incentive or pressure to commit fraudulent financial reporting may exist when management is under pressure, from sources outside or inside the entity, to achieve an expected (and perhaps unrealistic) earnings target or financial outcome—particularly since the consequences to management for failing to meet financial goals can be significant. Similarly, individuals may have an incentive to misappropriate assets, for example, because the individuals are living beyond their means.
- A perceived opportunity to commit fraud may exist when an individual believes internal control can be overridden, for example, because the individual is in a position of trust or has knowledge of specific deficiencies in internal control.
- Individuals may be able to rationalize committing a fraudulent act. Some individuals possess an attitude, character, or set of ethical values that allow them knowingly and intentionally to commit a dishonest act. However, even otherwise honest individuals can commit fraud in an environment that imposes sufficient pressure on them.

Fraudulent financial reporting involves intentional misstatements including omissions of amounts or disclosures in financial statements to deceive financial statement users. It can be caused by the efforts of management to manage earnings in order to deceive financial statement users by influencing their perceptions as to the entity's performance and profitability. Such earnings management may start out with small actions or inappropriate adjustment of assumptions and changes in judgments by management. Pressures and incentives may lead these actions to increase to the extent that they result in fraudulent financial reporting. Such a situation could occur when, due to pressures to meet market expectations or a desire to maximize compensation based on performance, management intentionally takes positions that lead to fraudulent financial reporting by materially misstating the financial statements. In some entities, management may be motivated to reduce earnings by a material amount to minimize tax or to inflate earnings to secure bank financing.

Fraudulent financial reporting may be accomplished by the following:

- Manipulation, falsification (including forgery), or alteration of accounting records or supporting documentation from which the financial statements are prepared

- Misrepresentation in, or intentional omission from, the financial statements of events, transactions, or other significant information
- Intentional misapplication of accounting principles relating to amounts, classification, manner of presentation, or disclosure

Fraudulent financial reporting often involves management override of controls that may otherwise appear to be operating effectively. Fraud can be committed by management overriding controls using such techniques as:

- Recording fictitious journal entries, particularly close to the end of an accounting period, to manipulate operating results or achieve other objectives
- Inappropriately adjusting assumptions and changing judgments used to estimate account balances
- Omitting, advancing, or delaying recognition in the financial statements of events and transactions that have occurred during the reporting period
- Concealing, or not disclosing, facts that could affect the amounts recorded in the financial statements
- Engaging in complex transactions that are structured to misrepresent the financial position or financial performance of the entity
- Altering records and terms related to significant and unusual transactions

Misappropriation of assets involves the theft of an entity's assets and is often perpetrated by employees in relatively small and immaterial amounts. However, it can also involve management who are usually more able to disguise or conceal misappropriations in ways that are difficult to detect. Misappropriation of assets can be accomplished in a variety of ways, including:

- Embezzling receipts (e.g., misappropriating collections on accounts receivable or diverting receipts in respect of written-off accounts to personal bank accounts)
- Stealing physical assets or intellectual property (e.g., stealing inventory for personal use or for sale, stealing scrap for resale, or colluding with a competitor by disclosing technological data in return for payment)
- Causing an entity to pay for goods and services not received (e.g., payments to fictitious vendors, kickbacks paid by vendors to the entity's purchasing agents in return for inflating prices, or payments to fictitious employees)
- Using an entity's assets for personal use (e.g., using the entity's assets as collateral for a personal loan or a loan to a related party)

Misappropriation of assets is often accompanied by false or misleading records or documents in order to conceal the fact that the assets are missing or have been pledged without proper authorization.

Responsibility for the Prevention and Detection of Fraud

The primary responsibility for the prevention and detection of fraud rests with both those charged with governance of the entity and management. Management, with the oversight of those charged with governance, should place a strong emphasis on both fraud prevention, which may reduce opportunities for fraud to take place, and fraud deterrence, which could persuade individuals not to commit fraud because of the likelihood of detection and punishment.

This involves a commitment to creating a culture of honesty and ethical behavior which can be reinforced by an active oversight by those charged with governance. In exercising oversight responsibility, those charged with governance consider the potential for override of controls or other inappropriate influence over the financial reporting process, such as efforts by management to manage earnings in order to influence the perceptions of analysts and investors as to the entity's performance and profitability.

Responsibilities of the Auditor

An auditor conducting an audit in accordance with ISAs is responsible for obtaining reasonable assurance that the financial statements taken as a whole are free from material misstatement, whether caused by error or fraud. As described in ISA 200, *Overall Objectives of the Independent Auditor and the Conduct of an Audit in Accordance with International Standards on Auditing*, owing to the inherent limitations of an audit, there is an unavoidable risk that some material misstatements of the financial statements will not be detected, even though the audit is properly planned and performed in accordance with the ISAs.

The risk of not detecting a material misstatement resulting from fraud is higher than the risk of not detecting one resulting from error. This is because fraud might involve sophisticated and carefully organized schemes designed to conceal it, such as forgery, deliberate failure to record transactions, or intentional misrepresentations being made to the auditor. Such attempts at concealment may be even more difficult to detect when accompanied by collusion, as collusion may cause the auditor to believe that audit evidence is persuasive when it is, in fact, false.

The auditor's ability to detect a fraud depends on factors such as the skillfulness of the perpetrator, the frequency and extent of manipulation, the degree of collusion involved, the

relative size of individual amounts manipulated, and the seniority of those individuals involved. While the auditor may be able to identify potential opportunities for fraud to be perpetrated, it is difficult for the auditor to determine whether misstatements in judgment areas such as accounting estimates are caused by fraud or error.

Furthermore, the risk of the auditor not detecting a material misstatement resulting from management fraud is greater than for employee fraud because management is frequently in a position to directly or indirectly manipulate accounting records, present fraudulent financial information, or override control procedures designed to prevent similar frauds by other employees.

When obtaining reasonable assurance, the auditor is responsible for maintaining an attitude of professional skepticism throughout the audit, considering the potential for management override of controls, and recognizing the fact that audit procedures that are effective for detecting error may not be effective in detecting fraud. The requirements in ISA 240 are designed to assist the auditor in identifying and assessing the risks of material misstatement due to fraud and in designing procedures to detect such misstatement.

Objectives

The objectives of the auditor, as outlined in ISA 240, are:

- To identify and assess the risks of material misstatement of the financial statements due to fraud;
- To obtain sufficient appropriate audit evidence about the assessed risks of material misstatement due to fraud, through designing and implementing appropriate responses; and
- To respond appropriately to identified or suspected fraud.

Definitions

For purposes of the ISAs, the following terms have the meanings attributed below:

- *Fraud*—An intentional act by one or more individuals among management, those charged with governance, employees, or third parties, involving the use of deception to obtain an unjust or illegal advantage
- *Fraud risk factors*—Events or conditions that indicate an incentive or pressure to commit fraud or provide an opportunity to commit fraud

MATERIALITY

While not officially described in ISA 240, it is important to understand the concept of materiality in a financial statement audit, especially as it pertains to fraud. ISAs 1 and 8 define *materiality* as follows: “Information is material if omitting, misstating or obscuring it could reasonably be expected to influence the decisions that the primary users of general purpose financial statements make on the basis of those financial statements, which provide financial information about a specific reporting entity.”

Materiality is often considered in quantitative terms within an audit (e.g., by establishing a threshold amount by which the financial statements must be misstated to be considered materially misstated). However, the qualitative aspects of fraud can, and often do, override the general quantitative materiality threshold. For example, an intentional manipulation of an account for an amount just under the determined quantitative materiality threshold might still be deemed material for purposes of the audit, as it indicates management’s intent to “omit, misstate, or obscure” information to influence the decisions of the financial statement users.

Professional Skepticism

According to ISA 200, the auditor shall maintain an attitude of professional skepticism throughout the audit, recognizing the possibility that a material misstatement due to fraud could exist, notwithstanding the auditor’s past experience of the honesty and integrity of the entity’s management and those charged with governance.

Unless the auditor has reason to believe the contrary, the auditor may accept records and documents as genuine. If conditions identified during the audit cause the auditor to believe that a document may not be authentic or that terms in a document have been modified but not disclosed to the auditor, the auditor shall investigate further.

Where responses to inquiries of management or those charged with governance are inconsistent, the auditor shall investigate the inconsistencies.

Discussion Among the Engagement Team

ISA 315 (Revised) requires a discussion among the engagement team members and a determination by the engagement partner of which matters are to be communicated to those team members not involved in the discussion.

This discussion shall place particular emphasis on how and where the entity's financial statements might be susceptible to material misstatement due to fraud. Additionally, the discussion should include matters such as:

- How management could perpetrate and conceal fraudulent financial reporting
- How the entity's assets could be misappropriated
- Circumstances that might be indicative of earnings management
- The known external and internal organizational factors that might:
 - Create an incentive or pressure for individuals to commit fraud.
 - Provide the opportunity for fraud to be perpetrated.
 - Indicate a culture or environment that enables the rationalization of fraud.
- Management's involvement in overseeing employees with access to cash or other assets susceptible to misappropriation
- Any unusual or unexplained changes in behavior or lifestyle of management or employees which have come to the attention of the engagement team
- The importance of maintaining a proper state of mind throughout the audit regarding the potential for material misstatement due to fraud
- The types of circumstances that, if encountered, might indicate the possibility of fraud
- How an element of unpredictability will be incorporated into the nature, timing and extent of the audit procedures to be performed
- The audit procedures that might be selected to respond to the susceptibility of the entity's financial statements to material misstatement due to fraud and whether certain types of audit procedures are more effective than others
- Any allegations of fraud that have come to the auditor's attention
- The risk of management override of controls

Additionally, the discussion shall occur with the setting aside of any beliefs that the engagement team members may have that management and those charged with governance are honest and have integrity.

Risk Assessment Procedures and Related Activities

When performing risk assessment procedures and related activities to obtain an understanding of the entity and its environment, including the entity's internal control, the auditor shall perform the following procedures to obtain information for use in identifying the risks of material misstatement due to fraud.

INQUIRIES OF MANAGEMENT AND OTHERS WITHIN THE ENTITY

The auditor shall make inquiries of management regarding:

- Management's assessment of the risk that the financial statements may be materially misstated due to fraud, including the nature, extent, and frequency of such assessments;
- Management's process for identifying and responding to the risks of fraud in the entity, including any specific risks of fraud that management has identified or that have been brought to its attention, or classes of transactions, account balances, or disclosures for which a risk of fraud is likely to exist;
- Management's communication, if any, to those charged with governance regarding its processes for identifying and responding to the risks of fraud in the entity; and
- Management's communication, if any, to employees regarding its views on business practices and ethical behavior.

The auditor shall make inquiries of management, and others within the entity as appropriate, to determine whether they have knowledge of any actual, suspected, or alleged fraud affecting the entity.

For those entities that have an internal audit function, the auditor shall make inquiries of internal audit to determine whether it has knowledge of any actual, suspected, or alleged fraud affecting the entity, and to obtain its views about the risks of fraud.

INQUIRIES OF THOSE CHARGED WITH GOVERNANCE

Unless all of those charged with governance are involved in managing the entity, the auditor shall obtain an understanding of how those charged with governance exercise oversight of management's processes for identifying and responding to the risks of fraud in the entity and the internal control that management has established to mitigate these risks.

The auditor shall make inquiries of those charged with governance to determine whether they have knowledge of any actual, suspected, or alleged fraud affecting the entity. These inquiries are made in part to corroborate the responses to the inquiries of management.

EVALUATION OF UNUSUAL OR UNEXPECTED RELATIONSHIPS IDENTIFIED

The auditor shall evaluate whether unusual or unexpected relationships that have been identified in performing analytical procedures, including those related to revenue accounts, may indicate risks of material misstatement due to fraud.

CONSIDERATION OF OTHER INFORMATION

The auditor shall consider whether other information obtained by the auditor indicates risks of material misstatement due to fraud.

EVALUATION OF FRAUD RISK FACTORS

The auditor shall evaluate whether the information obtained from the other risk assessment procedures and related activities performed indicates that one or more fraud risk factors are present. While fraud risk factors may not necessarily indicate the existence of fraud, they have often been present in circumstances where frauds have occurred and therefore may indicate risks of material misstatement due to fraud.

The fact that fraud is usually concealed can make it very difficult to detect. Nevertheless, the auditor may identify events or conditions that indicate an incentive or pressure to commit fraud or provide an opportunity to commit fraud (fraud risk factors). For example:

- The need to meet expectations of third parties to obtain additional equity financing may create pressure to commit fraud;
- The granting of significant bonuses if unrealistic profit targets are met may create an incentive to commit fraud; and
- A control environment that is not effective may create an opportunity to commit fraud.

Fraud risk factors cannot easily be ranked in order of importance. The significance of fraud risk factors varies widely. Some of these factors will be present in entities where the specific conditions do not present risks of material misstatement. Accordingly, the determination of whether a fraud risk factor is present and whether it is to be considered in assessing the risks of material misstatement of the financial statements due to fraud requires the exercise of professional judgment.

Examples of fraud risk factors related to fraudulent financial reporting and misappropriation of assets are presented in the appendix to ISA 240 (discussed below). These illustrative risk factors are classified based on the three conditions that are generally present when fraud exists:

- An incentive or pressure to commit fraud;
- A perceived opportunity to commit fraud; and
- An ability to rationalize the fraudulent action.

Risk factors reflective of an attitude that permits rationalization of the fraudulent action may not be susceptible to observation by the auditor. Nevertheless, the auditor may become aware

of the existence of such information. Although the fraud risk factors described in the ISA's appendix cover a broad range of situations that may be faced by auditors, they are only examples and other risk factors may exist.

The entity's size, complexity, and ownership characteristics have a significant influence on the consideration of relevant fraud risk factors. For example, in the case of a large entity, there might be factors that generally constrain improper conduct by management, such as:

- Effective oversight by those charged with governance
- An effective internal audit function
- The existence and enforcement of a written code of conduct

Furthermore, fraud risk factors considered at a business segment operating level may provide different insights when compared with those obtained when considered at an entity-wide level.

Identification and Assessment of the Risks of Material Misstatement Due to Fraud

The auditor shall identify and assess the risks of material misstatement due to fraud at the financial statement level, as well as at the assertion level for classes of transactions, account balances, and disclosures.

When identifying and assessing the risks of material misstatement due to fraud, the auditor shall, based on a presumption that there are risks of fraud in revenue recognition, evaluate which types of revenue, revenue transactions, or assertions give rise to such risks. Specific documentation is required when the auditor concludes that the presumption is not applicable in the circumstances of the engagement and, accordingly, has not identified revenue recognition as a risk of material misstatement due to fraud.

The auditor shall treat those assessed risks of material misstatement due to fraud as significant risks and accordingly, to the extent not already done so, the auditor shall obtain an understanding of the entity's related controls, including control activities, relevant to such risks.

Responses to the Assessed Risks of Material Misstatement Due to Fraud

OVERALL RESPONSES

In accordance with ISA 330, the auditor shall determine overall responses to address the assessed risks of material misstatement due to fraud at the financial statement level. In doing so, the auditor shall:

- Assign and supervise personnel, taking account of the knowledge, skill, and ability of the individuals to be given significant engagement responsibilities and the auditor's assessment of the risks of material misstatement due to fraud for the engagement; this might include assigning additional individuals with specialized skill and knowledge, such as forensic and IT specialists, or assigning more experienced individuals to the engagement.
- Evaluate whether the selection and application of accounting policies by the entity, particularly those related to subjective measurements and complex transactions, might be indicative of fraudulent financial reporting resulting from management's effort to manage earnings.
- Incorporate an element of unpredictability in the selection of the nature, timing, and extent of audit procedures.

AUDIT PROCEDURES RESPONSIVE TO ASSESSED RISKS OF MATERIAL MISSTATEMENT DUE TO FRAUD AT THE ASSERTION LEVEL

In accordance with ISA 330, the auditor shall design and perform further audit procedures whose nature, timing, and extent are responsive to the assessed risks of material misstatement due to fraud at the assertion level.

AUDIT PROCEDURES RESPONSIVE TO RISKS RELATED TO MANAGEMENT OVERRIDE OF CONTROLS

Management is in a unique position to perpetrate fraud because of management's ability to manipulate accounting records and prepare fraudulent financial statements by overriding controls that otherwise appear to be operating effectively. Although the level of risk of management override of controls will vary from entity to entity, the risk is nevertheless present in all entities. Due to the unpredictable way in which such override could occur, it is a significant risk of material misstatement due to fraud.

To respond to the risk of management override of controls, the auditor shall design and perform audit procedures to:

- Test the appropriateness of journal entries recorded in the general ledger and other adjustments made in the preparation of the financial statements. In designing and performing audit procedures for such tests, the auditor shall:
 - Make inquiries of individuals involved in the financial reporting process about inappropriate or unusual activity relating to the processing of journal entries and other adjustments;

- Select journal entries and other adjustments made at the end of a reporting period; and
 - Consider the need to test journal entries and other adjustments throughout the period.
- Review accounting estimates for biases and evaluate whether the circumstances producing the bias, if any, represent a risk of material misstatement due to fraud. In performing this review, the auditor shall:
 - Evaluate whether the judgments and decisions made by management in making the accounting estimates included in the financial statements, even if they are individually reasonable, indicate a possible bias on the part of the entity's management that may represent a risk of material misstatement due to fraud. If so, the auditor shall reevaluate the accounting estimates taken as a whole; and
 - Perform a retrospective review of management judgments and assumptions related to significant accounting estimates reflected in the financial statements of the prior year.
- For significant transactions that are outside the normal course of business for the entity, or that otherwise appear to be unusual given the auditor's understanding of the entity and its environment and other information obtained during the audit, the auditor shall evaluate whether the business rationale (or the lack thereof) of the transactions suggests that they may have been entered into to engage in fraudulent financial reporting or to conceal misappropriation of assets.

The auditor shall determine whether, in order to respond to the identified risks of management override of controls, the auditor needs to perform other audit procedures in addition to those specifically referred to above.

Evaluation of Audit Evidence

The auditor shall evaluate whether analytical procedures that are performed when forming an overall conclusion as to whether the financial statements as a whole are consistent with the auditor's understanding of the entity and its environment indicate a previously unrecognized risk of material misstatement due to fraud.

When the auditor identifies a misstatement, the auditor shall evaluate whether such a misstatement is indicative of fraud. If there is such an indication, the auditor shall evaluate the implications of the misstatement in relation to other aspects of the audit, particularly the reliability of management representations, recognizing that an instance of fraud is unlikely to be an isolated occurrence.

If the auditor identifies a misstatement, whether material or not, and the auditor has reason to believe that it is or may be the result of fraud and that management (in particular, senior management) is involved, the auditor shall reevaluate the assessment of the risks of material misstatement due to fraud and its resulting impact on the nature, timing, and extent of audit procedures to respond to the assessed risks. The auditor shall also consider whether circumstances or conditions indicate possible collusion involving employees, management, or third parties when reconsidering the reliability of evidence previously obtained.

When the auditor confirms that, or is unable to conclude whether, the financial statements are materially misstated as a result of fraud, the auditor shall evaluate the implications for the audit.

Auditor Unable to Continue the Engagement

If, as a result of a misstatement resulting from fraud or suspected fraud, the auditor encounters exceptional circumstances that bring into question the auditor's ability to continue performing the audit, the auditor shall:

- Determine the professional and legal responsibilities applicable in the circumstances, including whether there is a requirement for the auditor to report to the person or persons who made the audit appointment or, in some cases, to regulatory authorities;
- Consider whether it is appropriate to withdraw from the engagement, where withdrawal from the engagement is legally permitted; and
- If the auditor withdraws:
 - Discuss with the appropriate level of management and those charged with governance the auditor's withdrawal from the engagement and the reasons for the withdrawal; and
 - Determine whether there is a professional or legal requirement to report to the person or persons who made the audit appointment or, in some cases, to regulatory authorities, the auditor's withdrawal from the engagement and the reasons for the withdrawal.

Management Representations

The auditor shall obtain written representations from management that:

- It acknowledges its responsibility for the design, implementation, and maintenance of internal control to prevent and detect fraud;
- It has disclosed to the auditor the results of its assessment of the risk that the financial statements may be materially misstated as a result of fraud;
- It has disclosed to the auditor its knowledge of fraud or suspected fraud affecting the entity involving:

- Management;
- Employees who have significant roles in internal control; or
- Others where the fraud could have a material effect on the financial statements; and
- It has disclosed to the auditor its knowledge of any allegations of fraud, or suspected fraud, affecting the entity's financial statements communicated by employees, former employees, analysts, regulators, or others.

Communications to Management and with Those Charged with Governance

If the auditor has identified a fraud or has obtained information that indicates that a fraud may exist, the auditor shall communicate these matters on a timely basis to the appropriate level of management in order to inform those with primary responsibility for the prevention and detection of fraud of matters relevant to their responsibilities.

Unless all of those charged with governance are involved in managing the entity, if the auditor has identified or suspects fraud involving management, employees who have significant roles in internal control, or others where the fraud results in a material misstatement in the financial statements, the auditor shall communicate these matters to those charged with governance on a timely basis. If the auditor suspects fraud involving management, the auditor shall communicate these suspicions to those charged with governance and discuss with them the nature, timing, and extent of audit procedures necessary to complete the audit.

The auditor shall communicate with those charged with governance any other matters related to fraud that are, in the auditor's judgment, relevant to their responsibilities.

Communications to Regulatory and Enforcement Authorities

If the auditor has identified or suspects a fraud, the auditor shall determine whether there is a responsibility to report the occurrence or suspicion to a party outside the entity. Although the auditor's professional duty to maintain the confidentiality of client information may preclude such reporting, the auditor's legal responsibilities may override the duty of confidentiality in some circumstances.

Documentation

The auditor's documentation of the understanding of the entity and its environment and the assessment of the risks of material misstatement shall include:

- The significant decisions reached during the discussion among the engagement team regarding the susceptibility of the entity's financial statements to material misstatement due to fraud; and
- The identified and assessed risks of material misstatement due to fraud at the financial statement level and at the assertion level.

The auditor's documentation of the responses to the assessed risks of material misstatement required by ISA 330 shall include:

- The overall responses to the assessed risks of material misstatement due to fraud at the financial statement level; the nature, timing, and extent of audit procedures; and the linkage of those procedures with the assessed risks of material misstatement due to fraud at the assertion level
- The results of the audit procedures, including those designed to address the risk of management override of controls.

The auditor shall document communications about fraud made to management, those charged with governance, regulators, and others.

When the auditor has concluded that the presumed risk of material misstatement due to fraud related to revenue recognition is not applicable in the circumstances of the engagement, the auditor shall document the reasons for that conclusion.

International Standard on Auditing 265, *Communicating Deficiencies in Internal Control to Those Charged with Governance and Management*²

During the course of a financial statement audit, the external auditor might identify deficiencies in the organization's internal controls that could result in a misstatement in the financial statements. ISA 265 provides guidance regarding the auditor's responsibility to communicate such control deficiencies appropriately with management and those charged with governance. In addition to communicating any identified control deficiencies, ISA 265 notes that its requirements do not preclude the auditor from communicating with management and those charged with governance about other internal control matters that the auditor identified during the audit.

² ISA 265, *Communicating Deficiencies in Internal Control to Those Charged with Governance and Management*, can be viewed at www.ifac.org/system/files/downloads/a015-2010-iaasb-handbook-isa-265.pdf.

Objective

The objective of the auditor is to communicate appropriately to those charged with governance and to management about internal control deficiencies that the auditor has identified during their audit and that, in the auditor's professional judgment, are of sufficient importance to merit their respective attentions.

Definitions

For purposes of ISA 265, the following definitions apply:

- *Deficiency in internal control*—This exists when either of the following occurs:
 - A control is designed, implemented, or operated in such a way that it is unable to prevent, or detect and correct, misstatements in the financial statements on a timely basis; or
 - A control that is necessary to prevent, or detect and correct, misstatements in the financial statements on a timely basis is missing.
- *Significant deficiency in internal control*—A deficiency or combination of deficiencies in internal control that, in the auditor's professional judgment, is of sufficient importance to merit the attention of those charged with governance

Requirements

ISA 265 requires the auditor to determine whether, on the basis of the audit work performed, the auditor has identified one or more deficiencies in internal control. If the auditor has identified one or more deficiencies in internal control, the auditor is required to:

- Determine, on the basis of the audit work performed, whether, individually or in combination, they constitute significant deficiencies.
- Communicate in writing significant deficiencies in internal control identified during the audit to those charged with governance on a timely basis.
- Communicate to management at an appropriate level of responsibility on a timely basis:
 - In writing, significant deficiencies in internal control that the auditor has communicated or intends to communicate to those charged with governance, unless it would be inappropriate to communicate directly to management in the circumstances
 - Other deficiencies in internal control identified during the audit that have not been communicated to management by other parties and that, in the auditor's professional judgment, are of sufficient importance to merit management's attention

In the written communications regarding significant deficiencies in internal controls, the auditor must include:

- A description of the deficiencies and an explanation of their potential effects
- Sufficient information to enable those charged with governance and management to understand the context of the communication, including explanations that:
 - The purpose of the audit was for the auditor to express an opinion on the financial statements.
 - The audit included consideration of internal control relevant to the preparation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of internal control.
 - The matters being reported are limited to those deficiencies that the auditor has identified during the audit and that the auditor has concluded are of sufficient importance to merit being reported to those charged with governance.

International Principles for Auditor Oversight

Auditor oversight—whether through a regulatory body or some other process—is a necessary external check on the quality and integrity of the independent audit process. Some jurisdictions directly regulate the audit profession. In addition, as a result of several large financial scandals, a number of other jurisdictions have or are considering adjusting their approaches in this area. Likewise, the IFAC, an international industry association that has spearheaded efforts to develop ISAs, promoted the establishment of a Public Interest Oversight Board (PIOB) to add greater public policy input into its workings and thereby improve the quality of IFAC's standards-setting procedures and the standards themselves.

Yet even effective auditor oversight might be insufficient to prevent audit failures that are the result of fraud and the complicity of the auditors themselves. However, effective auditor oversight, combined with strong enforcement measures, might help deter fraud from occurring in the first place, or detect it relatively soon after it has occurred.

An additional issue regarding auditor oversight arises in situations where international networks of auditors exist. These networks, which frequently market themselves under a single brand identity, are often composed of elements incorporated and regulated separately in a number of jurisdictions. Network members often share information and resources amongst each other for some marketing and operational purposes, and they might also have internal quality control reviews on a worldwide basis.

However, the extent of international quality control and policy implementation is often limited because of national laws mandating local control of audit firms, desires of the auditing firms to limit their liability for failures of a member of the network in another jurisdiction, and many other reasons. Efforts to remove these barriers to creating true international audit firms may be necessary. In addition, enhanced cooperation among regulators may be necessary to ensure proper oversight of the entire audit network.

The International Organization of Securities Commissions' Principles for Auditor Oversight³

The International Organization of Securities Commissions (IOSCO) is an international association of securities regulators that was created in 1983. The organization's membership includes securities regulators and other securities market participants in more than 115 jurisdictions, accounting for more than 95% of the world's capital markets.

The stated objectives of the organization's members are:

- To cooperate in developing, implementing, and promoting adherence to internationally recognized and consistent standards of regulation, oversight, and enforcement in order to protect investors; maintain fair, efficient, and transparent markets; and seek to address systemic risks
- To enhance investor protection and promote investor confidence in the integrity of securities markets, through strengthened information exchange and cooperation in enforcement against misconduct and in supervision of markets and market intermediaries
- To exchange information at both global and regional levels on their respective experiences in order to assist the development of markets, strengthen market infrastructure, and implement appropriate regulation⁴

IOSCO has undertaken considerable work regarding auditor oversight issues. In 2002, the Technical Committee released its *Principles for Auditor Oversight*, which laid out a comprehensive set of objectives that any auditor oversight approach should strive to achieve.

³ The material in this section is compiled from materials and resources issued by the International Organization of Securities Commissions (IOSCO). For more information about this organization, please see www.iosco.org.

⁴ www.iosco.org/about/pdf/IOSCO-Fact-Sheet.pdf.

Principles for Auditor Oversight notes that auditor oversight should take place at several levels—within the audit firm, by professional associates, and through government regulation. However, *Principles for Auditor Oversight* states that, within jurisdictions, audit firms should be subject to oversight by some body that acts and is seen to act in the public interest. Further, this auditor oversight body should have in place a regular review process designed to ascertain whether audit firms adhere to quality control policies and procedures that address all significant aspects of auditing. The following is the full text of the Principles as released by IOSCO's Technical Committee:⁵

INTRODUCTION

1. Investor confidence is fundamental to the successful operation of the world's financial markets. That confidence depends on investors having credible and reliable financial information when making decisions about capital allocation.
2. The objectives of securities regulation include the protection of investors; ensuring that markets are fair, efficient, and transparent; and the reduction of systemic risk. In pursuit of these objectives, in the area of reporting to investors, there should be full, timely, and accurate disclosure of financial results and other information that is material to investors' decisions. Full and fair disclosure is essential to investor protection, enhances investor confidence, and promotes market liquidity and efficiency.
3. Independent auditors play a critical role in enhancing the reliability of financial information by attesting as to whether the financial statements prepared by management fairly present the financial position and past performance of the public enterprise in compliance with accepted accounting standards.
4. Effective oversight of the accounting profession and of independent audits is critical to the reliability and integrity of the financial reporting process. The Technical Committee of the IOSCO has developed a list of general principles for oversight of audit firms and auditors who audit financial statements of companies whose securities are publicly traded in the capital markets (hereinafter referred to as "auditors").

⁵ www.iosco.org/library/pubdocs/pdf/IOSCOPD134.pdf.

5. At the present time, a variety of systems for auditor oversight exist among the IOSCO Technical Committee members. In many cases, these existing systems are undergoing review as a result of financial reporting failures, weaknesses discovered in self-regulatory structures, changes in public expectations, requirements of new legislation, or for other reasons. One jurisdiction has reported that firm-on-firm peer review under self-regulation failed and that new legislation has directed the creation of an auditor oversight body, independent of the accounting profession, with strengthened powers for rulemaking, inspection and disciplinary authority. A number of other jurisdictions have announced that changes will be made in auditor oversight processes and structures. The Technical Committee believes that there is a growing consensus internationally as to the benefits of an auditor oversight system that is not based exclusively or predominantly on self-regulation.
6. The principles set forth herein are intended to assist securities market regulatory authorities, and other authorities with responsibility for auditor oversight, in developing and enhancing regulatory structures for auditor oversight in the wide range of different legal, business, and professional environments that exist in IOSCO member jurisdictions. The Technical Committee encourages IOSCO members to work toward implementing these principles in their own jurisdictions. In jurisdictions in which the securities regulator does not have primary responsibility for auditor oversight, it will nevertheless have an interest in ensuring that the oversight system is consistent with maintaining and enhancing investor confidence in published financial statements.

OVERSIGHT PRINCIPLES

1. Oversight of auditors can occur in several ways, including within audit firms, by professional organizations and public or private sector oversight bodies, and through government oversight. In addition, oversight may be provided by supervisory boards and audit committees representing investors in matters relating to individual companies.
2. Within a jurisdiction, auditors should be subject to oversight by a body that acts and is seen to act in the public interest. While the nature of an auditor oversight body and the process through which it carries out its activities might differ among jurisdictions, IOSCO believes that effective oversight generally includes the following:

I. QUALIFICATIONS AND COMPETENCY

A mechanism should exist to require that auditors have proper qualifications and competency before being licensed to perform audits and to maintain professional competence. A mechanism also should exist to withdraw authorization to perform audits of publicly traded companies if proper qualifications and competency are not maintained.

IOSCO believes establishing qualification requirements and requiring maintenance of professional competency should improve the quality of auditing. Moreover, the risk that authorization can be revoked for failure to have or maintain the necessary qualification should be an incentive for compliance and adherence to auditing standards.

II. INDEPENDENCE

A mechanism should exist to require that auditors are independent of the enterprises that they audit, both in fact and in appearance. Effective standards, regular assessments, and regulatory oversight generally increase the likelihood that independence is maintained.

III. OVERSIGHT BODY

A mechanism should exist to provide that a body, acting in the public interest, provides oversight over the quality and implementation of auditing, independence, and ethical standards used in the jurisdiction, as well as audit quality control environments.

IV. OVERSIGHT PROCESS

A mechanism should exist to require auditors to be subject to the discipline of an auditor oversight body that is independent of the audit profession, or, if a professional body acts as the oversight body, is overseen by an independent body. Such an auditor oversight body must operate in the public interest, and have an appropriate membership, an adequate charter of responsibilities and powers, and adequate funding that is not under the control of the auditing profession, to carry out those responsibilities.

An auditor oversight body should establish a process for performing regular reviews of audit procedures and practices of firms that audit the financial statements of listed public companies. This oversight process may be performed in coordination with

similar quality control mechanisms that are in place within the audit profession, provided the oversight body maintains control over key issues such as the scope of reviews, access to and retention of audit work papers and other information needed in reviews, and follow-up of the outcome of reviews. Reviews should be conducted on a recurring basis, and should be designed to determine the extent to which audit firms have and adhere to adequate quality control policies and procedures that address all significant aspects of auditing. Matters to be considered include:

- a. Independence, integrity, and ethics of auditors
- b. Objectivity of audits
- c. Selection, training, and supervision of personnel
- d. Acceptance, continuation, and termination of audit clients
- e. Audit methodology
- f. Audit performance, that is, compliance with applicable generally accepted auditing standards (GAAS)
- g. Consultation on difficult, contentious, or sensitive matters and resolution of differences of opinion during audits
- h. Second partner reviews of audits
- i. Communications with management, supervisory boards, and audit committees of audit clients
- j. Communications with bodies charged with oversight over the financial reporting process; for example, on matters such as regulatory inquiries, changes in auditors, or other matters as may be required
- k. Provisions for continuing professional education

An auditor oversight body also should address other matters such as professional competency, rotation of audit personnel, employment of audit personnel by audit clients, consulting and other non-audit services, and other matters as deemed appropriate.

V. REMEDIAL MEASURES

An auditor oversight body should have the authority to stipulate remedial measures for problems detected and to initiate and/or carry out disciplinary proceedings to impose sanctions on auditors and audit firms, as appropriate.

VI. INTERNATIONAL COOPERATION

In relation to companies operating or listing on a cross-border basis, IOSCO members are encouraged to provide each other, whether directly or through coordinating with the auditor oversight body in their jurisdiction, with the fullest assistance permissible in efforts to examine or investigate matters in which improper auditing may have occurred and on any other matters relating to auditor oversight. Members are also encouraged to explore approaches to enhance cooperation among jurisdictions.

The Public Interest Oversight Board⁶

The PIOB is the global independent oversight body that seeks to improve the quality and public-interest focus of the international auditing, education, and ethics standards promulgated by the IFAC. Through its oversight activities, the PIOB works to bring greater transparency and integrity to the global audit profession, thereby contributing to the enhanced quality of international financial reporting.⁷

The PIOB's objective is to increase the confidence of investors and others that the public interest activities of IFAC—including the setting of standards by independent boards operating under the auspices of IFAC—are properly responsive to the public interest. To meet this objective, the PIOB provides independent oversight of IFAC's full standard-setting process to help ensure that the resulting standards meet stakeholder needs and are accountable and transparent.

OVERVIEW

The PIOB was formally established in February 2005 to oversee IFAC's auditing and assurance, ethics, and education standard-setting activities, as well as its Member Body Compliance Program. This last activity is designed to encourage member bodies to adopt international standards and to implement quality assurance and investigation and discipline programs.

The establishment of the PIOB was the result of a collaborative effort by the international financial regulatory community, working with IFAC, to ensure that auditing and assurance, ethics, and educational standards for the accounting profession are set in a transparent manner that reflects the public interest. It was mutually recognized that high quality, transparent standard-setting processes with public and regulatory input, together with

⁶ The material in this section is compiled from materials and resources issued by the PIOB. For more information about this organization, please see www.ipiob.org.

⁷ PIOB, "What Is the PIOB?" www.ipiob.org/index.php/what-is-the-piob.

regulatory monitoring and public interest oversight, are necessary to enhance the quality of external audits of entities. For this reason, the PIOB also maintains active liaison with independent audit regulators around the world.

ORGANIZATION

The PIOB comprises individuals from a number of professions and all branches of regulation. Its ten members were nominated by IOSCO, the Basel Committee on Banking Supervision (BCBS), the International Association of Insurance Supervisors (IAIS), the World Bank, and the European Commission.

