DISCLAIMER

No publication could cover all of the rules and regulations applicable for every country around the globe. The editors of this work have attempted to provide general information about concepts and methods of fraud detection, investigation, and prevention that are commonly used worldwide. Because this publication is a compendium of information from various countries and jurisdictions, the specific laws, rules, regulations, and terminology may (and probably will) vary in your area.

Every effort has been made to ensure that the contents of this publication are accurate and free from error. However, it is possible that errors exist, both typographical and in content. Therefore, the information provided herein should be used only as a guide and not as the only source of reference.

This publication is not intended to be a legal or accounting reference, and nothing contained herein is to be considered as the rendering of legal or accounting advice for specific subjects or areas. Readers are responsible for obtaining such advice from legal or accounting professionals in their jurisdictions. This publication and any forms or samples within are intended for educational and informational purposes only.

Descriptions of products, software programs, organizations, service organizations, etc., are provided as a convenience to the reader. Readers are advised to obtain further information from the provider of the product or service before purchasing.

The author, advisors, and publishers shall have neither liability nor responsibility to any person or entity with respect to any loss, damage, or injury caused or alleged to be caused directly or indirectly by any information contained in or omitted from this publication.

CFE Code of Professional Standards	4.1101

PREFACE

The *Fraud Examiners Manual*, published by the Association of Certified Fraud Examiners (ACFE), contains the primary body of knowledge on which the Certified Fraud Examiner (CFE) credential is based, and it continues to function as an essential reference tool for anti-fraud professionals long after the certification has been obtained. The *Fraud Examiners Manual's* content is organized into four main sections: Financial Transactions and Fraud Schemes, Law, Investigation, and Fraud Prevention and Deterrence.

The Financial Transactions and Fraud Schemes section describes thousands of fraud schemes and the techniques that can be used to prevent and detect them. This section begins with an overview of basic accounting concepts. It then discusses various occupational fraud schemes (i.e., asset misappropriations, corruption, and fraudulent financial statements), organized in a taxonomy originally developed for the book *Occupational Fraud and Abuse* (now *The Corporate Fraud Handbook*). The remainder of this section details a number of other fraud schemes ranging from financial institution fraud to health care fraud.

The Law section focuses on the statutes and common law principles involved in prosecuting fraudsters through both the criminal and civil systems; the legal nuances involved in examining several specific categories of fraud, such as money laundering and securities fraud; and the legal challenges one might encounter in conducting an investigation. It also contains information about how to testify as a witness.

The Investigation section provides the basic tools and techniques necessary to develop information and evidence when conducting a fraud examination and identifying the perpetrators. It describes how to gather testimonial, digital, and documentary evidence and provides guidance regarding interview best practices. It also contains information about using data analysis techniques, digital forensics, public records, and the internet to locate evidence and other resources.

The Fraud Prevention and Deterrence section reflects a concrete approach to preventing and deterring fraud. It not only discusses why people commit crime, but it also contains practicable advice about how to use that knowledge to prevent fraud through proactive policies, formal fraud risk assessment and fraud risk management initiatives, corporate governance practices, and compliance programs. It also includes a number of meaningful

PREFACE

statistics about fraud, as well as a discussion of the types and impact of organizational and occupational crime. This section concludes with a discussion of the ACFE Code of Professional Ethics and its meaning for fraud examiners.

The content presented in the *Fraud Examiners Manual* is intended to apply to a global audience. It is up to the individual user to seek out additional information or professional advice based on the rules in their particular jurisdiction; however, some additional country-specific supplemental information can be found in the online version of the Manual located at fraudexaminersmanual.com.

If you have questions or feedback regarding the content of the *Fraud Examiners Manual*, please contact us at FraudExaminersManual@ACFE.com.

Thanks and Acknowledgements

ACCOUNTING CONCEPTS

Fraudulent acts are usually of a financial nature. The fraud examiner must therefore understand the essential nature of financial transactions and how they affect records. Additionally, the fraud examiner should have a grasp of both financial terminology and accounting theory.

Accounting Basics

The Merriam-Webster.com Dictionary defines *accounting* as “the system of recording and summarizing business and financial transactions and analyzing, verifying, and reporting the results”¹ for an enterprise’s decision-makers and other interested parties. The measurement and recording of this data are accomplished through keeping a balance of the accounting equation. The accounting model or accounting equation, as shown below, is the basis for all double-entry accounting:

$$\text{Assets} = \text{Liabilities} + \text{Owners' Equity}$$

By definition, *assets* consist of the net resources owned by an entity. Examples of assets include cash, receivables, inventory, property, and equipment, as well as intangible items of value such as patents, licenses, and trademarks. To qualify as an asset, an item must (1) be owned by the entity and (2) provide future economic benefit by generating cash inflows or decreasing cash outflows.

Liabilities are the obligations of an entity or outsider’s claims against a company’s assets. Liabilities usually arise from the acquisition of assets or the incurrence of operational expenses. Examples of liabilities include accounts payable, notes payable, interest payable, and long-term debt.

Owners’ equity represents the investment of a company’s owners plus accumulated profits (revenues less expenses). Owners’ equity is equal to assets minus liabilities.

¹ Merriam-Webster.com Dictionary, s.v. “accounting (*n.*),” accessed September 14, 2018, www.merriam-webster.com/dictionary/accounting.

This equation has been the cornerstone of accounting since Luca Pacioli developed it in 1494. Balance is the key of this equation. If a company borrows from a bank, cash (an asset) and notes payable (a liability) increase to show the receipt of cash and an obligation owed by the company. Since both assets and liabilities increase by the same amount, the equation stays in balance.

Accounts and the Accounting Cycle

The major components of the accounting equation consist of numerous detail accounts. An account is nothing more than a specific accounting record that provides an efficient way to categorize similar transactions. All transactions are recorded in accounts that are categorized as asset accounts, liability accounts, owners' equity accounts, revenue accounts, and expense accounts. Account format occurs in a number of ways. The simplest, most fundamental format is the use of a large letter *T*, often referred to as a *T account*.

Entries to the left side of an account are *debits* (dr), and entries to the right side of an account are *credits* (cr). Debits increase asset and expense accounts, while credits decrease them. Conversely, credits increase liability, owners' equity, and revenue accounts; debits decrease them. Every transaction recorded in the accounting records has both a debit and a credit, thus the term *double-entry accounting*. The debit side of an entry always equals the credit side so that the accounting equation remains in balance. The accounting equation, in the form of T accounts, looks like the following:

$$\begin{array}{c} \text{Assets} \\ \hline \text{dr} \quad | \quad \text{cr} \end{array} = \begin{array}{c} \text{Liabilities} \\ \hline \text{dr} \quad | \quad \text{cr} \end{array} + \begin{array}{c} \text{Owners' Equity} \\ \hline \text{dr} \quad | \quad \text{cr} \end{array}$$

Fraud investigation often requires an understanding of the debit-and-credit process. For example, a fraud examiner who is investigating the disappearance of \$5,000 in cash finds a debit in the legal expense account and a corresponding credit in the cash account for \$5,000, but cannot find genuine documentation for the charge. The fraud examiner can then reasonably suspect that a perpetrator might have attempted to conceal the theft by labeling the misappropriated \$5,000 as a legal expense.

Discovering concealment efforts through a review of accounting records is one of the easier methods of detecting internal fraud; usually, one needs only to look for weaknesses in the

various steps of the accounting cycle. Legitimate transactions leave an audit trail. The accounting cycle starts with a source document such as an invoice, check, receipt, or receiving report. These source documents become the basis for journal entries, which are chronological listings of transactions with their debit and credit amounts. Entries are made in various accounting journals. These entries are then posted to the appropriate individual general ledger accounts. The summarized account amounts become the basis for a particular period's financial statements.

To help explain how transactions affect the financial statements, this flow of transactional information through the accounting process is illustrated below, followed by examples of typical accounting transactions:

Journal Entries

As transactions occur, they are recorded in a company's books via *journal entries*. Each journal entry serves as a record of a particular transaction and forms an audit trail that can be retraced later to obtain an understanding of a company's operations. Journal entries that are not prompted by a transaction, called *adjusting journal entries*, are also made at the end of a reporting period for items such as depreciation expense and accounts receivable write-offs.

EXAMPLE

XYZ Company completed the following transactions during its first year of operations, 20XX.