RESPONSIBILITIES

The PIOB oversees IFAC's Public Interest Activity Committees (PIACs) comprising the IAASB, International Accounting Education Standards Board (IAESB), International Ethics Standards Board for Accountants (IESBA), their respective Consultative Advisory Groups (CAGs), and the Compliance Advisory Panel (CAP). In this capacity, the PIOB:

- Ensures that the processes of standard development under its oversight follow due process and are responsive to the public interest
- Ensures the completeness of the strategies and work plans of the standard setting boards
- Oversees the process of nominations to all PIACs and CAGs under its oversight
- Oversees the CAP

Internal Auditors' Fraud-Related Responsibilities

Internal auditors play a key role in helping organizations prevent and detect fraudulent activity. Because of their proximity to and understanding of the inner workings of the organization, internal auditors are in a unique position to uncover potential unscrupulous acts. In fact, the ACFE's 2020 *Report to the Nations* shows that the internal audit function plays a vital role in detecting occupational frauds, accounting for the detection of 15% of the 2,504 cases included in the study.

As part of its *International Professional Practices Framework* (IPPF), The Institute of Internal Auditors (IIA) has developed the *International Standards for the Professional Practice of Internal Auditing*. This section includes those IIA standards that pertain to the internal auditor's responsibilities for preventing, detecting, and assessing the risk of fraud within an organization. More detail on these and all other IIA standards can be found at the IIA's website (<https://theiia.org>).

Standard 1210—*Proficiency*

Internal auditors must possess the knowledge, skills, and other competencies needed to perform their individual responsibilities. The internal audit activity collectively must possess or obtain the knowledge, skills, and other competencies needed to perform its responsibilities.

1210.A2

Internal auditors must have sufficient knowledge to evaluate the risk of fraud and the manner in which it is managed by the organization, but are not expected to have the expertise of a person whose primary responsibility is detecting and investigating fraud.

Standard 1220—*Due Professional Care*

Internal auditors must apply the care and skill expected of a reasonably prudent and competent internal auditor. Due professional care does not imply infallibility.

1220.A1

Internal auditors must exercise due professional care by considering the:

- Extent of work needed to achieve the engagement's objectives
- Relative complexity, materiality, or significance of matters to which assurance procedures are applied
- Adequacy and effectiveness of governance, risk management, and control processes
- Probability of significant errors, fraud, or noncompliance
- Cost of assurance in relation to potential benefits

1220.A3

Internal auditors must be alert to the significant risks that might affect objectives, operations, or resources. However, assurance procedures alone, even when performed with due professional care, do not guarantee that all significant risks will be identified.

Standard 2060—*Reporting to Senior Management and the Board*

The chief audit executive (CAE) must report periodically to senior management and the board of directors on the internal audit activity's purpose, authority, responsibility, and performance relative to its plan and on its conformance with the IIA's Code of Ethics and its *International Standards for the Professional Practice of Internal Auditing*. Reporting must also include significant risk and control issues, including fraud risks, governance issues, and other matters that require the attention of senior management and/or the board of directors.

Standard 2110—Governance

The internal audit activity must assess and make appropriate recommendations to improve the organization's governance processes for:

- Making strategic and operational decisions
- Overseeing risk management and control
- Promoting appropriate ethics and values within the organization
- Ensuring effective organizational performance management and accountability
- Communicating risk and control information to appropriate areas of the organization
- Coordinating the activities of, and communicating information among, the board, external and internal auditors, other assurance providers, and management

2110.A1

The internal audit activity must evaluate the design, implementation, and effectiveness of the organization's ethics-related objectives, programs, and activities.

Standard 2120—Risk Management

The internal audit activity must evaluate the effectiveness and contribute to the improvement of risk management processes.

2120.A1

The internal audit activity must evaluate risk exposures relating to the organization's governance, operations, and information systems regarding the:

- Achievement of the organization's strategic objectives
- Reliability and integrity of financial and operational information
- Effectiveness and efficiency of operations
- Safeguarding of assets
- Compliance with laws, regulations, and contracts

2120.A2

The internal audit activity must evaluate the potential for the occurrence of fraud and how the organization manages fraud risk.

Standard 2130—Control

The internal audit activity must assist the organization in maintaining effective controls by evaluating their effectiveness and efficiency and by promoting continuous improvement.

2130.A1

The internal audit activity must evaluate the adequacy and effectiveness of controls in responding to risks within the organization's governance, operations, and information systems regarding the:

- Achievement of the organization's strategic objectives
- Reliability and integrity of financial and operational information
- Effectiveness and efficiency of operations
- Safeguarding of assets
- Compliance with laws, regulations, and contracts

Standard 2210—Engagement Objectives

Objectives must be established for each engagement.

2210.A1

Internal auditors must conduct a preliminary assessment of the risks relevant to the activity under review. Engagement objectives must reflect the results of this assessment.

2210.A2

Internal auditors must consider the probability of significant errors, fraud, noncompliance, and other exposures when developing the engagement objectives.

The IIA's IPPF—Practice Guide: Internal Auditing and Fraud

To help auditors comply with their responsibilities pertaining to fraud, the IIA released *IPPF—Practice Guide: Internal Auditing and Fraud* (the Practice Guide). Although not mandatory, the guidance included in the Practice Guide is strongly recommended. Specifically, the Practice Guide addresses fraud awareness; potential fraud indicators; roles and responsibilities for fraud prevention and detection; the internal auditor's role during audit engagements; fraud risk assessment; fraud prevention and detection; fraud investigation; and forming an opinion on internal controls related to fraud. The Practice Guide also includes an appendix that lists IPPF Practice Advisories that pertain to fraud. The following is a discussion of selected topics from the Practice Guide. The complete guide is available from the IIA's website (<https://theiia.org>).

Internal Audit's Role in Fighting Fraud

Fighting fraud in an organization requires the combined efforts of many different departments, including internal audit. Internal auditors assist in the prevention and detection of fraud by evaluating the adequacy and effectiveness of internal controls, assisting management in establishing effective fraud prevention measures, proactively auditing for fraud, and investigating suspected fraud. Specifically, the Practice Guide states that, in conducting audit engagements, the internal auditor should:

- Consider fraud risks in the assessment of internal control design and determination of audit steps to perform.
- Have sufficient knowledge of fraud to identify red flags indicating fraud might have been committed.
- Be alert to opportunities that could allow fraud, such as control deficiencies.
- Evaluate whether management is actively retaining responsibility for oversight of the fraud risk management program, whether timely and sufficient corrective measures have been taken with respect to any noted control deficiencies or weaknesses, and whether the plan for monitoring the program continues to be adequate for the program's ongoing success.
- Evaluate the indicators of fraud and decide whether any further action is necessary or whether an investigation should be recommended.
- Recommend investigation when appropriate.

The role internal audit plays in fraud investigations varies by organization. Internal audit may have primary responsibility for fraud investigations, may serve as a resource for the investigations, or may have no involvement at all in the investigations. For internal auditors who find themselves involved in fraud investigations, the Practice Guide discusses the investigation process, the role of the internal auditor, conducting the investigation, reporting the investigation, resolution and communication of fraud incidents, and analysis of lessons learned.

The Practice Guide also emphasizes that internal auditors must exercise professional skepticism—an attitude that includes a questioning mind and a critical assessment of audit evidence—in all audit work. By exercising professional skepticism and focusing on the effectiveness of internal controls, auditors increase the likelihood that they will uncover possible fraudulent activity.

COMMUNICATING AND REPORTING ABOUT FRAUD

In addition, the Practice Guide provides guidance about internal audit's role in communicating fraud-related issues with management and the board of directors. In specific, the Practice Guide notes that "internal auditors, through the unique role they play, are well positioned to elevate the importance of fraud prevention and detection programs with management and the board."

In support of IIA Standard 2060, *Reporting to Senior Management and the Board*, the Practice Guide states that CAEs may include the following in their communications with management and the board of directors:

- All fraud audits performed
- The fraud risk assessment process
- Fraud or conflicts of interest
- The results of monitoring programs concerning compliance with law, code of conduct, or code of ethics
- The internal audit activity's organizational structure as it pertains to addressing fraud
- Coordination of fraud audit activity with external auditors
- Overall assessment of the organization's control environment
- Productivity and budgetary measures of internal audit's fraud activities
- Benchmarking comparisons of internal audit's fraud activities with other organizations
- Role of internal audit in fraud investigations

The Practice Guide recommends that CAEs have such discussions about fraud with senior management and the board of directors *before* issues arise concerning what those parties need to know, when they need to know it, and how the communication should be made.

Other Roles and Responsibilities for Fraud Prevention and Detection

Other typical roles and responsibilities for fraud detection and prevention outlined in the Practice Guide include the following:

- *Board of directors:* The board of directors is responsible for effective and responsible corporate fraud governance and is tasked with overseeing management's actions to manage fraud risks.
- *Audit committee:* The audit committee's role is to evaluate management's identification of fraud risks and the implementation of anti-fraud measures, and to provide the tone at the top that fraud will not be accepted in any form. The audit committee is also responsible for overseeing controls to prevent or detect management fraud.

- *Management*: Management is responsible for overseeing the activities of employees, assessing the entity's vulnerability to fraud, and establishing and maintaining an effective internal control system at a reasonable cost.
- *Legal counsel*: Legal counsel advises the organization on legal matters pertaining to fraud.
- *External auditors*: External auditors have a responsibility to comply with professional standards and to plan and perform the audit of the organization's financial statements to obtain reasonable assurance about whether the financial statements are free of material misstatements, whether caused by error or fraud. (For more information on the external auditor's responsibilities for fraud, see the previous discussion on "External Auditors' Fraud-Related Responsibilities.")
- *Loss prevention manager*: The loss prevention manager deals with crimes, disasters, accidents, waste, and other business risks, and this individual usually works closely with internal auditors to identify areas of weak internal controls within the organization.
- *Fraud investigators*: Fraud investigators are responsible for detecting and investigating fraud, as well as recovering assets.
- *Other employees*: All employees have a responsibility to report suspicious activity to a hotline, the internal audit department, or management.

The IIA's IPPF—Practice Guide: Auditing Anti-Bribery and Anti-Corruption Programs

As the risks of bribery and corruption have increased in significance and focus for many organizations, internal auditors are increasingly being tasked with auditing the programs designed to combat these risks. The IIA issued IPPF—Practice Guide: Auditing Anti-Bribery and Anti-Corruption Programs as a to complement the *Internal Auditing and Fraud* practice guide (discussed above) to fully support internal auditors in their responsibilities pertaining to fraud and corruption. The full text of the *Auditing Anti-Bribery and Anti-Corruption Programs* guide can be found at <https://na.theiia.org/standards-guidance/recommended-guidance/practice-guides/Pages/Auditing-Anti-bribery-and-Anti-corruption-Programs-Practice-Guide.aspx>. The following discussion summarizes some of the key points of this guidance pertaining to the internal auditor's responsibilities regarding bribery and corruption.

Internal Audit's Role in Anti-Bribery and Anti-Corruption Programs

The specific role of internal audit in anti-bribery and anti-corruption programs varies across organizations, depending on the relevant governance structure. Nonetheless, internal audit can play a significant role in reinforcing the program, both through identifying the existence of potential and actual incidents and assessing the effectiveness of the program designed to anticipate and address these risks.

Specifically, internal audit can reinforce each of the following program components in the noted ways:

- Tone at the top/governance structure, by:
 - Understanding the attitude and tolerance of management and the board regarding bribery and corruption risks
 - Assessing whether that attitude is sufficiently restrictive
 - Validating that this attitude has been effectively communicated throughout the organization
 - Scrutinizing the governance structure and oversight of the anti-bribery and anti-corruption program
- Bribery and corruption risk assessment, by:
 - Understanding all aspects of the anti-bribery and anti-corruption program before performing risk assessments
 - Evaluating inherent bribery and corruption risks as part of a comprehensive risk assessment
 - Ensuring the audit plan for assessing the anti-bribery and anti-corruption program is based on the results of risk assessment
- Policies and procedures, by testing whether they are:
 - Documented appropriately
 - Approved by management
 - In compliance with applicable laws and regulations
 - Implemented effectively
- Communication and training, by:
 - Sharing information with other functions or parties (e.g., fraud investigation, legal, compliance, external audit, regulators), as appropriate
 - Assisting in communicating and training employees in anti-bribery and anti-corruption policies (to the extent that doing so does not impair their objectivity)
- Monitoring and auditing, by:
 - Ensuring risk assessments, analyses, and communication are effective in supporting management's monitoring role
- Investigations and reports, by:
 - Participating in investigations as appropriate, based on the team's resources, the organization's governance structure, and formal protocols
 - Understanding the cultural and legal landscape of the jurisdictions involved
 - Being familiar with local protocols for investigating and reporting

- Following the organization's protocol regarding any audit evidence that might indicate bribery or corruption
- Performing and documenting adequate audit actions to support any findings, conclusions, or recommendations pertaining to bribery or corruption
- Seeking legal advice or recommending management seek legal advice regarding any evidence of illegal activity uncovered during an audit
- Working with appropriate personnel to determine whether an irregularity or illegal act has occurred and gauge its effect
- Enforcement and sanctions, by:
 - Working with management to adhere to a defined process for evaluating cases of bribery or corruption and, if appropriate, implementing sanctions according to a formal policy

Government Auditors' Fraud-Related Responsibilities

International Standards of Supreme Audit Institutions Framework

The International Organization of Supreme Audit Institutions (INTOSAI) is an autonomous, independent, and non-political organization. It is a non-governmental organization founded in 1953, with special consultative status with the Economic and Social Council (ECOSOC) of the United Nations (UN). INTOSAI currently has 192 full members, 5 associate members, and 1 affiliate member.

INTOSAI operates as an umbrella organization for the external government audit community and provides an institutionalized framework for supreme audit institutions (SAIs) to foster the exchange of ideas, knowledge, and experiences; the organization acts as a recognized voice of SAIs within the international community. INTOSAI provides high-quality auditing standards for the public sector in an effort to promote good governance while fostering SAI capacity development and continuous performance improvement.

According to INTOSAI, several different documents combine to form the comprehensive International Standards of Supreme Audit Institutions (ISSAI) framework with the following hierarchy:⁸

⁸ For more information about the ISSAI framework, please see www.issai.org/professional-pronouncements.

- INTOSAI Principles, the initial level of the INTOSAI professional framework, are found in *INTOSAI-P 1 – The Lima Declaration*, with its comprehensive precepts on auditing in the public sector. The core principles are also included in this level of the framework and consist of *INTOSAI-P 10 – Mexico Declaration on SAI Independence*, *INTOSAI-P 12 – The Value and Benefits of Supreme Audit Institutions – making a difference to the lives of citizens*, *INTOSAI-P 20 – Principles of Transparency and Accountability*, and *INTOSAI-P 50 – Principles of jurisdictional activities of SAIs*.
- INTOSAI Standards, at the second level, provide the essential concepts, elements, and principles that apply to all public-sector audits. This level includes *ISSAI 100 – Fundamental Principles of Public-Sector Auditing*, *ISSAI 130 – Code of Ethics*, and *ISSAI 140 – Quality Control for SAIs*. It also includes principles and standards pertaining to specific types of audit engagements (i.e., financial audits, performance audits, and compliance audits).
- INTOSAI Guidance, which is the third level, provides practical assistance to SAIs in implementing the framework in their individual constituencies.

Portions of the first two elements of this framework are summarized in the following sections.

The Lima Declaration: General Precepts for Auditing in the Public Sector

INTOSAI-P 1 – The Lima Declaration is the foundation of the INTOSAI professional framework. It contains a comprehensive yet concise list of all goals and issues relating to government auditing.

The main purpose of *INTOSAI-P 1 – The Lima Declaration* is to call for independent government auditing. However, the demands of *INTOSAI-P 1 – The Lima Declaration* are not satisfied by an SAI just achieving independence; this independence is also required to be anchored in the legislation. For this, however, well-functioning institutions of legal security must exist, and these are only to be found in a democracy based on the rule of law. Rule of law and democracy are, therefore, essential premises for true independent government auditing and are the foundation on which *INTOSAI-P 1 – The Lima Declaration* is based.

INTOSAI Standards

The INTOSAI Standards contain common pronouncements of the generally recognized professional principles that underpin effective, independent auditing of public-sector organizations. They contain a set of principles for general public-sector audits, as well as standards specific to financial, performance, and compliance audits.

The following discussion focuses on those principles that apply to all public-sector audits, irrespective of their form or context. The full text of these principles, as well as the principles that are specific to financial, performance, and compliance audits, can be found at www.issai.org/pronouncements/issai-100-fundamental-principles-of-public-sector-auditing.

FUNDAMENTAL PRINCIPLES OF PUBLIC-SECTOR AUDITING

The principles contained in this section are fundamental to the conduct of an audit. Although auditing is a cumulative and iterative process, for the purposes of presentation, the fundamental principles are grouped by principles related to the SAI's organizational requirements, general principles that the auditor should consider prior to commencement and at more than one point during the audit, and principles related to specific steps in the audit process.

ORGANIZATIONAL REQUIREMENTS

Each SAI should establish and maintain procedures for ethics and quality control on an organizational level that will provide it with reasonable assurance that the SAI and its personnel are complying with professional standards and the applicable ethical, legal, and regulatory requirements.

GENERAL PRINCIPLES

- *Ethics and independence*—Auditors should comply with the relevant ethical requirements and be independent. Ethical principles should be embodied in an auditor's professional behavior. The SAIs should have policies addressing ethical requirements and emphasizing the need for compliance by each auditor. Auditors should remain independent so that their reports will be impartial and be seen as such by the intended users.
- *Professional judgment, due care, and skepticism*—Auditors should maintain appropriate professional behavior by applying professional skepticism, professional judgment, and due care throughout the audit. The auditor's attitude should be characterized by professional skepticism and professional judgment, which are to be applied when forming decisions about the appropriate course of action. Auditors should exercise due care to ensure that their professional behavior is appropriate.

- *Quality control*—Auditors should perform the audit in accordance with professional standards on quality control. An SAI's quality control policies and procedures should comply with professional standards, the aim being to ensure that audits are conducted at a consistently high level. Quality control procedures should cover matters such as the direction, review and supervision of the audit process and the need for consultation in order to reach decisions on difficult or contentious matters.
- *Audit team management and skills*—Auditors should possess or have access to the necessary skills. The individuals in the audit team should collectively possess the knowledge, skills, and expertise necessary to successfully complete the audit. This includes an understanding and practical experience of the type of audit being conducted, familiarity with the applicable standards and legislation, an understanding of the entity's operations, and the ability and experience to exercise professional judgment. Auditors should maintain their professional competence through ongoing professional development.
- *Audit risk*—Auditors should manage the risks of providing a report that is inappropriate in the circumstances of the audit. The *audit risk* is the risk that the audit report may be inappropriate. The auditor performs procedures to reduce or manage the risk of reaching inappropriate conclusions, recognizing that the limitations inherent to all audits mean that an audit can never provide absolute certainty of the condition of the subject matter.
- *Materiality*—Auditors should consider materiality throughout the audit process. Materiality is relevant in all audits. A matter can be judged material if knowledge of it would be likely to influence the decisions of the intended users. Determining materiality is a matter of professional judgment and depends on the auditor's interpretation of the users' needs. This judgment may relate to an individual item or to a group of items taken together. Materiality is often considered in terms of value, but it also has other quantitative as well as qualitative aspects.
- *Documentation*—Auditors should prepare audit documentation that is sufficiently detailed to provide a clear understanding of the work performed, evidence obtained, and conclusions reached. Audit documentation should include an audit strategy and audit plan. It should record the procedures performed and evidence obtained and support the communicated results of the audit. Documentation should be sufficiently detailed to enable an experienced auditor, with no prior knowledge of the audit, to understand the nature, timing, scope, and results of the procedures performed, the evidence obtained in support of the audit conclusions and recommendations, the reasoning behind all significant matters that required the exercise of professional judgment, and the related conclusions.

- *Communication*—Auditors should establish effective communication throughout the audit process. It is essential that the audited entity be kept informed of all matters relating to the audit. This is key to developing a constructive working relationship. Communication should include obtaining information relevant to the audit and providing management and those charged with governance with timely observations and findings throughout the engagement. The auditor may also have a responsibility to communicate audit-related matters to other stakeholders, such as legislative and oversight bodies.

PRINCIPLES RELATED TO THE AUDIT PROCESS

- Planning an audit:
 - *Auditors should ensure that the terms of the audit have been clearly established.* Audits may be required by statute, requested by a legislative or oversight body, initiated by the SAI, or carried out by simple agreement with the audited entity. In all cases, the auditor, the audited entity's management, those charged with governance, and others, as applicable, should reach a common formal understanding of the terms of the audit and their respective roles and responsibilities.
 - *Auditors should obtain an understanding of the nature of the entity/program to be audited.* This includes understanding the relevant objectives, operations, regulatory environment, internal controls, financial and other systems, and business processes, and researching the potential sources of audit evidence. Knowledge can be obtained from regular interaction with management, those charged with governance, and other relevant stakeholders.
 - *Auditors should conduct a risk assessment or problem analysis and revise this as necessary in response to the audit findings.* The auditor should consider and assess the risk of different types of deficiencies, deviations, or misstatements that may occur in relation to the subject matter. Both general and specific risks should be considered. The auditor should assess management's response to identified risks, including its implementation and design of internal controls to address them. The identification of risks and their impact on the audit should be considered throughout the audit process.
 - *Auditors should identify and assess the risks of fraud relevant to the audit objectives.* Auditors should make enquiries and perform procedures to identify and respond to the risks of fraud relevant to the audit objectives. They should maintain an attitude of professional skepticism and be alert to the possibility of fraud throughout the audit process.

- *Auditors should plan their work to ensure that the audit is conducted in an effective and efficient manner.* Planning for a specific audit includes strategic and operational aspects. Strategically, planning should define the audit scope, objectives, and approach. Operationally, planning entails setting a timetable for the audit and defining the nature, timing, and extent of the audit procedures. Audit planning should be responsive to significant changes in circumstances and conditions. It is an iterative process that takes place throughout the audit.
- Conducting an audit:
 - *Auditors should perform audit procedures that provide sufficient appropriate audit evidence to support the audit report.* The auditor's decisions on the nature, timing, and extent of audit procedures will have an impact on the evidence to be obtained. The choice of procedures will depend on the risk assessment or problem analysis. Evidence should be both sufficient in quantity and appropriate in quality (i.e., relevant, valid, and reliable) to persuade a knowledgeable person that the findings are reasonable. The auditor's assessment of the evidence should be objective, fair, and balanced. Preliminary findings should be communicated to and discussed with the audited entity to confirm their validity. The auditor must respect all requirements regarding confidentiality.
 - *Auditors should evaluate the audit evidence and draw conclusions.* After completing the audit procedures, the auditor will review the audit documentation in order to determine whether the subject matter has been sufficiently and appropriately audited. Before drawing conclusions, the auditor reconsiders the initial assessment of risk and materiality in light of the evidence collected and determines whether additional audit procedures need to be performed. When evaluating the audit evidence and assessing materiality of findings, the auditor should take both quantitative and qualitative factors into consideration. Based on the findings, the auditor should exercise professional judgment to reach a conclusion on the subject matter or subject matter information.
- Reporting and follow-up:
 - *Auditors should prepare a report based on the conclusions reached.* The audit process involves preparing a report to communicate the results of the audit to stakeholders, others responsible for governance, and the general public. The purpose is also to facilitate follow-up and corrective action. Reports should be easy to understand, free from vagueness or ambiguity, and complete. They should be objective and fair, only including information that is supported by sufficient and appropriate audit evidence and ensuring that findings are put into perspective and context. The form and content of a report will depend on the nature of the audit, the intended users, the applicable standards, and legal requirements.

FRAUD-RELATED STANDARDS FOR FINANCIAL AUDITS

ISSAI 200 – Fundamental Principles of Financial Auditing provides key principles and standards related to an audit of financial statements in the public sector.⁹ According to ISSAI 200, the auditor has the following objectives when conducting such an engagement:

- To obtain reasonable assurance about whether the financial statements as a whole are free from material misstatement, whether due to fraud or error, thereby enabling the auditor to express an opinion on whether the financial statements are prepared, in all material respects, in accordance with an applicable financial reporting framework
- To report on the financial statements, and communicate the result of the audit, in accordance with the auditor's findings

In furtherance of these objectives, ISSAI 200 includes the following standards and guidance pertaining to the auditor's consideration of fraud when conducting a financial audit. These requirements are:

- The auditor should identify and assess the risks of material misstatement in the financial statements due to fraud, should obtain sufficient appropriate audit evidence regarding the assessed risks of material misstatement due to fraud, and should respond appropriately to fraud or suspected fraud identified during the audit.
- The primary responsibility for the prevention and detection of fraud rests with the entity's management and those charged with governance. It is important that management, under the oversight of those charged with governance, strongly emphasizes fraud prevention (limiting opportunities for fraud to take place) and fraud deterrence (dissuading individuals from committing fraud because of the likelihood of detection). The auditor is responsible for obtaining reasonable assurance that the financial statements taken as a whole are free from material misstatement, whether caused by fraud or error.
- Misstatements in the financial statements can arise from either fraud or error. The distinguishing factor is whether the action resulting in a misstatement was intentional or unintentional. Although fraud is a broad legal concept, the auditor is concerned only with fraud that causes a material misstatement in the financial statements. Two types of intentional misstatements are relevant to the auditor—misstatements resulting from fraudulent financial reporting and those resulting from the misappropriation of assets.

⁹ ISSAI 200 – *Fundamental Principles of Financial Auditing* is available at www.intosai.org/fileadmin/downloads/documents/open_access/ISSAI_100_to_400/issai_200/issai_200_en.pdf.

- The auditor is expected to maintain an attitude of professional skepticism throughout the audit, recognizing the possibility of material misstatement due to fraud at both the financial statement level and the assertion level for classes of transactions, account balances and disclosures, notwithstanding the auditor's past experience of the honesty and integrity of management and those charged with governance. When performing risk assessment procedures and related activities to obtain an understanding of the audited entity and its environment, the auditor should seek to obtain information that can be used to identify risks of material misstatement due to fraud.
- Areas in which auditors should be alert to fraud risks leading to material misstatement may include procurement, grants, privatizations, intentional misrepresentation of results or information, and misuse of authority or power.
- Requirements for the reporting of fraud in the public sector may be the subject of specific provisions in the audit mandate or related laws or regulations, and the auditor may be required to communicate such issues to parties outside the audited entity, such as regulatory and enforcement authorities. In some environments, there may be a specific obligation to refer indications of fraud to investigative bodies and even to cooperate with such bodies on determining whether fraud or abuse has occurred. In other environments, auditors may be obliged to report circumstances that may indicate the possibility of fraud or abuse to the competent jurisdictional body or to the appropriate part of the government or legislature, such as prosecutors, the police, or (if relevant to legislation) affected third parties. Auditors should also consider that the use of public monies tends to raise the profile of fraud. As a result, auditors may need to be responsive to public expectations regarding fraud detection.

In addition, ISSAI 1240 provides supplementary guidance regarding the applicability of International Standard on Auditing (ISA) 240 to public-sector financial statement audits. This practice note states that ISA 240 is applicable to auditors of public-sector entities in their role as auditors of financial statements and includes the following application considerations specifically for public-sector audits:

- *Broader audit objectives:* The objectives of a financial audit in the public sector are often broader than expressing an opinion as to whether the financial statements have been prepared, in all material respects, in accordance with the applicable financial reporting framework (i.e., the scope of the financial statement audits under the ISAs). The audit mandate arising from legislation, regulation, ministerial directives, government policy requirements, or resolutions of the legislature may result in additional objectives.

These additional objectives may include audit and reporting responsibilities, for example, relating to reporting whether the public-sector auditors found any instances of noncompliance with authorities, including budgets and accountability frameworks and/or reporting on the effectiveness of internal control. However, even where there are no such additional objectives, there may be general public expectations for public-sector auditors to report any noncompliance with authorities detected during the audit or to report on effectiveness of internal control. These additional responsibilities and the related fraud risks need to be considered by the public-sector auditor when planning and performing the audit.

- *Consideration of the concept of abuse.* In addition to fraud, public-sector auditors must remain alert throughout the audit for occurrences of abuse. In this context, *abuse* involves behavior that is deficient or improper when compared with behavior that a prudent person would consider reasonable and necessary business practice given the facts and circumstances. Abuse also includes misuse of authority or position for personal financial interests or those of an immediate or close family member or business associate. Abuse does not necessarily involve fraud, violation of laws, regulations, or provisions of a contract or grant agreement. Abuse is a departure from the concept of propriety, which relates to the general principles of sound public-sector financial management and conduct of public-sector officials. When information is obtained indicating that abuse might have occurred, public-sector auditors consider whether such possible abuse could significantly affect the financial statements. Such abuse may be considered from both a qualitative and quantitative perspective. Public-sector auditors do not provide reasonable assurance of the detection of abuse but should consider the need to report such instances as deemed appropriate.
- *Specific threats to professional skepticism.* In the public sector, threats to maintaining an attitude of professional skepticism throughout the audit might exist and include the following:
 - The nature of personal or professional relationships as a result of the political process/environment
 - The public-sector audit organization's exclusive mandate, resulting in the lack of audit competitors
 - In some environments, the lack of requirements to rotate auditors regularly

Public-sector auditors must take appropriate action to reduce such threats.

- *Expanded discussion among the engagement team:* ISA 240 requires a discussion among the engagement team members and a determination by the engagement partner of which matters are to be communicated to those team members not involved in the discussion. In the public sector, the discussion may also cover the additional objectives and related risks of material misstatement specific to the public sector. Public-sector auditors may include auditors engaged in performance audits and other audit activities of the entity in such a discussion.
- *Additional inquiries:* When making the required inquiries of management and those charged with governance under ISA 240, the public-sector auditor may also:
 - Inquire as to management's communication with other government bodies as appropriate.
 - Include responsible officials of, for example, a ministry, board members, or members of relevant legislative committees.
- *Adjusted analytical procedures:* When performing analytical procedures as required under ISA 240, the public-sector auditor should:
 - Consider areas of potential significance (in addition to revenue recognition, as required in ISA 240) depending on the nature of the operations of the entity (e.g., procurement and grants may be more relevant than revenue accounts for many public-sector entities).
 - Consider the unique challenges of using the cash-basis of accounting and the related possibilities for manipulation of financial information.
- *Fraud risk factors specific to the public sector:* When evaluating fraud risk factors, auditors should take note of additional risk factors that may be relevant in the public sector.
- *Fraud risks specific to the public sector:* When identifying and assessing the risks of material misstatement, the public-sector auditor should consider that revenue recognition may not always be the most relevant area for the presumption that there are risks of fraud (as required by ISA 240). This risk may be highly relevant for tax authorities or other agencies that collect revenues (e.g., state universities and colleges, hospitals, or regulatory agencies, which charge fees for services rendered, or are recipients of donor funds). However, in many public-sector entities, the focus is on expenditures and areas such as procurement and payment of grants. Therefore, in addition to revenue recognition, where relevant, public-sector auditors may consider such other areas when making the presumption of fraud risks.

- *Additional audit procedures:* Public-sector auditors should take note that additional audit procedures may be relevant in the public sector. Additionally, ISA 240 requires the auditor to evaluate the business purpose of significant transactions outside the normal course of business for the entity; for public-sector entities, such transactions may include: economic development incentives, onerous provisions in union contracts, real-estate purchases or sales, land swaps, granting of easements, public/private partnerships, privatization of governmental services, early extinguishment of debt, and government guarantees or assurances to rescue private-sector entities if they have financial difficulties.
- *Inability to withdraw from the engagement:* Public-sector auditors do not normally have the option to withdraw from an audit engagement. Therefore, public-sector auditors must consider the impact on the audit opinion and any requirements for other forms of reporting, including whether it may be appropriate to report separately to the legislature or to issue classified or restricted reports.
- *Additional communications about fraud-related matters:* Public-sector auditors may be required or may decide to communicate matters with other parties, such as the legislature, in addition to those charged with governance. Furthermore, the requirements for reporting of fraud in the public sector may be subject to specific provisions of the audit mandate or related legislation or regulation (e.g., regulatory and enforcement authorities). In some environments, there may be a duty to refer indications of fraud to investigative bodies and even cooperate with such bodies to determine if fraud or abuse has occurred. In other environments, public-sector auditors may be obliged to report circumstances that may indicate the possibility of fraud or abuse to the competent jurisdictional body or to the appropriate part of the government or legislature, such as prosecutors, the police, and (if relevant to legislation) affected third parties. Consequently, public-sector auditors need to be familiar with applicable laws and regulations in regard to reporting, communication, and documentation of indications or suspicions of fraud. They should also take care to avoid interfering with potential investigations or legal proceedings and should consider the need to obtain legal advice in issues regarding indications of fraud.

FRAUD-RELATED STANDARDS FOR COMPLIANCE AUDITS

ISSAI 400 – Fundamental Principles of Compliance Auditing provides key principles and standards related to a public-sector compliance audit. According to ISSAI 400, a compliance audit is an independent assessment of whether a given subject matter is in compliance with applicable authorities. Such an engagement involves assessing whether the relevant activities, financial

transactions, and information comply, in all material respects, with the authorities that govern the audited entity. ISSAI specifically asserts that compliance auditing promotes good governance in the public sector by considering the risk of fraud in relation to compliance.

To support the objectives of a compliance audit, ISSAI 400 requires public-sector auditors to consider the risk of fraud when conducting this type of engagement. Specifically, the standard provides the following considerations regarding the risk of fraud in compliance audits:

- While detecting fraud is not the main objective of a compliance audit, auditors should include fraud risk factors in their risk assessments and remain alert to indications of fraud when carrying out their work.
- Fraud in compliance auditing relates mainly to the abuse of public authority, but also to fraudulent reporting on compliance issues. Instances of noncompliance with authorities may constitute deliberate misuse of public authority for improper benefit. The execution of public authority includes decisions, non-decisions, preparatory work, advice, information handling, and other acts in the public service. Improper benefits are advantages of a non-economic or economic nature gained by an intentional act by one or more individuals among management, those charged with governance, employees, or third parties.
- If the auditor comes across instances of noncompliance that may indicate fraud, they should exercise due professional care and caution so as not to interfere with any future legal proceedings or investigations.

INTERNATIONAL CODE OF ETHICS FOR AUDITORS IN THE PUBLIC SECTOR

ISSAI 130 – Code of Ethics is intended to provide a set of values and principles on which auditors should base their behavior, as well as to give guidance on how to embed those values in the daily work within an SAI. Thus, *ISSAI 130 – Code of Ethics* provides an overall approach to ethical behavior, a description of the overall responsibilities of SAIs, and five fundamental values that guide ethical conduct.

APPLICABILITY

ISSAI 130 – Code of Ethics is intended for all those who work for, or on behalf of, an SAI, including the head of the SAI, its members, executive management, and all individuals directly employed by, or contracted to conduct business on behalf of, the SAI. *ISSAI 130 – Code of Ethics* also applies to those charged with governance of an SAI.

Due to differences of culture and legal and social systems, each SAI should develop its own code of ethics and an ethical control system to implement it. *ISSAI 130 – Code of Ethics* is intended to constitute a foundation—and set the minimum stringency—for each SAI's code of ethics.

FUNDAMENTAL ETHICAL VALUES

ISSAI 130 – Code of Ethics provides the following five fundamental values that should drive the decisions of SAIs and auditors:

- Integrity
- Independence and objectivity
- Competence
- Professional behavior
- Confidentiality and transparency

FRAUD PREVENTION PROGRAMS

Fraud prevention requires a system of policies and procedures, which, in their aggregate, minimize the likelihood of fraud occurring while maximizing the possibility of detecting any fraudulent activity that might transpire. The possibility of being caught serves as a deterrent to potential fraudsters. Thus, the existence of a thorough control system is essential to fraud prevention.

Selling Fraud Prevention to Management

Management might be resistant to supporting investment in fraud prevention measures for one of several reasons, including:

- Management's concerns relate to areas other than audit or fraud. Those in charge don't typically understand that fraud is hidden and that losses go undetected. They also might refuse to believe that their own workers are capable of stealing even when studies suggest that one-third of employees might actually steal.
- Because fraud can be concealed, managers are understandably reluctant to believe in the presence of fraud. And, if one employee is caught committing fraud, management might too often claim that it is an isolated problem and not worth additional consideration. Management must understand that when instances of fraud are detected, it is too late to do anything about them.
- Management sometimes unreasonably feels that mentioning the issue will alienate the work force. This problem can be addressed by reminding management that the rank-and-file workers appreciate working for an honest company. It is also helpful to point out to management what the losses might be.

Many anti-fraud professionals complain that management does not adequately support fraud prevention efforts. There are generally two reasons behind this complaint: Management either believes that fraud is not really a problem in the company, or it believes that even addressing the subject has a negative impact. In either scenario, it is difficult for the auditor to deconstruct management's built-in resistance to dealing with fraud prevention. Some of the following suggestions might be helpful in "selling" fraud prevention to management.

The Impact on the Bottom Line

One of the best ways to persuade management on the importance of fraud prevention is by showing the impact on the bottom line. Fraud affects net sales dollar for dollar. For example, if a company nets 20% on sales, it must sell five items at regular prices to recover losses (cost plus lost profit) from the theft of one item. Fraud can be very expensive.

The cost/benefit analysis of investing in fraud prevention should be clear. It is much more cost effective to proactively address fraud risks than to endure preventable fraud and spend valuable resources on detecting, investigating, prosecuting, and cleaning up after it. In other words, stopping fraud before it occurs directly increases the organization's bottom line.

The Impact of Negative Publicity

Many corporate executives are more sensitive to adverse publicity than almost any other issue. Certainly, one way to convince management of the logic of fraud prevention is to mention that negative publicity can have a devastating impact on the bottom line, even in small cases. This negative impact can be eliminated or reduced by a proactive fraud prevention program.

Procedures to Prevent Fraud

The following are examples of procedures and mechanisms that are specifically designed to detect and prevent fraud.

Increasing the Perception of Detection

Most experts agree that it is much easier to prevent fraud than to detect it. To prevent fraud, we should understand something about the potential perpetrator's mindset. Increasing the perception of detection might be the most effective fraud prevention method. Controls, for example, are not very effective in preventing theft and fraud if those at risk do not know of the presence of possible detection. In the audit profession, this means letting employees, managers, and executives know that auditors are actively seeking information concerning internal theft. This can be accomplished in several ways, such as through proactive audit policies, employee anti-fraud education, enforcement of mandatory-vacation and job-rotation policies, strong management oversight, and effective reporting programs.

Proactive Audit Procedures

Implementing proactive audit procedures demonstrates management's intention to aggressively look for possible fraudulent conduct instead of waiting for instances to be reported. Such techniques include the use of analytical review, fraud assessment questioning, and surprise audits where possible.

Use of Analytical Review Procedures

Some internal fraud is discovered as a result of analytical review procedures performed during a financial statement audit. To uncover fraud using such techniques, however, the scheme must materially impact the financial statements. Auditors should be especially mindful of the following trends:

- Increasing expenses
- Increasing cost of sales
- Increasing receivables/decreasing cash
- Increasing inventories
- Increasing sales/decreasing cash
- Increasing returns and allowances
- Increasing sales discounts

Fraud Assessment Questioning

Fraud assessment questioning is a non-accusatory interview technique used as a part of a normal audit. It is based on the theory that employees' attitudes are a good indicator of potential problems and that one of the most effective ways to assess potential fraud is to ask about it.

Below are some suggested questions that can be asked as part of the normal audit. Note that the questions here begin with the general and proceed to the specific.

- Part of my duty as an auditor is to find fraud, waste, and abuse. Do you understand that?
- Do you think fraud is a problem for business in general?
- Do you think this company has any particular problem with fraud?
- Has anyone ever asked you to do anything that you felt was illegal or unethical?
- If you felt that there was a problem in the company with respect to fraud, what would you do?
- Do you have any indication that there is fraud occurring in the company now?

Surprise Audits Where Possible

In addition to regularly scheduled fraud audits, surprise fraud audits of business functions in which fraud is most likely to occur can be effective both in increasing employees' perception of detection and in uncovering actual frauds that have been perpetrated. The surprise element must be present for this control to be effective; predictability allows perpetrators the time to conceal their acts by altering, destroying, or misplacing records and other evidence.

Employee Anti-Fraud Education

Each entity should have a policy for educating managers, executives, and employees about fraud. This education can be accomplished through memoranda, organization-wide emails and voice mails, formal training programs, and other intercompany communication methods. Any education efforts should be positive and non-accusatory. The goal is to make others within the company vigilant for any potential frauds.

Who Should Attend?

Every employee within the organization should be required to participate in the fraud awareness training program. No individuals—regardless of their position within the organization—should be provided an exemption from receiving an initial orientation and ongoing anti-fraud education.

FRAUD AWARENESS TRAINING FOR MANAGERS AND EXECUTIVES

In addition to the information presented to all employees, managers and executives should receive special training that addresses the added fraud prevention and detection responsibility—and ability—provided by their authority positions. For example, department managers should be trained in the specific warning signs and prevention/detection methods pertinent to their department's functions. Purchasing managers should be well versed in the red flags of bribery schemes; likewise, controllers should understand just how important their vigilance is in preventing and detecting fraudulent disbursements.

Frequency and Length of Fraud Awareness Training

Like any educational efforts, frequent exposure to anti-fraud topics is crucial to ensuring that employees absorb—and apply—the information provided. Formal fraud awareness training should be an ongoing process that begins at the time of hire. Employees should also participate in refresher training at least annually to help keep the program active and engrained in their minds. Additionally, all employees should sign an annual statement acknowledging their understanding of and commitment to the program.

Training Delivery Methods

Formal anti-fraud training can take many forms, including live, in-class instruction; recorded video or animated courses; or interactive self-study programs. Of these options, a live class is preferable, as it allows employees the opportunity to actively participate, interact with other employees, discuss the true fraud risks facing the organization, and seek and provide feedback regarding the anti-fraud program as a whole. Integrating games and role-playing exercises into the training curriculum can make the course more enjoyable—and thus more effective—for participants.

Perhaps most important, however, is that the training be based on the realities of the organization, rather than on generic anti-fraud messages. While providing general information is good and necessary, doing so without addressing the company's specific concerns or providing employees with practical knowledge and ideas on how to apply it will render the training program ineffective.

In addition, the organization can use other informal means to reinforce its anti-fraud stance on a more constant basis. Periodic newsletters, posters in break rooms, and other casual reminders help keep employees mindful of fraud prevention and detection.

CASCADING TRAINING

As messages from an employee's direct supervisor are often the most significant and impressionable to an employee, the concept of cascading training can be an especially effective means of anti-fraud education. In cascading training, managers are tasked with and specifically educated on how to provide anti-fraud training to their own staff. This allows training to be customized to each team's own needs, as well as for the message to come directly from the team's own leader.

Topics to Cover

The following topics should form the basis of the training, but the information presented should focus on the specific risks faced by the organization to provide employees with practical, implementable knowledge.

WHAT FRAUD IS AND WHAT IT IS NOT

A good anti-fraud training program informs employees of what behavior is acceptable and what is not. Providing employees with the legal definition of fraud is not enough; effective training includes an interactive discussion and examples of fraud, as well as examples of errors and abuse.

HOW FRAUD HURTS THE ORGANIZATION

Surprisingly, some employees view the theft of a few thousand dollars from a big organization as having a negligible impact on the entire company. Others might believe that manipulating numbers in the accounting records to help the company reach its goals is actually a helpful act.

Fraud awareness training programs must indicate clearly to employees how such actions harm the organization—how all frauds result in lost resources, decreased productivity, and lowered morale; investments of time and money into investigation, punishment, and remediation; and damage to the company's reputation.

HOW FRAUD HURTS EMPLOYEES

Employees must also be made aware of how a fraud perpetrated by another individual can negatively affect them through decreased salaries, loss of bonuses, possible layoffs, increased scrutiny, decreased trust throughout the organization, and the need to compensate for or offset any negative consequences of the fraud. Personalizing the fallout in this way helps increase employees' commitment to aiding fraud prevention and detection efforts.

WHO PERPETRATES FRAUD

Anyone who has the combination of sufficient pressure, adequate opportunity, and an ability to rationalize a dishonest act is at risk of committing fraud. Fraudsters come from all age groups and may work in virtually any department. Further, ACFE research shows that the typical fraudster is college educated and does not have a criminal history. Anti-fraud training should work to dispel any preconceived notions held by employees regarding what a fraud perpetrator looks like and should help employees learn to focus on identifying the warning signs of fraudulent behavior.

HOW TO IDENTIFY FRAUD

It is ineffective to instruct employees that they must help the organization fight fraud if they do not have some accompanying information about what to look for. The following are some warning signs of fraud that employees should be aware of.

FINANCIAL/TRANSACTIONAL RED FLAGS

- Structural red flags
- Personnel red flags
- Operational red flags
- Accounting system red flags
- Financial performance red flags
- Professional service red flags

BEHAVIORAL RED FLAGS

- Living beyond their means
- Financial difficulties
- Control issues, unwilling to share duties
- Unusually close relationship with vendor/customer
- Wheeler-dealer attitude
- Divorce/family problems
- Irritability, suspiciousness, defensiveness
- Addiction problems
- Unwilling to take vacation days
- Past employment-related problems
- Complained about inadequate pay
- Excessive pressure from within the organization
- Past legal problems
- Instability in life circumstances
- Excessive family/peer pressure for success
- Complained about lack of authority

HOW TO REPORT FRAUD

As previously discussed, more fraud is uncovered by tips than by any other means, making employees the best possible fraud detection control. But for employees to be able to serve this function, they must be well informed on how to report any suspicious activity, as well as empowered to make such reports without risk of retribution.

THE PUNISHMENT FOR DISHONEST ACTS

The opportunity to commit fraud becomes more attractive when employees believe fraud normally goes undetected and unprosecuted. It's crucial that employees are informed of the punishment and its severity (termination and possible prosecution) in advance. Providing examples of past transgressions that have gone punished can reinforce the stance that such acts will be addressed with certainty, swiftness, and severity.

Enforcement of Mandatory Vacations

Many internal frauds require manual intervention and are discovered when the perpetrator is away on vacation. The enforcement of mandatory vacations will aid in the prevention of some frauds.

Job Rotation Policy

Some frauds are detected when the perpetrator is sick or unexpectedly absent because they require continuous, manual intervention. Requiring employees in certain functions (e.g., accounting clerks) to periodically rotate job duties or accounts reviewed can increase the perception of detection in the potential perpetrator's mind.

EXAMPLE

A manager who embezzled \$1.6 million from their company said, "If the company had coupled a two-week vacation with four weeks of rotation to another job function, my embezzlement would have been impossible to cover up." Their fraud lasted three years.

Effective Management Oversight

It is common for employees who steal to use the proceeds for lifestyle improvements. Some examples include more expensive cars, extravagant vacations, expensive clothing, new or remodeled homes, expensive recreational property, and outside investments. Managers should be educated to be observant of these signs. To further increase the deterrent effect, employees should know that supervisors are watching for unexplained or suspicious anomalies of this nature.

EXAMPLE

Discovery of a \$97,000 embezzlement, which occurred over a two-year period, resulted when an observant manager asked the internal auditors to examine the responsibilities of a seven-year veteran of the company. The manager noticed that this employee had begun wearing designer clothes, which they flaunted,) and was driving a new BMW. The manager was also aware of the fact that this employee had no outside income that might explain the upgrade in lifestyle.

Reporting Programs

An anonymous reporting channel, such as an ethics hotline, is an integral part of an anti-fraud control system. Employees must be made aware of the existence of the reporting mechanism, taught how to use it, and be able to trust that they can report suspicious activity anonymously or confidentially (where permitted by law) without fear of reprisal. In addition, it should be made clear to employees that reports of suspicious activity will be promptly and thoroughly evaluated.

Education about a reporting program should specifically emphasize that:

- Fraud, waste, and abuse occur in nearly all companies.
- Such conduct costs the company jobs and profits.
- The company actively encourages any employee with information to disclose it.
- The employee can provide information anonymously and without fear of retaliation for good-faith reporting.
- There is an exact method for reporting an incident (e.g., a telephone number or online form).
- The report need not be made to one's immediate superiors.

Hotlines

Hotlines have proved to be a very effective reporting mechanism. However, most hotline reports do not result in fraud cases. With careful screening of calls and proper handling, false and illegitimate complaints can be effectively removed from consideration. There are three general types of hotlines. The advantages and disadvantages of each are summarized below.

PART TIME, IN-HOUSE

These hotlines are assigned to an employee with other duties. An audit or security department usually staffs an in-house hotline. When the employee is out, a recorder takes calls.

The main advantage is cost. The main disadvantage is that the hotline is not staffed full-time, which can discourage calls. Also, some people might be reluctant to report their concerns directly to the company.

FULL TIME, IN-HOUSE

A full-time, in-house hotline might be feasible depending on the company size. The advantage is that people can make reports at any time, day or night, and talk to a person. The disadvantage is cost, and, like the part-time line, some people might be reluctant to report directly to the company.

THIRD PARTY

An outside company that specializes in services of this type most often staffs a third-party hotline. The advantages are cost, efficiency, and anonymity. Some are staffed around the clock and will provide the information immediately to the client subscriber. They also provide anonymity to those who might be more comfortable with it. Their disadvantage is that the operation is beyond the company's control.

Rewards

A reward, such as a cash payment, can provide an incentive for employees to report wrongdoing. Strict criteria should exist for the payment of rewards, and any proposed policies should be reviewed and approved by legal counsel. Additionally, to help prevent anyone from taking advantage of the incentive program by filing false reports, it must be stated clearly that rewards are given only if an investigation reveals that an actual act of fraud or misconduct did occur.

The appropriate incentive depends on the organization, the whistleblower, and the allegation reported. Some organizations provide monetary rewards. Various methods of calculating such rewards can be used (e.g., fixed fees, a percentage of the recovery), but studies have generally indicated that rewards should not exceed a few thousand dollars.

In addition to or instead of cash payments, employees who provide information on wrongdoing can be rewarded with public recognition (if they wish), lunch with the chief executive officer (CEO), or some other non-monetary incentive that focuses on the qualitative value of reporting and highlights management's support of and encouragement for individuals to disclose tips.

Whistleblower Support and Protection

A major concern of individuals who wish to report misconduct in the workplace is the fear of being retaliated against for their disclosure. *Retaliation* occurs when an employer takes any adverse action against an employee that would dissuade a reasonable person from raising a concern about a possible violation, and it can have negative effects on employee morale throughout all levels of the company. Some examples of adverse actions that can arise include:

- Terminations or layoffs
- Demotion
- Promotion denial
- Intimidation or harassment
- Reduction in pay rate or hours
- Interference in future employment opportunities

While the global landscape of legal protection offered to whistleblowers varies, more countries are beginning to enact measures that protect whistleblowers who suffer retaliation. Some countries have anti-retaliation laws to protect employees against retaliation in the workplace. In successful cases, these laws might offer remedies that reinstate employment, award back pay with interest, and recover attorneys' fees or other litigation costs.

In jurisdictions that do not have formal legal protection for whistleblowers, countries often use their own employment laws and anti-corruption provisions as a framework; however, due to legalities, these employment laws and anti-corruption provisions might be limited in their ability to protect whistleblowers against retaliation in the workplace for reporting misconduct.

Nevertheless, even in the absence of strong legal protection, organizations can empower employees who wish to disclose information without the fear of negative consequences by creating a safe environment for them to voice their concerns. This can be accomplished by implementing a clear whistleblower policy that details standard reporting protocols and the consequences for retaliating against whistleblowers. This policy can stand alone or be part of the anti-fraud policy, which is discussed later in this chapter.

It is important for management to establish and publicize the organization's whistleblower procedures so that individuals both inside and outside the organization are aware of the appropriate channels for reporting misconduct. The whistleblower policy should emphasize that it applies to all employees, regardless of their positions or seniority, as well as to anyone external to the organization who has knowledge of potential wrongdoing by any employees or

on the company's part. It should detail what types of misconduct to report, how to report concerns, and any rewards available for disclosing credible information. In addition, a whistleblower policy should include an anti-retaliation component that details the protections the organization affords to whistleblowers and how people will be punished if they violate the policy. By instituting and transparently enforcing a zero-tolerance policy against retaliation, management can increase the likelihood that employees will feel comfortable raising concerns without fear of retribution.

In addition, organizations that make it easy and acceptable to report misconduct internally decrease the possibility that whistleblowers might damage the organizations' reputation by contacting external outlets, such as the media, with their knowledge or suspicions instead.

By developing a whistleblower policy and proactively taking steps to make whistleblowers feel safe, organizations can simultaneously help detect and prevent misconduct while promoting a culture of accountability and integrity.

Tone at the Top

A significant part of a fraud prevention program is the expressed commitment of the board and senior management. This commitment forms the basis of the organization's anti-fraud culture. A strong corporate culture can most often be observed by its outcome, rather than by any individual component. Fostering a culture of ethics and compliance is more beneficial than simply implementing a checklist of initiatives; similarly, a culture of corruption can exist even in companies with seemingly sound policies in place. However, organizations that cultivate ethical corporate cultures frequently have one thing in common: a strong "tone at the top."

To achieve an organizational culture with a strong value system founded on integrity, management must show employees through its words and actions that dishonest or unethical behavior will not be tolerated. Management must also create an environment in which employees feel safe to challenge management's decisions or speak up if they think something is wrong. A culture that encourages employees to share their concerns can reduce the risk of fraud significantly because employees often feel more loyal to their superiors. Such a culture might also prevent unethical behavior because issues of anger or stress can be addressed before they escalate to the point of a fraud.

Additionally, management must exude ethics in order to model the behavior that is expected of the staff. When management believes and acts as though it is “above the law” with respect to company policies, staff members are much less likely to follow rules. Staff members frequently resent management for expecting them to behave in a certain way when members of management do not behave in the same way themselves. However, when management acts ethically and follows organizational policies, the staff tends to respect and appreciate the behavior and copy it.

Organizational Structure

A well-designed organizational structure—with key areas of authority and clear and proper lines of reporting—can be an effective fraud prevention measure. A confused structure, in contrast, makes it easier for a fraudster to perpetrate and conceal their misdeeds. Establishing and communicating the proper flow of information to everyone in the organization is an essential component of a well-designed organizational structure. Flowcharts displaying organizational and departmental hierarchies can be a helpful tool for this purpose. To ensure that information is being properly received and that instructions are being carried out, such checks must be established.

Background Checks

One of the most basic steps in preventing employee fraud is to avoid hiring employees who have a history of theft. Before hiring anyone, management should conduct a background check (where and to the extent permitted by law) to find out as much as possible about the employee’s previous experience with employers and law enforcement. Each company must decide whether the time and expense of such background checks is worth the return. It is always a good practice, but, at a minimum, employers should check the background of any employee who will have constant access to cash, checks, credit card numbers, or any other items that are easily stolen.

Background checks should also be run on existing employees who are being promoted or moved to positions that include access to sensitive or valuable company resources. Even if such a check was performed on the employee at the time of hire, an updated background check should be run to identify any significant changes or occurrences that have taken place during the individual’s tenure.

In assessing individuals for hire or promotion, employers should conduct as many of the following background checks as possible and as legally permissible.

Past Employment Verification

Even though most employers will only verify position and dates of employment, you can usually tell by their tone of voice what they think of the employee. Also, ask the previous employers whether the applicant is eligible for rehire.

Criminal Conviction Checks

Many public records services have criminal conviction records. Criminal conviction information can also be obtained by searching the criminal conviction records in the jurisdictions in which the employee has resided.

Drug Screening

Many companies are now conducting drug screenings for potential hires, as well as current employees.

Reference Checks

It might seem surprising, but very few employers call the references a candidate provides. Most operate under the theory that someone wouldn't provide a bad reference. However, some job applicants will list important-sounding individuals as references with the hope that the hiring organization won't call. In addition, people often just assume, incorrectly, that a former supervisor or coworker will provide a good reference. But obtaining negative information from someone the candidate listed as a recommendation can be very revealing and should serve as a serious warning sign to the hiring organization.

Education and Certification Verification

It is always a good idea to verify a person's education. Also, if the person claims they have a license or other certification, call the issuing organization to verify it. It is not that unusual for someone to claim a certification or license that has actually been revoked due to a disciplinary action. Most licensing or certification organizations, including the ACFE, will verify whether any disciplinary action has been taken against a particular member.

Performance Management and Measurement

In addition to hiring qualified, ethical employees, it is important to place employees in situations where they are able to thrive without resorting to unethical conduct. Organizations should provide employees with well-defined job descriptions and performance goals. Performance goals should be routinely reviewed to ensure that they do not set unrealistic standards.

Training should be provided on a consistent basis to ensure that employees maintain the skills needed to perform their tasks effectively. Regular ethics training will help employees identify potential trouble spots and avoid getting in compromising situations. Management should also quickly determine where deficiencies in an employee's conduct exist and work with the employee to fix the problem.

Additionally, it is easy for employees to waver between performance goals that motivate them to challenge themselves and those that are so ambitious that the only way they can meet them is to perpetrate fraud. When employee compensation, including bonuses, or job security is tied to unachievable performance goals, employees have the incentive to mastermind creative (i.e., fraudulent) approaches to meeting them.

Moreover, including ethics-based metrics—those that focus on how employees do business, not just how much business they do—as a component of performance goals and evaluation can be an especially effective way to foster ethical behavior and reinforce the importance of ethics as the guiding factor in making business decisions.

Handling of Known Fraud Incidents

The way that management handles incidents of fraud within the organization plays an important role in its fraud prevention program. Specifically, it must be emphasized to all employees that the company maintains a policy of zero tolerance for fraud; otherwise, once an employee learns that small frauds are possible, larger frauds might be committed shortly thereafter. In addition, by not consistently punishing perpetrators, a company renders its fraud prevention program less effective, if not useless. Having a public record of the incident can also be important, so reporting known incidents of fraud to law enforcement can be an effective step in making the organization's zero-tolerance stance clear.

Minimizing Employee Pressures

While most internal controls are designed to reduce the opportunity to commit and conceal fraud, organizations should also be mindful of the pressures, such as financial hardships or family problems, that can lead to fraud. Unfortunately, such pressures can be difficult to detect in employees. However, companies should take steps to increase managers' awareness of such potential problems, as well as to assist an employee who might be having difficult times.

Open-Door Policies

An open-door policy that allows employees to speak honestly about pressures can provide management with the opportunity to alleviate such pressures before they become acute, which will help prevent fraud. If employees and others know they can speak candidly to their supervisors, they might be more willing to discuss the personal and professional issues that could lead to illicit actions if not dealt with properly. Additionally, managers will have more opportunities to understand the pressures faced by employees and might be able to assist them in addressing those issues.

EXAMPLE

The controller of a small fruit-packing company in California stole \$112,000 from the company. When asked why, he said, "Nobody at the company ever talked to me, especially the owners. They were unfair. They talked down to me, and they were rude. They deserve everything they got."

Fair Personnel Policies and Procedures

It is not uncommon for employees who feel that they have been treated unfairly in some way to want to right a perceived injustice. To some disgruntled employees, getting even translates to committing fraud. For example, an employee who receives a pay cut might view walking off with company assets as a way to obtain retribution. Or an employee who feels underappreciated by their employer might get revenge by disclosing classified company information to a competitor in an effort to sabotage the organization.

Efforts of human resources (HR) managers to assess and maintain morale at a high level are an important preventive control. HR managers can monitor employee morale through observation, anonymous employee surveys, an open-door policy, and other means.

Further, ensuring that personnel policies and procedures are fair and equitably applied can boost morale and thereby reduce fraud risk. Other measures employers can take to boost morale include providing the following:

- Proper management training
- Career development opportunities
- Special events for employees
- Recognition of employees for a job well done

Employee Support Programs

Many progressive companies and agencies have realized the benefit of employee support programs. Some kinds of support programs include alcohol and drug assistance, as well as counseling for gambling, family and marital problems, and financial difficulties. In addition to addressing the direct pressures that might contribute to an individual resorting to fraud, making such programs available to employees who are facing personal problems shows employees that management cares for their well-being, which can reduce the employee's ability to rationalize a dishonest act.

Anti-Fraud Policy

Another important element of an overall fraud prevention program is a written anti-fraud policy that specifically spells out who in an organization handles varying fraud matters under differing circumstances. Instituting a separate, formal anti-fraud policy sends a strong message to employees about the organization's intolerance for employee fraud.

Writing the Anti-Fraud Policy

Companies often have an ethics policy that sets forth in detail what is expected in the ethical climate of the company. Other companies have an anti-fraud policy that specifically indicates who handles fraud matters under what circumstances. The components of an anti-fraud policy will differ from company to company. Many anti-fraud policies have some of the following elements.

Policy Statement

An anti-fraud policy should formally define *fraud* and outline management's position or attitude toward fraud in the workplace. The message should be clear, concise, and strictly endorsed by senior management. The policy statement might include straightforward messages, such as: "Fraudulent behavior will not be tolerated at any level within the organization. Anyone involved in a fraudulent act will be disciplined and/or terminated."

Scope of Policy

The anti-fraud policy should clearly state that it applies to everyone at all levels, from staff-level employees to executives.

Responsibility for Fraud Prevention and Detection

Management is ultimately responsible for fraud prevention and detection within the organization. However, management might delegate the day-to-day oversight of anti-fraud efforts to other individuals or bodies within the organization that have significant authority (e.g., the chief compliance officer [CCO] or the director of internal audit). Consequently, oversight responsibility for fraud prevention and detection should be clearly defined in the anti-fraud policy.

In addition, the company must make employees aware that fraud prevention is a joint effort, and that everyone shares responsibility for preventing, detecting, and reporting instances of fraud. The policy should also include a statement informing employees that their cooperation in a fraud investigation is required and that “all employees have a fiduciary duty to report any suspicious activity, and failure to do so could potentially result in disciplinary action.”

Actions Constituting Fraud

To avoid being overly broad in nature, and thus difficult to enforce, anti-fraud policies should include specific examples of fraud. The scope of fraud within an organization might range from internal theft of cash in small amounts to a third-party billing scheme worth millions. Regardless of the materiality of a fraud, management should clearly define all types of fraud that could occur within the company. Doing so both lays out specific guidance so employees can understand what actions constitute fraud and provides management with the legal grounds to investigate and punish violators.

Examples of fraudulent offenses include:

- Using company equipment (e.g., office supplies, company vehicles, mobile phones, computers) for personal reasons
- Stealing company assets (e.g., cash, receivables, inventory)
- Inflating reported hours worked
- Forging or altering checks and other documents
- Disclosing proprietary information to competitors
- Accepting bribes from or paying bribes to vendors or customers
- Engaging in transactions in which the employee has an undisclosed conflict of interest
- Destroying company records with malicious intent
- Intentionally misstating financial statements

This list is not all-inclusive, nor does it define every fraudulent offense that could occur. It is important, however, for management teams to assess the control environment within their own organizations and identify specific areas and situations where fraud could occur. This assessment will help them determine which types of offenses to include in their anti-fraud policy.

Non-Fraud Irregularities

In addition to explaining what acts constitute fraud, the anti-fraud policy can address allegations of personal improprieties or other irregularities and state that management should resolve them.

Reporting Procedures

The anti-fraud policy should state that if employees have concerns or observe suspicious activity, they should report it immediately through the proper channels so that the appropriate parties can review the complaint and determine what further actions need to be taken.

Investigation Responsibilities

The anti-fraud policy should address who will investigate suspected irregularities, as well as to whom these irregularities will be reported (e.g., management, law enforcement, or legal counsel).

Authorization for Investigation

The anti-fraud policy should include a statement that whoever is in charge of the investigation has the authority to take control of and examine all records necessary to conduct the investigation. Management might want to consider including specific examples of items or documents that can searched, reviewed, or confiscated at any time during an investigation. Additionally, management should inform employees that their full cooperation is required during an investigation.

Confidentiality

The anti-fraud policy should include a section describing the confidential nature of all fraud investigations. It should also state that the investigation will not be disclosed to outsiders except as required.

Disciplinary Action

As previously discussed, to ensure an anti-fraud policy is effective, management should take a zero-tolerance stance and clearly state in the policy that fraudulent conduct in any form will not be tolerated. Employees should be aware of the disciplinary action they can expect to receive for fraudulent behavior. Examples include:

- Verbal or written warning
- Loss of benefits
- Docked or no pay
- Suspension
- Probation
- Demotion (e.g., reduction in job responsibilities and title change)
- Denial of a promotion
- Termination
- Reporting the fraud to law enforcement
- Legal action to recover proceeds lost to fraud

Communicating the Anti-Fraud Policy

Management must periodically and appropriately communicate the company's anti-fraud policy to all employees and third parties. It is ineffective to have an anti-fraud or ethics policy if it is not clearly and thoroughly communicated. Again, in such communications, the policy should be presented in a positive, non-accusatory manner. The overarching goals of distributing and communicating the policy are to make it:

- Easily accessible (by both employees and third parties)
- Memorable

Communications regarding the policy can be accomplished in several ways.

Orientation/Annual Training

New employees should be advised of the anti-fraud policy at the time of hire. During initial employee orientation, the anti-fraud policy should be discussed. This is the first opportunity the company has to make its point, and it should be made thoroughly.

Additionally, employees should sign an annual statement acknowledging that they understand the policy. Reminding employees via annual online or live training reinforces the policy and management's expectations that it be followed.

Memoranda

An interoffice memorandum from the chief executive officer (CEO) detailing the anti-fraud policy is a good idea. Once again, the policy should concentrate on the positive aspects of working for an ethical company.

Posters

Some companies might wish to use posters displayed in common areas. However, this should be carefully considered, as some employees might object to such tactics.

Quizzes/Games

Games can be a fun and informal way to reinforce and communicate the anti-fraud policy in an organization. Quizzes with prizes might also be used to reward those who demonstrate awareness of the policy.

Employee Morale

If an employee is properly instructed, communication of an anti-fraud policy can have a positive impact on morale. Honest workers want to work for an honest company. An anti-fraud policy helps set the proper tone.

Legal Considerations

In developing the anti-fraud policy, management should check with legal counsel regarding any legal considerations with respect to the policy. One of the most important legal considerations is to ensure everyone and every allegation is handled in a uniform manner. Additionally, if the type of conduct that is considered unacceptable is not accurately detailed, there might be legal problems in discharging a dishonest employee.

To assist organizations with developing their anti-fraud policies, a sample anti-fraud policy is contained at the end of this chapter.

Ethics Programs

In most social groups, the majority of people share the same values. They typically agree on what is good and bad, what is right and wrong, and what is moral and immoral. Although all group members will not hold the same set of values, the social values of the majority will affect the beliefs and behaviors of all people.

The collection of a person's beliefs and morals makes up a set of principles known as *ethics*. Ethics are the judgments about right and wrong or, more specifically, a person's moral obligations to society that determine their actions. Determining ethical rights and wrongs is complicated by the fact that moral standards and generally accepted social behavior change with time. In addition, different groups in the same society might have conflicting ideas of right and wrong. These individual values and ethics are reflected in employees' actions and influence a wide range of organizational decisions. There are four factors that generally affect employees' ethical decisions:

- The law and other government regulations
- Industry and organizational ethical codes
- Social pressures
- Tension between personal standards and organizational needs

A common fallacy in discussions about ethics is: *If it's legal, it's ethical*. A common defense to charges of unethical behavior is to invoke the law. This legalistic approach to ethics mistakenly implies that actions that are not explicitly prohibited by the law are ethical. The main error in this approach is that legal standards do not establish ethical principles. Although abiding by the law is a part of ethical behavior, laws themselves do not describe how an ethical person should behave. One can be dishonest, unprincipled, untrustworthy, unfair, and uncaring without breaking the law. Ethical people measure their conduct by basic principles rather than rules. Thus, in making personal or occupational decisions, the law is only the minimum threshold in determining what is legally possible, and it does not address how people should behave ethically.

A written ethics policy is an excellent method by which management can objectively communicate its philosophy and develop a successful ethics program. The policy should be disseminated among both new and old employees. Additionally, some companies have found it effective to share the ethics policy with their vendors, and many organizations make their ethics policies available for the public, such as by posting them on the company's website. Such exposure helps reinforce the importance the organization places on ethics and provides parties outside the organization with a tool to help identify and report breaches of expected employee conduct.

Origins of Ethics

There are theories that state that, by the time one becomes an adult and enters the workplace, a basic code of ethics is already in place. Ethical character is hardwired into the personality before or during adolescence. This theory suggests that, if a person did not learn to be ethical in childhood, there is little chance that they will act ethically as an adult.

An opposing theory holds that operational values that guide behavior are not formed until early adulthood and, even after that, they are subject to change. Until one has to make serious, binding decisions, it is not necessary to act according to one's beliefs. Based on this theory, as long as individuals have the capacity to reflect and make value judgments, they can modify their personal ethics and change their behavior.

Business ethics programs rely on the validity of the latter theory. With the hope that adult behavior can be affected or modified, ethics programs are designed to guide employees in the right direction.

Ethics' Current Place in Business

The decline in public attitudes about business in recent years has reinforced the importance of ethics in the workplace. Although there seems to be a further deterioration of public confidence, substantial endeavors have been made by organizations with respect to business ethics. These initiatives include adoption of codes of conduct, introduction of ethics into employee and management training, and the establishment of ethics and compliance offices.

Ethics Program Development

Identifying key organizational characteristics and issues is a start to the development of an ethics program. These considerations include:

- Understanding of why good people can commit unethical acts
- Defining current—as well as desired—organizational values
- Determining if organizational values have been properly communicated
- Determining if ethics is a leadership issue in the organization
- Ascertaining how board members, stockholders, management, employees, and any other pertinent members of the organization define success
- Producing written ethics policies, procedures, or structures

With a good understanding of the aforementioned issues, a more effective ethics program can be built. The following 12 components are necessary to develop, implement, and manage a comprehensive ethics program:

- Focus on ethical leadership
- Vision statement
- Values statement
- Code of ethics
- Designated ethics official
- Ethics task force or committee
- Ethics communication strategy
- Ethics training
- Ethics help and fraud report telephone line
- Ethical behavior rewards and sanctions
- Comprehensive system to monitor and track ethics data
- Periodic evaluation of ethics efforts and data

A sample of a typical Code of Business Ethics and Conduct and an Annual Code of Conduct Compliance Questionnaire are provided at the end of this chapter.

SAMPLE ANTI-FRAUD POLICY

BACKGROUND

The corporate anti-fraud policy is established to facilitate the development of controls that will aid in the detection and prevention of fraud against ABC Corporation. It is the intent of ABC Corporation to promote consistent organizational behavior by providing guidelines and assigning responsibility for the development of controls and the conduct of investigations.

SCOPE OF POLICY

This policy applies to any irregularity or suspected irregularity involving employees, as well as shareholders, consultants, vendors, contractors, and outside agencies doing business with employees of such agencies, and/or any other parties with a business relationship with ABC Corporation (also called the Company).

Any investigative activity required will be conducted without regard to the suspected wrongdoer's length of service, position/title, or relationship to the Company.

POLICY

Management is responsible for the detection and prevention of fraud, misappropriations, and other irregularities. *Fraud* is defined as the intentional, false representation, or concealment of a material fact for the purpose of inducing another to act upon it to their injury. Each member of the management team will be familiar with the types of improprieties that might occur within their area of responsibility and be alert for any indication of irregularity.

Any irregularity that is detected or suspected must be reported immediately to the Director of _____, who coordinates all investigations with the Legal Department and other affected areas, both internal and external.

**ACTIONS
CONSTITUTING
FRAUD**

The terms *defalcation*, *misappropriation*, and *other fiscal irregularities* refer to, but are not limited to, the following:

- Any dishonest or fraudulent act
 - Misappropriation of funds, securities, supplies, or other assets
 - Impropriety in the handling or reporting of money or financial transactions
 - Profiteering as a result of insider knowledge of company activities
 - Disclosing confidential and proprietary information to outside parties
 - Disclosing to other persons securities activities engaged in or contemplated by the company
 - Accepting or seeking anything of material value from contractors, vendors, or persons providing services/materials to the Company (Exception: Gifts less than \$50 in value)
 - Destruction, removal, or inappropriate use of records, furniture, fixtures, and equipment
 - Any similar or related irregularity
-

**OTHER
IRREGULARITIES**

Irregularities concerning an employee's moral, ethical, or behavioral conduct should be resolved by departmental management and the Employee Relations Unit of Human Resources (HR) rather than the _____ Unit.

If there is any question as to whether an action constitutes fraud, contact the Director of _____ for guidance.

**INVESTIGATION
RESPONSIBILITIES**

The _____ Unit has the primary responsibility for the investigation of all suspected fraudulent acts as defined in the policy. If the investigation substantiates that fraudulent activities have occurred, the _____ Unit will issue reports to appropriate designated personnel and, if appropriate, to the Board of Directors through the Audit Committee.

Decisions to prosecute or refer the examination results to the appropriate law enforcement and/or regulatory agencies for independent investigation will be made in conjunction with legal counsel and senior management, as will final decisions on disposition of the case.

CONFIDENTIALITY

The _____ Unit treats all information received confidentially. Any employee who suspects dishonest or fraudulent activity will notify the _____ Unit immediately and *should not attempt to personally conduct investigations or interviews/interrogations* related to any suspected fraudulent act (see REPORTING PROCEDURES section below).

Investigation results *will not be disclosed or discussed* with anyone other than those who have a legitimate need to know. This is important in order to avoid damaging the reputations of persons suspected but subsequently found innocent of wrongful conduct and to protect the Company from potential civil liability.