Transaction	Analysis	Journal Entry			Balance Sheet Effect		
		Account	Debit	Credit	Assets =	Liabilities +	Owners' Equity
Enterprise established	Cash increased	Cash	192,000		192,000		
Owner invested \$192,000	Equity increased	Common stock		192,000			192,000
	Liabilities no effect						
Cumulative balance			192,000	192,000	192,000	-	192,000
Company borrowed \$80,000 on a note payable	Cash increased	Cash	80,000		80,000		
	Liabilities increased	Notes payable		80,000		80,000	
	Equity no effect						
Cumulative balance			272,000	272,000	272,000	80,000	192,000
Purchased business equipment for \$70,000	Fixed assets increased	Equipment	70,000		70,000		
	Cash decreased	Cash		70,000	(70,000)		
	Liabilities and equity no effect						
Cumulative balance			342,000	342,000	272,000	80,000	192,000
Billed client \$40,000 for services rendered; collected \$15,000 in cash	Cash increased	Cash	15,000		15,000		
	A/R increased	Accounts receivable	25,000		25,000		
	Equity increased	Sales revenue		40,000			40,000
Cumulative balance			382,000	382,000	312,000	80,000	232,000
Incurred \$25,000 in operating expenses; paid \$14,000 in cash	Equity decreased	Operating expenses	25,000				(25,000)
	Cash decreased	Cash		14,000	(14,000)		
	Liabilities increased	Accounts payable		11,000		11,000	
Cumulative balance			407,000	407,000	298,000	91,000	207,000
Paid \$5,000 on note payable	Liabilities decreased	Notes payable	5,000			(5,000)	
	Cash decreased	Cash		5,000	(5,000)		
	Equity no effect						
Cumulative balance			412,000	412,000	293,000	86,000	207,000
Recorded 1 year of equipment depreciation; estimated 10-year life (\$70,000/10) = \$7,000	Equity decreased	Depreciation expense	7,000				(7,000)
	Asset decreased	Accumulated depreciation		7,000	(7,000)		
	Liabilities no effect						
Cumulative balance			419,000	419,000	286,000	86,000	200,000

Accounting Methods

There are two primary methods of accounting: cash basis and accrual basis. The main difference between the two methods is the timing in which revenue and expenses are recognized.

Cash-Basis Accounting

Cash-basis accounting involves recording revenues and expenses based on when a company receives or pays out cash. For example, sales are recorded when a company receives cash payment for goods, regardless of when the goods are delivered. If a customer purchases goods on credit, the company does not record the sale until the cash is received for the sale. Likewise, if a customer prepays for a sale, the company records the sales revenue immediately, rather than when the goods are given to the customer. The process is the same with expenses: The expenses are recorded when paid, without consideration to the accounting period in which they were incurred.

The key advantage of cash-basis accounting is its simplicity—the only thing its accounting system must track is cash being received or paid. Thus, cash-basis accounting is often used by

individuals or small businesses. Using this method makes it easier for companies to track their cash flow. However, a company might decide to delay paying some expenses so they are not recorded in the current accounting period under this method, which results in an artificially inflated bottom line. A major disadvantage of cash-basis accounting is that cash-rich companies might be able to overstate the financial health of their company by having large amounts of unrecorded accounts payable that exceed the cash balance in their accounting records.

Accrual-Basis Accounting

Accrual-basis accounting requires revenues to be recorded when they are earned (generally, when goods are delivered or services are rendered to a customer), without regard to when cash exchanges hands. Expenses are recorded in the same period as the revenues to which they relate. For example, employee wages are expensed in the period during which the employees provided services, which might not necessarily be the same period in which they are paid.

Generally accepted accounting principles (GAAP) mandate the use of accrual-basis accounting. Accrual-basis accounting records accounts receivable for money that has yet to be received from customers and records accounts payable for purchases made on credit. This accounting method provides immediate feedback to companies on their expected cash inflows and outflows, which makes it easier for them to manage their current resources and efficiently plan for the future. When companies recognize economic events by matching their revenues with the expenses that directly relate to those revenues, it provides a more accurate representation of their financial situation.

Financial Statements

The results of the accounting cycle are summarized in consolidated reports, or financial statements, that present the financial position and operating results of an entity. It is important to have a basic understanding of how financial statements work because they are often the vehicles through which fraud occurs.

Financial statements are presentations of financial data and accompanying notes prepared in conformity with either generally accepted accounting principles (GAAP)—such as International Financial Reporting Standards (IFRS) or a country's specific accounting standards—or some other comprehensive basis of accounting.

The following is a list of typical financial statements:

- Statement of financial position (*balance sheet*)
- Statement of profit or loss and other comprehensive income for the period (*income statement*)
- Statement of changes in owners' equity or statement of retained earnings
- Statement of cash flows

Financial statements might also include other financial data presentations, such as:

- Statement of assets and liabilities that does not include owners' equity accounts
- Statement of revenue and expenses
- Summary of operations
- Statement of operations by product lines
- Statement of cash receipts and disbursements
- Prospective financial information (forecasts)
- Proxy statements
- Interim financial information (e.g., quarterly financial statements)
- Current value financial presentations
- Personal financial statements (current or present value)
- Bankruptcy financial statements

Other comprehensive bases of accounting include:

- Government or regulatory agency accounting
- Tax-basis accounting
- Cash receipts and disbursements, or modified cash receipts and disbursements
- Any other basis with a definite set of criteria applied to all material items, such as the price-level basis of accounting

Consequently, the term *financial statements* includes almost any financial data presentation prepared in accordance with GAAP or another comprehensive basis of accounting.

Throughout this section, the term *financial statements* will include the aforementioned forms of reporting financial data, including the accompanying footnotes and management's discussion.

For most companies, however, a full set of financial statements comprises a statement of financial position (*balance sheet*), a statement of profit or loss and other comprehensive income (*income statement*), a statement of changes in owners' equity or a statement of retained earnings, and a statement of cash flows, as well as the supplementary notes to the financial statements.

Therefore, fraud examiners should be familiar with the purpose and components of each of these financial statements.

Balance Sheet

The *balance sheet*, or *statement of financial position*, shows a snapshot of a company's financial situation at a specific point in time, generally the last day of the accounting period. The balance sheet is an expansion of the accounting equation, $Assets = Liabilities + Owners' Equity$. That is, it lists a company's assets on one side and its liabilities and owners' equity on the other side. The nature of the accounting equation means that the two sides of the statement should balance.

The following balance sheet, derived from the journal entries in the aforementioned example, shows the financial position of XYZ Company on the last day of its first year of operations.

XYZ Company Balance Sheet December 31, 20XX

<u>Assets</u>		<u>Liabilities</u>	
Current Assets		Current Liabilities	
Cash	\$ 198,000	Accounts Payable	<u>\$ 11,000</u>
Accounts Receivable	<u>25,000</u>	Total Current Liabilities	\$ 11,000
Total Current Assets	\$ 223,000		
Fixed Assets		Long-Term Liabilities	
Equipment	70,000	Notes Payable	<u>75,000</u>
Less: Accumulated Depreciation	<u>(7,000)</u>	Total Long-Term Liabilities	<u>75,000</u>
Total Fixed Assets	<u>63,000</u>	Total Liabilities	86,000
		<u>Owners' Equity</u>	
		Common Stock	192,000
		Retained Earnings	<u>8,000</u>
		Total Owners' Equity	<u>200,000</u>
Total Assets	<u>\$ 286,000</u>	Total Liabilities and Equity	<u>\$ 286,000</u>

As mentioned previously, assets are the resources owned by a company. Generally, assets are presented on the balance sheet in order of liquidity, or how soon they are expected to be converted to cash. The first section on the assets side, *current assets*, includes all those assets that are expected to be converted to cash, sold, or used up within one year. This category usually includes cash, accounts receivable (the amount owed to a company by customers for sales on credit), inventory, and prepaid items. Following the current assets are the *long-term assets*, or those assets that will likely not be converted to cash within one year, such as fixed

assets (e.g., land, buildings, equipment) and intangible assets (e.g., patents, trademarks, goodwill). A company's fixed assets are presented net of accumulated depreciation, an amount that represents the cumulative expense taken for normal wear and tear on a company's property. Likewise, intangible assets are presented net of accumulated amortization, an amount that represents the collective expense taken for declines in value of the intangible property.

Liabilities are presented in order of maturity. Like current assets, *current liabilities* are those obligations that are expected to be paid within one year, such as accounts payable (the amount owed to vendors by a company for purchases on credit), accrued expenses (e.g., taxes payable or salaries payable), and the portion of long-term debts that will come due within the next year. Those liabilities that are not due for more than a year are listed under the heading *long-term liabilities*. The most common liabilities in this group are bonds, notes, and mortgages payable. The total balance of the note payable is listed under long-term liabilities on XYZ Company's balance sheet, indicating that it does not have to make any payments on the note during the next year. However, if a \$5,000 payment was required during the next year, the company would have to reclassify \$5,000 of the note balance to the current liabilities section and show the remaining \$70,000 as a long-term liability. This adjustment would not change the total amount of the outstanding liability that was shown—all \$75,000 would still appear on the balance sheet—but it would allow financial statement users to know that the company had an obligation to pay \$5,000 during the next year rather than at some unspecified time in the future.

The owners' equity in a firm generally represents amounts from two sources—owner contributions (usually referred to as *common* or *capital stock* and *paid-in capital*) and undistributed earnings (usually referred to as *retained earnings*). The balance in the capital stock account increases when the owners of a company invest in it through the purchase of company stock. The retained earnings balance increases when a company has earnings and decreases when a company has losses. The retained earnings account is also decreased when earnings are distributed to a company's owners in the form of dividends. XYZ Company's balance sheet shows that the company's owners have contributed \$192,000 to the company and that the company has retained \$8,000 of earnings as of December 31, 20XX.

Income Statement

Whereas the balance sheet shows a company's financial position at a specific point in time, the *income statement*, or *statement of profit or loss and other comprehensive income*, details how much

profit (or loss) a company earned during a period of time, such as a quarter or a year. The accounts reflected on the income statement are temporary; at the end of each fiscal year, they are reduced to a zero balance (closed), with the resulting net income (or loss) added to (or subtracted from) retained earnings on the balance sheet.