AUTHORIZATION FOR INVESTIGATING SUSPECTED FRAUD

Members of the Investigation Unit will have:

- Free and unrestricted access to all Company records and premises, whether owned or rented
- The authority to examine, copy, and/or remove all or any portion of the contents of files, desks, cabinets, and other storage facilities on the premises without prior knowledge or consent of any individual who might use or have custody of any such items or facilities when it is within the scope of their investigation

REPORTING PROCEDURES

Great care must be taken in the investigation of suspected improprieties or irregularities so as to avoid mistaken accusations or alerting suspected individuals that an investigation is under way.

An employee who discovers or suspects fraudulent activity will *contact the _____ Unit immediately*. The employee or other complainant may remain anonymous. All inquiries concerning the activity under investigation from the suspected individual, their attorney or representative, or any other inquirer should be directed to the Investigations Unit or the Legal Department. No information concerning the status of an investigation will be given out. The proper response to any inquiries is: "I am not at liberty to discuss this matter." *Under no circumstances* should any reference be made to "the allegation," "the crime," "the fraud," "the forgery," "the misappropriation," or any other specific reference.

The reporting individual should be instructed to do the following:

- Do not contact the suspected individual in an effort to determine facts or demand restitution.
- Do not discuss the case, facts, suspicions, or allegations with anyone unless specifically asked to do so by the Legal Department or _____ Unit.

ACTING IN GOOD FAITH

Anyone reporting any irregularity that is detected or suspected must be acting in good faith and have reasonable grounds for believing the information provided. Allegations made maliciously or with knowledge of their falsity will not be tolerated. People making such allegations may be subject to institutional disciplinary action and/or legal actions by the individuals accused of fraudulent conduct.

WHISTLEBLOWER PROTECTION

Employees of ABC Corporation may not retaliate against a whistleblower for reporting an activity which that person believes to be fraudulent or dishonest with the intent or effect of adversely affecting the terms or conditions of employment (including, but not limited to, threats of physical harm, dismissal, transfer to an undesirable job assignment, demotion, suspension, or impact on salary or wages). A whistleblower is defined as an employee who informs a manager, supervisor, or Director of _____ about an activity which that person believes to be fraudulent or dishonest.

Whistleblowers who believe that they have been retaliated against may file a written complaint with the Director of _____. Any complaint of retaliation will be promptly investigated by the _____ and appropriate remedial measures will be taken if allegations of retaliation are proven. This protection from retaliation is not intended to prohibit managers or supervisors from taking action, including disciplinary action, in the usual scope of their duties and based on valid performance-related factors.

TERMINATION

If an investigation results in a recommendation to terminate an individual, the recommendation will be reviewed for approval by the designated representatives from HR and the Legal Department and, if necessary, by outside counsel, before any such action is taken. The _____ Unit does not have the authority to terminate an employee. The decision to terminate an employee is made by the employee's management. Should the _____ Unit believe the management decision inappropriate for the facts presented, the facts will be presented to executive level management for a decision.

ADMINISTRATION

The Director of _____ is responsible for the administration, revision, interpretation, and application of this policy. The policy will be reviewed annually and revised as needed.

Sample Code of Business Ethics and Conduct

Introduction

This section reaffirms the importance of high standards of business conduct. Adherence to this Code of Business Ethics and Conduct by all employees is the only sure way we can merit the confidence and support of the public.

Many of us came from a culture that provided answers or direction for almost every situation possible. Managing our business was not so complex; the dilemmas we faced were—for the most part—simple, making our choices relatively easy. We would probably all agree that managing in today's environment is not so simple.

This code has been prepared as a working guide and not as a technical legal document. Thus, emphasis is on brevity and readability rather than providing an all-inclusive answer to specific questions. For example, the term *employee* is used in its broadest sense and refers to every officer and employee of the company and its subsidiaries. The word *law* refers to laws, regulations, orders, etc.

In observance of this code, as in other business conduct, there is no substitute for common sense. Each employee should apply this code with common sense and the attitude of seeking full compliance with the letter and spirit of the rules presented.

It is incumbent upon you, as an employee of the company, to perform satisfactorily and to follow our policies and comply with our rules as they are issued or modified from time to time.

These policies and rules are necessary to effectively manage the business and meet the ever-changing needs of the marketplace. Good performance and compliance with business rules lead to success. Both are crucial since our ability to provide you with career opportunities depends totally upon our success in the marketplace. Nonetheless, changes in our economy, our markets, and our technology are inevitable. Indeed, career opportunities will vary between the individual companies. For these reasons, we cannot contract or even imply that your employment will continue for any particular period of time. While you might terminate your employment at any time, with or without cause, we reserve that same right. This relationship might not be modified, except in writing signed by an appropriate representative of the company.

This Code of Business Ethics and Conduct is a general guide to acceptable and appropriate behavior at the company, and you are expected to comply with its contents; however, it does not contain all of the detailed information you will need during the course of your employment. Nothing contained in this code or in other communications creates or implies an employment contract or term of employment. We are committed to reviewing our policies continually. Thus, this code might be modified or revised from time to time.

You should familiarize yourself with this code so that you might readily distinguish any proposal or act that would constitute a violation. Each employee is responsible for their actions. Violations can result in disciplinary action, including dismissal and criminal prosecution. There will be no reprisal against an employee who in good faith reported a violation or suspected violation.

The absence of a specific guideline practice or instruction covering a particular situation does not relieve an employee from exercising the highest ethical standards applicable to the circumstances.

If any employee has doubts regarding a questionable situation that might arise, that employee should immediately consult their supervisor or a higher-level manager.

Competition

Fair Competition

The company supports competition based on quality, service, and price. We will conduct our affairs honestly, directly, and fairly. To comply with the anti-trust laws and our policy of fair competition, employees must:

- Never discuss with competitors any matter directly involved in competition between us and the competitor (e.g., sales price, marketing strategies, market shares, and sales policies)
- Never agree with a competitor to restrict competition by fixing prices, allocating markets, or other means
- Not arbitrarily refuse to deal with or purchase goods and services from others simply because they are competitors in other respects
- Not require others to buy from us before we will buy from them
- Not require customers to take from us a service they don't want just so they can get one they do want

- Never engage in industrial espionage or commercial bribery
- Be accurate and truthful in all dealings with customers and be careful to accurately represent the quality, features, and availability of company products and services

Compliance with Laws and Regulatory Orders

The applicable laws and regulatory orders of every jurisdiction in which the company operates must be followed. Each employee is charged with the responsibility of acquiring sufficient knowledge of the laws and orders relating to their duties in order to recognize potential dangers and to know when to seek legal advice.

In particular, when dealing with public officials, employees must adhere to the highest ethical standards of business conduct. When we seek the resolution of regulatory or political issues affecting the company's interests, we must do so solely on the basis of merit and pursuant to proper procedures in dealing with such officials. Employees may not offer, provide, or solicit, directly or indirectly, any special treatment or favor in return for anything of economic value or the promise or expectation of future value or gain. In addition, there shall be no entertaining of employees of the federal or provincial government.

Conflicts of Interest

There are several situations that could give rise to a conflict of interest. The most common are accepting gifts from suppliers, employment by another company, ownership of a significant part of another company or business, close or family relationships with outside suppliers, and communications with competitors. A potential conflict of interest exists for employees who make decisions in their jobs that would allow them to give preference or favor to a customer in exchange for anything of personal benefit to themselves or their friends and families.

Such situations could interfere with an employee's ability to make judgments solely in the company's best interest.

Gifts and Entertainment

DEFINITION OF GIFTS

Gifts are items and services of value that are given to any outside parties, but do not include items described below.

- Normal business entertainment items, such as meals and beverages, are not to be considered gifts.
- Items of minimal value, given in connection with sales campaigns and promotions or employee service, safety, or retirement awards are not to be considered gifts for purposes of this code.
- Contributions or donations to recognized charitable and nonprofit organizations are not considered gifts.
- Items or services with a total value under \$100 per year are excluded.

DEFINITION OF SUPPLIER

Supplier includes not only vendors providing services and material to the company, but also consultants, financial institutions, advisors, and any person or institution that does business with the company.

GIFTS

No employee or member of their immediate family shall solicit or accept from an actual or prospective customer or supplier any compensation, advance loans (except from established financial institutions on the same basis as other customers), gifts, entertainment, or other favors that are of more than token value or that the employee would not normally be in a position to reciprocate under normal expense account procedures.

Under no circumstances should a gift or entertainment be accepted that would influence the employee's judgment. In particular, employees must avoid any interest in or benefit from any supplier that could reasonably cause them to favor that supplier over others. It is a violation of the code for any employee to solicit or encourage a supplier to give any item or service to the employee regardless of its value, no matter how small. Our suppliers will retain their confidence in the objectivity and integrity of our company only if each employee strictly observes this guideline.

REPORTING GIFTS

An employee who receives, or whose family member receives, an unsolicited gift prohibited by these guidelines should report it to their supervisor and either return it to the person making the gift or, in the case of a perishable gift, give it to a nonprofit charitable organization.

DISCOUNTS

An employee might accept discounts on a personal purchase of the supplier's or customer's products only if such discounts do not affect the company's purchase price and are generally offered to others having a similar business relationship with the supplier or customer.

BUSINESS MEETINGS

Entertainment and services offered by a supplier or customer may be accepted by an employee when they are associated with a business meeting and the supplier or customer provides them to others as a normal part of its business. Examples of such entertainment and services are transportation to and from the supplier's or customer's place of business, hospitality suites, golf outings, lodging at the supplier's or customer's place of business, and business lunches and dinners for business visitors to the supplier's or customer's location. The services should generally be of the type normally used by the company's employees and allowable under the applicable company's expense account.

Outside Employment

Employees must not be employed outside the company:

- In any business that competes with or provides services to the company or its subsidiaries
- In a manner that would affect their objectivity in carrying out their company responsibilities
- Where the outside employment would conflict with scheduled hours, including overtime, or the performance of the company assignments; employees must not use company time, materials, information, or other assets in connection with outside employment

Relationships with Suppliers and Customers

Business transactions must be entered into solely for the best interests of the company. No employee can, directly or indirectly, benefit from their position as an employee or from any sale, purchase, or other activity of the company. Employees should avoid situations involving a conflict or the appearance of conflict between duty to the company and self-interest.

An employee who deals with individuals or organizations doing or seeking to do business with the company, or who makes recommendations with respect to such dealings, should not:

- Serve as an officer, director, employee, or consultant.
- Own a substantial interest in any competitor of the company, or any organization doing or seeking to do business with the company. *Substantial interest* means an economic interest that might influence or reasonably be thought to influence judgment or action, but it shall

not include an investment representing less than 1% of a class of outstanding securities of a publicly held corporation. Every employee must complete the included Conflict of Interest Questionnaire.

In addition, an employee who deals with individuals or organizations doing or seeking to do business with the company, or who makes recommendations with respect to such dealings, may not:

- Have any other direct or indirect personal interest in any business transactions with the company (other than customary employee purchases of company products and services as consumers and transactions where the interest arises solely by reason of the employee relationship or that of a holder of securities).
- Provide telecommunications or information service or equipment, either directly or as a reseller, in a manner that would place the objectivity or integrity of the company in question.

Our policy is that employees will not do business on behalf of the company with a close personal friend or relative; however, recognizing that these transactions do occur, they must be reported on the Conflict of Interest Questionnaire.

This policy is applicable equally to the members of the immediate family of each employee, which normally includes your spouse, children and their spouses, and the father, mother, sisters, and brothers of yourself and your household.

Employment of Relatives

Relatives of employees will not be employed on a permanent or temporary basis by the company where the relative directly reports to the employee or the employee exercises any direct influence with respect to the relative's hiring, placement, promotions, evaluations, or pay.

Confidential Information and Privacy of Communications

Confidential Information

Confidential information includes all information, whether technical, business, financial, or otherwise concerning the company, which the company treats as confidential or secret and/or which is not available or is not made available publicly. It also includes any private information of, or relating to, customer records, fellow employees, other persons or other companies, and national security information obtained by virtue of the employee's position.

Company policy and various laws protect the integrity of the company's confidential information, which must not be divulged except in strict accordance with established company policies and procedures. The obligation not to divulge confidential company information is in effect even though material might not be specifically identified as confidential, and the obligation exists during and continues after employment with the company.

A few examples of prohibited conduct are:

- Selling or otherwise using, divulging, or transmitting confidential company information
- Using confidential company information to knowingly convert a company business opportunity for personal use
- Using confidential company information to acquire real estate that the employee knows is of interest to the company
- Using, divulging, or transmitting confidential company information in the course of outside employment or other relationship, or any succeeding employment or other relationship at any time
- Trading in the company stocks, or the stocks of any company, based on information that has not been disclosed to the public or divulging such information to others so that they might trade in such stock (constitutes insider trading, which is prohibited by company policy and by law)

Employees shall not seek, accept, or use any confidential company information of or from a competitor of the company. In particular, should we hire an employee who previously worked for a competitor, we must neither accept nor solicit confidential information concerning that competitor from our employee.

Company Assets

Cash and Bank Accounts

All cash and bank account transactions must be handled so as to avoid any question or suspicion of impropriety. All cash transactions must be recorded in the company's books of account.

All accounts of company funds, except authorized imprest funds, shall be established and maintained in the name of the company or one of its subsidiaries and may be opened or closed only on the authority of the company's Board of Directors. Imprest funds must be maintained in the name of the custodian, and the custodian is wholly responsible for these funds. All cash received shall be promptly recorded and deposited in a company or subsidiary

bank account. No funds shall be maintained in the form of cash, except authorized petty cash, and no company shall maintain an anonymous (numbered) account at any bank. Payments into numbered bank accounts by the company might leave that company open to suspicion of participation in a possibly improper transaction. Therefore, no disbursements of any nature might be made into numbered bank accounts or other accounts not clearly identified to the company as to their ownership.

No payments can be made in cash (currency) other than regular, approved cash payrolls and normal disbursements from petty cash supported by signed receipts or other appropriate documentation. Further, corporate checks shall not be written to “cash,” “bearer,” or similar designations.

Company Assets and Transactions

Compliance with prescribed accounting procedures is required at all times. Employees having control over company assets and transactions are expected to handle them with the strictest integrity and ensure that all transactions are executed in accordance with management’s authorization. All transactions shall be accurately and fairly recorded in reasonable detail in the company’s accounting records.

Employees are personally accountable for company funds over which they have control. Employees who spend company funds should ensure that the company receives good value in return and must maintain accurate records of such expenditures. Employees who approve or certify the correctness of a bill or voucher should know that the purchase and amount are proper and correct. Obtaining or creating false invoices or other misleading documentation or the invention or use of fictitious sales, purchases, services, loans, entities, or other financial arrangements is prohibited.

Employees must pay for personal telephone calls and use, except to the extent that specifically defined benefit programs or allowances otherwise provide.

Expense Reimbursement

Expenses actually incurred by an employee in performing company business must be documented on expense reports in accordance with company procedures. In preparing expense reports, employees should review these procedures for the documentation in order to be reimbursed for business expenses.

Company Credit Card

Company credit cards are provided to employees for convenience in conducting company business. No personal expenses can be charged on company credit cards except as specifically authorized by company procedures. Any charged personal expenses must be paid promptly by the employee. Company credit cards should not be used to avoid preparing documentation for direct payment to vendors. Where allowed by local law, charges on company credit cards for which a properly approved expense report has not been received at the time of an employee's termination of employment might be deducted from the employee's last paycheck. The company will pursue repayment by the employee of any amounts it has to pay on the employee's behalf.

Software and Computers

Computerized information and computer software appear intangible, but they are valuable assets of the company and must be protected from misuse, theft, fraud, loss, and unauthorized use or disposal, just as any other company property.

Employees cannot access company records of any kind for their personal use.

Misappropriation of computer space, time, or software includes, but is not limited to, using a computer to create or run unauthorized jobs, operating a computer in an unauthorized manner, or intentionally causing any kind of operational failure.

Company-owned computers can be used for company-sanctioned education programs, as well as personal use incidental to company business use, with the permission of your supervisor. However, personal use is not allowed for personal financial gain.

Political Contributions

The level of contributions that can be made by corporations to political parties or candidates is set out by the applicable jurisdictions' laws. In addition to direct cash contributions, the term *political contributions* include the donation of property or services and the purchases of tickets to fundraising events.

Where corporate political contributions are legal in connection with federal, provincial, or municipal elections, such contributions shall be made only from funds allocated for that purpose, and with the written approval of the president of the company making the contribution.

Employee Conduct

Conduct on Company Business

Dishonest or illegal activities on company premises or while on company business will not be condoned and can result in disciplinary action, including dismissal and criminal prosecution.

The following illustrates activities that are against company policy, and that will not be tolerated on company premises, in company vehicles, or while engaged in company business:

- Consumption and storage of alcoholic beverages, except where legally licensed or authorized by an officer of the company
- The use of controlled substances, such as drugs or alcohol; the unlawful manufacture, distribution, dispensation, possession, transfer, sale, purchase, or use of a controlled substance
- Driving vehicles or operating company equipment while under the influence of alcohol or controlled substances
- Illegal betting or gambling
- Carrying weapons of any sort on company premises, in company vehicles, or while on company business; even employees with permits or licenses cannot carry weapons on company property or while on company business

The company reserves the right to inspect any property that might be used by employees for the storage of their personal effects. This includes desks, lockers, and vehicles owned by the company. It is a violation of company policy to store any contraband, illegal drugs, toxic materials, or weapons on company property.

Reporting Violations

All employees are responsible for compliance with these rules, standards, and principles. In the area of ethics, legality, and propriety, each employee has an obligation to the company that transcends normal reporting relationships. Employees should be alert to possible violations of the code anywhere in the company and are encouraged to report such violations promptly. Reports should be made to the employee's supervisor, the appropriate security, audit, or legal department personnel, or elsewhere as the circumstance dictates. Employees will also be expected to cooperate in an investigation of violations. In addition, any employee who is convicted of a criminal offense, whether related to these rules or not, should also report that fact.

All cases of questionable activity involving the code or other potentially improper actions will be reviewed for appropriate action, discipline, or corrective steps. Whenever possible, the

company will keep confidential the identity of employees about or against whom allegations of violations are brought, unless or until it has been determined that a violation has occurred. Similarly, whenever possible, the company will keep confidential the identity of anyone reporting a possible violation. Reprisal against any employee who has, in good faith, reported a violation or suspected violation is strictly prohibited.

All employees are required to notify the company within five days of any conviction of any criminal statute violation occurring on the job. In addition, any employee who is convicted of a felony, whether related to these rules or not, should report that fact.

Discipline

Violation of this code can result in serious consequences for the company, its image, credibility, and the confidence of its customers, and can include substantial fines and restrictions on future operations, as well as the possibility of fines and prison sentences for individual employees. Therefore, it is necessary that the company ensure that there will be no violations. Employees should recognize that it is in their best interest, as well as the company's, to follow this code carefully.

The amount of any money involved in a violation might be immaterial in assessing the seriousness of a violation since, in some cases, heavy penalties might be assessed against the company for a violation involving a relatively small amount of money, or no money.

Disciplinary action should be coordinated with the appropriate Human Resources (HR) representatives. The overall seriousness of the matter will be considered in setting the disciplinary action to be taken against an individual employee. Such action, which might be reviewed with the appropriate HR representatives, might include:

- Reprimand
- Probation
- Suspension
- Reduction in salary
- Demotion
- Combination of the above
- Dismissal

In addition, individual cases might involve:

- Reimbursement of losses or damages
- Referral for criminal prosecution or civil action
- Combination of the above

Disciplinary action might also be taken against supervisors or executives who condone, permit, or have knowledge of illegal or unethical conduct by those reporting to them and do not take corrective action. Disciplinary action might also be taken against employees who make false statements in connection with investigations of violations of this code.

The company in its sole discretion will determine the disciplinary action appropriate to a given matter. The listing of possible actions is informative only and does not bind the company to follow any particular disciplinary steps, process, or procedure.

The company's rules and regulations regarding proper employee conduct will not be waived in any respect. Violation is cause for disciplinary action, including dismissal. All employees will be held to the standards of conduct described in this booklet.

The company never has and never will authorize any employee to commit an act that violates this code or to direct a subordinate to do so. With that understood, it is not possible to justify commission of such an act by saying someone directed it in higher management.

Compliance Letter and Conflict of Interest Questionnaire

Annually, all officers of the company will represent in writing that there are no violations of this code known to the officer, after the exercise of reasonable diligence, or if such violations have been committed, to disclose such violations in a format to be specified.

Annually, each employee will review the Code of Business Ethics and Conduct, sign the Code's Acknowledgment form, and complete and sign the Conflict of Interest Questionnaire. If the employee's circumstances change at any time, a new Conflict of Interest Questionnaire or letter of explanation must be completed.

The Code of Business Ethics and Conduct Acknowledgment form should be signed and given to your supervisor for inclusion in your personnel file.

[Company Name]

Code of Conduct Compliance Questionnaire

Managerial employees are being asked to complete this Compliance Questionnaire. [Company Name] and its subsidiaries are committed to providing a workplace where employees can and do act responsibly and ethically. The [Company Name] Code of Conduct sets out specific standards of conduct that should govern our behavior toward our fellow employees, suppliers, and customers. Please answer each of the following questions and, if necessary, provide an explanation. *(For any "yes" response, please explain in the extra space provided on the last page.)*

Conflict of Interest

1. During fiscal 20XX, did you receive, or are you aware of anyone who received, from any person or company doing business with your employer any loan, gift, trip, gratuity, or other payment that did or could cause prejudice toward or obligation to the giver, or could be perceived by others as creating an obligation to the giver? *(Note: Each item, or the total of items from a single vendor with a value of more than \$50, must be reported, except that you do not need to report loans made by financial institutions on normal and customary terms, common stock dividends, or insurance policy payments).*

☐ Yes ☐ No

2. In fiscal 20XX, did you participate in or influence, or are you aware of anyone who participated in or influenced, any transaction between your employer and another entity in which they or any member of their family had a direct or indirect financial interest?

☐ Yes ☐ No

3. In fiscal 20XX, did you have a material financial interest in or hold a position of influence with, or are you aware of anyone who had a material financial interest in or held a position of influence with, any business that furnishes goods or services to your employer? *(Note: The term material financial interest means someone who by virtue of their stock ownership or monetary interest in a company is able to direct or to influence business decisions, or a commissioned sales representative; position of influence means someone holding an influential position such as a sole proprietor, partner, member of a board of directors, an executive, or a manager.)*

☐ Yes ☐ No

4. For fiscal 20XX, did you use, or are you aware of anyone who used, company assets or other resources (including funds, equipment, supplies, or personnel) for purposes other than company business or company-sponsored activities?

☐ Yes ☐ No

5. During fiscal 20XX, did you receive, or are you aware of anyone who received, gifts or entertainment from individuals or organizations having dealings with the company, including but not necessarily limited to loans, any form of cash gratuities, private or personal discounts not sanctioned by the company, or remuneration or service related to illegal activities?

☐ Yes ☐ No

6. During fiscal 20XX, did you accept, or are you aware of anyone who accepted, any consideration or special favors from suppliers or potential suppliers that in fact or appearance could be deemed a bribe, kickback, or reward given to influence your business judgment?

☐ Yes ☐ No

7. Were you involved in, or are you aware of any employee who was involved in, a conflict of interest situation during fiscal year 20XX?

☐ Yes ☐ No

8. I have read the attached Conflict of Interest Policy Statement, which is set forth in the [\[Company Name\]](#) [and Subsidiaries] Code of Conduct and Compliance Program. Accordingly, I have listed below all relationships and outside activities that require disclosure under the policy. I have also listed names, addresses, and the nature of the relationships of all persons or entities doing business with my employer from whom I or any member of my immediate family has received, directly or indirectly, cash or a gift of more than nominal value (\$50) during the fiscal year ended May 31, 20XX. *(If there are no persons or entities to be listed, so indicate by writing "NONE" in the first space provided below.)*

Name of Person/Entity	Nature of Relationship/Outside Activity

Political

9. In fiscal 20XX, did you receive, or are you aware of anyone who received, any payments from your employer for the purpose of making a contribution to any political party, candidate, or election committee?

☐ Yes ☐ No

Securities Trading

10. Did you buy or sell, or are you aware of anyone who may have bought and/or sold, stock based on confidential information, or communicated confidential information to influence [Company Name] stock transactions?

☐ Yes ☐ No

Financial Integrity

11. Are you aware of any entries made in the books and records of your employer in fiscal 20XX that you believe are false or intentionally misleading?

☐ Yes ☐ No

12. Are you aware of any assets, liabilities, or transactions that you believe were improperly omitted from the books of your company in fiscal 20XX?

☐ Yes ☐ No

13. In fiscal 20XX, are you aware of anyone seeking to influence any government official (including foreign officials) or government employee, or individual doing business with your company, by offering money, goods, or services in return for some special consideration?

☐ Yes ☐ No

Other

14. Are you aware of any incident involving your employer that you feel constituted noncompliance with laws, regulations, policies, guidelines, procedures, or ethical principles, other than those matters referred to in other questions or incidents that have already been reported? *(Note: If you prefer to report an incident or violation anonymously, please answer this question “no” and contact a member of the Ethics Committee or call the Confidential Ethics Hotline.)*

☐ Yes ☐ No

15. Please provide any explanations for “yes” responses.

16. In the space below, please provide any suggestions you may have for improving the Code of Conduct and Compliance Program.

FRAUD RISK ASSESSMENT

For an organization to effectively manage its fraud risks, the risks must first be identified using a formal risk assessment. If performed and used correctly, a fraud risk assessment can be a powerful proactive tool in the fight against fraud for any business. Additionally, regulators, professional standard-setters, and law enforcement authorities continue to emphasize the crucial role that fraud risk assessment plays in developing and maintaining effective anti-fraud programs and controls.

What Is Fraud Risk?

Cressey's Fraud Triangle teaches that there are three interrelated elements that enable someone to commit fraud: the *motive* or *pressure* that drives a person to want to commit the fraud, the *opportunity* that enables them to commit the fraud, and the *ability to rationalize* the fraudulent behavior. The vulnerability that an organization faces from individuals capable of combining all three of these elements is *fraud risk*. Fraud risk can come from sources both internal and external to the organization, and it is one of the many types of risks managed by an organization.

Inherent and Residual Fraud Risks

When considering the fraud risks faced by an organization, it is helpful to analyze how significant a risk is before and after risk response. Risks that are present before the effect of internal controls (including targeted anti-fraud controls) are described as *inherent risks*. The risks that remain after the effect of these controls are described as *residual risks*.

For example, there is an inherent risk that the employee in charge of receiving customer payments at a small company might embezzle incoming cash. Anti-fraud controls, such as separation of duties and oversight from the company owner, can be implemented to help mitigate this risk; however, even with such controls in place, some residual risk will likely remain in that the bookkeeper might still manage to embezzle funds. The objective of the controls is to make the residual risk significantly smaller than the inherent risk.

What Factors Influence Fraud Risk?

Many factors influence how at-risk an organization is to fraud. Some of the main factors are:

- The nature of the business in which it is engaged
- The environment in which it operates
- The effectiveness of its anti-fraud controls
- The ethics and values of the company and its employees

The Nature of the Business

The types of risks an organization faces are directly connected to the nature of the business in which it is engaged. For example, the inherent fraud risks that hospitals and medical practices face are vastly different from those faced by banks and financial institutions, construction companies, educational institutions, or retail organizations.

The Operating Environment

The environment in which the organization operates has a direct impact on its vulnerability to fraud. Businesses with a physical presence have a very different risk profile than purely internet-based businesses. Likewise, local businesses have different risk profiles than those that operate in the international arena.

The Effectiveness of Its Anti-Fraud Controls

A good system of anti-fraud controls, with the right balance of preventive and detective controls, can greatly reduce an organization's vulnerability to fraud. *Preventive controls* are those manual or automated processes that stop something bad from happening before it occurs. *Detective controls* can also be manual or automated but are designed to identify something bad that has already occurred. No system of anti-fraud controls can fully eliminate the risk of fraud, but well-designed and effective anti-fraud controls can deter the average fraudster by reducing the opportunity to commit the fraud and increasing the perception of detection.

The Ethics and Values of the Company and Its Employees

It is extremely difficult, if not impossible, to have a company made up of individuals whose ethics and values are fully aligned with those of the organization. Any significant gaps in alignment can increase an organization's fraud risk.

While many organizations have codes of conduct, those codes are not always clear in drawing a definitive line between acceptable and unacceptable behavior. That lack of clarity leaves room for fraudsters to rationalize their actions. For example, in most organizations, it is

generally understood that manipulating financial records is unacceptable behavior that will result in termination; however, it is not always apparent whether taking a pen or pencil home that belongs to the company is unacceptable behavior, or what the consequence, if any, would be.

An organization that is clear and consistent about its ethics, values, and expectations will reduce the potential fraudster's ability to rationalize their actions. Likewise, an organization that demonstrates consistency and predictability in how it handles and holds accountable unacceptable behaviors can significantly reduce the risk of fraud.

What Is a Fraud Risk Assessment?

Fraud risk assessment is a process aimed at proactively identifying and addressing an organization's vulnerabilities to both internal and external fraud. As every organization is different, the fraud risk assessment process is often more an art than a science. What gets evaluated and how it gets assessed should be tailored to the organization—there is no one-size-fits-all approach. Additionally, organizational fraud risks continually change. It is therefore important to think about a fraud risk assessment as an ongoing, continuous process, rather than just a onetime activity.

A fraud risk assessment starts with an identification and prioritization of fraud risks that exist in the business. The process evolves as the results of that identification and prioritization begin to drive education, communication, organizational alignment, and action around effectively managing fraud risk and identifying new fraud risks as they emerge.

What Is the Objective of a Fraud Risk Assessment?

In the simplest terms, the objective of a fraud risk assessment is to help an organization recognize what makes it most vulnerable to fraud. Through a fraud risk assessment, the organization is able to identify where fraud is most likely to occur, enabling proactive measures to be considered and implemented to reduce the chance that it could happen. The strategic reasoning used in conducting a fraud risk assessment requires a skeptical mindset and involves asking questions such as:

- How might a fraud perpetrator exploit weaknesses in the system of controls?
- How could a perpetrator override or circumvent controls?
- What could a perpetrator do to conceal the fraud?

Why Should Organizations Conduct Fraud Risk Assessments?

Every organization should conduct a fraud risk assessment and should create processes to keep the assessment current and relevant. Not only is doing so a sound corporate governance strategy, but it also makes good business sense. The benefits of conducting a fraud risk assessment include enabling the organization to:

- Improve communication and awareness about fraud.
- Identify where the company is most vulnerable to fraud and what activities put it at the greatest risk.
- Know who puts the organization at the greatest risk.
- Develop plans to mitigate fraud risk.
- Develop techniques to investigate and determine if fraud has occurred in high-risk areas.
- Assess anti-fraud controls.
- Comply with regulations and professional standards.

Improve Communication and Awareness About Fraud

A fraud risk assessment can be an effective medium for an organization to start communication and raise awareness about fraud. When employees are engaged in an open discussion about fraud, the conversations themselves can help in reducing fraud vulnerability. Employees are reminded that the organization does care about preventing fraud and are empowered to come forward if they suspect fraud is occurring. Open communication and awareness about fraud can also deter potential fraudsters by reducing their ability to rationalize bad behavior and increasing their perception that someone might figure out their actions and report them.

Identify What Activities Are the Most Vulnerable to Fraud

Management must know where the company is most vulnerable to fraud to prevent it from happening. For most companies, the normal course of business generally involves many different activities; however, not all of the activities that the company engages in are equal in terms of increasing the business's exposure to fraud. The fraud risk assessment helps guide the organization to focus on the activities that put the company at greatest risk.

Know Who Puts the Organization at the Greatest Risk

The actions of certain individuals can significantly increase the company's vulnerability to fraud. The risk can emerge from the way in which someone makes decisions, behaves, or treats others within and outside the organization. The fraud risk assessment can help identify those people and their activities that might increase the company's overall fraud risk.

Develop Plans to Mitigate Fraud Risk

If management knows where the greatest fraud risks are, it can put plans in place to reduce or mitigate those risks. The results of the fraud risk assessment can be used to gain alignment among stakeholders and advance preventive action.

Develop Techniques to Determine If Fraud Has Occurred in High-Risk Areas

Assessing an area as having a high fraud risk does not conclusively mean that fraud is occurring there. Nevertheless, the fraud risk assessment is useful in identifying areas that should be proactively investigated for evidence of fraud. In addition, putting high-risk areas under increased scrutiny can deter potential fraudsters by increasing their perception of detection.

Assess Anti-Fraud Controls

Many organizations rely heavily on their internal control system to prevent and detect fraud. Although an effective internal control system, including targeted anti-fraud controls, is critical in fraud prevention and detection, it is a dynamic system that requires constant reevaluation of its weaknesses. Performing a fraud risk assessment provides management with the opportunity to review the company's anti-fraud controls for effectiveness, taking into account the following considerations:

- Controls that might have been eliminated due to restructuring efforts (e.g., elimination of separation of duties due to downsizing)
- Controls that might have eroded over time due to reengineering of business processes
- New opportunities for collusion
- Lack of anti-fraud controls in a vulnerable area
- Nonperformance of control procedures (e.g., control procedures compromised for the sake of expediency)
- Inherent limitations of anti-fraud controls, including opportunities for those responsible for a control to commit and conceal fraud (e.g., through management and system overrides)

Comply with Regulations and Professional Standards

Fraud risk assessments can assist management and auditors (internal and external) in satisfying regulatory requirements and complying with professional standards pertaining to their responsibility for fraud risk management.

For example, International Standard on Auditing (ISA) 315, *Identifying and Assessing the Risks of Material Misstatement*, requires auditors to undertake risk assessment procedures during audit

engagements and includes key points that should be considered during this process. Many countries that have their own auditing standards have incorporated similar requirements as well.

What Makes a Good Fraud Risk Assessment?

A good fraud risk assessment is one that is embedded in the culture of the organization, is sponsored and supported by the right people, encourages everyone to openly participate, and is generally accepted throughout the business as an important and valuable process.

Conversely, a fraud risk assessment that is conducted without these conditions will have inferior results.

Collaborative Effort of Management and Auditors

As regulations and professional standards indicate, both management and auditors have a responsibility for fraud risk management. However, each of these parties has unique knowledge and perspective of the fraud risks faced by the organization. Management has intricate familiarity with day-to-day business operations; responsibility for assessing business risks and implementing organizational controls; authority to adjust operations; influence over the organization's culture and ethical atmosphere; and control over the organization's resources (e.g., people and systems). Auditors, conversely, are trained in risk identification and assessment, and have an expertise in evaluating internal controls, which is critical to the fraud risk assessment process. Consequently, the fraud risk assessment is most effective when management and auditors share ownership of the process and accountability for its success.

The Right Sponsor

Having the right sponsor for a fraud risk assessment is extremely important in ensuring its success and effectiveness. The sponsor must be senior enough in the organization to command the employees' respect and elicit full cooperation in the process. The sponsor also must be someone who is committed to learning the truth about where the company's fraud vulnerabilities are; they must be a truth seeker—not someone who is prone to rationalization or denial. In the ideal situation, the sponsor would be an independent board director or audit committee member; however, a chief executive officer (CEO) or other internal senior leader can be equally as effective.

Organizational culture is crucial in influencing the organization's vulnerability to fraud. If the company's culture is shaped by a strong and domineering leader, obtaining candid

participation from the people in the business might be difficult with that leader as sponsor of the fraud risk assessment.

The right sponsor is someone who is willing to hear anything, whether it is positive or negative. For example, suppose a fraud risk assessment reveals that one of the greatest fraud risks facing the organization is bribery/corruption based on the close relationship between one of the key business leaders and the company's business partners. For the fraud risk assessment to be effective, the sponsor needs to be independent and open in their evaluation of the situation and, most important, appropriate in their response to the identified risks.

Independence and Objectivity of the People Leading and Conducting the Work

A good fraud risk assessment can be effectively conducted either by people inside the organization or with external sources. Either way, it is critical that the people leading and conducting the fraud risk assessment remain independent and objective throughout the assessment process. Additionally, they must be perceived as independent and objective by others.

The people leading and conducting the work should be mindful of any personal biases they might have regarding the organization and the people within it, and they should take steps to reduce or eliminate all biases that might affect the fraud risk assessment process. For example, if an employee on the fraud risk assessment team had a bad experience with someone in the accounts payable department, they might allow that experience to affect their evaluation of the fraud risks related to that area of the business. To preclude this possibility, someone else should perform the fraud risk assessment work related to the accounts payable department's activities.

Cultural neutrality is an important aspect of independence and objectivity when leading or conducting a fraud risk assessment. Some organizations have very strong corporate cultures that can significantly influence the way the people inside the organizations think about fraud risk. If people within the organization are leading and conducting the fraud risk assessment, they must be able to go beyond the corporate culture to assess and evaluate the presence and significance of fraud risks in the business.

Functional Knowledge of the Business

The individuals leading and conducting the fraud risk assessment need to have well-rounded, functional knowledge of the business. Every organization is unique; even companies that

appear similar have characteristics that differentiate them—and their fraud risks—from their competitors. Some of those differences can be obvious, whereas others are subtle.

To ensure functional knowledge of the business, the fraud risk assessor must know, beyond a superficial level, what the business does and how it operates. That individual must also have an understanding of what makes the organization both similar to and different from other companies in related lines of business.

Obtaining information about broad industry fraud risks from external sources can be helpful. Such sources include industry news; criminal, civil, and regulatory complaints and settlements; and professional associations and organizations.

Access to People at All Levels of the Organization

It is often said that perception is reality. In other words, how an individual perceives a situation is the individual's reality of that situation. In an organization, it is important that the perceptions of people at all levels are included in the fraud risk assessment process.

Leaders of a business or function often have very different perspectives from their subordinates on how something is perceived or executed; however, this does not mean that one perspective is right and the other is wrong. What it does mean is that expectations and perceptions within the organization are not aligned, which could increase fraud risk.

Risk assessments created or performed by management and auditors without the input of the staff performing the operational tasks will be ineffective. It is crucial to include members of all levels of the organization in the risk assessment process to ensure that all relevant risks are addressed and reviewed from many different perspectives. Additionally, asking employees at lower levels of the organization specific questions about the company culture or eliciting ideas to strengthen anti-fraud controls can provide incredibly valuable information that might not be obtainable from any other source.

Engendered Trust

If management and employees do not trust the people leading and conducting the fraud risk assessment, they will not be open and honest about the realities of the business, its culture, and its vulnerability to fraud. Trust is not something that can be granted by authority; it must be earned through words and actions. As the people leading and conducting the fraud risk

assessment engage with employees throughout the business, they should deliberately and carefully plan the initial contact with an effort to develop a rapport and gain trust.

Thinking Like a Fraudster

Most honest people are not naturally inclined to think like a criminal. In fact, many large-scale frauds that have occurred would have been deemed unthinkable by people closest to the events. But a necessary part of conducting an effective fraud risk assessment involves thinking like a fraudster. A good fraud risk assessment has to allow for the people leading and conducting the assessment to be expansive in their consideration and evaluation of fraud risk. Thoughts of “it couldn’t happen here” should not be allowed to moderate the evaluation of fraud risk.

A Plan to Keep the Framework Active and Relevant

The fraud risk assessment should not be treated as a onetime exercise that is executed and reported on but then becomes dormant. The organization should strive to keep the process active and relevant through ongoing dialogue, active management of action plans, and development of procedures to ensure the assessment is maintained on a current and routine basis.

Considerations for Developing an Effective Fraud Risk Assessment

A fraud risk assessment is only effective if the organization embraces it and uses the results to monitor, change, or influence the factors that put the company at risk for fraud.

Packaging the Framework Correctly

People do not easily relate to or accept things they don’t understand. Every organization has its own vocabulary and preferred methods of communication. The announcement and execution of the fraud risk assessment, including the reporting of the results, will only be effective if completed in the language of the business. For example:

- In a creative organization where decisions are made based on qualitative assessments and instinct, and where the majority of communication is visual, a quantitative approach to assessing fraud risk—one that is driven by numbers and calculations—would most likely be rejected.
- In an organization where the business is built and run on quantitative decision-making models, a qualitative approach with no quantitative components would most likely be rejected.

The assessor must remain mindful of the language used throughout the fraud risk assessment. Specifically, the assessor should stay away from technical language that won't resonate with people in the business. For example, many people might not easily relate to or understand the term *cash larceny*. If cash larceny is one of the organization's greatest fraud risks, it might be more effective to explain the concept in layman's terms, such as *theft of cash*.

Tailoring the Framework

What works in one organization most likely will not easily work in another. Recognizing the nuances and differences of each business and tailoring the approach and execution to the specific organization contributes to the success of the fraud risk assessment. While a generic framework or toolset can be a valuable starting point for the development of the fraud risk assessment, it must be adapted to fit the business model, culture, and language of the organization.

Keeping the Framework Simple

The more complicated the fraud risk assessment is, the more difficult it will be to execute and use it to be an effective tool. Whether the assessor uses a generic assessment framework or develops one specifically for the organization, they should focus the effort and time on evaluating the areas that are most likely to have fraud risk.

Preparing the Company for a Fraud Risk Assessment

Properly preparing the company for the fraud risk assessment is critical to the assessment's success. The culture of the organization should influence the approach used in the fraud risk assessment preparation. The goals of the preparation should be to:

- Assemble a multi-disciplinary team to lead and conduct the fraud risk assessment.
- Determine the most effective techniques to use in conducting the fraud risk assessment.
- Obtain the sponsor's agreement on the work to be performed.
- Educate the employees and openly promote the process.

Assemble a Multi-Disciplinary Team to Lead and Conduct the Fraud Risk Assessment

The organization should build a fraud risk assessment team consisting of individuals with diverse knowledge, skills, and perspectives to lead and conduct the assessment. The size of

the team will depend on the size of the organization and the methods used to conduct the assessment. The team should have individuals who are credible and have experience in gathering and eliciting information.

The team members can include internal and external sources such as:

- Accounting and finance personnel who are familiar with the financial reporting processes and anti-fraud controls
- Nonfinancial business unit and operations personnel who have knowledge of day-to-day operations, customer and vendor interactions, and issues within the industry
- Risk management personnel who can ensure that the fraud risk assessment process integrates with the organization's enterprise risk management program
- The general counsel or other members of the legal department
- Members of any ethics or compliance functions within the organization
- Internal auditors
- Internal security or investigative personnel who are familiar with investigations of past fraud incidents
- External consultants with fraud and risk expertise
- Any business leader with direct accountability for the effectiveness of the organization's fraud risk management efforts

Identify the Information to Be Gathered and Determine the Most Effective Techniques to Use in Conducting the Fraud Risk Assessment

There are many ways to conduct a fraud risk assessment. Picking a method or combination of methods that is culturally right for the organization will help to ensure its success. The assessment team should also consider the best ways to gather candid information from people throughout all levels of the organization, starting by understanding what techniques are commonly and effectively used throughout the organization.

Information to be gathered includes:

- The identification of inherent fraud risks
- Discussion of past known fraud incidents and how they were handled
- Assessment of the likelihood and significance of identified risks
- Perceptions regarding the overall control environment
- Perceptions regarding the operating effectiveness of specific anti-fraud controls

The following are some examples of techniques commonly used to gather this information.

Interviews

Interviews can be an effective way to conduct a candid one-on-one conversation. But their usefulness depends on how willing people in the organization are to be open and honest in a direct dialogue with the interviewer. The assessor must consider whether interviews are commonly and effectively used in the organization to gather and elicit information. They should also speak with individuals who have previously conducted interviews with employees to glean lessons learned. For each potential interviewee, the assessor should gauge the willingness of the interviewee to be open and honest—some people might be good interview candidates, whereas others might need to be engaged through a different approach.

Focus Groups

Focus groups enable the assessor to observe the interactions of employees as they discuss a question or issue. Some topics might lend themselves to being discussed in an open forum in which people feel comfortable among their colleagues. Additionally, when discussing tough or controversial issues in a group, an anonymous, real-time voting tool can be an effective way of opening up a dialogue. Focus groups are especially useful with employees at lower levels of the organization.

The success of a focus group will be highly dependent on the skill of the facilitator. If focus groups are used as part of the fraud risk assessment, they should be led by an experienced facilitator whom the group will relate to and trust. Getting a group to talk openly and honestly can be very difficult. An experienced facilitator will be able to read the group and use techniques, such as group icebreakers, to make the session a success.

Surveys

Surveys can be anonymous or directly attributable to individuals. Sometimes people will share more openly when they feel protected behind a computer or paper questionnaire. In an organization where the culture is not one in which people may speak candidly, an anonymous survey can be an effective way to get feedback. However, employees can be skeptical about the true anonymity of a survey, especially in organizations that use surveys to solicit feedback anonymously but send follow-up emails to individual delinquent respondents. If the assessor determines that an anonymous survey is an appropriate technique to use in the fraud risk assessment, they should clearly and explicitly explain to employees how anonymity will be maintained.

Anonymous Feedback Mechanisms

In some organizations, anonymous suggestion boxes or similar mechanisms are used to encourage and solicit frequent employee feedback. In these companies, information pertaining to the fraud risk assessment can be requested in the same way. Additionally, use of an anonymous feedback mechanism can be effective in an environment where people are less likely to be open and honest through other methods and techniques.

One approach to effectively using the anonymous feedback technique involves establishing a question of the day that is prominently displayed above a collection box. A sample question is: “If you thought fraud were occurring in the company, would you come forward? Why or why not?”

Another approach involves using a table lineup of five to ten opaque boxes, each with a statement posted above it. Employees are provided with poker chips in two different colors and told that one color indicates “I agree” and the other indicates “I disagree.” Employees are then encouraged to respond to each statement by putting a corresponding chip in each box to indicate their response.

Obtain the Sponsor’s Agreement on the Work to Be Performed

Before the fraud risk assessment procedures begin, the sponsor and the assessment team need to agree on:

- The scope of work that will be performed
- The methods that will be used (e.g., surveys, interviews, focus groups, or anonymous feedback mechanisms)
- The individuals who will participate in the chosen methods
- The content of the chosen methods
- The form of output for the assessment

Educate Employees and Openly Promote the Process

The fraud risk assessment process should be visible and communicated throughout the business. Employees will be more inclined to participate in the process if they understand its purpose and the expected outcomes.

Sponsors should be strongly encouraged to openly promote the process. The more personalized the communication from the sponsor, the more effective it will be in encouraging employees to participate. Whether through a video, town-hall meeting, or

companywide email, the communication should be aimed at eliminating any reluctance employees have about participating in the fraud risk assessment process.

Fraud Risk Assessment Frameworks

Fraud risk assessments can be executed in many ways. To ensure the assessment's success, the approach should be structured, rational, and tailored to the organization. Consequently, when conducting a fraud risk assessment, it is helpful to use a framework for performing, evaluating, and reporting on the results of the work. Fraud risk can be analyzed and reported both qualitatively and quantitatively using a consistent framework. In adopting a framework, however, the fraud risk assessment team must ensure that the specific needs and culture of the organization are considered and accounted for. Without tailoring the fraud risk assessment approach to the specific organization, the team encounters the risk of missing important factors or obtaining results that are unreliable or meaningless.

The following sample fraud risk assessment frameworks illustrate how the elements of fraud risk assessment are applied under different approaches.

Sample Fraud Risk Assessment Framework #1¹

Using this framework, based on information contained in *Fraud Risk Management Guide*, a joint publication by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) and the ACFE, the fraud risk assessment team incorporates the following steps into the fraud risk assessment strategy:

1. Identify potential inherent fraud risks and schemes.
2. Assess the likelihood of occurrence of the identified inherent fraud risks.
3. Assess the significance of each inherent fraud risk to the organization.
4. Evaluate which people and departments are most likely to commit fraud.
5. Identify and map existing preventive and detective controls to the relevant fraud risks.
6. Evaluate whether the identified controls are operating effectively and efficiently.
7. Identify, evaluate, and respond to residual fraud risks that need to be mitigated.

The following table, as featured on page 35 of *Fraud Risk Management Guide*, provides a visual representation of the steps involved in this framework and can be filled in as the fraud risk assessment is performed.

¹ [ACFE.com/fraudrisktools/guide.aspx](https://www.acfe.com/fraudrisktools/guide.aspx).

Fraud Risk Assessment Framework							
Identified Fraud Risks and Schemes	Likelihood	Significance	Personnel/ Departments Involved	Existing Fraud Control Activities	Effectiveness of Existing Control Activities	Residual Fraud Risks	Fraud Risk Response
Financial Statement Fraud:							
Asset Misappropriation:							
Corruption and Illegal Acts:							
External Risks:							
Other Risks:							

Identify Potential Inherent Fraud Risks and Schemes

One of the first steps in a fraud risk assessment involves identifying potential fraud risks inherent to the organization. The fraud risk assessment team should brainstorm to identify the inherent fraud risks that could apply to the organization. Brainstorming should include discussions regarding the topics discussed in the following sections.

INCENTIVES, PRESSURES, AND OPPORTUNITIES TO COMMIT FRAUD

When assessing incentives, pressures, and opportunities to commit fraud, the fraud risk assessment team should evaluate:

- Opportunities to commit fraud that arise from a person's position (i.e., given that person's responsibilities and authority)
- Incentive programs and how they might affect employees' behavior when conducting business or applying professional judgment
- Pressures on individuals to achieve performance or other targets and how such pressures might influence employees' behavior
- Opportunities to commit fraud that arise from weak anti-fraud controls, such as a lack of separation of duties
- Highly complex business transactions and how they might be used to conceal fraudulent acts
- Opportunities for collusion (intrinsic to schemes such as bribery or kickbacks)

RISK OF MANAGEMENT'S OVERRIDE OF CONTROLS

When considering the potential for management's override of controls, the fraud risk assessment team should keep in mind that:

- Management personnel within the organization generally know the controls and standard operating procedures that are in place to prevent fraud.
- Individuals who are intent on committing fraud might use their knowledge of the organization's controls to do it in a manner that will conceal their actions.

POPULATION OF FRAUD RISKS

The fraud risk identification process requires an understanding of the universe of fraud risks and the subset of risks that apply to a particular organization. It includes gathering information about the business itself, including its business processes, industry, and operating environment, as well as all associated potential fraud risks. Such information can be obtained from external sources—such as industry news outlets; criminal, civil, and regulatory complaints and settlements; and professional organizations and associations—and from internal sources by interviewing and brainstorming with personnel, reviewing complaints on the whistleblower hotline, and performing analytical procedures.

Fraud risks from internal sources can be classified into three major areas: fraudulent financial reporting (also called *financial statement fraud*), asset misappropriation, and corruption. Fraud risks from external sources should also be considered.

FRAUDULENT FINANCIAL REPORTING

Potential fraudulent financial reporting risks include:

- Inappropriately reported revenues, expenses, or both
- Inappropriately reflected balance sheet amounts, including reserves
- Inappropriately improved or masked disclosures
- Concealed misappropriation of assets
- Concealed unauthorized receipts, expenditures, or both
- Concealed unauthorized acquisition, use, or disposition of assets

ASSET MISAPPROPRIATIONS

Potential asset misappropriation risks include misappropriation of:

- Tangible assets
- Intangible assets
- Proprietary business opportunities

CORRUPTION

Potential corruption risks include:

- Payment of bribes or illegal gratuities to companies, private individuals, or public officials
- Receipt of bribes, kickbacks, or illegal gratuities by employees or agents of the company
- Aiding and abetting of fraud by outside parties, such as customers or vendors

EXTERNAL FRAUD

External fraud risks include:

- Fraud committed by customers (e.g., fraudulent customer payments)
- Fraud committed by vendors (e.g., overbilling by a vendor or collusion between bidding contractors to inflate contract price)
- Fraud committed by competitors (e.g., corporate espionage)
- Fraud committed by unrelated third parties (e.g., hacking)

RISK OF REGULATORY AND LEGAL MISCONDUCT

Regulatory and legal misconduct includes a wide range of risks, such as conflicts of interest, insider trading, theft of competitor trade secrets, anti-competitive practices, environmental violations, and trade and customs regulations in areas of import and export. Depending on the particular organization and the nature of its business, some or all of these risks might be applicable and should be considered in the fraud risk assessment process.

REPUTATION RISK

Reputation risk must be considered as part of the organization's risk assessment process because fraudulent acts can damage an organization's reputation with customers, suppliers, capital markets, and others. For example, fraud leading to a financial restatement can damage an organization's reputation in capital markets, which can increase the organization's cost of borrowing and depress its market capitalization.

RISK TO INFORMATION TECHNOLOGY

IT is a critical component of fraud risk assessment. Organizations rely on IT to conduct business, communicate, and process financial information. A poorly designed or inadequately controlled IT environment can expose an organization to threats to data integrity, threats from hackers to system security, and theft of financial and sensitive business information. Whether in the form of hacking, economic espionage, web defacement, sabotage of data, viruses, or unauthorized access to data, IT fraud risks can result in significant financial and information losses.

Assess the Likelihood of Occurrence and the Significance of the Identified Inherent Fraud Risks

Assessing the likelihood and significance of each potential fraud risk is a subjective process that allows the organization to manage its fraud risks and apply preventive and detective controls rationally. The fraud risk assessment team should first consider fraud risks to the organization on an inherent basis, without consideration of known controls. By approaching the assessment in this manner, the team will be better able to consider all relevant fraud risks and then evaluate and design controls to address those risks.

ASSESS THE LIKELIHOOD OF OCCURRENCE OF THE IDENTIFIED FRAUD RISKS

The likelihood of occurrence of each fraud risk can be classified as *remote*, *reasonably possible*, or *probable*. The fraud risk assessment team should consider the following factors in assessing the likelihood of occurrence of each fraud risk:

- Past instances of the particular fraud at the organization
- Prevalence of the fraud risk in the organization's industry
- The organization's internal control environment
- Resources available to address fraud
- Management's support of fraud prevention efforts
- Management's ethical standards and the organization's ethical culture
- Number of individual transactions involved

- Number of people involved in reviewing or approving a relevant process
- Complexity of the fraud risk
- Unexplained losses
- Complaints by customers or vendors
- Information from fraud surveys such as the ACFE's *Report to the Nations*

ASSESS THE SIGNIFICANCE TO THE ORGANIZATION OF THE FRAUD RISKS

The fraud risk assessment team should consider qualitative and quantitative factors when assessing the significance (sometimes referred to as the *impact*) of identified fraud risks to the organization. For example, a particular fraud risk that might only pose an immaterial direct financial risk to the organization, but that could greatly affect its reputation, would be deemed a significant risk to the organization.

The significance of each potential fraud can be classified as *immaterial*, *significant*, or *material*. In assessing the significance of each fraud risk, the fraud risk assessment team should consider the following factors:

- Financial statement and monetary significance
- Financial condition of the organization
- Value of the threatened assets
- Criticality of the threatened assets to the organization
- Revenue generated by the threatened assets
- Significance to the organization's operations, brand value, and reputation
- Whether employees suffered any financial damages
- Whether any financial damages have been caused to third parties (e.g., customers)
- Criminal, civil, and regulatory liabilities
- Whether the fraud results in required reporting to governmental authorities
- Reputational damage among stakeholders (e.g., customers, stockholders)
- Adverse media coverage
- Advantages to competing companies
- Decline in employee morale
- Lost productivity
- Loss of key staff
- Whether the event would result in data loss
- Whether the event would result in a work stoppage
- Time spent investigating and following up on the fraud event

Evaluate Which People and Departments Are Most Likely to Commit Fraud and Identify the Methods They Are Likely to Use

In identifying potential fraud risks, the risk assessment team will have evaluated the incentives and pressures on individuals and departments to commit fraud. The team should use the information gained in that process to identify the individuals and departments most likely to commit fraud and the methods they are likely to use. This knowledge will assist the organization in tailoring its fraud risk response, including establishing appropriate separation of duties, proper review and approval chains of authority, and proactive fraud auditing procedures.

Identify and Map Existing Preventive and Detective Controls to the Relevant Inherent Fraud Risks

After identifying and assessing fraud risks for likelihood of occurrence and for significance, the fraud risk assessment team should identify and map existing preventive and detective controls to the relevant fraud risks.

PREVENTIVE CONTROLS

Preventive controls, which are intended to prevent fraud before it occurs, include:

- Bringing awareness of the fraud risk management program to personnel throughout the organization
- Performing background checks on employees (where permitted by law)
- Hiring competent personnel and providing them with anti-fraud training
- Conducting exit interviews
- Implementing policies and procedures
- Separating of duties
- Implementing physical security measures
- Implementing security measures to restrict electronic access to data
- Ensuring proper alignment between an individual's authority and level of responsibility
- Reviewing third-party and related-party transactions

DETECTIVE CONTROLS

Detective controls, which are intended to detect fraud if it does occur, include:

- Establishing and marketing the presence of a confidential reporting system, such as a whistleblower hotline
- Implementing proactive controls for the fraud detection process, such as independent reconciliations, reviews, physical inspections and counts, analysis, and audits

- Implementing proactive fraud detection procedures, such as data analysis and continuous auditing techniques
- Performing surprise audits

Evaluate Whether the Identified Controls Are Operating Effectively and Efficiently

The fraud risk assessment team must ensure that there are adequate controls in place, that the controls are mitigating fraud risk as intended, and that the benefit of the controls exceeds the cost. Such an assessment requires:

- Review of the accounting policies and procedures in place
- Consideration of the risk of management's override of controls
- Interviews with management and employees
- Observation of control activities
- Tests of samples of transactions subject to identified controls for compliance
- Walkthroughs of transactions
- Review of previous audit reports
- Review of previous reports on fraud incidents, shrinkage, and unexplained shortages

Identify and Evaluate Residual Fraud Risks Resulting from Ineffective or Nonexistent Controls

Consideration of the overall internal control structure and of targeted anti-fraud controls might reveal certain residual fraud risks, including management's override of established controls, that have not been adequately mitigated due to:

- Lack of appropriate prevention and detection controls
- Noncompliance with established prevention and control measures

The likelihood and significance of occurrence of these residual fraud risks should be evaluated by the fraud risk assessment team in the development of the fraud risk response.

Sample Fraud Risk Assessment Framework #2—Fraud Risk Index

The following is a suggested framework that has two components: the Fraud Risk Index, which looks at indicators of areas that put the organization at risk for fraud, and the Leadership Risk Profile, which examines the way business leaders operate to help determine if they behave or conduct business in a way that can increase the company's risk of fraud.

Fraud Risk Index

The Fraud Risk Index is the overall assessment of fraud risk for the organization based on three components:

- The Environmental Risk Index
- The Culture Quotient
- The Prevent/Detect Index

THE ENVIRONMENTAL RISK INDEX

The Environmental Risk Index is an assessment of macro-level fraud risk indicators that can affect the organization's vulnerability to fraud. These include factors such as pressures on the business, the organization's system of internal controls, the tone at the top, and the overall quality of the mechanisms that the company has in place to prevent and detect fraud.

THE CULTURE QUOTIENT

The Culture Quotient is an assessment of how the organization and its people behave or are perceived to behave. The Culture Quotient includes:

- Tolerance Index—This metric is based on an assessment of the organization's tolerance for bad behavior. An organization that has a high tolerance for bad behavior can significantly increase the company's vulnerability to fraud risk.
- Entitlement Index—This index reflects an assessment that helps determine whether people in the company display or promote a sense of entitlement. An organization that sustains a strong sense of entitlement from its employees or leaders can have a higher risk of fraud.
- Notification Index—This factor comes from an assessment of how likely it is that employees will come forward when they suspect something is wrong. An organization where there is a low probability that employees will come forward is at significantly greater risk of fraud than an organization where it is likely that employees will come forward.

Both the Environmental Risk Index and Culture Quotient are elements of the Fraud Risk Index that are aimed at identifying and evaluating macro-level indicators of fraud risk to which the company might be exposed. The content and approach for performing these parts of the assessment should be tailored for the organization under review.

THE PREVENT/DETECT INDEX

The Prevent/Detect Index assesses the quality of the specific mechanisms that the organization has in place to prevent or detect potential fraud, particularly those fraud schemes for which the company is at the greatest risk. This component of the assessment can be used to identify the company's greatest fraud risks by pinpointing areas and methods that provide opportunities for potential fraudsters to get something—of either real or perceived value—out of the business.

To calculate the Prevent/Detect Index, a standard, comprehensive population of fraud schemes, such as the ACFE Occupational Fraud Classification System, is used to evaluate each scheme that applies to the business and determine which schemes are the high-risk schemes that the organization should focus on. For those fraud schemes that apply to the company, an evaluation of each scheme should be performed to identify:

- The likelihood that the scheme could be perpetrated
- The significance of the fraud risk to the company
- Whether there are preventive or detective anti-fraud controls in place to moderate the risk to a sufficient level

Leadership Risk Profile

The Leadership Risk Profile is developed to provide a macro-level organizational view of which business leaders, if any, increase the organization's vulnerability to fraud through their:

- Leadership style
- Operating behaviors
- Decision-making practices

The fraud risk assessment team should develop or obtain an organizational chart that shows the organizational structure of the business and identifies its leaders. The team should then develop a profile of each of the leaders and evaluate the fraud risk associated with their leadership styles, operating behaviors (including how they interact with their team and partners across the business), and decision-making practices.

As part of this evaluation, the team should consider any information that indicates unique pressures on or incentives for each leader that could increase the organization's fraud risk. Such pressures and incentives can include, but are not limited to:

- A significant amount of personal net worth invested in the company
- A large portion of compensation tied to activities that the leader can manipulate (e.g., sales volumes or other business performance measures)
- A pending divorce
- Recent organizational changes that have either greatly expanded or reduced/eliminated the leader's span of control
- Living larger than life
- Dependence on drugs or alcohol
- Gambling problems

Note that a comprehensive approach to conducting a fraud risk assessment using this framework would include the assessment of both the Fraud Risk Index and the Leadership Risk Profile. However, due to the sensitive nature of the Leadership Risk Profile, the sponsor may decide to focus the assessment on only the Fraud Risk Index.

Addressing the Identified Fraud Risks

Establishing an Acceptable Level of Risk

Because it is neither practical nor cost effective for an organization to eliminate all fraud risk, management must establish an acceptable level of fraud risk—often referred to as a *risk tolerance*—based on the business objectives and risk tolerance of the organization. In responding to fraud risks identified during the fraud risk assessment, management must determine how the fraud risks affect business objectives and, using cost/benefit analysis, decide where to best allocate resources for fraud prevention and detection.

Ranking and Prioritizing Risks

Once risks are identified, they need to be prioritized. There are two basic frameworks for prioritizing risk:

- Estimating the likely cost of a risk
- Using a quadrant graph, called a heat map, to identify those risks that are both likely and significant

Estimating Likely Cost of a Risk

Estimating the likely cost of a risk involves determining a quantitative value for the expected loss based on the risk's potential cost and likelihood of occurrence. Both of these factors are

estimates—and are far from objective—but by engaging in a process to estimate and quantify these elements of risk, an organization can prioritize its risks from the highest to lowest expected cost and focus on the outcomes that would be the most expensive.

Under this model, $\text{Risk} = \text{Likelihood} \times \text{Cost}$.

Consider the following risk scenarios:

1. Risk of lost business and reputation damage from a disruption in data processing:
 Likely cost (in lost revenue) = \$100,000
 Likelihood of occurrence = 2%
 Potential loss = \$2,000 (2% x \$100,000)
2. Risk of lost revenues from losing a major client:
 Likely cost (in lost revenue) = \$500,000
 Likelihood of occurrence = 15%
 Potential loss = \$75,000 (15% x \$500,000)
3. Risk of employee embezzlement:
 Likely cost = \$150,000
 Likelihood of occurrence = 7%
 Potential loss = \$10,500 (7% x \$150,000)

This analysis could then be used to rank these three risks by listing them from highest to lowest potential loss:

Risk	Potential Loss
Loss of a major client	\$75,000
Employee embezzlement	\$10,500
Data process disruption	\$2,000

Based on this listing, the assessment team would be equipped with an awareness of the most expensive losses and could allocate their compliance resources accordingly to mitigate, share, or abandon the highest cost risks.

Plotting Risks on a Heat Map

With a heat map, the risk assessment team is seeking to focus its attention on those risks that are both likely and significant. The risk assessment team goes through the list of risks and places each in a quadrant of the heat map, based on its assessed significance and likelihood. The following analysis prioritizes those risks that are in the red and yellow areas.

Responding to Residual Fraud Risks

Regardless of the framework used to conduct the fraud risk assessment, management will need to address the identified risks to ensure that the organization is within its established tolerance level for fraud risk.

Larry Cook, CFE, who is the principal author of the ACFE Fraud Risk Assessment Tool ([ACFE.com/fraud-risk-assessment.aspx](https://www.acfe.com/fraud-risk-assessment.aspx)), suggests that management can use one or a combination of the following approaches to respond to the organization's residual fraud risks:²

- Avoid the risk.
- Transfer the risk.

² Larry E. Cook, "Risky Business: Conducting the Internal Fraud Risk Assessment," *Fraud Magazine*, March/April 2005.

- Mitigate the risk.
- Assume the risk.

Avoid the Risk

Management may decide to avoid the risk by eliminating an asset or discontinuing an activity if the control measures required to protect the organization against an identified threat are too expensive. This approach requires the fraud risk assessment team to complete a cost-benefit analysis of the value of the asset or activity to the organization compared to the cost of implementing measures to protect the asset or activity. For example, a multinational conglomerate might choose not to conduct business in countries with a very poor ranking on the Transparency International Corruption Perception Index.

Transfer the Risk

Management may transfer some or all of the risk by purchasing fidelity insurance or a fidelity bond. The cost to the organization is the premium paid for the insurance or bond. The covered risk of loss is then transferred to the insurance company. Transferring risk through insurance coverage is not just a strategy to protect against employee frauds; it should be considered for certain third-party risks as well. For example, as part of its vendor management program, a financial institution might require its outside systems analysts to have third-party fidelity coverage before allowing them to do work for the financial institution.

Mitigate the Risk

Management can mitigate the risk by implementing appropriate countermeasures, such as prevention and detection controls. The fraud risk assessment team should evaluate each countermeasure to determine whether it is cost effective and reasonable given the probability of occurrence and impact of loss. For example, the accounting-system administrator might provide read-only access to managers responsible for authorizing transactions or reviewing transactions for accuracy and completeness, which would keep managers from being able to enter data or reconcile accounts.

Assume the Risk

Management may choose to assume the risk if it determines that the probability of occurrence and impact of loss are low. Management may decide that it is more cost effective to assume the risk than it is to eliminate the asset or discontinue the activity, buy insurance to transfer the risk, or implement countermeasures to mitigate the risk. For example, a petty-cash-fund custodian has access to company funds, but the amount susceptible to

embezzlement by the employee is limited to the amount in the fund, which is generally immaterial. And if the custodian is paid well, it is unlikely that they will be tempted by a small amount they could sneak out of the fund using fake receipts. Consequently, management devotes little, if any, effort to preventing such fraud.

Combination Approach

Management may also elect a combination of these approaches. For example, if the probability of occurrence and impact of loss are high, management may decide to transfer part of the risk through the purchase of insurance, as well as to implement preventive and detective controls to mitigate the risk. In virtually all cases, some level of assumption (acceptance) of residual risk exists.

Reporting the Results of the Fraud Risk Assessment

The success of the fraud risk assessment process depends on how effectively the results are reported and what the organization then does with those results. A poorly communicated report can undermine the entire process and stall the established momentum. The report should be delivered in a style most suited to the language of the business. If management prefers succinct PowerPoint presentations, the fraud risk assessment team should not deliver a fifty-page Word document.

Considerations When Reporting the Assessment Results

To maximize the effectiveness of the process, the team should consider the following points when developing the report of the results.

Report Objective—Not Subjective—Results

Much instinct and judgment go into performing the fraud risk assessment. When reporting the results of the assessment, the team must report only the facts and keep all opinions and biases out of the report. A report that is interspersed with the assessment team's subjective perspective will dilute and potentially undermine the results of the work.

Keep the Reporting Simple

The assessment results should be reported in a way that is easy to understand and that resonates with management. The reader of the report should be able to quickly view and comprehend the results. A simple one-page visual can sometimes make the most impact.

Focus on What Really Matters

Less is often more when it comes to reporting the results of the fraud risk assessment. The team should take care not to turn the report into a tedious list of things that management will have to sort through and prioritize. Instead, the report should be presented in a way that focuses on what really matters, clearly highlighting those points that are most important and that will make the most impact on the organization's fraud risk management efforts.

Identify Actions That Are Clear and Measurable to Drive Results

The report should include key recommendations for action that are clear and measurable and that will decrease fraud risks. The actions should be presented in a way that makes apparent exactly what needs to be done. The report should not include recommendations that are vague or that wouldn't reduce the risk of fraud. Additionally, management and those affected by the suggested actions should have already vetted and agreed to the recommendations.

Sample Report Formats

The following are two examples of simple formats that can be used or adapted to report on the results of a fraud risk assessment based on the Fraud Risk Index framework discussed earlier in this chapter.

Graphic Report Format

The first sample report format, shown below, would work well in an organization that uses dashboards or tends to be visually oriented. The gauges can be substituted with any type of visual representation that the organization uses in the normal course of business. This report should be accompanied by a one- or two-page action plan.

Executive Summary Report Format

The following report format is a simple one-page, executive-summary-type report. It gives the reader a snapshot view of the results of the work, along with insight into what is producing the results and what actions can be taken to reduce the fraud risk. Using a simple format like this forces the assessment team to focus on what really matters and what will make the most impact.

XXX Corp	
Tolerance Index 	Fraud Risk Index 
Entitlement Index 	
Notification Index 	
Prevent/Detect Index 	
Overall Assessment:	
Key Risk Drivers 1. 2. 3. 4. 5.	
Key Vulnerability Reduction Actions 1. 2. 3. 4. 5.	

Reporting the Leadership Risk Assessment Results

The results of the Leadership Risk Profile should be treated with great sensitivity. The fraud risk assessment team should discuss with the sponsor what the best method is for conveying the results of that work. If a formal report is requested, a color-coded organization chart can be used as a quick visual to convey the fraud risk associated with each leadership area across the business.

Making an Impact with the Fraud Risk Assessment

To make the most of the fraud risk assessment process, management should use the results to:

- Begin a dialogue across the company.
- Look for fraud in high-risk areas.
- Hold responsible parties accountable for progress.

- Keep the assessment process active and relevant.
- Modify or create the code of conduct or ethics policy.
- Monitor key controls.

Begin a Dialogue Across the Company

The results of the initial fraud risk assessment can be used to begin a dialogue across the company that promotes awareness, education, and action planning aimed at reducing the risk of fraud. Engaging in an active dialogue is an effective way to further establish boundaries of acceptable and unacceptable behavior. Open communication about fraud risks also increases the chance that employees will come forward if they believe they have witnessed potential fraud.

Look for Fraud in High-Risk Areas

An internal audit or investigative team within the organization can use the results of the fraud risk assessment to identify high-risk processes or activities and unusual transactions that might indicate fraud. This practice can also provide some reassurance if the subsequent search for fraud reveals that, despite the assessed risk, fraud does not appear to be occurring in that specific instance. Management should remember, however, that just because there is no evidence that fraud is occurring in the present, the risk that it could occur in the future is not eliminated.

Hold Responsible Parties Accountable for Progress

It is often said that what gets measured gets done. To effectively reduce identified fraud risk, management must hold employees accountable for driving results. The organization should track and measure progress against agreed-upon action plans. Publicly celebrating successes can be as or more effective in encouraging the right behaviors as providing negative consequences for failing to deliver results.

Keep the Assessment Active and Relevant

Since there are so many factors that can affect an organization's vulnerability to fraud risk, management must ensure that the fraud risk assessment stays current and relevant. Someone within the organization should be assigned ownership of the fraud risk assessment process. That person or team should build processes to ensure that all changes in the business model, company operating environment, and personnel are considered relative to their impact on the company's risk of fraud.

Modify or Create the Code of Conduct or Ethics Policy

The results of a fraud risk assessment can be extremely helpful in designing or redesigning an organization's code of conduct or ethics policy. By writing such policies while being mindful of the largest risk areas, management can be sure to include clear, appropriate guidance for employees who operate in those areas.

Monitor Key Controls

At the culmination of a fraud risk assessment, the organization should have a clear view of both the areas where the organization is susceptible to fraud and the controls that are designed and implemented to address those weak spots. To effectively manage the identified fraud risks, management should use the results of the fraud risk assessment to monitor the performance of key anti-fraud controls. Such proactive attention will allow for the identification and correction of deficiencies in control design or operation as quickly as possible.

The Fraud Risk Assessment and the Audit Process

The fraud risk assessment should play a significant role in informing and influencing the audit process. In addition to being used in the annual audit planning process, the fraud risk assessment should motivate thinking and awareness in the development of audit programs for areas that have been identified as having a moderate-to-high risk of fraud. Although auditors should always be vigilant of things that might be indicators of fraud risk, the results of the fraud risk assessment can help them design audit procedures in a way that enables them to look for fraud in known areas of high risk.