The following is the income statement for XYZ Company for its first year of operations based on the sample transactions previously listed.

XYZ Company
Income Statement
For the Year Ended December 31, 20XX

Revenue

Net Sales	\$ 400,000	
Less: Cost of Goods Sold	<u>250,000</u>	
Gross Profit		\$ 150,000

Operating Expenses

Payroll	97,000	
Supplies	4,000	
Utilities	19,000	
Taxes	15,000	
Depreciation	<u>7,000</u>	
Total Operating Expenses		<u>142,000</u>

Net Income		<u>\$ 8,000</u>

Two basic types of accounts are reported on the income statement—*revenues* and *expenses*. Revenues represent amounts received from the sale of goods or services during the accounting period. Most companies present *net sales* or *net service revenues* as the first line item on the income statement. The term *net* means that the amount shown is the company's total sales minus any sales refunds, returns, discounts, or allowances. Conversely, *gross revenues* refer to the company's total sales during the accounting period before any deductions are made.

From net sales, an expense titled *cost of goods sold* or *cost of sales* is deducted. Regardless of the industry, this expense denotes the amount a company spent (in past, present, and/or future accounting periods) to produce the goods or services that were sold during the current

period. For a company that manufactures goods, cost of goods sold signifies the amount the company spent on materials, labor, and overhead expenses to produce the goods that were sold during the accounting period. For a merchandise reseller, this expense is the amount the company has paid to purchase the goods that were resold during the period. For a service company, the cost of sales is typically the amount of salaries paid to the employees who performed the services that were sold. The difference between net sales and cost of goods sold is called *gross profit* or *gross margin*, which represents the amount left over from sales to pay the company's operating expenses.

Operating expenses are those costs that a company incurs to support and sustain its business operations. Generally, these expenses include items such as advertising, management's salaries, office supplies, repairs and maintenance, rent, utilities, depreciation, interest, and taxes. Accrual accounting requires that these items be included on the income statement in the period in which they are incurred, regardless of when they are paid.

A company's *net profit* (also known as *net income* or *net earnings*) for the period is determined after subtracting operating expenses from gross profit. If a company's total expenses were greater than its total revenues and the bottom line is negative, then it had a *net loss* for the period. Commonly, a profitable company will distribute some of its net income to its owners in the form of dividends. Whatever income is not distributed is transferred to the retained earnings account on the balance sheet. In the case of XYZ Company, net income for the year was \$8,000. The company did not distribute any of these earnings, so the total amount—\$8,000—is shown on the balance sheet as retained earnings. If the company is also profitable during its next year of operations, any net income that is not distributed as dividends will be added to the \$8,000 balance in retained earnings. If expenses outperform revenues and XYZ Company shows a loss for its second year, the loss will be deducted from the \$8,000 retained earnings balance at the end of the second year.

To summarize, the income statement ties to the balance sheet through the retained earnings account as follows:

Statement of Changes in Owners' Equity

The *statement of changes in owners' equity* details the changes in the total owners' equity amount listed on the balance sheet. Because it shows how the amounts on the income statement flow through to the balance sheet, it acts as the connecting link between the two statements. The balance of the owners' equity at the beginning of the year is the starting point for the statement. The transactions that affect owners' equity are listed next and are added together. The result is added to (or subtracted from, if negative) the beginning-of-the-year balance, which provides the end-of-the-year balance for total owners' equity.

The statement of changes in owners' equity for XYZ Company would appear as follows:

XYZ Company
Statement of Changes in Owners' Equity
For the Year Ended December 31, 20XX

Owners' equity, January 1, 20XX		\$ -
Investment by owners during the year	\$ 192,000	
Net income for the year	<u>8,000</u>	
Increase in owners' equity		<u>200,000</u>
Owners' equity, December 31, 20XX		<u>\$ 200,000</u>

XYZ Company completed two types of transactions that affected the owners' equity during 20XX: the \$192,000 invested by the company's shareholders, and the revenue and expenses that resulted in the net income of \$8,000. Had the company distributed any money to the shareholders in the form of dividends, that amount would be listed as a subtraction on the

statement of changes in owners' equity as well. Notice that the \$8,000 ties directly to the bottom line of the income statement, and the \$200,000 owners' equity ties to the *total owners' equity* amount on the balance sheet.

Some companies present a statement of retained earnings rather than a statement of changes in owners' equity. Similar to the statement of changes in owners' equity, the statement of retained earnings starts with the retained earnings balance at the beginning of the year. All transactions affecting the retained earnings account are then listed and added to the beginning balance to arrive at the ending balance in the retained earnings account. The following is an example of the statement of retained earnings for XYZ Company:

XYZ Company
Statement of Retained Earnings
For the Year Ended December 31, 20XX

Retained earnings, January 1, 20XX		\$ -
Net income for the year	<u>\$ 8,000</u>	
Increase in owners' equity		<u>8,000</u>
Retained earnings, December 31, 20XX		<u>\$ 8,000</u>

Statement of Cash Flows

The *statement of cash flows* reports a company's sources and uses of cash during the accounting period. This statement is often used by potential investors and other interested parties in tandem with the income statement to determine a company's true financial performance during the period being reported. The nature of accrual-basis accounting allows (and often requires) the income statement to contain many noncash items and subjective estimates that make it difficult to fully and clearly interpret a company's operating results. However, it is much harder to falsify the amount of cash that was received and paid during the year, so the statement of cash flows enhances the financial statements' transparency.

The following is the statement of cash flows for XYZ Company:

XYZ Company
Statement of Cash Flows—Direct Method
For the Year Ended December 31, 20XX

Cash flows from operating activities		
Cash received from customers	\$ 15,000	
Cash paid for merchandise	<u>(14,000)</u>	
Net cash flows from operating activities		\$ 1,000
Cash flows from investing activities		
Cash paid for purchase of equipment	<u>(70,000)</u>	
Net cash flows from investing activities		<u>(70,000)</u>
Cash flows from financing activities		
Cash received as owners' investment	192,000	
Cash received from issuing note payable	80,000	
Cash paid on note payable	<u>(5,000)</u>	
Net cash flows from financing activities		<u>267,000</u>
Increase in cash		198,000
Cash balance at the beginning of the year		<u>0</u>
Cash balance at the end of the year		<u><u>\$ 198,000</u></u>

The statement of cash flows is broken down into three sections: cash flows from operating activities, cash flows from investing activities, and cash flows from financing activities.

Cash Flows from Operations

The cash flows from operations section summarizes a company's cash receipts and payments arising from its normal business operations. Cash inflows included in this category commonly consist of payments received from customers for sales, and cash outflows include payments to vendors for merchandise and operating expenses and payments to employees for wages.

This category can also be summarized as those cash transactions that ultimately affect a company's operating income; therefore, it is often considered the most important of the three cash flow categories. If a company continually shows large profits per its income statement, but cannot generate positive cash flows from operations, then questionable accounting practices might be to blame. On the other hand, net income that is supported by positive and increasing net cash flows from operations generally indicates a strong company.

There are two methods of reporting cash flows from operations. In the previous example, XYZ Company's statement of cash flows is presented using the *direct method*. This method lists the sources of operating cash flows and the uses of operating cash flows, with the difference between them being the net cash flow from operating activities.

In contrast, the *indirect method* reconciles net income per the income statement with net cash flows from operating activities; that is, accrual-based net income is adjusted for noncash revenues and expenses to arrive at net cash flows from operations. The following is an example of XYZ Company's cash flows from operations using the indirect method:

XYZ Company
Statement of Cash Flows—Indirect Method
For the Year Ended December 31, 20XX

Cash flows from operating activities		
Net income, per income statement		\$ 8,000
Add: Depreciation	\$ 7,000	
Increase in accounts payable	<u>11,000</u>	<u>18,000</u>
		26,000
Subtract: Increase in accounts receivable	(25,000)	<u>(25,000)</u>
Net cash flows from operating activities		1,000

Note that the net cash flows from operating activities is the same amount—in this case, \$1,000—regardless of the method that is used. The indirect method is usually easier to compute and provides a comparison of a company's operating results under the accrual and cash methods of accounting. As a result, most companies choose to use the indirect method, but either method is acceptable.

Cash Flows from Investing Activities

Cash inflows from investing activities usually arise from the sale of fixed assets (e.g., property and equipment), investments (e.g., the stocks and bonds of other companies), or intangible assets (e.g., patents and trademarks). Similarly, cash outflows from investing activities include any cash paid for the purchase of fixed assets, investments, or intangible assets.

Cash Flows from Financing Activities

Cash flows from financing activities involve the cash received or paid in connection with issuing debt and equity securities. Cash inflows in this category occur when a company sells

its own stock, issues bonds, or takes out a loan. A company's cash outflows from financing activities include paying cash dividends to shareholders, acquiring shares of its own stock (called *treasury stock*), and repaying debt.

The total cash flows from all three categories are combined to arrive at the net increase or decrease in cash for the year. This total is then added to or subtracted from the cash balance at the beginning of the year to arrive at the cash balance at the end of the year, which ties back to the amount of cash reported on the balance sheet.

Users of Financial Statements

Financial statement fraud schemes are most often perpetrated by management against potential users of the statements. Financial statement users include company ownership and management, lending organizations, investors, regulatory agencies, vendors, and customers. The production of truthful financial statements plays an important role in an organization's continued success. However, fraudulent statements can be used for a number of reasons. The most common use is to bolster an organization's apparent success in the eyes of potential and current investors. (For more information, see the chapter on "Financial Statement Fraud" in this section of the *Fraud Examiners Manual*.)

Generally Accepted Accounting Principles

In preparing financial statements, management, accountants, and auditors are charged with following the relevant standardized financial reporting practices known as *generally accepted accounting principles* (GAAP). GAAP are the rules by which a company's financial transactions are recorded into their appropriate account classifications and properly reported as part of the entity's financial statements.

Historically, each country has promulgated its own GAAP, which has led to a worldwide divergence of accounting practices. It has also contributed to some difficulties in comparing the financial performance of companies in different countries, as well as financial reporting challenges for multinational entities. Consequently, accounting standard-setters have been working toward a uniform set of accounting standards to enhance the transparency and comparability of financial reporting, facilitate cross-border commerce, and encourage international investment. The resulting International Financial Reporting Standards (IFRS) has been adopted as the source of GAAP for reporting companies in many countries. However,

some countries, such as the United States, have retained their own set of accounting standards that form GAAP for reporting companies in those jurisdictions. Currently, there is not a universally accepted accounting recording and reporting system in existence.

Publicly traded companies must adhere to the specific financial reporting practices of their jurisdiction, which differ among regions. While U.S. GAAP and IFRS are some of the most commonly used accounting frameworks, other countries have their own form of GAAP that might contain different standards. IFRS is considered more of a principle-based accounting framework, whereas U.S. GAAP is known to be more of a rules-based accounting framework. Proponents of IFRS say that a principle-based accounting system better captures an entity's true economic situation.

U.S. GAAP

The accounting principles that compose U.S. GAAP have developed through the accumulation of authoritative accounting pronouncements issued by several authoritative bodies. Historically, these pronouncements included Accounting Research Bulletins (ARB), Accounting Principles Board (APB) Opinions, Financial Accounting Standards Board (FASB) Statements and Interpretations, Emerging Issues Task Force (EITF) Abstracts, and U.S. Securities and Exchange Commission (SEC) Staff Accounting Bulletins (SAB).

In 2009, FASB launched the FASB Accounting Standards Codification (FASB ASC) as the sole source of authoritative U.S. GAAP for non-governmental organizations (NGOs). The FASB ASC compiles and organizes all previous sources of GAAP by topic, providing an efficient and easy-to-use structure for researching and referencing accounting standards. It effectively supersedes the pre-FASB ASC GAAP hierarchy established in Statements on Auditing Standards (SAS) No. 69 and FASB Statement No. 162.

Basic Underlying Accounting Principles

Basic accounting principles in the United States, referred to as *U.S. generally accepted accounting principles*, are a common set of principles, standards, and procedures that companies must follow when compiling their financial statements.

These principles have evolved over time and are expected to continue changing in response to shifts in social and economic conditions, advancements in technology, and demand by users for more useful or productive standards. The following is a list of the basic underlying

principles on which accountants should base their practices. Note that these principles as defined below are the generally accepted principles under U.S. GAAP and do not necessarily reflect the accounting standards of other parts of the world.

HISTORICAL COST

Although some exceptions exist, historical cost is, generally, the proper basis for the recording of assets, expenses, equities, etc. For example, a piece of operational machinery should be shown on the balance sheet at initial acquisition cost and not at current market value or an estimated replacement value.

REVENUE RECOGNITION

Under the current U.S. GAAP revenue recognition standard, ASC 606, *Revenue from Contracts with Customers*, revenue is recognized or recorded when (or as) an entity satisfies a performance obligation by transferring a promised good or service (asset) to a customer. An asset is transferred when (or as) the customer obtains control of that asset.

Therefore, revenue should not be recognized for work that is to be performed in subsequent accounting periods, even though the work might currently be under contract; the revenue should be recognized in the period in which the performance obligation is satisfied and the promised goods or services are transferred to the customer.

A detailed discussion of the accounting standards related to revenue recognition can be found in the “Financial Statement Fraud” chapter in the Financial Transactions and Fraud Schemes section of the *Fraud Examiners Manual*.

MATCHING

The matching principle requires that expenses be recorded in the same accounting period as the revenues they help generate. Estimates, accruals, and allocations are often needed to meet this requirement. When a sale is recorded, the appropriate charges for cost of goods sold, or other expenses directly corresponding to the sale, should be recorded in the same accounting period.

CONSISTENCY

Entities should employ consistent accounting procedures from period to period. Variations or changes in accounting policies and procedures must be justifiable. Standards used to value

inventory, depreciate assets, or accrue expenses should be consistent from one accounting period to the next. Any changes in accounting policy or procedures must be disclosed in the supplemental notes to the financial statements.

FULL DISCLOSURE

An entity's financial statements should include all information necessary for users to make valid decisions. The statements should not include too much information, but they are required to include enough information to refrain from misleading the user. Supplemental notes to the financial statements are usually required to meet these criteria.

OBJECTIVITY

Accounting records should be designed and kept on objective, rather than subjective, evidence. Basic verifiability must exist for the information contained in the statements. For example, assets are carried at historical cost and not at an estimated current value. Historical cost should be verifiable through legitimate proof of purchase.

SEPARATE ENTITY ASSUMPTION

An entity's economic activity should be kept separate from other personal or business entities. For example, an entity's owners or operators' personal business transactions should not be included in the entity's financial reports.

GOING CONCERN—CONTINUITY ASSUMPTION

The company's management and auditors are required to provide disclosures when existing events or conditions indicate that it is more likely than not that the entity might be unable to meet its obligations within a reasonable period of time after the financial statements are issued. There is an underlying assumption that an entity will continue as a going concern; that is, the life of the entity will be long enough to fulfill its financial and legal obligations. Any evidence to the contrary must be reported in the entity's financial statements and as a separate paragraph in the auditor's report.

UNIT OF MEASURE

All transactions for an organization must be consistently recorded using the same currency. If international transactions occur that are denominated in a foreign currency, the amount must be converted to the home currency used by the organization before it can be recorded.

All financial reports are based on the monetary unit; for example, the dollar for U.S. entities and the euro for European entities. Adjustments for inflationary trends are not shown in the entity's financial statements.

PERIODICITY—TIME PERIOD ASSUMPTION

An entity's life is divided into economic time periods on which reporting statements are fashioned. These reporting periods vary, but a year is the most common. Some companies follow the calendar year, while others use a business year that ends near the lowest point of business activity in a 12-month cycle, regardless of where that point falls in the calendar year.

Some companies issue interim financial reports, which cover a period of less than a year, to convey the company's performance prior to year-end. Interim financial statements provide the public and investors with up-to-date financial information between annual reporting periods and may be issued in the form of complete financial statements or as a summary. Interim financial information is often provided for each interim period, on a cumulative year-to-date basis, or both. Unlike annual financial statements, interim financial statements are not required to be audited.

Accounting principles used for interim financial reporting must be based on the same principles used to prepare previous financial statements unless a change has been adopted in the current year. In such circumstances, any adjustments to costs and expenses should be estimated in a manner reasonable for anticipated annual amounts, to the extent possible. Examples of such items might include inventory shrinkage, allowance for uncollectible accounts, allowance for quantity discounts, and discretionary year-end bonuses.

International Financial Reporting Standards

The IFRS Foundation was formed in 2001 with the goal of developing “a single set of high quality, understandable, enforceable, and globally accepted [reporting standards] through its standard-setting body, the International Accounting Standards Board (IASB).” For each accounting function, the IASB looks for the most appropriate principle for how transactions should be accounted for, or the most suitable method of reporting the results.

More than 166 international jurisdictions require IFRS for domestic reporting, and 86 of those permit or require the use of specifically designed international accounting requirements tailored to small- and medium-sized entities.²

Qualitative Characteristics of Useful Financial Information

Financial reports provide information about the reporting entity's economic resources, claims against the reporting entity, and the effects of transactions and other events and conditions that change those resources and claims. If financial information is to be useful, it must be relevant and faithfully represent what it purports to represent. The usefulness of financial information is enhanced by the following list of qualitative characteristics of useful financial information that accountants should use when creating financial statements in accordance with IFRS.

RELEVANCE

Any financial information that might affect a decision made by a user of the financial statements is considered relevant. Financial information is relevant if it has predictive value, confirmatory value, or both. *Predictive value* is present if the information can be used as an input to processes employed by users to predict future outcomes. *Confirmatory value* indicates the information provides feedback about previous evaluations.

MATERIALITY

The amount of an item is *material* if its omission or misstatement would affect the judgment of a reasonable person who is relying on the financial statements. Materiality is an entity-specific aspect of relevance based on the nature or magnitude, or both, of the items to which the information relates in the context of an individual entity's financial report.