In the course of their work, auditors should validate that the organization is appropriately managing the moderate-to-high fraud risks identified in the fraud risk assessment by:

- Identifying and mapping the existing preventive and detective controls that pertain to the moderate-to-high fraud risks identified in the fraud risk assessment
- Designing and performing tests to evaluate whether the identified controls are operating effectively and efficiently
- Identifying within the moderate-to-high fraud risk areas whether there is a moderate-to-high risk of management override of controls
- Developing and delivering reports that incorporate the results of their validation and testing of the fraud risk controls

The following template can be used by auditors to evaluate how effectively the moderate-to-high fraud risks are being managed by the business:

Identified Fraud Risks	Existing Preventive Controls	Existing Detective Controls	Are Controls Effective and Efficient?	Is There Risk of Management Override?	Is the Fraud Risk Effectively Managed?

Fraud Risk Assessment Tools and Resources

The following tools can be helpful for fraud examiners, organizational managers, and others in designing and conducting a fraud risk assessment:

- The ACFE's Fraud Risk Assessment Tool: [ACFE.com/fraud-risk-assessment.aspx](https://www.acfe.com/fraud-risk-assessment.aspx)
- The Fraud Risk Assessment and Follow-Up Action Templates in the library of tools that accompanies *Fraud Risk Management Guide*, a joint publication by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) and the ACFE: [ACFE.com/fraudrisktools/tools.aspx](https://www.acfe.com/fraudrisktools/tools.aspx)

FRAUD RISK MANAGEMENT

Risk can be defined as the effect, whether positive or negative, of uncertainty on an organization's objectives. The risk of fraud is just one of many risks that organizations must manage. Unfortunately, many risk management professionals tend to underestimate the role of fraud in—or even exclude fraud risks from—the scope of their professional duties. As management teams increase their focus on risk, they should take the opportunity to consider, enact, and improve measures to detect, deter, and prevent fraud.

Foundational Guidance for Fraud Risk Management

Managing the risk of fraud can be a significant challenge. Fortunately, a number of excellent resources exist to assist organizations in their efforts. Foundational sources of fraud risk management guidance referenced throughout this chapter include:¹

- *Enterprise Risk Management—Integrating with Strategy and Performance*, published in 2017 by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) (referred to as *COSO ERM 2017*)—www.coso.org/Pages/default.aspx
- *Fraud Risk Management Guide*, jointly published in 2016 by COSO and the ACFE (referred to as *FRM 2016*)—ACFE.com/fraudrisktools
- *Managing the Business Risk of Fraud: A Practical Guide*, jointly published in 2008 by The Institute of Internal Auditors (IIA), American Institute of Certified Public Accountants (AICPA), and ACFE (referred to as *MBRF 2008*)—ACFE.com/MBRF
- *Internal Control—Integrated Framework*, published in 2013 by COSO (referred to as *COSO IC 2013*)—www.coso.org/Pages/ic.aspx (discussed in detail in the “Management’s Fraud-Related Responsibilities” chapter of this Manual)
- ISO 31000:2018, *Risk Management—Guidelines*, published in 2018 by the International Organization for Standardization (ISO) (referred to as *ISO 31000*)—www.iso.org/iso-31000-risk-management.html

¹ For the purpose of readability, when an acronym is stated as being “referred to as” in the following list, these acronyms (excluding ISO 31000) have been created by the ACFE for specific use in the *Fraud Examiners Manual* and should generally not be applied to other contexts.

What Is Risk Management?

In *Enterprise Risk Management—Integrating with Strategy and Performance* (COSO ERM 2017), the Committee of Sponsoring Organizations of the Treadway Commission (COSO) defines *enterprise risk management (ERM)* as “the culture, capabilities, and practices, integrated with strategy-setting and its performance, that organizations rely on to manage risk in creating, preserving, and realizing value.”² Another widely used definition comes from ISO 31000:2018, *Risk Management—Guidelines* (ISO 31000), which defines *risk management* as “coordinated activities to direct and control an organization with regard to risk.”³

Thus, risk management involves the identification, prioritization, treatment, and monitoring of risks that threaten an organization’s ability to provide value to its stakeholders, whether increasing profitability and shareholder value for a for-profit entity or achieving program-specific goals for a nonprofit or governmental agency. More specifically, risk management balances risk appetite—how much risk management is willing to accept—with the ability to meet the organization’s strategic, operational, reporting, and compliance objectives.

The Current State of Risk Management Initiatives

In 2019, the ERM Initiative released a report on the current state of enterprise risk oversight initiatives.⁴ Among the findings outlined in the report were:

- Organizations face an increasing volume and complexity of risks, with 68% of survey respondents admitting that they were caught off guard by an operational surprise in the last five years.
- Of the organizations surveyed, 12% had no enterprise-wide risk management processes in place even though 50% of the organizations described their risk culture as “strongly risk averse” or “risk averse.”
- At 65% of the organizations surveyed, the board of directors is asking for increased senior involvement in risk oversight.
- In addition to requests from the board of directors, the three most frequently cited factors for increasing senior management involvement in risk oversight are (1) emerging best practice expectations, (2) unanticipated risk events affecting the organization, and (3) regulator demands.

² Committee of Sponsoring Organizations of the Treadway Commission, *Enterprise Risk Management—Integrating with Strategy and Performance*, 2017.

³ International Organization for Standardization, ISO 31000:2018, *Risk Management—Guidelines*, 2018.

⁴ Mark Beasley, Bruce Branson, and Bonnie Hancock, *The State of Risk Oversight: An Overview of Enterprise Risk Management Practices*, 10th Edition, Spring 2019, <https://erm.ncsu.edu/library/research-report/2019-the-state-of-risk-oversight-an-overview-of-erm-practices>.

- While the number of organizations embracing ERM is on the rise, the level of risk management initiatives is still immature based on responses from surveyors, with only 23% describing their organization's risk management maturity as "robust" or "mature."
- Of respondents surveyed, 50% indicated that an individual had been formally assigned to serve as the chief risk officer (CRO) or an equivalent designation, up from 48% in 2017, indicating that more organizations are designating a specific individual in the c-suite to focus on enterprise risk.
- While 49% of respondents indicated that their risk inventories are maintained at the enterprise level, a majority of the organizations did not have defined guidelines or measures on how to assess the probability and impact of risks (55% and 58%, respectively).
- Of respondents surveyed, 35% stated that their organizations either had no structured process for identifying and reporting risk exposures to the board or track risks by silos with minimal reporting of aggregate risk exposures to the board.
- One of the more notable areas needing improvement in risk oversight is the integration of risk management with strategic planning; 32% of organizations do not conduct any formal risk assessments of emerging strategic, market, or industry risks.
- Barriers to progress still exist that restrict the effectiveness of a risk management process, with the most common being the belief that "risks are monitored in other ways besides ERM."

Risk Management Frameworks

Every organization faces a unique set of risks based upon its industry, financial condition, regulatory environment, culture, and a host of other factors. Consequently, an entity's risk management program must be tailored to the specifics of the organization for it to be effective. Nevertheless, an established risk management framework can be very helpful in providing guidance and structure in developing such a program. The following are some examples of widely accepted risk management frameworks; however, others exist and might be more applicable to the specifics of particular organizations.

COSO Enterprise Risk Management—Integrating with Strategy and Performance

In 2017, the Committee of Sponsoring Organizations of the Treadway Commission (COSO) published *Enterprise Risk Management—Integrating with Strategy and Performance* (COSO ERM 2017) to update its original enterprise risk management (ERM) framework and address the evolving needs and landscape related to risk management. The framework described in

COSO ERM 2017 closely aligns with both COSO's *Internal Control—Integrated Framework* (COSO IC 2013) and *Fraud Risk Management Guide* (FRM 2016), which was a joint publication by COSO and the ACFE in 2016.

COSO ERM 2017 is composed of a set of principles organized into five interrelated components and twenty supporting principles that are based on a holistic view of an organization's risk portfolio.⁵ These five components and their related principles are as follows.

Governance and Culture

The organization's governance and culture form the foundation for the ERM program. According to COSO ERM 2017, governance sets the organizational tone, reinforces the importance of risk management, and establishes the oversight responsibilities for managing risks, while culture is reflected in decision-making. The principles relating to governance and culture are:

1. The board of directors exercises risk oversight.
2. The organization establishes operating structures.
3. The organization defines its desired culture.
4. The organization demonstrates a commitment to its core values.
5. The organization attracts, develops, and retains capable individuals.

Strategy and Objective-Setting

COSO ERM 2017 notes that ERM is integrated into the organization's strategic plan through the formal process of setting strategy and defining business objectives. The principles relating to strategy and objective-setting are:

6. The organization analyzes business context when determining its risk profile.
7. The organization defines its risk appetite.
8. The organization evaluates alternative strategies.
9. The organization formulates business objectives with consideration of its risk profile.

Performance

The actual performance of ERM within an organization involves identifying and assessing risks that might affect the organization's ability to meet its strategic and business objectives and then prioritizing and responding to those risks. The principles relating to performance are:

⁵ COSO, *Enterprise Risk Management—Integrating with Strategy and Performance*, 2017.

10. The organization identifies risk that impacts its performance and ability to meet objectives.
11. The organization assesses the severity of risk.
12. The organization prioritizes risk.
13. The organization implements risk responses.
14. The organization develops a portfolio view of risk.

Review and Revision

According to COSO ERM 2017, as part of its ERM activities, the organization should review how well the ERM capabilities and practices have increased value over time and how they will continue to drive value for the organization. The principles pertaining to review and revision are:

15. The organization assesses substantial changes that might affect its strategy and objectives.
16. The organization reviews its risk and performance.
17. The organization pursues improvement in ERM.

Information, Communication, and Reporting

COSO ERM 2017 defines *communication* as “the continual, iterative process of obtaining information and sharing it throughout the entity.” Thus, management must use information gathered from both internal and external sources to support ERM. The principles related to information, communication, and reporting are:

18. The organization leverages information and technology to support ERM.
19. The organization communicates risk information.
20. The organization reports on risk, culture, and performance throughout the entity.

ISO 31000

The International Organization for Standardization (ISO) has developed ISO 31000, a set of international standards providing principles and guidance on risk management. Most organizations with a risk management function that do not follow the COSO ERM model follow the ISO model. Some organizations have developed a customized model that incorporates elements of both the COSO and ISO models.

The ISO 31000 family of standards includes:

- ISO 31000:2018, *Risk Management—Guidelines*
- ISO/IEC 31010:2009, *Risk Management—Risk Assessment Techniques*, which focuses on risk assessment concepts, processes, and techniques
- ISO Guide 73:2009, *Risk Management Vocabulary*, which includes terms and definitions related to risk management

According to ISO, “using ISO 31000 can help organizations increase the likelihood of achieving objectives, improve the identification of opportunities and threats, and effectively allocate and use resources for risk treatment. ... Organizations using it can compare their risk management practices with an internationally recognized benchmark, providing sound principles for effective management and corporate governance.”⁶

ISO 31000 lays out eight principles of effective risk management and provides guidance on developing both a framework and a process for managing risk that is based on those principles. The standard shows the relationships among these components as follows:

(Source: ISO 31000:2018, *Risk Management—Guidelines*)

The ISO 31000 principles establish the groundwork for an effective risk management function. The principles center on not only creating value but also protecting that value and improving organizational performance in many areas. More specifically, the following eight ISO 31000:2018 principles provide that an effective and efficient risk management program:

⁶ www.iso.org/iso-31000-risk-management.html.

1. Is integrated into all organizational activities
2. Is structured and comprehensive
3. Is customized and proportionate to the organization's operations and objectives
4. Is inclusive and provides for appropriate and timely consideration of stakeholders' knowledge, views, and perceptions
5. Is dynamic and responsive to change
6. Is based upon the best available information
7. Takes human and cultural factors into account
8. Facilitates continuous improvement

The elements of the ISO 31000 framework are:

- A foundation set by effective leadership and commitment
- Integration throughout every part of the organization's structure
- A design that involves:
 - Understanding the organization and its context
 - Articulating risk management commitment
 - Assigning organization roles, authorities, responsibilities, and accountabilities
 - Allocating resources
 - Establishing communication and consultation
- Effective implementation that includes
 - An appropriate plan regarding time and resources
 - Outlining when, where, and how decisions will be made
 - Modifying decision-making processes as necessary
 - Understanding that risk management initiatives are clearly understood and adhered to
- Evaluation of the risk management program's performance and determination of whether it is meeting its objectives
- Improvement by continuous monitoring, adaptation, and enhancement of the framework

Integrating Anti-Fraud Initiatives into Risk Management

The spectrum of risks faced by organizations is extremely broad, encompassing natural disasters, global economic shifts, product obsolescence, employee strikes, new competitors, regulatory changes, and incompetent management.

However, every organization is vulnerable to fraud—no entity is immune to that risk. The key to reducing this vulnerability is to be consciously aware of and realistic about the organization's weaknesses. Only then can management establish mechanisms that effectively prevent or detect fraudulent activities. In fact, it is those organizations that deny the true possibility of fraud that are placing themselves at the greatest risk.

The Business Case for Managing Fraud Risk

According to the ACFE's 2020 *Report to the Nations*, the typical organization loses an estimated 5% of its annual revenues to fraud. That is 5% of gross income lost without any direct benefit to the business. Furthering the damage, most organizations recover very little, if any, of the amounts lost to fraud. Additionally, if and when a fraud is detected, the organization must invest additional time and money in investigating how it happened, pursuing action against the perpetrator, and taking steps to remediate the system weaknesses that allowed the malfeasance to occur. The results of a poor fraud risk management program have brought about the downfall of countless organizations.

The cost/benefit analysis of investing in fraud risk management should be clear: It is much more cost effective to proactively address fraud risks than to suffer preventable fraud and spend valuable resources to detect, investigate, prosecute, and clean up after it. Stopping fraud before it occurs directly increases the organization's bottom line.

In addition to the financial benefits, effective fraud risk management:

- Sends a clear message that fraudulent actions will be proactively sought out and will not be tolerated
- Demonstrates a sound business strategy to employees and third parties
- Enhances the organization's public image and reputation
- Promotes goodwill with other organizations and the general public
- Ensures compliance with certain laws and regulations

Even the most honest and trusted employees can one day become dishonest. Lives change, needs change, situations change, motivations change, and rationalizations change. Effective fraud risk management is a continuous process of reviewing and addressing the significant risks of fraud.

Fraud Risk Management—The Convergence of ERM and Internal Control

The 2016 publication, *Fraud Risk Management Guide* (FRM 2016), published by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) in collaboration with the ACFE, is significant in that it recognizes the importance of the eighth principle of internal control from *Internal Control—Integrated Framework* (COSO IC 2013) (the requirement to perform fraud risk assessments), while also recognizing that all five components of internal control have critical relationships with fraud risk management. The purpose of FRM 2016 is to be supportive of COSO IC 2013. And though *Enterprise Risk Management—Integrating with Strategy and Performance* (COSO ERM 2017) does not formally reference it, FRM 2016 is consistent in format and includes several obvious connections.

FRM 2016 describes five broad principles, one for each of the five interrelated components of internal control listed in COSO IC 2013. The details of FRM 2016 are discussed in detail later in this section, but the following chart depicts the five FRM 2016 principles, their formal relationships to each of the five interrelated components of internal control, and their connections with the components of ERM described in COSO ERM 2017.

IC 2013 Component	FRM 2016 Principle	ERM 2017 Component
Control environment	The organization establishes and communicates a fraud risk management program that demonstrates the expectations of the board of directors and senior management and their commitment to high integrity and ethical values regarding managing fraud risk.	Governance and culture
Risk assessment	The organization performs comprehensive fraud risk assessments to identify specific fraud schemes and risks, assess their likelihood and significance, evaluate existing fraud control activities, and implement actions to mitigate residual fraud risks.	Strategy and objective-setting
Control activities	The organization selects, develops, and deploys preventive and detective fraud control activities to mitigate the risk of fraud events occurring or not being detected in a timely manner.	Performance
Information and communication	The organization establishes a communication process to obtain information about potential fraud and deploys a coordinated approach to investigation and corrective action to address fraud appropriately and in a timely manner.	Information, communication, and reporting
Monitoring activities	The organization selects, develops, and performs ongoing evaluations to ascertain whether each of the five principles of fraud risk management is present and functioning and communicates deficiencies in the fraud risk management program in a timely manner to parties responsible for taking corrective action, including senior management and the board of directors.	Review and revision

Managing Third-Party Fraud Risks

In addition to managing internal fraud risks, organizations must also protect themselves from risk that can arise as a result of conducting business with third parties, such as vendors and customers. Although most organizations are aware that these external fraud risks exist, some lack the necessary processes or controls in place to mitigate them. It is important for organizations to implement proper due diligence procedures and compliance requirements when engaging in transactions with third parties. Due diligence methods should be exercised using a risk-based approach that is proportionate to a company's size and the unique risks that the company encounters.

Customers

Customer due diligence (CDD) is a necessary element in effectively managing risk and protecting organizations from becoming involved in illegal activity. CDD procedures, also referred to as *know your customer* (KYC) in some industries, involve performing background checks based on the level of risk presented by the customer. In general, there are three levels of CDD procedures:

- Simplified CDD
- Standard CDD
- Enhanced CDD

Organizations can determine the level of risk the customer presents—and thus the appropriate level of due diligence—by evaluating the specifics of the transaction and the initial information provided about the customer. If the organization later receives additional information that suggests the customer might be a higher risk, a higher level of CDD procedures should be performed at that time.

Simplified Customer Due Diligence

Simplified due diligence is the lowest level of due diligence that can be performed on a potential customer. Conducting simplified due diligence procedures would be most appropriate in situations where there is little opportunity or risk of a customer engaging in illegal activity. The only requirement for simplified due diligence is to identify the customer.

Standard Customer Due Diligence

Standard CDD procedures involve identifying the customer, as well as verifying their identity. This type of due diligence is most widely used in situations where the customer presents a risk—that is, there is some opportunity for the customer to engage in illegal activity—but it is unlikely that the risk will manifest.

Standard CDD requires the organization to gather information that allows it to understand the nature of the business relationship with the potential customer and to ensure that the customer's identity is legitimate (e.g., the customer is not using a stolen or synthetic identity, the customer is not a shell company). Performing this type of CDD allows the organization to better know its customer and reduce the likelihood of the transaction involving illegal activity.

Enhanced Customer Due Diligence

When certain customers present higher risks for engaging in illegal activity, organizations should undertake enhanced due diligence procedures. Factors that might trigger enhanced CDD include high-profile customers, large-value transactions, or foreign business dealings in countries known for corruption. While these enhanced due diligence procedures depend on the nature and severity of the risk presented by the customer, organizations should gather additional information to reduce their potential risk. Specifically, organizations should gather and analyze data to ensure that they are dealing with a customer who has good intentions.

Under enhanced due diligence procedures, the following customer elements should be examined with a greater level of scrutiny to ensure legitimacy and that the risk has been responded to appropriately:

- Identity (i.e., Is the customer who they claim to be?)
- Source of income and overall net worth (i.e., Can the customer pay for the transaction, especially if they are requesting to pay on credit?)
- Expected pattern of purchasing (i.e., Is this a one-time transaction or a series of transactions?)
- Expected value (i.e., How large is the cumulative financial risk?)
- Expected method of payment (i.e., Is the customer requesting to use a higher-risk payment method, such as a personal check or line of credit?)

Vendors

Nearly all organizations rely on external vendors to provide them with goods, services, or other types of support, and some vendors might take advantage of this reliance. Common fraud activities that vendors engage in include inflating prices, billing for incorrect goods or services, and delivering items that do not conform to contract specifications. Management should conduct proper due diligence when seeking new vendors or evaluating the relationship of existing vendors to prevent and detect misconduct.

The following are effective practices that organizations should take when developing a vendor due diligence program:

- Use third-party questionnaires.
- Assess vendor commitment to compliance and ethics.
- Conduct vendor background checks.
- Manage the vendor master file.

Use Third-Party Questionnaires

The best way to obtain information about a third party is often directly from the third party itself. Before entering into a relationship with a new vendor, management should seek to obtain information from the vendor by using a questionnaire. This will provide the organization with some background information about the vendor that can also be cross-referenced during a background check. Information to request from vendors using the third-party questionnaire might include:

- Company profile and strategy
- Names of owners or stakeholders
- Names of executives or key managers
- Tax ID number
- Number of employees
- Contact information of the vendor's bank and lawyers
- Years the entity has been in existence
- Information about the vendor's other customers

Assess Vendor Commitment to Compliance and Ethics

In addition to evaluating a potential vendor's operations and financial status, management should also take into account the vendor's ethical climate and commitment to compliance. An organization can assess a vendor's commitment to compliance and ethics by performing the following due diligence procedures:

- Ensure that vendors have their own ethics and compliance program before engaging in any transactions.
- Provide the vendor with the organization's code of conduct and require the vendor's agents to sign and agree to abide by the code.
- Inquire about the vendor's internal audit department and the types of audits the vendor is subject to.
- Include contract clauses that require vendors to report any misconduct.
- Alert the vendor that they will be liable for any unethical conduct that occurs in doing business with the organization.

Conduct Vendor Background Checks

Background checks should not be limited to potential new hires; background checks should be performed for new vendors as well. Conducting background checks on vendors might alert the organization to vendors who are potentially engaging in illegal activity.

The following procedures can be used to gain information during a vendor background check:

- Verify the vendor's contact information, tax ID, and other details provided in the vendor questionnaire.
- Review government watch lists for individuals connected to the vendor that could be involved in illegal activities.
- Conduct a corporate registry search of the vendor.
- Verify the vendor's key employees.
- Search politically exposed persons (PEPs) databases to assess whether vendors are connected to foreign governments.
- Confirm the vendor's insurance and professional licenses.
- Perform a site visit at the vendor's business locations.
- Evaluate the vendor's social media and internet presence.

Manage the Vendor Master File

A *vendor master file* is a database that contains a record of all vendors with whom a company conducts business. This master file includes records related to purchasing functions, vendor contact information, and accounts payable information. To establish due diligence procedures regarding the vendor master file, the organization should implement clear procedures for adding new vendors or altering existing vendor records. Vendor master files should be reviewed regularly for inactive accounts, duplicate vendors, and vendors with incomplete records. Additional due diligence procedures for ensuring that the vendor master file is reliable include:

- Limit the ability to alter or add information in the vendor master file to three people.
- Require review and approval for all changes or additions to vendor records.
- Create a weekly report of all changes in the vendor master file and have a member of management review it.

Continuous Monitoring

While customer and vendor due diligence procedures should be undertaken prior to entering into a business transaction, these third parties should continuously be monitored throughout the business relationship. Ongoing monitoring procedures should be risk-based—that is, they should focus on areas that pose the greatest threat to the organization. Such procedures might include the use of data analytics to identify fraudulent activity or the establishment of compliance committees to oversee the actions of third parties. Events that might increase an organization's risk (e.g., changes to the goods or services provided to the customer, concerns raised over information collected during the initial third-party due diligence procedures, or

suspected criminal activity by a customer) should all be assessed as they arise to ensure that the organization continues to protect itself. Conducting proper due diligence on third parties, as well as continuing to monitor the related risks, will help prevent organizations from becoming victims of fraudulent activity.

Who Is Responsible for Managing Fraud Risk?

According to *Fraud Risk Management Guide* (FRM 2016), “personnel at all levels of the organization—including every level of management, staff, and internal auditors—have responsibility for managing fraud risk.”

While everyone within the organization has the duty to help fight fraud, the practical implementation of fraud risk management must start somewhere. The organization must have a team of specific individuals—or a dedicated department—that is made explicitly responsible for executing, monitoring, and ensuring the success of its fraud management initiatives.

Depending on the size and structure of the organization, the following individuals and groups may have crucial roles in ensuring effective fraud risk management:

- Executive management
- The audit committee
- The investigations group
- The compliance function
- The controller’s group
- Internal audit
- IT
- Security
- The legal department
- Human resources

Without clear assignment of the fraud-related roles and responsibilities to the parties overseeing the organization, any fraud risk management program will be ineffective. The following discussion highlights the duties of specific parties involved in the fraud risk management process.

Board of Directors

To ensure that the fraud risk management program is effective in both operation and design, it must be fully accepted by those charged with governing and overseeing the organization. Specifically, the board of directors must recognize the true and specific risks of fraud to the organization, as well as their potential impact, and respond by:

- Setting an appropriate tone and realistic expectations of management to enforce an anti-fraud culture
- Gaining sufficient knowledge of the organization's activities and the environments in which it operates
- Raising awareness of the risks of fraud throughout the organization
- Developing a strategy to assess and manage fraud risks that aligns with the organization's risk appetite and strategic plans
- Overseeing the organization's fraud risk management activities
- Maintaining open communications with senior management and other personnel

Audit Committee

As a sub-group of the board of directors, the audit committee is often delegated oversight of the organization's financial, accounting, and audit matters and reports to the full board. As part of this responsibility, the committee must take an active role in overseeing the assessment and monitoring of the organization's fraud risks. This involves:

- Receiving regular reports on the status of reported or alleged fraud
- Being aware of fraud risks that are common in the organization's industry
- Meeting regularly with key internal parties (e.g., the chief audit executive or other senior financial persons) to discuss identified fraud risks and the steps being taken to prevent and detect fraud
- Understanding how internal and external audit strategies address fraud risk
- Providing external auditors with evidence that the audit committee is dedicated to effective fraud risk management
- Engaging in open conversations with external auditors about any known or suspected fraud
- Seeking advice of legal counsel whenever it deals with allegations of fraud

Senior Management

Senior management has the primary responsibility for designing, implementing, monitoring, and improving the fraud risk management program. As part of this responsibility, senior management should:

- Be extremely familiar with the organization's fraud risks.
 - Perform (or oversee the performance of) a fraud risk assessment and update it regularly.
 - Form a risk management team within the organization to stay actively abreast of emerging risks.
- Ensure that the organization has specific and effective internal controls in place to prevent and detect fraud. This function may be performed by an outsourced firm if internal resources are unavailable.
 - Perform a cost/benefit analysis so as not to “over-control” the organization such that important business processes cannot occur or will suffer.
 - Perform routine checks to ensure that internal controls are adequate and performing as intended.
- Set a tone at the top and monitor the company culture to ensure that it appropriately supports the organization's fraud prevention and detection strategies. Senior management must exude ethics for staff to be inspired and feel obligated to follow suit.
- Clearly communicate—both in words and actions—that fraud is not tolerated.
 - Send regular voice mails or emails to all staff about the importance of ethics and controls.
 - Give annual refresher training on company policies and expectations.
 - Discuss expectations at new hire orientation training so that staff understands expectations from the very beginning.
- Take seriously all reports of fraud and undertake investigations for any such reports deemed reliable. Management might not be the optimal group to perform investigations but should ensure investigations occur for all allegations of fraud deemed reliable. Investigations might be best performed by other departments or outsourced companies.
 - Ensure open channels for communication of fraudulent activity to investigators.
 - Implement mechanisms through which fraud allegations can be reported confidentially and are handled according to a defined protocol.
- Punish perpetrators of discovered fraud appropriately. Punishing perpetrators reinforces the culture of ethics and the fact that fraud will not be tolerated.
- Take any steps necessary to remediate weaknesses that allowed frauds to occur.
- Report to the board of directors on a regular basis regarding the effectiveness of the organization's fraud risk management program.

Staff Members

According to FRM 2016 and *Managing the Business Risk of Fraud: A Practical Guide* (MBRF 2008), all levels of staff, including management, should:

- Understand the organization's ethical culture and the organization's commitment to that culture.
- Have a basic understanding of fraud and be aware of the red flags.
- Understand:
 - Their individual roles within the organization's fraud risk management framework
 - How their job procedures are designed to manage fraud risks
 - When noncompliance might create an opportunity for fraud to occur or go undetected
- Read and understand policies and procedures such as the organization's fraud policy, code of conduct, whistleblower policy, procurement manuals, etc.
- As required, participate in:
 - Creating a strong control environment
 - Designing and implementing fraud control activities
 - Monitoring activities
- Report suspicions or incidents of fraud.
- Cooperate in investigations.

Internal Auditors

Part of the internal audit function's role is to evaluate and improve the effectiveness of the organization's risk management, control, and governance processes. Clearly, each of these organizational components—risk management strategies, internal controls, and governance processes—serves an important function in the fight against fraud. According to FRM 2016 and MBRF 2008, internal auditors should:

- Devote adequate time and attention to assessing—so that they can provide objective assurance to the board and management—that fraud controls are sufficiently designed and operating effectively to address identified fraud risks.
- Review the comprehensiveness and adequacy of the fraud risks identified by management (giving particular consideration to fraud risks related to management override of controls).
- Consider the organization's fraud risk assessment when developing its audit plan.
- Periodically review management's fraud risk management program.
- Communicate regularly with those responsible for the fraud risk assessment to ensure all fraud risks have been appropriately considered.
- Maintain an attitude of professional skepticism and watch for signs of fraud.
- Take an active role in supporting the organization's ethical culture.
- Where applicable, work with or lead fraud working groups within the organization to assist in identifying and assessing fraud risks.
- Report to the audit committee on plans for and the results of audit work.

Additionally, depending on the organization's structure and the internal audit charter, the internal audit function may be explicitly responsible for investigating suspected fraud, analyzing factors that contributed to the occurrence of known fraud, recommending improvements to anti-fraud controls, monitoring incoming reports of suspected fraud, and providing ethics training for employees.

Risk and Control Personnel

Depending on a variety of factors (e.g., size and structure), an organization might have a separate risk and control group. In some cases, risk and control personnel report to each of the functional heads of the organization.

Regardless of the reporting structure, when risk and control personnel are present, their responsibilities include identifying known and emerging fraud risks and assisting in the assessment of those risks. These personnel might also provide communication and education on fraud risks and responsibilities.

Forming the Fraud Risk Management Team

In formulating the fraud risk management team, a cross-departmental approach allows a diverse skill set and holistic perspective to be incorporated into the anti-fraud team's initiatives. However, the group should have a designated leader—such as the chief compliance officer or chief ethics officer—to guide the team and monitor achievement of its objectives. Additionally, each member's roles and responsibilities must be clearly outlined, and explicit expectations must be set.

The Objectives of a Fraud Risk Management Program

Fraud risk management programs must address fraud before, during, and after it occurs. Consequently, effective fraud risk management programs must incorporate policies and procedures designed to do all of the following:

- Prevent fraud.
- Detect fraud.
- Respond to identified fraud.

Fraud Prevention

Fraud prevention activities focus on proactively identifying and assessing fraud risks and taking steps to address those risks. These are the first line of defense against fraud in the organization and generally include policies, procedures, training, and communication.

Fraud Detection

Fraud detection activities seek to identify fraud occurrences as soon as possible after they begin to limit the damage done.

Fraud Response

Responding to suspected fraud occurrences includes:

- Investigating the allegation to determine the party or parties responsible, the means of the infraction, and the extent of the resulting damage
- Punishing the perpetrator, whether through employment sanctions or legal action
- Remediating the control weaknesses that allowed the fraud to be undertaken
- Rebuilding stakeholders' confidence in the organization

Fraud Risk Management Principles

To help meet the objectives of a fraud risk management program, *Fraud Risk Management Guide* (FRM 2016) describes five broad principles, one for each of the five interrelated components of internal control listed in *Internal Control—Integrated Framework* (COSO IC 2013). Each principle is then supported by several points of focus. The principles and underlying points of focus combine to create a full framework that can be used to design, implement, and assess an effective fraud risk management program.

The following are the five principles provided in FRM 2016:

- Fraud risk governance
- Fraud risk assessment
- Fraud control activities
- Fraud investigation and corrective action
- Fraud risk management monitoring activities

Fraud Risk Governance

The fraud risk governance principle of FRM 2016 states:

The organization establishes and communicates a fraud risk management program that demonstrates the expectations of the board of directors and senior management and their commitment to high integrity and ethical values regarding managing fraud risk.

To support effective fraud risk governance, FRM 2016 provides the following points of focus that organizations should adhere to:

- *Make an organizational commitment to fraud risk management*—The board of directors and senior management initiate the fraud risk management process by establishing an organizational commitment to deter, prevent, and detect fraud.
- *Support fraud risk governance*—The board of directors and senior management make an organizational commitment to fraud risk management as a crucial element of corporate governance.
- *Establish a comprehensive fraud risk management policy*—The board of directors and senior management provide a solid foundation of fraud risk management by establishing a comprehensive fraud risk management policy.
- *Establish fraud risk governance roles and responsibilities throughout the organization*—The board of directors and senior management identify the roles and responsibilities of all personnel as they relate to fraud risk governance.
- *Document the fraud risk management program*—The board of directors and senior management ensure that the fraud risk management program is thoroughly documented and updated on a regular basis.
- *Communicate fraud risk management at all organizational levels*—The board of directors and senior management support the ongoing effectiveness of the fraud risk management program by maintaining and communicating a continuous focus on fraud deterrence, prevention, and detection throughout the organization.

Fraud Risk Assessment

The fraud risk assessment principle of FRM 2016 states:

The organization performs comprehensive fraud risk assessments to identify specific fraud schemes and risks, assess their likelihood and significance, evaluate existing fraud control activities, and implement actions to mitigate residual fraud risks.

FRM 2016 provides the following points of focus that organizations should implement with respect to fraud risk assessments:

- *Involve appropriate levels of management*—The fraud risk assessment team includes appropriate levels of management.
- *Include entity, subsidiary, division, operating unit, and functional levels*—The fraud risk assessment team recognizes that frauds can happen at any level or component of the organization.
- *Analyze internal and external factors*—The fraud risk assessment team considers both internal and external factors and their impact on the achievement of objectives.
- *Consider various types of fraud*—The fraud risk assessment team considers a variety of possible fraud schemes and exposures.
- *Specifically consider the risk of management override of controls*—The fraud risk assessment team understands that catastrophic frauds have been perpetrated by senior members of management overriding existing and otherwise effective controls and focuses on these risks.
- *Estimate the likelihood and significance of risks identified*—The fraud risk assessment team carefully evaluates the probability that each particular fraud could occur and the potential effects on the organization if that particular fraud occurs.
- *Assess the personnel or departments involved and all aspects of the Fraud Triangle*—The fraud risk assessment team focuses on incentives and pressures, opportunities, and attitudes and rationalizations to commit fraud.
- *Identify existing fraud control activities and assess their effectiveness*—The fraud risk assessment team identifies and evaluates existing controls for effectiveness to determine residual fraud risks that require mitigation.
- *Determine how to respond to risks*—The fraud risk assessment team’s ultimate goal is to formulate effective and appropriate responses to all fraud risks.
- *Use data analytics techniques for fraud risk assessment and fraud risk responses*—The organization uses data analytics to improve the effectiveness and results of the fraud risk assessment.
- *Perform periodic reassessments and assess changes to fraud risk*—The organization repeats the risk assessment process periodically and considers changes affecting the organization—including changes in the external environment, operations, personnel, and leadership—that can affect fraud risks.
- *Document the risk assessment*—The organization understands that the risk assessment serves as the central element of the fraud risk management process and ensures that it is carefully and thoroughly documented.

These components are discussed in greater detail in the “Fraud Risk Assessment” chapter.

Fraud Control Activities

The fraud control activities principle of FRM 2016 states:

The organization selects, develops, and deploys preventive and detective fraud control activities to mitigate the risk of fraud events occurring or not being detected in a timely manner.

To support the implementation of effective fraud control activities, FRM 2016 provides the following points of focus that organizations should adhere to:

- *Promote fraud deterrence through preventive and detective control activities*—The organization addresses its fraud deterrence as a process of eliminating factors that might cause fraud to occur and understands that deterrence results from having effective preventive and detective fraud control activities in place.
- *Integrate with the fraud risk assessment*—The organization ensures that the design and implementation of fraud control activities link directly to the fraud risk assessment.
- *Consider organization-specific factors and relevant business processes*—The organization ensures that the design and implementation of fraud control activities consider a range of factors, including factors unique to the organization, its industry, and its operating environment.
- *Consider the application of control activities to different levels of the organization*—The organization ensures that fraud control activities exist throughout the organization at all appropriate organizational levels.
- *Use a combination of fraud control activities*—The organization ensures that fraud control activities include a range, variety, and mix of preventive and detective controls.
- *Consider management override of controls*—The organization includes fraud control activities that consider and address the ability of senior management personnel to circumvent or override internal control activities, including fraud control activities.
- *Use proactive data analytics procedures*—The organization implements a well-designed, rigorous system of data analytic processes and procedures that can identify anomalous transactions or events for further investigation.
- *Deploy control activities through policies and procedures*—The organization ensures that fraud control activities are thoroughly documented and implemented through organizational policies.

Fraud Investigation and Corrective Action

The fraud investigation and corrective action principle of FRM 2016 states:

The organization establishes a communication process to obtain information about potential fraud and deploys a coordinated approach to investigation and corrective action to address fraud appropriately and in a timely manner.