FAITHFUL REPRESENTATION

Financial information must faithfully represent the economic data of the enterprise that it purports to represent. Every effort shall be made to maximize the qualities of perfectly faithful representation: complete, neutral, and free from error. A *complete* depiction includes all information necessary to understand the data presented. A *neutral* depiction is without bias in the selection or presentation of financial information. *Free from error* means there are no material errors or omissions in the financial reporting data and that the process used to produce the reported information has been selected and applied with no errors.

² AICPA/IFRS Resources, available at www.ifrs.com.

COMPARABILITY AND CONSISTENCY

Users of financial statements base their decisions on comparisons between different entities and on similar information from a single entity for another reporting period. *Comparability* is the qualitative characteristic that enables users to identify and understand similarities and differences between such items. Information about a company is more useful if it is comparable with similar information about other entities and with similar information about the same entity for another period or another date. Although a single economic occurrence can be faithfully represented in multiple ways, permitting alternative accounting methods for the same economic occurrence diminishes comparability.

Consistency, although related to comparability, is not the same. *Consistency* refers to the use of the same methods for the same items, either from period to period within a reporting entity or in a single period across entities. Comparability is the goal; consistency helps to achieve that goal.

However, both comparability and consistency do not prohibit a change in an accounting principle previously employed. An entity's management is permitted to change an accounting policy only if the change either:

- Is required by a standard or interpretation
- Results in the financial statements providing more reliable and relevant information about the effects of transactions; other events; or conditions on the entity's financial position, financial performance, or cash flows

The entity's financial statements must include full disclosure of any such changes.

VERIFIABILITY

Verifiability helps assure users that information is accurate and faithfully represents the financial position of the entity. Verifiability means that different knowledgeable and independent observers could reach consensus, although not necessarily complete agreement, that a particular depiction is a faithful representation.

TIMELINESS

Timeliness means providing information to decision-makers in time to be capable of influencing their decisions. In general, the older information is, the less useful it is.

UNDERSTANDABILITY

Classifying, characterizing, and presenting information clearly and concisely makes it understandable. However, some economic data are fundamentally complex. Therefore, enough information should be provided about such events so that a reasonable financial statement user can understand what took place. An entity's financial statements should include all information necessary for users to make valid decisions and must not mislead them.

GOING CONCERN

A company's management is required to provide disclosures when existing events or conditions indicate that it is more likely than not that the entity might be unable to meet its obligations within a reasonable period of time after the financial statements are issued. There is an underlying assumption that an entity will continue as a going concern; that is, the life of the entity will be long enough to fulfill its financial and legal obligations. Any evidence to the contrary must be reported in the entity's financial statements.

Recognition of the Elements of Financial Statements

Recognition is the process of incorporating an item that meets the definition of an element and satisfies the criteria for recognition into the balance sheet or income statement. It involves the depiction of the item in words and by a monetary amount and the inclusion of that amount in the balance sheet or income statement totals. Items that satisfy the recognition criteria should be recognized in the balance sheet or income statement. The failure to recognize such items is not rectified by disclosure of the accounting policies used, nor by notes or explanatory material.

An item that meets the definition of an element should be recognized if:

- It is probable that any future economic benefit associated with the item will flow to or from the entity.
- The item has a cost or value that can be measured with reliability.

THE PROBABILITY OF FUTURE ECONOMIC BENEFIT

The concept of probability is used in the recognition criteria to refer to the degree of uncertainty that the future economic benefits associated with the item will flow to or from the entity. The concept is in keeping with the uncertainty that characterizes the environment in which an entity operates. Assessments of the degree of uncertainty attaching to the flow of future economic benefits are made on the basis of the evidence available when the financial statements are prepared.

For example, when it is probable that a receivable owed to an entity will be paid, it is then justifiable, in the absence of any evidence to the contrary, to recognize the receivable as an asset. For a large population of receivables, however, some degree of non-payment is normally considered probable; hence an expense representing the expected reduction in economic benefits is recognized. This expense is known as *bad debt expense*, and the corresponding liability is the provision for doubtful debts.

RELIABILITY OF MEASUREMENT

The second criterion for the recognition of an item is that it possesses a cost or value that can be measured with reliability. In many cases, cost or value must be estimated; the use of reasonable estimates is an essential part of the preparation of financial statements and does not undermine their reliability. When, however, a reasonable estimate cannot be made, the item is not recognized in the balance sheet or income statement.

For example, the expected proceeds from a lawsuit might meet the definitions of both an asset and income, as well as the probability criterion for recognition; however, if it is not possible for the claim to be measured reliably, it should not be recognized as an asset or as income; the existence of the claim, however, would be disclosed in the footnotes, explanatory material, or supplementary schedules.

RECOGNITION OF ASSETS

An asset is recognized in the balance sheet when it is probable that the future economic benefits will flow to the entity and the asset has a cost or value that can be measured reliably.

RECOGNITION OF LIABILITIES

A liability is recognized in the balance sheet when it is probable that an outflow of resources embodying economic benefits will result from the settlement of a present obligation and the amount at which the settlement will take place can be measured reliably.

RECOGNITION OF INCOME

Income is recognized in the income statement when an increase in future economic benefit related to an increase in an asset or a decrease of a liability has arisen that can be measured reliably. This means, in effect, that recognition of income occurs simultaneously with the recognition of increases in assets or decreases in liabilities (e.g., the net increase in assets arising on a sale of goods or services or the decrease in liabilities arising from the waiver of a debt payable).

In general, revenue is recognized to depict the transfer of promised goods or services to a customer in an amount that reflects the consideration to which the entity expects to be entitled in exchange for those goods or services. According to accrual accounting, revenue should not be recognized for work that is to be performed in subsequent accounting periods, even though the work might currently be under contract. For a performance obligation satisfied over time, an entity should select an appropriate measure of progress to determine how much revenue should be recognized as the performance obligation is satisfied.

The procedures normally adopted in practice for recognizing income are applications of the recognition criteria previously discussed. Such procedures are generally directed at restricting the recognition as income to those items that can be measured reliably and have a sufficient degree of certainty.

RECOGNITION OF EXPENSES

Expenses are recognized in the income statement when a decrease in future economic benefit related to a decrease in an asset or an increase of a liability has arisen that can be measured reliably. This means, in effect, that recognition of expenses occurs simultaneously with the recognition of an increase in liabilities or a decrease in assets (e.g., the accrual of employee entitlements or the depreciation of equipment).

Expenses are recognized in the income statement on the basis of a direct association between the costs incurred and the earning of specific items of income. This process, commonly referred to as the *matching principle*, involves the simultaneous or combined recognition of revenues and expenses that result directly and jointly from the same transactions or other events; for example, the various components of expense making up the cost of goods sold are recognized at the same time as the income derived from the sale of the goods.

When economic benefits are expected to arise over several accounting periods and the association with income can only be broadly or indirectly determined, expenses are recognized in the income statement on the basis of systematic and rational allocation procedures. This is often necessary in recognizing the expenses associated with using up assets such as property, plant, and equipment; goodwill; and patents and trademarks. In such cases, the expense is referred to as *depreciation* or *amortization*. These allocation procedures are intended to recognize expenses in the accounting periods in which the economic benefits associated with these items are consumed or expire.

An expense is recognized immediately in the income statement when an expenditure produces no future economic benefits or when, and to the extent that, future economic benefits do not qualify, or cease to qualify, for recognition in the balance sheet as an asset.

Measurement of the Elements of Financial Statements

A number of different measurement bases are employed to different degrees and in varying combinations in financial statements. They include the following:

- **Historical cost**—Assets are recorded at the amount of cash or cash equivalents paid or the fair value of the consideration given to acquire them at the time of their acquisition. Liabilities are recorded at the amount of proceeds received in exchange for the obligation, or in some circumstances (e.g., income taxes), at the amounts of cash or cash equivalents expected to be paid to satisfy the liability in the normal course of business.
- **Current (replacement) cost**—Assets are carried at the amount of cash or cash equivalents that would have to be paid if the same or an equivalent asset were acquired currently. Liabilities are carried at the undiscounted amount of cash or cash equivalents that would be required to settle the obligation currently.
- **Realizable (settlement) value**—Assets are carried at the amount of cash or cash equivalents that could currently be obtained by selling the asset in an orderly disposal. Liabilities are carried at their settlement values; that is, the undiscounted amounts of cash or cash equivalents expected to be paid to satisfy the liabilities in the normal course of business.
- **Present value**—Assets are carried at the present discounted value of the future net cash inflows that the item is expected to generate in the normal course of business. Liabilities are carried at the present discounted value of the future net cash outflows that are expected to be required to settle the liabilities in the normal course of business.
- **Fair value**—Assets are carried at the price that would be received to sell an asset in an orderly transaction between market participants at the measurement date. Liabilities are carried at the price that would be paid to transfer a liability in an orderly transaction between market participants at the measurement date.

The measurement basis most commonly adopted by entities in preparing their financial statements is historical cost. This is usually combined with other measurement bases. For example, inventories are usually carried at the lower of cost or net realizable value; marketable securities can be carried at market value; and pension liabilities are carried at their present value. Furthermore, some entities use the current cost basis as a response to the inability of the historical cost accounting model to deal with the effects of changing prices of non-monetary assets.