FRM 2016 provides the following points of focus for organizations regarding effective fraud investigation and corrective action initiatives:

- *Establish fraud investigation and response protocols*—The organization establishes, formally documents, and maintains a process for the receipt, evaluation, and treatment of communications of potential fraud.
- *Conduct investigations*—The organization undertakes investigations of potential fraud, giving due consideration to the scope, severity, credibility, and implications of the communicated matter.
- *Communicate investigation results*—The investigation team communicates the results of the investigation to the appropriate internal authority and, when necessary, to external third parties.
- *Take corrective action*—The organization selects discipline, remediation, asset recovery, or other activities to address the findings of the investigation.
- *Evaluate investigation performance*—The organization performs evaluations periodically to provide objective feedback on the effectiveness of the investigation process.

Fraud Risk Management Monitoring Activities

The fraud risk management monitoring activities principle of FRM 2016 states:

The organization selects, develops, and performs ongoing evaluations to ascertain whether each of the five principles of fraud risk management is present and functioning and communicates deficiencies in the fraud risk management program in a timely manner to parties responsible for taking corrective action, including senior management and the board of directors.

FRM 2016 provides the following points of focus for organizations in implementing effective fraud risk management monitoring activities:

- *Consider a mix of ongoing and separate evaluations*—Management includes a combination of ongoing and separate fraud risk management program monitoring evaluations to determine whether each of the five principles of fraud risk management is present and functioning.
- *Consider factors for setting the scope and frequency of evaluations*—Management considers changes in the organization, its operating environment, and its control structure to determine the appropriate scope and frequency of its fraud risk management program monitoring activities.

- *Establish appropriate measurement criteria*—Management establishes appropriate measurement criteria to assist in the objective evaluation of its fraud risk management program.
- *Consider known fraud schemes and new cases*—Management considers known fraud schemes and newly discovered or reported frauds in other organizations and assesses the likelihood of occurrence in the organization.
- *Evaluate, communicate, and remediate deficiencies*—Management and the board of directors assess the results of ongoing and separate fraud risk management program monitoring evaluations; communicate deficiencies to those responsible for corrective action; and determine that appropriate remediation is implemented in a timely manner.

Steps in Developing a Fraud Risk Management Program

Define Program Objectives

While the broad objectives of a fraud risk management program include the prevention of, detection of, and response to fraud, because the fraud risks and strategic initiatives of each organization differ, the detailed objectives of the fraud risk management program should be tailored to the organization's specific needs and goals.

Like any corporate initiative, without a clear, explicit definition of what the organization intends to accomplish through its fraud risk management program, the program will have limited or no success. Consequently, management must balance the following factors in determining the program's objectives:

- Management's risk appetite
- The investment in anti-fraud controls
- The prevention of frauds that are material in nature or amount

For example, a zero-tolerance approach—which generally indicates that management will take action against any fraud, regardless of size or nature—prioritizes the prevention of frauds over the costs involved and indicates a very low appetite to take on fraud risks.

Define Risk Appetite

No fraud risk management program will prevent all fraud; some risk of fraud will always remain. Consequently, an important component in defining the objective of the fraud risk management program is determining management's risk appetite. *Enterprise Risk Management—Integrating with Strategy and Performance* (COSO ERM 2017) defines *risk appetite* as

“the types and amount of risk, on a broad level, an organization is willing to accept in pursuit of value.” Without an adequate understanding of just how much risk those charged with governance are willing to accept, any stated objectives of the fraud risk management program will be inaccurate.

Risk appetite can be measured and expressed either qualitatively—low, medium, or high, for example—or quantitatively, using a numeric scale. For example, a company’s management might decide that it prefers to reduce the residual risk of fraud down to a low level, implying a desire for strong controls and monitoring of such controls over a particular area of the business. Another company might decide that any risk rated three or higher is unacceptable (for a risk scale between one and five). Risk appetite can also be broken down into specific types or sources of fraud, which allows for prioritization of fraud risk management strategies based on the assessed components.

Whatever means of measuring risk appetite that management chooses to use, the results should be a continuous focus on developing an effective fraud risk management strategy.

Examine Previous Fraud Incidents

Another helpful starting point in determining the fraud risk management strategy is to examine previous occurrences of fraud and explore how management’s ideal fraud risk management program would have prevented, detected, and responded to them. In examining such incidents, management should consider the factors that allowed such frauds to occur. Specifically, management should assess the following:

- Were the fraud risks not fully understood?
- Were internal controls insufficient in design or operation?
- Were the applicable internal controls overridden?
- Were there any warning signs that were missed?

Such analysis can be extremely useful in guiding management’s definition of program objectives and determining which areas of the fraud risk management program will need significant attention.

Assess Fraud Risks

Before a program to effectively manage fraud risks can be developed, management must first identify and thoroughly understand the risks faced by the organization. Any program

components developed based on an insufficient understanding of the company's specific fraud risks will likely be ineffective in preventing fraud, a waste of resources, and potentially counter-productive.

The fraud risk assessment process, although cumbersome and time-consuming, is very important in developing a fraud risk management program. There are many ways to complete this process, but the overall goal is to detail the fraud risks to the organization and determine the likelihood of their occurrence, as well as their potential damage. Only after the risks have been defined and well-understood can management make an educated decision about how best to reduce the risks, while taking into consideration the productivity and costs to the business.

The previous chapter on "Fraud Risk Assessment" contains more detailed information on how and why such assessments should be conducted.

Design Program Components

The specific components of the fraud risk management program must be designed, taking into consideration the organization's culture, operating environment, and specific risks, as well as management's defined program objectives and risk appetite. Additionally, the design of the program components should be undertaken by individuals with adequate knowledge of both fraud risk management tactics in general and the company's specific risks and operations.

Components of the customized fraud risk management program will generally include:

- Initiatives to increase the anti-fraud culture and tone of the organization
- Fraud prevention controls
- Fraud detection controls
- Formalized policies, processes, and procedures for investigating and responding to known instances of fraud

Implement Program Components

Even the best-designed fraud risk management program will be worthless if it is not implemented effectively. For example, the ethical tone of the organization must be clearly, openly, and consistently demonstrated in the actions of upper management, rather than simply being mandated to lower-level employees through ethics policies that do not apply to those at the top. Likewise, any internal controls will only work to prevent or detect fraud if those responsible for performing and monitoring the control functions are effectively fulfilling their duties.

Communicate Expectations

The purpose and expectations of the fraud risk management program must be communicated, both formally and informally, to employees at all levels throughout the organization. Employees who are told to perform a certain task a certain way will likely not understand the full impact of the anti-fraud control if they are not educated about how that task helps protect the organization from being defrauded. Additionally, employees must be informed about their responsibility to report suspected fraud and be empowered with the means and confidence to do so without concern for retaliation.

Ensure Compliance

The fraud risk management program must include mechanisms specifically designed to monitor, identify, and address breaches in compliance. Such breaches might include failures in the design or operation of anti-fraud controls, as well as outright occurrences of fraud. A specific individual or team should be designated as responsible for monitoring compliance with the fraud risk management program and for handling suspected instances of noncompliance. Formal sanctions for intentional noncompliance must be well-publicized and carried out in a consistent and firm manner.

Identify and Investigate Violations

Even the most well-designed fraud risk management program will not thwart all attempts to defraud the organization. Consequently, organizations must have in place clearly defined processes and protocols for investigating suspected frauds.

**Measure, Evaluate, and Report the Program's Performance and Effectiveness
(Benchmarking)**

The success of any initiative depends greatly on management's ability to adapt the program to its changing needs and to new information that is uncovered. Consequently, the fraud risk management program's performance will need to be periodically evaluated, with the results of such evaluations reported to senior management and the board of directors. Benchmarking against internal expectations as well as best practices can be extremely helpful in measuring the program's effectiveness.

Fraud Risk Management Program Components

Most organizations have controls designed to prevent and detect fraud; many also have written policies and procedures, such as a code of ethics or fraud investigation policy, that reinforce an anti-fraud stance. However, a proactive fraud risk management program is greatly benefited by formally compiling these activities and documents, assessing and refining how they work together, and communicating the totality of the program to employees, management, directors, vendors, customers, and other stakeholders.

While *Fraud Risk Management Guide* (FRM 2016) provides foundational principles and guidance for designing and implementing the components of a comprehensive fraud risk management program, *Managing the Business Risk of Fraud: A Practical Guide* (MBRF 2008), the predecessor to FRM 2016, provided the following list of ten essential components for effectively managing fraud risk:⁷

- Statement of commitment
- Fraud awareness
- Affirmation process
- Conflict disclosure
- Fraud risk assessment
- Reporting procedures and whistleblower protection
- Investigation process
- Corrective action
- Process evaluation and improvement (quality assurance)
- Continuous monitoring

Statement of Commitment

The board of directors and senior management should communicate, in writing, their commitment to proactively preventing, detecting, and addressing fraud. This communication can be made as part of the organization's written statement of values and principles, as part of the code of conduct, or in a separate short document, such as a letter, that is provided to all employees, vendors, and customers.

⁷ Much of the material in this discussion is taken from pages 16–18 of *Managing the Business Risk of Fraud: A Practical Guide*, a resource jointly published by the IIA, AICPA, and ACFE. For more information or to read the full text of this publication, please visit [ACFE.com/MBRF](https://www.acfe.com/MBRF).

The statement of commitment should:

- Be endorsed or authored by a senior executive or board member
- Be provided to employees as part of the orientation process and be reissued periodically
- Stress the importance of fraud risk mitigation
- Acknowledge the organization's vulnerability to fraud
- Establish the responsibility of each person within the organization to support fraud risk management efforts
- Reinforce management's no tolerance stance on fraudulent behavior

Fraud Awareness

To help convey fraud risk management expectations and to effectively prevent fraud, management should include a formal fraud awareness program as part of the fraud risk management initiative. The fraud awareness program should include periodic assessment, training, and frequent communications that:

- Define fraud.
- Describe pertinent fraud risks.
- Provide examples of types of fraud that might occur.
- Identify potential perpetrators of fraud.

When designing such programs, management should consider:

- Who should attend
- The frequency and length of training sessions
- Cultural sensitivities
- The inclusion of guidance on how to solve ethical dilemmas
- The appropriate delivery method(s)
- The training needs of individuals at different levels of authority (i.e., staff, supervisors, upper management, and board members)

Affirmation Process

An affirmation process is the requirement for directors, employees, and contractors to explicitly affirm (typically via electronic or manual signature) that they have read, understood, and complied with the organization's code of conduct, fraud control policy, and other such documentation that supports the fraud risk management program. In determining whether to enact an affirmation process, management must weigh any potential legal issues involved with having such a process with the increased fraud risk of not having one.

If an affirmation process is enacted, it should include consistent sanctions for individuals who refuse to sign-off on the acknowledgement. Additionally, the affirmation process might include requiring individuals to acknowledge that they have a fiduciary duty to report any known instances of fraud.

Ways to extend the affirmation process for further fraud protection include:

- Incorporating terms in contracts that require vendors to agree to abide by the organization's code of conduct
- Requiring senior management to sign a code of conduct specific to higher-level employees
- Requiring vendors to sign separate agreements on specific topics, such as confidentiality or use of company technologies

Conflict Disclosure

An important component of a fraud risk management program involves a mechanism for directors, employees, and contractors to self-disclose to the organization any potential or actual conflicts of interest.

All disclosures of potential or actual conflicts of interest—as well as management's decision regarding the situation—should be documented and reported to legal counsel. Additionally, any waivers of conflict of interest policy provisions should be—and, under certain securities regulations, might be required to be—disclosed. Management should also consider the benefits of and any legal requirements for disclosing the organization's code of conduct, anti-fraud policy, and related statements to the public.

Fraud Risk Assessment

As previously discussed, a thorough fraud risk assessment that accurately identifies the organization's fraud risks is the foundation for an effective fraud risk management program. Such an assessment is not a onetime endeavor, but rather should be performed on a systematic and recurring basis. Additionally, the assessment should consider all relevant fraud schemes and scenarios, and the results should be used to map mitigating controls to those fraud schemes and scenarios determined to put the organization at risk.

The previous chapter on “Fraud Risk Assessment” contains more detailed information on how and why such assessments should be conducted.

Reporting Procedures and Whistleblower Protection

Fraud is detected more often by tips than by any other means. Consequently, to be fully effective, a fraud risk management program must include mechanisms for receiving fraud allegations from employees and other parties.

The organization's reporting policies and procedures should:

- Be thoroughly and openly communicated to employees, customers, and vendors.
- Set the expectation that suspected fraud should be immediately reported.
- Clearly define and communicate the channels to use to make such reports (e.g., a hotline, ombudsman, or specific page on the organization's website).
- Provide explicit support and protection for whistleblowers.

Investigation Process

Part of an effective fraud risk management program is a formal investigation process that is performed when suspected fraud is reported. The protocol for this process should be properly documented, and should include consideration of:

- Who should conduct the investigation (internal parties or outside experts)
- Rules of evidence
- Chains of custody
- Reporting mechanisms
- Regulatory requirements
- Legal actions

Corrective Action

Organizations should enact policies that reflect the consequences and processes for individuals who commit or condone fraudulent activity. Such consequences might include termination of employment (or a contract, for nonemployees), reporting of the incident to law enforcement or regulatory authorities, and pursuit of civil or criminal action against the perpetrator(s). It is important for management to ensure that any corrective action taken is applied consistently for all involved in the fraudulent act.

The organization should also have specific policies in place to identify and remediate any control deficiencies that allowed fraudulent conduct to occur.

Process Evaluation and Improvement (Quality Assurance)

Management should determine and document specifically how it will periodically evaluate the fraud risk management program's effectiveness. It should also include specific provisions for monitoring changes to the program, obtaining measurements of program effectiveness, and analyzing statistics, benchmarks, resources, and survey results. The results of this process evaluation should be used by the board and management to improve the fraud risk management program.

Continuous Monitoring

All aspects of the fraud risk management program should be continuously reviewed and revised to ensure they are addressing the organization's current needs and risks, as well as to reflect management's ongoing commitment to preventing, detecting, and investigating fraud.

The Use of Data Analytics in Managing Fraud Risk

Fraud Risk Management Guide (FRM 2016) reinforces a point that organizations are increasingly aware of as the age of data analysis evolves: The effective analysis and monitoring of an organization's data is paramount to a successful fraud risk management program. Many fraud examiners have used data analytics in a reactive way to help detect and investigate fraud, but more and more organizations are seeing the value in proactive use of analytics as part of their overall anti-fraud strategy. FRM 2016 reflects this integrated use by incorporating the application of data analytics as part of each of the five fraud risk management principles, as well as by including a full appendix on data analytics and fraud risk management.

As part of the fraud risk governance principle, FRM 2016 notes that organizations should consider providing a strategy for proactively using data analysis activities to assess areas of high fraud risk and to monitor fraud mitigation activities and controls.

Additionally, one of the primary aspects of fraud risk assessment specifically highlights the importance of using data analytics techniques for fraud risk assessment and fraud risk responses. Specifically, FRM 2016 provides the following examples of techniques that can be used to gather fraud risk evidence:

- Data stratification
- Risk scoring
- Trend analysis
- Fluctuation analysis

- Data visualization
- Statistical analysis/predictive modeling
- Using data from external sources

The FRM 2016 principle for fraud control activities also includes a focal point covering the use of “a well-designed, rigorous system of data analytics processes and procedures that can identify anomalous transactions or events for further investigation.” Examples provided of the types of analytical procedures that can be used to identify such anomalies include Benford’s Law, journal entry examination, and review of data from external sources (e.g., social media feeds and watch list databases). The guidance also provides a five-phase framework for using data analytics procedures:

1. Analytics design
2. Data collection
3. Data organization and calculations
4. Data analysis
5. Findings, observations, and remediation

With respect to fraud investigation and corrective action, FRM 2016 notes computer-assisted data analysis is one method of gathering evidence as part of a fraud investigation. Following an investigation, data analysis can also be useful in assessing whether frauds similar to the one alleged might be occurring elsewhere in the organization.

FRM also reflects the importance of data analysis as part of the organization’s fraud risk management monitoring activities. Continuous monitoring and ad-hoc analysis via compliance verification and other analytical procedures can help management evaluate whether the fraud risk management program is functioning as expected, as well as provide insight into areas where deficiencies in the program’s design or implementation need remediation.

To assist organizations in implementing data analytics procedures as part of a fraud risk management program that aligns with FRM 2016, the ACFE and EY created an interactive library of sample data analytics tests, which is available at [ACFE.com/fraudrisktools-tests.aspx](https://www.acfe.com/fraudrisktools-tests.aspx).

ETHICS FOR FRAUD EXAMINERS

The decisions fraud examiners make are important to the organizations they work for, as well as to the individuals they might be called upon to investigate. Therefore, fraud examiners are held to a high ethical standard. The following material is designed to accomplish more than a recitation of rules of professional ethics for fraud examiners; it also contains a general discussion about ethics. The first portion deals with broad principles of moral philosophy, while the latter portion deals more specifically with rules of behavior in situations that characterize fraud examiners' work. The applications of the ACFE Code of Professional Ethics are also discussed.

What Is Ethics?

Ethics is concerned with what is right and wrong. In *A Critical Introduction to Ethics*, Philip Wheelwright defined *ethics* as:

[The] branch of philosophy which is the systematic study of reflective choice, of the standards of right and wrong by which it is to be guided, and of the goods toward which it may ultimately be directed.

This definition contains three key elements:

- Ethics involves questions requiring reflective choice (decision problems).
- Ethics involves guides of right and wrong (moral principles).
- Ethics is concerned with values (goods) inherent in ethical decisions.

Codes of Ethical Conduct

Why does an individual or a group need a code of ethical conduct? While employers want people who inherently make ethical decisions working for them, a code of conduct serves a useful purpose as a reference and benchmark for ethical guidance. A code makes explicit the conduct that is expected in a particular profession. Thus, codes of professional ethics can provide some direct solutions that might not be available from general ethics theories.

Furthermore, individuals will have a better understanding of what is expected of them when a code of ethical conduct is in place. From the viewpoint of an organized profession, a code is a public declaration of principled conduct and a means of facilitating enforcement of

standards of conduct. Practical enforcement and profession-wide internal discipline would be much more difficult if members were not first put on notice of the standards.

The Role of an Ethical Decision-Maker

While one of the main purposes of ethics is to guide the actions of individual decision-makers, the role of decision-maker does not fully describe a professional person's entire obligation. Each person acts not only as an individual but also as a member of a profession and as a member of society. Hence, fraud examiners are also *spectators* (observing the decisions of colleagues), *advisors* (counseling with coworkers), *instructors* (teaching students or new employees on the job), *judges* (serving on disciplinary committees), and *critics* (commenting on the ethical decisions of others). All of these roles are important in the practice of professional ethics.

Regarding general ethics, fraud examiners' primary goal is to arrive at a set of acceptable methods for making ethical decisions while fulfilling their duties. Consequently, an understanding of some of the general principles of ethics can help fraud examiners evaluate the difficult situations they might face and will also help them understand the ethical guidelines outlined in the ACFE Code of Professional Ethics.

Ethical Decisions

One of the key elements in ethics is reflective choice. *Reflective choice* refers to the process whereby an individual identifies a decision problem, analyzes the situation—collects information, considers rules of behavior, and thinks about consequences of alternative actions—and takes action. In short, reflective choice refers to decision making.

Ethical problems almost always involve projecting yourself in a future in which you have to live with your decisions. Professional ethics decisions usually turn on these questions: “What written and unwritten rules govern my behavior?” and “What are the possible consequences of my choices?”

We could dispense with any discussion of ethical theories and rules if we were willing to accept a simple proposition: “Let conscience be your guide.” Such a rule is appealing because it calls upon an individual's own judgment, which might be based on wisdom, insight, adherence to custom, or an authoritative code. However, it might also be based on caprice, immaturity, ignorance, stubbornness, or misunderstanding.

In a similar manner, reliance on the opinions of others or on the weight of opinion of a particular social group is not always enough. Another person or a group of people might perpetuate a custom or habit that is wrong. To adhere blindly to custom or group habits is to abdicate individual responsibility. Thus, the function of ethical principles and rules is not to provide a simple and sure answer to all problems, but to provide guidance for individual decisions and actions.

Morality, Ethics, and Legality

The concepts of morality, ethics, and legality are related, but they each represent different things. To illustrate, consider the following question: Is it acceptable to lie to catch a criminal? The answer is not immediately clear, and it depends on the underlying facts and a number of factors, including moral, ethical, and legal concerns. For further illustration, consider the following story about a fraud examination.

Management at Megacorp, Inc., suspected that its stockroom employees were stealing electronic parts from inventory and hired Abel, a fraud examiner, to discover if and how the thefts were occurring. Abel went undercover to investigate the matter, but only the president of Megacorp knew Abel's true identity. Abel applied for a job at Megacorp, and his application was processed through the personnel department in the normal manner. Ultimately, Abel was hired as a stockroom clerk. While working in the stockroom, Abel preserved his false identity, infiltrated the group responsible for the thefts, and gathered sufficient evidence to prove their misconduct. Consequently, the culpable employees were identified and charged with theft by state prosecutors.

This scenario illustrates the moral, ethical, and legal issues facing fraud examiners. These issues involve principles of moral philosophy, rules of ethics, legal considerations, values, and—above all—the problem of distinguishing right from wrong. *Morality* refers to the underlying codes of right and wrong. But the difficulty with morality is that it might be viewed as relative rather than absolute. For example, although lying is generally considered wrong, Abel could argue that his deceptive acts are morally justified under the circumstances.

In contrast, *ethics* refers to the appropriateness of a decision in light of morality. That is, ethics stress standards or codes of behavior expected by the group to which the individual belongs. To illustrate the difference between morals and ethics, consider a criminal defense lawyer who is hired to represent the stockroom employees charged with theft. Though the lawyer's

personal moral code likely finds theft immoral, ethics demand that the accused receive appropriate legal representation, even if the lawyer believes that the individuals are guilty. Accordingly, the ethics override the lawyer's personal belief that theft is immoral.

Legality refers to lawfulness by conformity to a legal statute. Although there might be overlap between ethics and the law, they do not always align with each other. For instance, even though speeding is illegal, many individuals would argue that it is not always unethical.

Upholding Ethical Standards

Most public and many private discussions of ethics quickly become philosophical, reaching toward lofty principles and broad generalizations about desirable behavior. People easily cite well-known guides and believe the ideas in them should never be violated. Such discussions often occur in isolation, apart from real-world situations. People generally exhort themselves and others to observe the highest principles of moral behavior. That is, they urge each other to take the high road, but often, promoting the high road is easier than taking it. Moreover, the idealistic nature of this level of discussion is often insufficient when helping people cope with problems as they are happening.

Conceptually, the *high road* refers to holding oneself to the highest moral standards and striving to uphold those standards even when faced with the pressure to act in an undignified and unethical fashion. That is, even if colleagues or associates are acting in a corrupt or reprehensible fashion, one should resist the pressure to behave in a similar manner and instead adhere to one's moral principles.

Moral Philosophy, Ethics, and Law

Moral philosophy is the branch of philosophy that involves systematizing, championing, and advocating concepts of right and wrong. That is, it evaluates human judgments and interactions based on standards that distinguish between behavior that is morally right and behavior that is morally wrong.

There are two aspects of moral philosophy that fraud examiners should consider. The first is the human judgment process, which deals with ways people analyze problems. The second is the standards or values—such as honesty, faithfulness, and unselfishness—that people can use to make moral principles useful.

Ethics can be distinguished from moral philosophy by considering the role that each have in society. People are usually more comfortable talking about ethics than moral philosophy because ethics often addresses practical problems, while moral philosophy is often concerned with approaching morality from a theoretical perspective. Ethics generally refers to a specific setting—a society, culture, nation, profession, or small group. In this context, ethics refers to behavior that conforms to some societal norms or to a written code of ethics, such as the ACFE Code of Professional Ethics.

When faced with an ethics-related problem, it is appropriate to begin analyzing the issue by asking: Is it legal? The law, including professional rules and regulations, deals with actions that are permitted and prohibited, but it is the lowest reference level for moral decisions.

Ethics and the law do not always align with each other; the law might permit an action that is prohibited by a profession's code of ethics. Laws, rules, and regulations function as standards by which to judge whether an action is legal or illegal but not whether the behavior is right. For instance, if you have promised an individual that you will honor a contract, you are ethically bound to do so, regardless of your legal responsibility; under these facts, upholding your promise is the right thing to do, no matter what the law says.

Similarly, morality, ethics, and the law do not always conform to each other. A profession's code of ethics might permit actions that are immoral, or the law might prohibit actions that are moral.

For example, the American Institute of Certified Public Accountants (AICPA) had rules of ethics that prohibited advertising, with the exception of broadly based institutional advertising. The profession believed that professional dignity and objectivity were enhanced by keeping practitioners out of this aspect of the commercial world. The U.S. Federal Trade Commission (FTC) and the U.S. Department of Justice (DOJ), however, reached a different conclusion. They decided that the prohibitions against advertising were against the laws barring restraint of trade. The government forced the profession to eliminate the rules against advertising. This example illustrates the triumph of one set of values (the government's belief that competition through advertising would benefit consumers) over another set (the profession's belief that professional dignity should be preserved).

All three areas—morality, ethics, and legality—are important for everyday decisions. When faced with an ethical decision, fraud examiners should consider whether a contemplated

action is legal, is permitted by the written code of ethics, and is moral. Thus, it is important to know the distinctions between morality, ethics, and legality (i.e., between the philosophy, the rules, and the law). Only with this knowledge can fraud examiners know where they stand when deciding upon and justifying a course of action.

This material observes one important limitation. It confines its consideration of ethics for fraud examiners to matters of moral philosophy, rules of ethics, and general values. It does not deal with detailed matters of the law or with questions about the legality or illegality of actions a fraud examiner might take. By taking this approach, this material does not state that the law is unimportant; instead, the law is beyond the scope of this section.

Means and Ends

Means-and-ends analysis is an approach to ethical problem solving. In assessing the ethicality of certain actions under this approach, we must look at the means (the techniques used) and the ends (the results sought). Ethics provide a measure through which the relationship between means and ends can be clarified.

People often use sayings like “the ends justify the means” or “fight fire with fire” in an attempt to justify actions that might be immoral, unethical, or illegal. Fraud examiners can be influenced by this way of thinking because they often deal with people who act immorally and disregard ethical considerations or relevant laws.

Flexibility in Morality

Even if a moral rule seems inflexible, people can think of situations that might justify breaking the rule. For example, some people think that lying is okay if done to catch a criminal. In Abel’s case, the fraudster’s dishonesty made it necessary for the fraud examiner to lie in return. Thus, under such analysis, the ends (catching criminals and upholding justice) justify the means (lying).

The means-end analysis evaluates how well an action—often in comparison with an alternative course of action—accomplishes its intended ends. The action itself is not judged as ethical or unethical; rather, the outcome is the deciding factor in whether the act is justified.

The problem with means-ends analyses is that they are often superficial, ending with the needed justification but failing to consider other aspects and consequences of the actions. To illustrate, consider the facts in the previous case study involving Megacorp. Megacorp’s

president must think about the moral, ethical, and legal climate of the company once it becomes known that an undercover agent was employed. (Will this cause employees to be suspicious of one another? Will it negatively affect employee morale?)

Conclusion

This discussion of ethics is intended to briefly describe the ways people approach difficult decisions. When faced with ethical problems, individuals should take general principles of moral philosophy and apply them to their situation. But the application of these principles through an individual's codes of professional ethics is where the challenge lies.

Codes of professional ethics and statutory law have two things in common. They are both based, more or less, on pervasive moral principles and values, and they both represent the aspects of behavior that a committee or legislature has chosen to put in writing. Neither codes of professional ethics nor the law provide guidance for every situation. Therefore, professional people, including fraud examiners, must often decide on a course of action without external guidance.

Two types of ethics operate in the professional environment—general ethics (the spirit) and professional ethics (the rules). In their book *The Philosophy of Auditing*, Robert K. Mautz and Hussein A. Sharaf contributed the following thoughts to the association of general ethics and professional ethics:

The theory of ethics has been a subject of interest to philosophers since the beginnings of recorded thought. Because philosophers are concerned with the good of all mankind, their discussions have been concerned with what we might call general ethics rather than the ethics of small groups such as the members of a given profession. We cannot look, therefore, to their philosophical theories for direct solutions to our special problems. Nevertheless, their work with general ethics is of primary importance to the development of an appropriate concept in any special field. Ethical behavior in auditing or in any other activity is no more than a special application of the general notion of ethical conduct devised by philosophers for people generally. Ethical conduct in auditing draws its justification and basic nature from the general theory of ethics. Thus, we are well-advised to give some attention to the ideas and reasoning of some of the great philosophers on this subject.

Accordingly, understanding the importance of ethical behavior is vital for fraud examiners, whose primary function is to aid in the prevention and detection of fraud. In practical terms, ethics involves making the right decision even when one's actions are not under scrutiny. Thus, fraud examiners must be able to make the correct choices in times of pressure, especially when there is no one to answer to but themselves.

Additionally, understanding ethics will help fraud examiners work through ethical dilemmas, provide them with a range of analytical tools with which they can assess ethical issues, and help them communicate ethical arguments to others.

We have attended to the ideas and reasoning of philosophers, and now we turn to the ACFE Code of Professional Ethics and its particular rules.

**ASSOCIATION OF CERTIFIED FRAUD EXAMINERS
CODE OF PROFESSIONAL ETHICS**

- I. An ACFE Member shall, at all times, demonstrate a commitment to professionalism and diligence in the performance of their duties.
- II. An ACFE Member shall not engage in any illegal or unethical conduct, or any activity which would constitute a conflict of interest that has not been properly disclosed to the appropriate parties.
- III. An ACFE Member shall, at all times, exhibit the highest level of integrity in the performance of all professional assignments, and will accept only assignments for which there is reasonable expectation that the assignment will be completed with professional competence.
- IV. An ACFE Member will comply with the lawful orders of the courts, and will testify to matters truthfully and without bias or prejudice.
- V. An ACFE Member, in conducting examinations, will obtain evidence or other documentation to establish a reasonable basis for any opinion rendered. No opinion shall be expressed regarding the guilt or innocence of any person or party.
- VI. An ACFE Member shall not reveal any confidential information obtained during a professional engagement without proper authorization.
- VII. An ACFE Member shall reveal all material matters discovered during the course of an examination, which, if omitted, could cause a distortion of the facts.
- VIII. An ACFE Member shall continually strive to increase the competence and effectiveness of professional services performed under their direction.

The ACFE Code of Professional Ethics was created by the Board of Regents of the Association of Certified Fraud Examiners (ACFE) and was adopted January 1, 1989.

Commitment to Professionalism and Diligence

An ACFE Member shall, at all times, demonstrate commitment to professionalism and diligence in the performance of their duties.

Professionalism

Professionalism refers to the standing, practice, methods, character, qualities, or typical features of a professional or a professional organization. Professionalism is a quality desired by most people, but it is obtained at a price. Professionalism exists on two basic levels: (1) for the professional group as a whole and (2) for the individual fraud examiner.

Professionalism for the Group as a Whole

People frequently refer to professions, professional men and women, and professional activities without defining the meaning of the concept “professionalism.” Some fraud examiners say, “I might not know how to define it, but I know it when I see it.”

There are five principal characteristics that help differentiate professional fields from other vocations. The five characteristics are as follows:

- A body of specialized knowledge acquired by formal education
- Admission to the profession governed by standards of professional qualifications
- Recognition and acceptance by society of professional status, and concurrent recognition and acceptance of social responsibility by the professional
- Standards of conduct governing relationships of the professional with clients, colleagues, and the public
- An organization devoted to the advancement of the obligations of the professional group

A BODY OF SPECIALIZED KNOWLEDGE AND FORMAL EDUCATION

Professional fields are characterized by a body of specialized knowledge. A fraud examiner’s work involves specialized knowledge derived from several other fields, such as accounting, auditing, criminology, investigation, and law. A profession might not have a body of knowledge truly unique unto itself, but it should have one that requires study, comprehension, and practice beyond the everyday abilities other people might possess.

In many fields, continuing education is a hallmark of professionalism, and ongoing efforts to increase competence and effectiveness are required by numerous professions. The ACFE requires twenty hours of continuing professional education (CPE) every 12-month period, half of which must be directly related to fraud detection or deterrence. Additionally, two hours of CPE must be directly related to ethics.

PROFESSIONAL ADMISSION STANDARDS

Professional fields are also characterized by an admissions process that is governed by standards of professional qualifications. Some industries govern admission to their ranks by qualifications contained in law, but legal recognition is not required.

Conversely, many professions are not regulated by legal statutes. For instance, the certified internal auditor (CIA) has the status of a profession without the benefit of licensing laws. The fraud examiner profession is another example.

Additionally, many professions require exams for certification purposes. Certification examinations are offered in many professions, such as law, medicine, real estate, insurance, finance, accounting management, public accounting, and internal auditing. For fraud examiners, the CFE Examination is part of the certification process, and it contributes to the field's professional recognition.

Moreover, many, but not all, professions impose work experience requirements. Experience is required for many, but not all, professional licenses and certifications. For example, experience is required to obtain the CIA designation. Likewise, designation as a Certified Fraud Examiner (CFE) requires at least two years of experience in combination with other qualifications.

RECOGNITION AND ACCEPTANCE BY SOCIETY: A RECIPROCAL RELATIONSHIP

No group of practitioners can become a profession merely by declaring itself to be one. Society must acknowledge the group as a professional body. At present, fraud examiners are at the stage of becoming a self-declared profession. Historically, other professions had the same starting point. Modern medicine overcame its roots in magic. Accountants rose from the level of bookkeepers. Internal auditors advanced social goals by presenting a responsible front to public bodies.

Although social recognition is essential, it is not necessarily permanent. Society will not continue to honor as professional any group that fails to serve a broad-based social and public interest. Thus, professionals such as fraud examiners must reciprocate and accept the social responsibility to serve the public interest.

STANDARDS OF CONDUCT

Professional fields are also characterized by the adoption of and adherence to a code of professional ethics and standards of conduct, and such codes and standards can help a profession achieve full social recognition.

Codes of ethics serve as a reference and benchmark for ethical guidance. Like professionals in other fields, ACFE members are required to adhere to an explicit code of ethical conduct—the ACFE Code of Professional Ethics.

Furthermore, codes of conduct provide a set of expectations with regard to professional conduct. They establish a basic framework of expectations for professionals by outlining common principles. From the viewpoint of an organized profession, a code is a public declaration of principled conduct and a means to facilitate the enforcement of standards of conduct.

Fraud examiners and other professionals must observe their codes with an awareness of the society around them. Professionals must not follow such rules in a self-serving manner or in a way that does not benefit the public. Possessing and following a set of behavioral rules is one thing; possessing and following a set of rules in a way that meets public expectations is another.

A PROFESSIONAL ORGANIZATION

Professional fields are typically characterized by a dedicated organization devoted to the advancement of the group's obligations. For example, the ACFE is an association of professionals comprising CFEs and associate members who have made a commitment to work together for the common goal of detecting and preventing fraud, waste, and abuse.

Professionalism for the Individual Fraud Examiners

Additionally, professionalism exists for the individual fraud examiner. But when the focus of professionalism is turned to the individual fraud examiner, individual members must not forget that their actions reflect on the group as a whole.

By gaining admission into the ACFE and attaining the CFE certification, individual members are presumed to possess a body of knowledge. Also, each member is expected to adhere to the ACFE Code of Professional Ethics and maintain membership in the organization.

Individual fraud examiners exhibit professionalism by continually striving to honor the recognition of the profession granted by the public. In day-to-day life, this is accomplished by exercising diligence in performing fraud examination work.

Diligence

The “diligence in performing their duties” phrase in the rule refers to several activities that collectively define high-quality fraud examination work. They include properly planning assignments and supervising assistants and colleagues, avoiding conflicts of interest, performing tasks with competence, obtaining sufficient evidence to establish a basis for opinions, maintaining confidential relations, and avoiding distortion of facts. These activities are the subjects of other rules in the ACFE Code of Professional Ethics, and they will be discussed in more detail later.

Legal and Ethical Conduct and Conflict of Interest

An ACFE Member shall not engage in any illegal or unethical conduct, or any activity which would constitute a conflict of interest that has not been properly disclosed to the appropriate parties.

This rule is a composite of three prohibitions: illegal conduct, unethical conduct, and conflict of interest.

Illegal Conduct

This rule states that ACFE members shall not engage in illegal conduct. The prohibition of illegal conduct seems straightforward, but it can sometimes be difficult. While some activities might be obviously illegal, the legality of others might not be so clear. When fraud examiners confront questionable situations, they should consult an attorney because fraud examiners generally are not entitled to claim ignorance of the law. At the same time, however, it might be difficult to know ahead of time whether such a consultation is necessary. Consider the following law-related problems (but remember that this chapter on ethics is not intended to be your primary guide to legal matters).