Departures from Generally Accepted Accounting Principles

As with rules for most things, departures from GAAP are sometimes required. It was impossible for GAAP developers to anticipate all circumstances to which the principles are applied. It can be assumed that adherence to GAAP almost always results in financial statements that are fairly presented. However, the standard-setting bodies recognize that, upon occasion, there might be an unusual circumstance when the literal application of GAAP would render the financial statements misleading. In these cases, a departure from GAAP is the proper accounting treatment.

The question of when it is appropriate to stray from GAAP is a matter of professional judgment; there is not a clear-cut set of circumstances that justifies such a departure.

However, departures from GAAP can be justified in the following circumstances:

- There is concern that assets or income would be overstated and expenses or liabilities would be understated (the conservatism constraint requires that when there is any doubt, one should avoid overstating assets and income or understating expenses and liabilities).
- It is common practice in the entity's industry for a transaction to be reported in a particular way.
- The substance of the transaction is better reflected (and, therefore, the financial statements are more fairly presented) by not strictly following GAAP.
- The results of departure appear reasonable under the circumstances, especially when strict adherence to GAAP would produce misleading financial statements and the departure is properly disclosed.
- If a transaction is considered immaterial (i.e., it would not affect a decision made by a prudent reader of the financial statements), then it need not be reported.
- The expected costs of adherence to GAAP exceed the expected benefits of compliance.

The following modifying conventions give guidance and should be considered when deviating from what is generally acceptable.

Conservatism

The conservatism constraint requires that when there is any doubt, one should avoid overstating assets and income or understating expenses and liabilities. This principle's intention is to provide a reasonable guideline in a questionable situation. If there is no doubt concerning an accurate valuation, this constraint need not be applied. An example of conservatism in accounting is the use of the lower of cost or net realizable value as it relates to inventory valuation. If a company's financial statements intentionally violate the conservatism constraint, they could be fraudulent.

Industry Practices and Peculiarities

The peculiarities and practices of an industry (such as banking, investment, and insurance) might warrant selective exceptions to accounting principles as long as they are infrequent and justifiable. Some differences in accounting also occur in response to legal requirements, such as those entities subject to regulatory controls.

Substance over Form

The economic substance of a transaction determines the accounting treatment, which might differ from the legal treatment. For example, although a lease contract may not transfer property rights, if the true substance of the transaction is a sale, then the lessee should record the transaction as an acquisition and capitalize the property.

Application of Judgment

An accountant may depart from GAAP if the results of departure appear reasonable under the circumstances, especially when strict adherence to GAAP will produce misleading financial statements and the departure is properly disclosed.

Materiality

The amount of an item is material if its omission would affect the judgment of a reasonable person who is relying on the financial statements. The materiality threshold does not mean that immaterial items do not have to be recorded; rather, strict adherence to GAAP is necessary only when the item has a significant effect on the financial statements of an entity. In addition, the aggregate effect of immaterial items must also be considered.

Cost-Benefit

A departure from GAAP is permitted if the expected costs of reporting a transaction in compliance with GAAP exceed the expected benefits of compliance. However, the fact that complying with GAAP would be more expensive or would make the financial statements look weaker is not a reason to use a non-GAAP method of accounting for a transaction.

FINANCIAL STATEMENT FRAUD

Financial statement schemes are one of a large category of frauds that comprise *Occupational Fraud and Abuse*, which is defined as “the use of one’s occupation for personal enrichment through the deliberate misuse or misapplication of the employing organization’s resources or assets.” Simply stated, occupational frauds are those in which an employee, manager, officer, or owner of an organization commits fraud to the organization’s detriment. The three major types of occupational fraud are corruption, asset misappropriation, and financial statement fraud. The following diagram shows the complete classification of occupational fraud, frequently referred to as the *Fraud Tree*.

(NOTE: The discussions pertaining to accounting rules and standards in the following sections are generalized and are based on accounting practices common to many countries. However, required accounting treatments vary among regions and organization types. Therefore, it is important to consult the applicable accounting standards governing the organization being examined to determine whether a particular accounting treatment is correct.)

The Fraud Tree

Occupational Fraud and Abuse Classification System

What Is Financial Statement Fraud?

Financial statement fraud is the *deliberate misrepresentation* of the financial condition of an enterprise accomplished through the *intentional misstatement* or *omission* of amounts or disclosures in the financial statements to *deceive* financial statement users.

Note that financial statement fraud, much like all types of fraud, is an intentional act. As stated in the International Standard on Auditing (ISA) 240, *The Auditor's Responsibilities Relating to Fraud in an Audit of Financial Statements*, and the American Institute of Certified Public Accountants (AICPA) Auditing Standard AU-C Section 240, *Consideration of Fraud in a Financial Statement Audit*, “misstatements in the financial statements can arise from error or fraud. The distinguishing factor between error and fraud is whether the underlying action that results in the misstatement of the financial statements is intentional or unintentional.”

Financial statement fraud is usually a means to an end rather than an end in itself. When people manipulate financial records, they might be stalling, so they can quietly “fix” business problems that prevent their company from achieving its expected earnings or complying with loan covenants. It might also be done to obtain or renew financing that would not be granted, or would be smaller, if honest financial statements were provided. People who are intent on profiting from crime might commit financial statement fraud to obtain loans they can then siphon off for personal gain or to inflate the price of the company's shares, allowing them to sell their holdings or exercise stock options at a profit, or even obtain bonus money calculated based on sales or profits. However, in many past financial statement fraud cases, the perpetrators have gained little or nothing personally in financial terms. Instead, the focus appears to have been preserving their status as the organizations' leaders—a status that might have been lost had the real financial results been published promptly.

Financial statement fraud almost always involves overstating assets, revenues, and profits and understating liabilities, expenses, and losses. However, sometimes the opposite result is desired. For example, understating assets or revenue might lead to a smaller tax liability for the company. Alternatively, a fraudster might wish to minimize over-budget results in a good year to help make up for any shortcomings during the subsequent year.

Financial statements are the responsibility of the organization's management. Accordingly, financial statement fraud is typically committed by individuals employed in managerial or senior executive positions who not only have the ability to alter the financial statements but also an incentive to do so. Chief executive officers (CEOs) are often perpetrators of financial

statement fraud because they have ultimate responsibility for the success of an organization. Since fraud investigations are typically conducted or overseen by management, financial statement fraud cases often persist for a long time before the fraud is discovered.

The Cost of Financial Statement Fraud

Financial statement fraud frequently has a devastating effect on an organization's reputation and financial position, as well as on the people involved. The stock market capitalization of companies affected by financial statement fraud might fall substantially almost overnight, losing billions of dollars for investors. Even if the balance sheet and income statement do not change substantially, a restatement is likely to damage investors' confidence in the reporting ability of the company's management and its auditors, and the company's stock price will decrease accordingly.

Many jobs might be lost as companies restructure to restore profitability. Financial statement fraud can influence the well-being of employees, who might lose their jobs, retirement funds, any savings invested in their employer's stock, and health care and other benefits. The company's auditors are likely to be sued for the amount of investors' losses, which could mean billions of dollars for large public companies. For large and small companies alike, financial statement fraud can be costly and potentially destroy the company.

Why Financial Statement Fraud Is Committed

There are a number of reasons why individuals commit financial statement fraud. Most commonly, financial statement fraud is used to make a company's earnings appear better on paper. Financial statement fraud occurs through a variety of methods, such as valuation judgments and manipulating the timing of transaction recording. These more subtle types of fraud are often dismissed as either mistakes or errors in judgment and estimation. Some of the more common reasons why people commit financial statement fraud include:

- To encourage investment through the sale of stock
- To demonstrate increased earnings per share or partnership profits interest, thus allowing increased dividend/distribution payouts
- To cover inability to generate cash flow
- To avoid negative market perceptions
- To obtain financing, or to obtain more favorable terms on existing financing
- To receive higher purchase prices for acquisitions

- To demonstrate compliance with financing covenants
- To meet company goals and objectives
- To receive performance-related bonuses

This limited list of reasons shows that the motivation for financial statement fraud does not always involve direct personal financial gain. Sometimes, the cause of fraudulent financial reporting is the combination of situational *pressures* on either the company or the manager, the *opportunity* to commit the fraud with a perceived minimal likelihood of being detected, and the ability to *rationalize* fraudulent behavior to justify the crime in an acceptable way. These three components make up the Fraud Triangle, a framework coined by American Sociologist Donald R. Cressey, designed to explain the reasoning behind a worker's decision to commit workplace fraud. (More information about the Fraud Triangle can be found in the "White-Collar Crime" chapter in the Fraud Prevention and Deterrence section of the *Fraud Examiners Manual*.)

These factors are known as *red flags*. That is to say, if red flags (situational pressures, opportunity, and potential rationalizations) are present, then the risk of financial reporting fraud increases significantly.

Examples of situational pressures include:

- Sudden decreases in revenue or market share experienced by a company or an industry
- Unrealistic budget pressures, particularly for short-term results (the pressures become even greater with arbitrarily established budgets that are without reference to current conditions)
- Financial pressures resulting from bonus plans that depend on short-term economic performance (these pressures are particularly acute if the bonus is a significant component of the individual's total compensation)

Opportunities to commit fraud most often arise gradually. Generally, these opportunities can come from a lack of adequate oversight functions within the company. The existence of an oversight function does not, in and of itself, guarantee the detection of fraudulent acts; the oversight function must also respond effectively. The perception of detection, not internal control by itself, is arguably the strongest deterrent to fraud.

Some of the more obvious opportunities for the existence of fraud are:

- Absence of a board of directors or audit committee
- Improper or lack of oversight or other neglectful behavior by the board of directors or audit committee

- Weak or nonexistent internal controls, including an ineffective internal audit staff and a lack of external audits
- Unusual or complex transactions (an understanding of the transactions, their component parts, and their effect on financial statements is paramount to fraud deterrence)
- Financial estimates that require significant subjective judgment by management

Rationalizing fraud involves a way of thinking that enables people to maintain their moral code and avoid guilt while partaking in unethical behavior. Since rationalization is purely a psychological state of being and kept secret from others outside of the fraud scheme, it is difficult to witness this aspect of fraud.

Examples of statements rationalizing fraud include:

- *“If we inflate the revenues this year, we can just deflate them next year to balance them out.”*
- *“The investors won’t know one way or the other if I alter the numbers a bit to make the firm’s performance look better this year.”*
- *“If we understate revenue this year, we’ll have a lower tax liability at the end of the year, which will save the company money.”*

Trends in Financial Statement Fraud

According to the ACFE’s 2020 *Report to the Nations*, financial statement fraud comprised 10% of the frauds reported in the study, with a median loss of \$954,000. However, it is important to note that quoted losses resulting from financial statement fraud are often measuring lost market capitalization or lost shareholder value rather than direct loss of financial assets. This does not make the scheme any less harmful; in fact, the lost shareholder value resulting from financial statement fraud can have devastating effects on even the largest companies. It can also have a tremendous impact on the organization’s shareholders. Although it is the least common type of occupational fraud, financial statement fraud is more costly than asset misappropriation and corruption schemes.

Similar results came out of a U.S. Securities and Exchange Commission (SEC) study required under the Sarbanes-Oxley Act (SOX). The agency was charged with reviewing incidents of financial statement fraud in the five years prior to passage of the legislation. From July 31, 1997, through July 30, 2002, the SEC filed 515 enforcement actions for financial reporting and disclosure violations arising out of 227 Division of Enforcement

investigations (enforcement matters). The 515 actions included 869 named parties, consisting of 164 entities and 705 individuals. The year-over-year numbers reveal the growing problem of financial reporting violations during the study period.

Study Year	Number of Actions Involving Issuer Financial Reporting Violations ¹
Year One	91
Year Two	60
Year Three	110
Year Four	105
Year Five	149

Most of the actions involved improper revenue recognition. In 126 of the 227 enforcement matters, management reported fictitious sales, improperly timed revenue recognition, or improperly valued revenue. Another 101 enforcement matters involved improper expense recognition, including improper capitalization or deferral of expenses; improper use of reserves; or other understatements of expenses. Additionally, 23 enforcement matters involved improper accounting for business combinations and 137 enforcement matters involved other accounting and reporting issues, such as inadequate Management's Discussion and Analysis (MD&A) disclosure and improper use of off-balance sheet arrangements. (See the following chart.² Note: The sum of the numbers in the second column is greater than the total number of 227 because most of the actions involved more than one type of improper conduct.)

¹ Chart content originates from the SEC, *Report Pursuant to Section 704 of the Sarbanes-Oxley Act of 2002*, www.sec.gov/news/studies/sox704report.pdf.

² Ibid.

Improper Accounting Practice	Number of Enforcement Matters Involving Practice
Improper Revenue Recognition	126
Improper Expense Recognition	101
Improper Accounting in Connection with Business Combinations	23
Other Accounting and Reporting Issues:	130
Inadequate Disclosures in MD&A and Elsewhere	43
Failure to Disclose Related-Party Transactions	23
Inappropriate Accounting for Non-Monetary and Roundtrip Transactions	19
Improper Accounting for Foreign Payments in Violation of the FCPA	6
Improper Use of Off-Balance Sheet Arrangements	3
Improper Use of Non-GAAP Financial Measures	2

The SEC study revealed further proof of management's involvement in financial statement fraud. In these enforcement matters, charges were brought against 75 chairmen of the board, 111 chief executive officers (CEOs), 111 presidents, 105 chief financial officers (CFOs), 21 chief operating officers (COOs), 16 chief accounting officers (CAOs), and 27 vice presidents (VPs) of finance.

Studies by the U.S. Government Accountability Office (GAO)—formerly known as the General Accounting Office—also revealed comparable trends in financial statement fraud. In July 2006, the GAO issued an update to its 2002 report, *Financial Statement Restatements: Trends, Market Impacts, Regulatory Responses, and Remaining Challenges*. The original report was based on the GAO's analysis of 689 of 919 financial statement restatements occurring from January 1, 1997, through June 30, 2002. To update the information in the original, the GAO undertook a similar analysis of 1,390 public company restatements that occurred between January 1, 2002, and September 30, 2005. The following are some of the findings outlined in the updated report, *Financial Restatements: Update of Public Company Trends, Market Impacts, and Regulatory Enforcement Activities*:

- The percentage of publicly traded companies announcing restatements increased from less than 1% in 1997 to over 3% by the end of 2002. This percentage rose again, to 6.8%, by September of 2005.
- The quantity of restatements resulting from accounting irregularities grew from 92 in 1997 to 314 in 2002, or approximately 241%. In the first nine months of 2005 (through September 30), there were 523 restatements announced, which amounted to an increase of approximately 67% from 2002 and more than 468% from 1997.

- The average size of a company restating its financial statements increased from \$500 million in 1997 to \$2 billion in 2002. By September 30, 2005, the average market capitalization of a company announcing a restatement had grown to \$6 billion.
- Cost and expense issues were the most common reason for restatements between July 2002 and September 2005. These restatements, which include over- or understating costs or expenses, improper classification of costs, and other misreporting of costs, accounted for over 35% of restatements examined during that period. In the 2002 study, cost and expense issues were the second most common reason for restatement, comprising 16% of all restatements.
- Of the restatements analyzed in the 2006 study, 20% were due to revenue recognition issues, making this the second most common reason for restatement during the period studied. This represents a decline from the 2002 study in which revenue recognition was the most common reason for restatement, comprising 38% of the population. Revenue recognition restatements include recognizing revenue sooner or later than allowed under U.S. generally accepted accounting principles (GAAP) or recognizing questionable or fictitious revenue.

Today, financial statement and accounting fraud cases continue to be the single largest category of SEC actions filed. Many relate to the subprime mortgage market, and another large group relates to executive compensation. Most notably, the SEC filed civil suits expanding the scope of substantive claims and remedies, aggressively applying the “clawback” provision of Section 304 of SOX, and alleging false disclosures of non-GAAP financial metrics in violation of Regulation G.

In 2010, the Committee of Sponsoring Organizations (COSO) published a follow-up study to its 1999 report. The report, *Fraudulent Financial Reporting: 1998–2007, An Analysis of U.S. Public Companies*, examined 347 companies involved in alleged instances of fraudulent financial reporting.

Among the highlights of the report are the following:

- From 1998 to 2007, the total cumulative misstatement or misappropriation was nearly \$120 billion across 300 fraud cases with available information (mean of nearly \$400 million per case). This compares to a mean of \$25 million of misstatement or misappropriation per sample fraud in COSO’s 1999 study.

- The average fraud period extended 31.4 months, with the median fraud period extending 24 months. This was slightly longer than the average and median fraud periods of 23.7 and 21 months, respectively, reported in COSO's 1999 study.
- With all the focus on audit committees in the past decade, one of the important insights from this study is that meaningful differences in audit committee characteristics between fraud and no-fraud firms are generally no longer observed.
- Most fraud and no-fraud firms maintained a compensation committee, and there were few differences in compensation committee characteristics between fraud firms and no-fraud firms.
- Of companies examined, 26% of the fraud firms versus 12% of the no-fraud firms changed auditors between the period that the company issued the last clean financial statements and the period the company issued the last set of fraudulent financial statements.
- The CEO was named as one of the parties involved in 72% of the fraud companies. The second most frequently identified senior executive was the CFO, who was named in 65% of the fraud companies. When considered together, the CEO and/or CFO were named in 89% of the cases.
- The majority of companies were mid-size, with total assets below \$500 million, and 73% of fraud firms were not listed on the New York or American stock exchanges.

Financial Statement Fraud Schemes

Fraud in financial statements typically takes the form of:

- Overstated assets or revenue
- Understated liabilities and expenses

Overstating assets or revenue falsely reflects a financially stronger company by inclusion of fictitious asset costs or artificial revenues. Understated liabilities and expenses are shown through exclusion of costs or financial obligations. Both methods result in increased equity and net worth for the company. This manipulation results in increased earnings per share or partnership profit interests or a more stable representation of the company's financial situation.