Libel and Slander

Libel and slander can cause personal injury and subject a fraud examiner to a lawsuit for damages. *Libel* is a written defamation of someone else's character. *Slander* is a spoken defamation. The content of a libelous or slanderous message must:

- Contain words that injure another person's character or reputation or expose them to ridicule or contempt
- Be communicated orally or in writing to other people
- Cause an actual damage to the person who is the subject of the communication

The risks involved in libel and slander are reasons for having the rule in the ACFE Code of Professional Ethics that prohibits expression of opinions on the guilt or innocence of people.

False Imprisonment

False imprisonment can mean more than putting a person behind bars. Courts have found many types of detainment to constitute false imprisonment, including locking an employee in a store, locking a passenger in a vehicle, and detaining a witness by force. While drastic action might be necessary, fraud examiners must accomplish their duties legally.

Compounding a Felony

In some jurisdictions (e.g., the United States), the criminal act of compounding a felony can result from participating in a trade for restitution for agreeing to forgo prosecution. While plea bargains might be acceptable under the supervision of a court, fraud examiners should be very careful, should be familiar with the relevant laws of the jurisdiction in which they are operating, and should obtain legal advice when negotiating private deals.

Ignorance of the Law

Some rules for professionals insert the word *knowingly* in relation to illegal activities, saying: "One should not knowingly be a party to an illegal activity." The ACFE Code of Professional Ethics does not include this way out. Fraud examiners are generally not entitled to claim ignorance of the law. They are expected to know a considerable amount of law in connection with investigations, and they are expected to know when to consult a lawyer.

Unethical Conduct

Additionally, this rule states that ACFE members shall not engage in unethical conduct. These materials have presented an array of issues in moral philosophy and ethical

thinking—intertwining considerations of principles and values. This latter part is set forth in the ACFE Code of Professional Ethics. Legitimate questions are: What manner of unethical conduct is meant by this rule? Does it refer to general matters of moral philosophy and ethics, or is its applicability limited only to the rules in this code?

In particular, this prohibition is complicated by the question of scope (i.e., the question of what conduct is within the scope of this prohibition). A narrow focus would center on the rules in the ACFE Code of Professional Ethics, but a broad focus would include a fraud examiner's interaction with the people affected by their choices. The broader focus is more consistent with the concept of professionalism because the code itself is a limited set of rules.

Moreover, a fraud examiner must take personal responsibility for decisions, and must be aware that other professionals are often criticized for adhering too rigidly to their codes. Lawyers face harsh criticisms when they seem to hide knowledge of criminal acts in their privileged communications. Doctors are often criticized for the things they tell their patients about terminal illnesses. Professions are criticized for having specialized rules that seem to permit their members to act contrary to social expectations.

Conflict of Interest and Independence Considerations

The rule also states that ACFE members shall not engage in undisclosed conflicts of interest. A *conflict of interest* exists when a fraud examiner's ability to objectively evaluate and present an issue for a client is impaired by a current, prior, or potential future relationship with parties to the fraud examination.

The parties whose interests might conflict range widely and can include the fraud examiner, the fraud examiner's clients (e.g., Client A might conflict with Client B or C), the fraud examiner's employer, the public (i.e., innocent bystanders), and law enforcement agencies. Almost every fraud examination involves most, if not all, of these parties, and the lines that connect them can be muddled.

Deciding if a conflict or a community of interests exists depends on the facts of each particular situation; however, the following are some general rules concerning conflicts of interest:

- A fraud examiner employed full time by a company should not engage in other jobs that create a hardship or loss to the employer.

- A fraud examiner should not be a “double agent” who is employed by one company but retained by another company or person to infiltrate the employer and transmit inside information (unless, of course, the employing company agrees to the arrangement in order to apprehend other parties employed by the company).
- A fraud examiner should not accept engagements from both sides to a controversy—just like lawyers are prohibited from representing both parties in a transaction, lawsuit, or trial.

Conflicts of interest and *independence* are related concepts; professional rules prohibiting conflicts of interest often exist specifically to convey to the public a perception of independence.

Independence and conflict avoidance are enhanced by refraining from having financial and managerial interests in clients or in joint cooperation with clients’ managers and directors. After all, they might be a suspect in an investigation. When a fraud examiner works as an employee of a company, the prohibitions about employment are not relevant because the employer-employee relationship is known to the employer, who is the client and recipient of any reports. In such cases, independence and conflict should be considered in relation to all the other parties involved.

Independence and Objectivity

ACFE members are responsible for maintaining independence in attitude and appearance and for approaching and conducting fraud examinations in an objective and unbiased manner.

INDEPENDENCE IN ATTITUDE AND APPEARANCE

Independence of attitude requires impartiality and fairness in conducting fraud examinations and in reaching resulting conclusions and judgments. Fraud examiners must also be sensitive to the appearance of independence so that conclusions and judgments will be accepted as impartial by knowledgeable third parties. Fraud examiners who become aware of a situation or relationship that could be perceived to impair independence, whether or not actual impairments exist, should inform management immediately and take steps to eliminate the perceived impairment, including withdrawing from the examination if necessary.

OBJECTIVITY

Objectivity refers to the ability to conduct fraud examinations without being influenced by one’s own personal feelings or the feelings and motives of others. To ensure objectivity in performing examinations, fraud examiners must maintain an independent mental attitude, reach judgments on examination matters without undue influence from others, and

avoid being placed in positions where they would be unable to work in an objective professional manner. All possible conflicts of interest should be disclosed.

Integrity and Competence

An ACFE Member shall, at all times, exhibit the highest level of integrity in the performance of all professional assignments, and will accept only assignments for which there is reasonable expectation that the assignment will be completed with professional competence.

This rule contains two parts. The first deals with integrity and the second with competence. Competence here is related to diligence, as discussed previously in relation to the first rule in the ACFE Code of Professional Ethics.

Integrity

In part, this rule provides that ACFE members must act with integrity at all times. If you were asked to name a desirable personal characteristic, integrity is one that would rank high on the scale, along with honesty, truthfulness, trustworthiness, and loyalty. Thus, outside observers of ACFE members' activity will look for signs of integrity in fraud examiners to determine whether trust is warranted. However, integrity hardly exists apart from other characteristics well known in moral philosophy and recognized in the ACFE Code of Professional Ethics.

Integrity requires honesty, truthfulness, trustworthiness, and confidentiality. It also requires subordination of desires for personal gain to the interests of clients, employers, and the public. It requires independence of mental attitude and avoidance of conflicts of interest.

Additionally, integrity means that a fraud examiner should have a well-developed sense of moral philosophy—an ability to analyze situations where no rules of the ACFE Code of Professional Ethics are specifically applicable and to be able to distinguish right from wrong. It does not mean, however, that an ACFE member must be perfect in all technical matters, nor does it mean that fraud examiners and others cannot have honest differences of opinion. In the course of a fraud examination, inadvertent errors, mistakes of judgment, and other problems might cause conflict. In such cases, a fraud examiner can preserve integrity either by admitting error or by convincingly justifying a difference of perception or opinion.

Professional Competence

This rule also states that ACFE members must be competent in their respective areas and disciplines, and they shall not accept assignments where competence is lacking. *Professional competence* refers to how well fraud examiners do their job.

Determination of competence always depends on the specific facts and circumstances of the assignment. Competence is best understood in the context of the *prudent practitioner*. The idea of a prudent professional practitioner is present in other social science theories; for example, the “economic man” of economic theory and the “reasonable man” of law. This concept can be summarized for fraud examiners as follows:

A prudent practitioner is assumed to have a knowledge of the philosophy and practice of fraud examinations, to have the degree of training, experience, and skill common to the average fraud examiner, to have the ability to recognize indications of frauds, and to keep abreast of developments in the perpetration and detection of fraud. Competence requires the fraud examiner to be acquainted with the company, activity, function, or program under investigation; to review the methods of control in operation; to obtain sufficient evidence pertinent to the suspected fraud or illegal activity; to be responsive to unusual events and unfamiliar circumstances; to persist until any reasonable doubts about the evidence have been eliminated; and to exercise caution in instructing assistants and reviewing their work.

A related concept is that of *due professional care*, which involves exercising the same level of care and skill that a prudent professional in the same profession and in similar circumstances would exercise. In exercising due professional care, fraud examiners are responsible for ensuring that there is sufficient predication for beginning a fraud examination; that each examination is conducted with diligence and thoroughness; that all applicable laws and regulations are observed; that appropriate methods and techniques are used; and that each examination is conducted in accordance with professional standards.

Thus, fraud examiners must be skilled in obtaining information from records, documents, and people; in analyzing and evaluating information and drawing sound conclusions; in communicating the results of fraud examinations, both orally and in writing; and in serving as an expert witness when appropriate. Fraud examiners must also be knowledgeable in investigative techniques, applicable laws and rules of evidence, fraud auditing, criminology, and ethics.

Fraud examiners cannot be expected to have an expert level of skill and knowledge for every circumstance that might be encountered in a fraud examination. Nevertheless, they must have sufficient skill and knowledge to recognize when additional training or expert guidance is required. It is the responsibility of a fraud examiner to ensure that necessary skills, knowledge, ability, and experience are acquired or available before going forward with a fraud examination.

Sources of Interference with Professional Competence

Professional competence also demands attention to three kinds of interference that can damage the independence and quality of a fraud examiner's work. Fraud examiners who permit these conditions to interfere with the assignment demonstrate less than the desired level of professional competence. The three types of interference are programming, investigation, and reporting.

PROGRAMMING

Fraud examiners must remain free from interference by managers who try to restrict, specify, or modify the procedures they need to perform, including any attempts to assign personnel or otherwise control the examination work. Occasionally, client or employer managers try to limit access to information or to other personnel, or to limit the amount of time available for the assignment.

INVESTIGATION

When appropriate, fraud examiners must have free access to books, records, correspondence, and other evidence. They must have the cooperation of managers or other employees without any attempt to interpret or screen evidence.

REPORTING

Client or employer managers should not be allowed to overrule the fraud examiner's judgments on the appropriate content of a report. Integrity is destroyed and judgment is subordinated when the fraud examiner is compelled to alter a report or to omit important information or to misstate facts. Fraud examiners must not let any feelings of misguided loyalty to the client, employer, or other sources of conflicts of interest interfere with their obligation to report fully and fairly.

Professional Skepticism

As part of exercising professional integrity and competence, fraud examiners must always perform their work with a mindset of professional skepticism and begin assignments with

the belief that something is wrong or someone is committing a fraud (depending on the nature of the assignment and the preliminary information available). Furthermore, fraud examiners should relax their attitude of skepticism only when the evidence shows no signs of fraudulent activity. At no time is a fraud examiner entitled to assume a fraud problem does not exist. Thus, professional skepticism can be dispelled only by evidence. As a result, opinions or attestations about a fraud-free environment are absolutely prohibited for ACFE members.

Court Orders and Testimony

An ACFE Member will comply with the lawful orders of the courts, and will testify to matters truthfully and without bias or prejudice.

This rule provides that ACFE members must comply with all lawful court orders, and they will testify to matters truthfully and without bias or prejudice. The essence of this rule is truth-telling. The first part of the rule, which concerns complying with lawful court orders, provides that fraud examiners should not flee from a summons or subpoena issued by a court. Even though the rule specifies “courts,” it is reasonable to extend it to other agencies that have the legal power to issue such orders (such as government commissions, grand juries, special prosecutors, and quasi-judicial administrative agencies).

If a fraud examiner is involved with legal counsel who devises a strategy to avoid or delay a court order, they can listen to the legal advice but must weigh it against their own knowledge of proper and legal behavior. In some cases, fraud examiners might need to obtain a second legal opinion. A fraud examiner accused of obstruction of justice could be on shaky grounds with a “my lawyer told me to do it” defense.

The second part of this rule provides that fraud examiners must testify to matters truthfully and without bias or prejudice. Fraud examiners commonly provide testimony in legal or equitable proceedings, and they must be truthful when doing so. Any exaggeration or embellishment, if uncovered, will likely reduce the fraud examiner’s credibility and persuasiveness. Moreover, the use of false statements, half-truths, and misrepresentations by a fraud examiner could cause the innocent to be punished or the guilty to go free. A fraud examiner’s word can have great influence, and this should be taken seriously.

Providing truthful testimony can present strategic problems, and fraud examiners—even those who are attorneys—should always be represented by counsel in a courtroom, deposition, or other testimony setting. Should attorneys find themselves as subjects of a legal matter, it is important that they have separate legal counsel. Counsel is necessary to protect witnesses from improper questioning.

When fraud examiners provide testimony in direct examination or cross-examination, they should respond to the questions that are asked—no more and no less. The attorney conducting the examination has the responsibility to ask the right questions, and the fraud examiner’s counsel has the responsibility to object to misleading, improper, or irrelevant questions. The fraud examiner’s counsel also has the obligation to correct any problems with the cross-examination. A “helpful” fraud examiner who tries to embellish the answers with additional material might offend the court or cause unintentional harm to the case. Of course, a fraud examiner may invoke their own legal rights, upon the advice of counsel.

Additionally, when responding to questions in a testimonial setting, fraud examiners must deliver their answer without bias or prejudice. It is the lawyer’s job to be biased and prejudiced—in the context of the adversary judicial system—establishing the case for their own client or for the government. The greatest danger for delivering biased or prejudicial testimony exists when responding to broad, open-ended questions, such as: “Tell the court about your findings in your fraud examination.” This type of question is an open-ended invitation to the fraud examiner’s thoughts, which might be inadvertently peppered with perceptions and bias. Responding to such questions amounts to delivering reports (which are covered in the next rule in the ACFE Code of Professional Ethics).

Reasonable Evidential Basis for Opinions

An ACFE Member, in conducting examinations, will obtain evidence or other documentation to establish a reasonable basis for any opinion rendered. No opinion shall be expressed regarding the guilt or innocence of any person or party.

Evidential Basis for Opinions

In part, this rule states that fraud examiners must obtain evidence to establish a reasonable basis for any opinion rendered. *Evidence* can be defined as all the information that influences

a decision maker in reaching decisions. Evidence might be quantitative or qualitative; it may be objective or it may have subjective qualities; it may be absolutely compelling to a decision or it may be mildly persuasive.

The accounting profession has similar rules, some of which are in the codes of ethics or technical practice standards issued by various professional oversight bodies. Here is a sample of these provisions:

To obtain reasonable assurance, the auditor shall obtain sufficient appropriate audit evidence to reduce audit risk to an acceptably low level and thereby enable the auditor to draw reasonable conclusions on which to base the auditor's opinion.¹

Internal auditors must identify, analyze, evaluate, and document sufficient information to achieve the engagement's objectives.²

A member shall ... obtain sufficient relevant data to afford a reasonable basis for conclusions or recommendations in relation to any professional services performed.³

Clearly, the accounting profession considers sufficient, relevant, appropriate evidence a compelling standard of practice, if not a matter of professional ethics.

Auditors sometimes say they gather evidence to show that financial statements are presented properly or that control procedures are operating effectively. They are following a time-tested method of investigation that consists of three parts:

- Recognize the problem or issue subject to investigation.
- Gather sufficient relevant evidence about it.
- Analyze the evidence and reach a conclusion about the problem or issue.

¹ International Auditing and Assurance Standards Board, *International Standard on Auditing 200—Overall Objectives of the Independent Auditor and the Conduct of an Audit in Accordance with International Standards on Auditing*, www.ifac.org/system/files/downloads/a008-2010-iaasb-handbook-isa-200.pdf.

² The Institute of Internal Auditors, Standard 2300, *International Standards for the Professional Practice of Internal Auditing*, <https://na.theiia.org/standards-guidance/Public%20Documents/IPPF-Standards-2017.pdf>.

³ AICPA, *Code of Professional Conduct and Bylaws*, <https://pub.aicpa.org/codeofconduct/Ethics.aspx>.

Most auditors' propositions are expressed positively, such as: "The cash balance is accurately stated." However, an auditor will actually seek evidence to show that the cash balance is *not* properly stated. Imagine a cash balance that is the sum of 110 separate bank accounts. An audit team will probably sample these accounts instead of looking at all of them. The auditors look for evidence that some of these cash balances are misstated. If they fail to find any misstatements in a sufficiently large sample, they have not proved that the total is proper, but they have no reason to believe that it is materially misstated.

A literal report on this kind of work is known as *negative assurance*, in which an auditor would say: "Nothing came to my attention to make me believe the cash balance is materially misstated." This statement of negative assurance is an accurate report of the audit process. As long as the "attention" consists of sufficient relevant evidence, the report is useful. Auditors might not know without any doubt that the balance is proper, but they are entitled to act as though it is because they have analyzed sufficient relevant evidence.

Some fraud examinations can take on this same character. Fraud examiners will be assigned to seek the truth about some business records or to try to determine whether some control procedures have failed. The fraud examiner will seek evidence of misstatement or failure, and, if none is found, will report the positive results.

In other cases, a client or employer might already know that fraud, thefts, shortages, control failures, or other such events have occurred. The fraud examiner's assignment is to then determine how the improper activity is being carried out, by whom, and to what extent. This kind of fraud investigation demands sufficient evidence, examples, and suitable documentation to prove the how/whom/extent findings. In these cases, the negative assurance type of conclusion is not appropriate. Fraud examiners must obtain the evidence to show the actual how/whom/extent conclusions.

As part of the ACFE Code of Professional Ethics, ACFE members are required to collect and evaluate a sufficient amount of relevant evidence to afford a reasonable and logical basis for any opinions rendered. Thus, fraud examiners must collect evidence, whether exculpatory or incriminating, that supports fraud examination results and will be admissible in subsequent proceedings. To do so, the fraud examiner must obtain and document evidence in a manner that ensures that all necessary evidence is obtained and that the chain of custody is preserved. Additionally, fraud examiners must act prudently to preserve the integrity of relevant evidence and material.

Opinions Regarding Guilt and Innocence

Additionally, this rule prohibits ACFE members from making statements of opinion as to the guilt or innocence of any person or party. Determining whether a person is guilty or innocent of a crime is not a decision for fraud examiners; it is a decision reserved for a judge or jury.

This is a rule of prudence. Clearly, it is prudent for a fraud examiner to refrain from usurping the role of the judge or jury. In a courtroom, no good attorney would ask a fraud examiner for such a conclusion, and no alert judge would allow such testimony.

In most situations, the fraud examiner's job is to present the evidence in their report. Such evidence might constitute a convincing case pointing to the guilt or innocence of a person. But a clear line should be drawn between a report that essentially says, "Here is the evidence and the reasonable conclusions that can be drawn from it," and one that goes beyond what is acceptable and says, "This person is guilty of the crime of fraud."

Although opinions on guilt or innocence should be avoided, fraud examiners may draw reasonable conclusions based on the evidence; however, they must be circumspect when doing so. Conclusions are based on observations of the evidence, whereas opinions call for an interpretation of the facts. For example, a fraud examiner might conclude that the suspect employee misappropriated company money, misrepresented a transaction, or concealed funds. There is no prohibition in the ACFE Code of Professional Ethics on expressing such conclusions, provided the conclusions have a reasonable basis in fact.

Additionally, opinions regarding technical matters generally are permitted if the fraud examiner is qualified as an expert in the matter. For example, a permissible opinion might address the relative adequacy of an entity's internal controls. Likewise, a permissible opinion might regard whether financial transactions conform to generally accepted accounting principles (GAAP).

Confidential Information

An ACFE Member shall not reveal any confidential information obtained during a professional engagement without proper authorization.

This rule provides that fraud examiners must not disclose confidential information obtained during the course of a professional engagement without appropriate authorization.

Confidential information rules in professional codes of ethics have the potential to create enormous conflicts—conflicts of principles and conflicts of values. Consider this possible exchange between a lawyer and client:

Client:

Because you have taken my case on this fraud charge, I think you should know more about my background.

Lawyer:

Go ahead.

Client:

Three years ago, I participated in an armed robbery and was never caught. My gun went off and killed the storekeeper. One of my buddies was accused and convicted. He's had all his appeals and is scheduled to be executed tomorrow. What can you do?

Lawyer:

Nothing.

The lawyer's single word response of "nothing" might be oversimplifying the situation, but the point is that lawyers have a keen awareness of the privileged information rights of their clients. Most lawyers will stoutly defend their duty not to endanger their clients, even at the cost of a life; most laymen find this shocking. One commentator responded to a lawyer defending the position with a sharp retort: "Do you mean you will sacrifice an innocent man to a rule?" The laymen's incredulity is appropriate. It brings into sharp focus two conflicting values: the benefits of a long-standing rule of legal practice and the sanctity of life itself. Not all situations are this dramatic, but fraud examiners can nevertheless get into similar conflicts.

Confidential information, for all practical purposes, is any and all information a fraud examiner might obtain in the course of work, whether it be from the company or client for whom the work is performed or from any other source consulted during the work.

Due to the nature of the anti-fraud profession, fraud examiners often come into contact with sensitive, privileged, or otherwise confidential information. It is imperative that fraud examiners maintain integrity and trustworthiness and safeguard such information from unauthorized viewing or disclosure.

The rules of confidence are based on the belief that confidentiality facilitates the flow of information between parties. The nature of professional engagements might make it necessary for fraud examiners to have access to sensitive information. Clients and employers would be less likely to reveal such information or to provide access to such information if they could not trust fraud examiners to keep it confidential. Therefore, fraud examiners must be able to exercise prudence and good judgment when dealing with data that should be kept confidential.

Additionally, fraud examiners must not disclose privileged information obtained during the course of a professional engagement without appropriate authority. *Privileged information* is information that cannot be demanded, even by a court; it is information that is protected by law from evidence.

Legal professional privilege⁴ precludes disclosure of confidential communications between professional legal advisors (e.g., solicitors, barristers, attorneys) and their clients. It is designed to encourage open and honest communications. Legal professionals are obligated to observe legal professional privilege; it can be waived only by the client (who is considered to be the “holder” of the privilege). Some jurisdictions provide similar professional privileges for physicians and priests.

Fraud examiners do not have any such privilege in common law or by statute, and the ACFE Code of Professional Ethics does not assume a privileged status for the fraud examiner-client/employer relationship. (Legal jurisdictions vary on what communications are protected, and not all of these privileges are recognized in all courts.)

Professionals are obligated to observe any applicable privilege, which can be waived only by the party who holds the privilege. Therefore, fraud examiners must not disclose privileged information without proper authorization from the fraud examiner’s client or employer. (The Law section of the *Fraud Examiners Manual* contains additional information on this subject.)

⁴ Legal professional privilege goes by many names, depending on the jurisdiction (e.g., *attorney-client privilege*, *legal advice privilege*, *solicitor-client privilege*, *legal professional privilege*).

If the client or employer consents to disclosure of information otherwise considered confidential, then the fraud examiner can transmit it to others. Even when such permission is granted, fraud examiners should be careful to let the client or employer know what the consent covers. Consequently, it is best to let the client or employer make the actual disclosure themselves.

The obligation to keep information confidential does not terminate when the engagement ends. Thus, the confidentiality rule does not permit disclosure after a case concludes, and fraud examiners are not permitted to disclose confidential information if they are fired, resign, or retire from an employing organization.

Proper Authorization and Other Circumstances for Disclosing Confidential Information

Again, Article VI of the Code of Professional Ethics states that an ACFE member shall not reveal any confidential information obtained during a professional engagement without proper authorization. Consent from a fraud examiner's client or employer is one form of proper authorization, but there are other forms. For example, fraud examiners are not bound by confidentiality when doing so would violate the law. Thus, fraud examiners can reveal client confidences when responding to a legal court order.

Fraud examiners must be careful in situations where keeping silent could be construed as obstructing justice or engaging in a conspiracy. When faced with such circumstances, fraud examiners should seek the advice of an attorney.

Other professions have exceptions that void the confidentiality or privilege rules. For example, lawyers can reveal client confidences if doing so is necessary to prevent a future crime or when initiating complaints to their disciplinary bodies.

Information Supplied by a Suspect

Questions might arise over information a fraud examiner received from someone being investigated. Suppose an employee being questioned tells the fraud examiner something in confidence concerning their role in a theft. Fraud examiners must remember that the confidentiality relationship is between a fraud examiner and their client or employer and that this promise of confidentiality is understood to exist without the need for affirmation.

To illustrate, consider the situation in which a suspect employee tells the fraud examiner something in confidence concerning the employee's role in a theft. The fraud examiner does not have an understood or unspoken promise of confidentiality with the employee and is therefore not bound by the rule of confidentiality. If the fraud examiner makes a promise of confidentiality to the employee-informant, the fraud examiner will likely break the promise by reporting the relevant evidence to the employer. Consequently, a fraud examiner should not promise confidentiality or leniency to an informant to obtain testimony.

Confidential Information and Conflicts of Interest

Additionally, fraud examiners must not use confidential information obtained during the course of a professional engagement in a way that conflicts with the interests of the client/employer.

The Institute of Internal Auditors' Code of Ethics contains language that makes the relation between conflicts of interest and confidential information very clear: "Members and Certified Internal Auditors shall be prudent in the use of information acquired in the course of their duties. They shall not use confidential information for any personal gain nor in any manner which would be contrary to law or detrimental to the welfare of their organization."

When a fraud examiner is privy to confidential information that can be used for personal gain, a conflict of interest exists—the fraud examiner's desire for wealth versus the client/employer's desire for and trust in confidential services. However, fraud examiners may only use confidential information in furtherance of their professional responsibilities; any other use without the client/employer's knowledge and consent is prohibited—particularly if such use is for the fraud examiner's personal benefit. For example, a fraud examiner who uses a client's customer database to promote their own services would be in violation of this standard. The same would be true of a fraud examiner who buys or sells stock shares based on confidential financial information that they obtained during a fraud examination or other professional engagement.

Moreover, using information for personal gain or using information to the detriment of the client/employer is akin to lying and stealing.

Public Information

Fraud examiners must be careful about revealing information obtained during the course of a professional engagement even if the information is public (i.e., information that can be accessed by the public).

It is tempting to consider confidential information to be *nonpublic information* instead of *all information* on the grounds that public information is available to everyone anyway, but such an interpretation is inappropriate. Public information might be hard to find and/or expensive to obtain and analyze. When information is public, let others find it for themselves.

Some might argue that no confidence is abused if a fraud examiner discloses public information that is published and widely distributed (e.g., financial statements in annual reports or stories in national newspapers), but the same might not be true if the fraud examiner discloses public information that is not widely available (e.g., real estate deed restrictions, liens on property, and credit records). Accordingly, defending a breach of confidence on the grounds that “it was public anyway” is a weak argument.

Confidentiality and Blowing the Whistle

Difficult problems arise over fraud examiners’ obligations to blow the whistle about clients’ or employers’ shady or illegal practices. The problems exist on two levels. The problem first occurs on the managerial level, where the fraud examiner might be employed or engaged by high-level managers who turn out to be involved in fraudulent practices. To be prepared for such issues, fraud examiners should always have a line of communication to levels of management above the ones at issue. Thus, for example, evidence of managerial-level misconduct can be reported to the board of directors and its audit committee without trampling on the confidentiality rule.

Second, the problem occurs on the highest level—involvement by the directors, the highest level of management, or the owners. This level presents the biggest problems. When fraud involves the highest level of management, the fraud examiner must communicate the matters to parties outside the organization, such as the police or other governmental or regulatory agencies.

In general, fraud examiners are not obligated to blow the whistle on clients or employers. However, circumstances might exist in which they are morally and legally justified in making disclosures to appropriate outside parties. Examples of such circumstances include those in which a client or employer has intentionally involved a fraud examiner in its illegal conduct or when a client or employer has distributed misleading reports based on the fraud examiner’s work. The confidentiality rule is not a license or excuse for inaction when action is appropriate.

Complete Reporting of Material Matters

An ACFE Member shall reveal all material matters discovered during the course of an examination, which, if omitted, could cause a distortion of the facts.

This rule provides that fraud examiners shall disclose all material matters discovered during the course of a fraud examination. It demands full and fair reporting of the findings made in investigations. Two words—*material* and *distortion*—are key to this requirement.

Material

Information is *material* if having knowledge of such information might reasonably be expected to influence a client's or employer's decisions based on a fraud examiner's report.

Accordingly, materiality is a user-oriented concept. Thus, an item of information that, if omitted from a report, would change a user's perceptions and conclusions is material.

When determining what information is material, fraud examiners should not consider what they themselves think is important and material; instead, they should try to decide what users will consider important and material. Thus, fraud examiners must project a decision-making process onto the users.

It is important for fraud examiners to learn from clients and employers the type of information they consider important. A fraud examiner should obtain as good an understanding as possible of the users' interests, the information desired, the level of detail needed, and other aspects of the users' needs.

Furthermore, information might be considered material in some circumstances and nonmaterial in others.

Distortion

This rule also provides that fraud examiners shall disclose all material matters discovered during the course of a fraud examination that, if omitted, could distort the facts. The "distortion of facts" portion of the rule refers to omissions. Distortion is related to materiality and users' decisions. The distortion of facts in a report could cause users to undertake inappropriate actions.

In some fraud examinations, it is not possible to obtain sufficient evidence to support a definitive conclusion or recommendation. In such circumstances, the fraud examiner should avoid rushing to judgment. When matters are not clear, the fraud examiner's report should stress the tentative nature of the evidence and withhold judgment. If the fraud examiner includes unwarranted or hasty conclusions, this might distort the facts.

Professional Improvement

An ACFE Member shall continually strive to increase the competence and effectiveness of professional services performed under their direction.

This rule provides advice and a directive for behavior; it instructs ACFE members to progress toward greater expertise so they can better service their clients and employers.

The anti-fraud profession changes continually. Years ago, investigators had to learn how to deal with computers in the world of fraud. Today, fraud examiners are faced with a growing array of ways to perpetrate fraud. Accordingly, learning is an ongoing and necessary process for fraud examiners to increase their professional competence and effectiveness.

To comply with this requirement, individuals who become CFEs agree to complete twenty hours of continuing professional education (CPE) each year. Course content is not specified in detail, but the requirement is that at least ten hours must be spent on technical subjects that contribute directly to fraud examination expertise, and at least two hours must relate directly to ethics.

CFEs who also are certified public accountants (CPAs), chartered accountants (CAs), or certified internal auditors (CIAs) or who hold other professional designations can double-count continuing education hours obtained for the other professional designations toward their CFE-related requirements, as long as the course content meets the ACFE's continuing education criteria. Further details about policies and procedures are available on the ACFE website: [ACFE.com/cpe.aspx](https://www.acfe.com/cpe.aspx).

Professional ethics for fraud examiners is not simply a matter covered by a few rules in a formal Code of Professional Ethics. Concepts of proper professional conduct permeate all areas of practice. Ethics are the foundation of fraud examiners' self-regulatory efforts.

The principled approach to thoughtful decisions is important in fraud examination work in all settings, such as private practice, industrial, government and foreign employment, and other working arrangements. The ethics rules might appear to be restrictive, but they are for the benefit of the public as well as for the discipline, use, and protection of ACFE members.

ASSOCIATION OF CERTIFIED FRAUD EXAMINERS CFE CODE OF PROFESSIONAL STANDARDS

(Adopted by the Board of Regents, October 1, 2020)

I. Preamble

The Association of Certified Fraud Examiners is an association of professionals committed to performing at the highest level of ethical conduct. Members of the Association pledge themselves to act with integrity and to perform their work in a professional manner.

Members have a professional responsibility to their clients, the public interest, and each other, a responsibility that requires subordinating self-interest to the interests of those served.

These Standards express basic principles of ethical behavior to guide Members in the fulfilling of their duties and obligations. By following these Standards, all Certified Fraud Examiners shall be expected, and all Associate Members shall strive, to demonstrate their commitment to excellence in service and professional conduct.

II. Applicability of Code

The CFE Code of Professional Standards shall apply to all certified Members of the Association of Certified Fraud Examiners (ACFE). Associate Members of the ACFE should strive to adhere to the Standards, but are not bound by them. The use of the terms “Certified Fraud Examiner” and “CFE” in this Code shall refer to certified Members. For purposes of these Standards, the term “fraud examination” means an assignment or engagement, a substantial purpose of which involves the prevention, detection, investigation, or resolution of fraud or fraud-related conduct.

III. Standards of Professional Conduct

A. Integrity and Objectivity

1. Certified Fraud Examiners shall conduct themselves with integrity, knowing that public trust is founded on integrity. CFEs shall not sacrifice integrity to serve their client, their employer or the public interest.

2. Prior to accepting the fraud examination, Certified Fraud Examiners shall investigate for actual, potential, and perceived conflicts of interest. CFEs shall disclose any such conflicts of interest to potentially affected clients or to their employers.
3. Certified Fraud Examiners shall maintain objectivity in discharging their professional responsibilities within the scope of the fraud examination.
4. Certified Fraud Examiners shall not commit acts discreditable to the ACFE or its membership, and shall always conduct themselves in the best interests of the reputation of the profession.
5. Certified Fraud Examiners shall not knowingly make a false statement when testifying under oath in a court of law or other dispute resolution forum. CFEs shall comply with lawful orders of the courts or other dispute resolution bodies. CFEs shall not commit criminal acts or knowingly induce others to do so.

B. Professional Competence

1. Certified Fraud Examiners shall be competent and shall not accept assignments where competence is lacking. In some circumstances, it may be possible to meet the requirement for professional competence by use of consultation or referral.
2. Certified Fraud Examiners shall maintain the minimum program of continuing professional education required by the Association of Certified Fraud Examiners. A commitment to professionalism combining education and experience shall continue throughout the CFE's professional career. CFEs shall continually strive to increase the competence and effectiveness of their professional services.

C. Due Professional Care

1. Certified Fraud Examiners shall exercise due professional care in the performance of their fraud examination services. Due professional care requires diligence, critical analysis, and professional skepticism in discharging professional responsibilities.

2. Conclusions shall be supported with evidence that is relevant, reliable, and sufficient.
3. Fraud examinations shall be adequately planned. Planning controls the performance of a fraud examination from inception through completion and involves developing strategies and objectives for performing the services.
4. Work performed by assistants and other professionals operating under the Certified Fraud Examiner's direction on a fraud examination shall be adequately supervised. The extent of supervision required varies depending on the complexities of the work and the qualifications of the assistants or professionals.

D. Understanding with Client or Employer

1. At the beginning of a fraud examination, Certified Fraud Examiners shall reach an understanding with those retaining them (client or employer) about the scope and limitations of the fraud examination and the responsibilities of all parties involved.
2. Whenever the scope or limitations of a fraud examination or the responsibilities of the parties change significantly, a new understanding shall be reached with the client or employer.

E. Communication with Client or Employer

1. Certified Fraud Examiners shall communicate to those who retained them (client or employer) significant findings made during the normal course of the fraud examination.

F. Confidentiality

1. Certified Fraud Examiners shall not disclose confidential or privileged information obtained during the course of a fraud examination without the express permission of a proper authority (such as the client or where required by statute or regulation) or the lawful order of a court. This requirement does not preclude professional practice or investigative body reviews as long as the reviewing organization agrees to abide by the confidentiality restrictions.

IV. Standards of Examination

A. Fraud Examinations

1. Fraud examinations shall be conducted in a legal, professional, and thorough manner. The Certified Fraud Examiner's objective shall be to obtain evidence and information that is complete, reliable and relevant.
2. Certified Fraud Examiners shall establish predication and scope priorities at the outset of a fraud examination and continuously reevaluate them as the examination proceeds. CFEs shall strive for efficiency in their examination.
3. Certified Fraud Examiners shall be alert to the possibility of conjecture, unsubstantiated opinion and bias of witnesses and others. CFEs shall consider both exculpatory and inculpatory evidence.

B. Evidence

1. Certified Fraud Examiners shall endeavor to establish effective control and management procedures for documents, data and other evidence obtained during the course of a fraud examination. CFEs shall be cognizant of the chain of custody including origin, possession and disposition of relevant evidence and material. CFEs shall strive to preserve the integrity of relevant evidence and material.
2. Certified Fraud Examiners' work product may vary with the circumstances of each fraud examination. The extent of documentation shall be subject to the needs and objectives of the client or employer.

V. Standards of Reporting

A. General

1. Fraud examination reports may be oral or written, including fact witness and/or expert witness testimony, and may take many different forms. There is no single structure or format that is prescribed for a CFE's report; however, the report should not be misleading.

B. Report Content

1. Certified Fraud Examiners' reports shall be based on evidence that is sufficient, reliable and relevant to support the facts, conclusions, opinions and/or recommendations related to the fraud examination. The report shall be confined to subject matter, principles and methodologies within the Member's area of knowledge, skill, experience, training or education.
2. No opinion shall be expressed regarding the legal guilt or innocence of any person or party.