However, in some cases, financial statement fraud takes the opposite form:

- Assets and revenues are understated
- Liabilities and expenses are overstated

To demonstrate the over- and understatements typically used to fraudulently enhance the financial statements, the schemes have been divided into five classes. Because the maintenance of financial records involves a double-entry system, fraudulent accounting entries always affect at least two accounts and, therefore, at least two categories on the financial statements. While the following areas reflect their financial statement classifications, keep in mind that the other side of the fraudulent transaction exists elsewhere. The five classifications of financial statement schemes are:

- Fictitious revenues
- Timing differences (including improper revenue recognition)
- Improper asset valuations
- Concealed liabilities and expenses
- Improper disclosures

As discussed in the following example, financial statement frauds can entail a combination of these schemes.

EXAMPLE OF MULTIPLE FRAUD SCHEMES

In February of 2008, the U.S. Securities and Exchange Commission (SEC) filed financial fraud charges against Bally Total Fitness Holding Corporation (Bally), a nationwide commercial operator of fitness centers, alleging that Bally violated the antifraud, reporting, books and records, and internal control provisions of the federal securities laws (United States Securities and Exchange Commission v. Bally Total Fitness Holding Corporation). According to the SEC, from at least 1997 through 2003, Bally's financial statements were compromised by more than two dozen accounting improprieties. The alleged improprieties caused Bally to overstate its originally reported year-end 2001 stockholders' equity by \$1.8 billion, or more than 340%; to understate its originally reported 2002 net loss by \$92.4 million, or 9341%; and to understate its originally reported 2003 net loss by \$90.8 million, or 845%. Bally settled the charges with the SEC in February of 2008 and emerged from bankruptcy proceedings under new, private ownership.

Later, in December of 2009, the former Bally chief financial officer (CFO) and former controller were charged for their roles in the accounting violations, as were Bally's independent auditor, Ernst & Young, LLP (E&Y), and six E&Y partners. According to the SEC, Bally's former CFO and former controller were responsible for the fraudulent financial accounting and disclosures, and the unqualified audit opinions issued by E&Y were false and misleading, as the auditors knew or should have known about the fraud. All parties charged settled with the SEC without admitting or denying the charges.

Bally's alleged improprieties involved fictitious revenues, timing differences, concealed liabilities and expenses, improper disclosures, and improper asset valuations. The following is a summary of just some of the many financial statement schemes employed by Bally.

Bally employed a number of inappropriate accounting tricks to overstate its revenue:

- Rather than recognize revenue from initiation fees over the entire estimated gym membership life, as was required by U.S. generally accepted accounting principles (GAAP), Bally chose to inappropriately recognize these fees over a shorter period of time.*
- Bally elected, in violation of U.S. GAAP, to recognize as revenue the entire amount of prepaid dues in the month payment was received, instead of deferring the prepaid dues and recognizing them as earned.*
- Bally recognized hypothetical membership reactivation fees as revenue anticipated (up to three years in the future). U.S. GAAP prohibited Bally from recognizing revenue from reactivation fees until after the reactivating members had entered into binding contracts.*
- Bally recognized revenue from unpaid dues on inactive memberships, a practice that was in violation of U.S. GAAP.*
- Under U.S. GAAP, Bally was to account for revenue from its bundled packages (consisting of gym memberships, nutritional products, and personal training services) as a single element, unless it met certain exceptions (which Bally did not meet). Bally failed to comply with U.S. GAAP, accounting for each item in the package as a separate element and prematurely recording revenue.*
- U.S. GAAP required that revenue from prepaid personal training services be recognized when earned; that is, when the services were actually provided. Bally recognized revenue related to prepaid personal training services before it was actually earned.*
- Bally prematurely recognized revenue from the sale of future receivables by accounting for these sales as sales of financial assets. Under U.S. GAAP, Bally was required to account for these transactions as debt.*

Bally was equally creative when it came to using accounting improprieties to understate its expenses and liabilities:

- Bally deferred as "membership acquisition costs" costs that were not directly related to the acquisition of membership contracts. Under U.S. GAAP, these costs were to be expensed as incurred.*
- Bally failed to include interest expense associated with a liability on bonds, in addition to improperly removing the bond obligation from its balance sheet. Both actions were in violation of U.S. GAAP.*

- Under U.S. GAAP, Bally was to expense advertising expenses no later than the first time the advertising took place. Bally violated U.S. GAAP by deferring recognition of the production costs of its advertisements over the estimated life of the advertisements.
- When Bally acquired other health clubs, it was required under U.S. GAAP to allocate a portion of the purchase price to certain separately identifiable intangible assets and to conduct impairment analysis of goodwill. Bally failed to do either, which resulted in an overstatement of goodwill and an understatement of expenses.

Additionally, Bally carried out various improprieties to understate its accumulated deficit:

- *In accounting for its leased facilities, Bally was not in compliance with U.S. GAAP for several reasons: (1) Bally improperly failed to recognize rent expense on club leases with escalating rental obligations using the required straight-line rent method; (2) Bally improperly reflected tenant allowances as a reduction of property and equipment on the balance sheet and improperly amortized these amounts and the related leasehold improvements to depreciation expense; (3) Bally improperly reflected tenant allowances as a component of cash flows from investing activities in its statement of cash flows; and (4) Bally improperly failed to depreciate leasehold improvements over the lesser of the asset's economic life, with a maximum of 15 years, or the contractual term of the lease, excluding all renewal options.*
- *At times, Bally temporarily closed various clubs while it undertook construction and remodeling in preparation for use by members. Bally still incurred rent costs during the construction periods, which, under U.S. GAAP, Bally was to recognize as expenses when incurred unless certain requirements were met. Bally didn't meet those requirements, but nonetheless improperly deferred recognition of the rent costs.*
- *While clubs were closed for remodeling and construction, Bally incurred certain internal compensation costs, which, under U.S. GAAP, were required to be expensed when services were rendered. Bally improperly capitalized and deferred these costs and recognized them as expenses in later periods.*

Under U.S. GAAP, Bally was required to periodically analyze whether the value of its fixed assets had been impaired, and if it had, to recognize the amount of the impairment as an expense. Bally failed to identify the existence of events that should trigger an asset impairment analysis and failed to measure the related impairment charges.

Fictitious Revenues

Fictitious or fabricated revenues involve the recording of sales of goods or services that did not occur. Fictitious sales most often involve fake customers but can also involve legitimate customers. For example, a fictitious invoice can be prepared (but not mailed) for a legitimate customer even though the goods are not delivered or the services are not rendered. At the end of the accounting period, the sale will be reversed, which will help conceal the fraud. However, the artificially high revenues of the period might lead to a revenue shortfall in the new period, creating the need for more fictitious sales. Another method is to use legitimate customers and artificially inflate or alter invoices to reflect higher amounts or quantities than are actually sold.

The challenge with both of these methods is balancing the other side of the entry. A credit to revenue increases the revenue account, but the corresponding debit in a legitimate sales transaction typically either goes to cash or accounts receivable. Since no cash is received in a fictitious revenue scheme, increasing accounts receivable is the easiest way to get away with recording the entry. However, accounts receivable stay on the books as an asset until they are collected. If the outstanding accounts never get collected, they will eventually need to be written off as bad debt expense. Mysterious accounts receivable on the books that are long overdue are a common sign of a fictitious revenue scheme.

EXAMPLE OF FICTITIOUS REVENUES

In one case, a foreign subsidiary of a U.S. company recorded several large fictitious sales to a series of companies. It invoiced the sales but did not collect any of the accounts receivable, which became severely past due. The manager of the foreign subsidiary arranged for false confirmations of the accounts receivable for audit purposes and even hired actors to pretend to be the customers during a visit from U.S. management. Background checks on the customers would have revealed that some of the companies were fictitious while others either were undisclosed related parties or operated in industries that would have no need for the goods supposedly supplied. An investigation revealed that the manager of the foreign subsidiary directed the scheme to record fictitious revenues to meet unrealistic revenue goals set by U.S. management.

In some cases, companies go to great lengths to conceal fictitious sales. A sample journal entry from such a case is detailed here. To record an alleged purchase of fixed assets, a fictional entry is made by debiting fixed assets and crediting cash for the amount of the alleged purchase:

Date	Description	Ref.	Debit	Credit
12/01/X1	Fixed Assets	104	350,000	
	Cash	101		350,000

A fictitious sales entry is then made for the same amount as the false purchase, debiting accounts receivable and crediting the sales account. The cash outflow that supposedly paid for the fixed assets is “returned” as payment on the receivable account, though in practice the cash might never have moved if the fraudsters didn’t bother to falsify that extra documentary support.

Date	Description	Ref.	Debit	Credit
12/01/X1	Accounts Rec	120	350,000	
	Sales	400		350,000
12/15/X1	Cash	101	350,000	
	Accounts Rec	120		350,000

The result of this completely fabricated sequence of events is an increase in both fixed assets and revenue. The debit could alternatively have been directed to other accounts, such as inventory or accounts payable, or simply left in accounts receivable if the fraud were committed close to the year’s end and the receivable could be left outstanding without attracting undue attention. The subsequent case describes yet another approach to revenue fabrication.

EXAMPLE OF REVENUE FABRICATION INVOLVING DECEPTIVE SALES AND CUSTOMERS

In what has become India’s largest corporate scandal, Satyam Computer Services Limited (Satyam) founder and chairman, B. Ramalinga Raju, suddenly quit in January 2009, confessing that he had falsified company accounts for years. In his four-and-a-half-page resignation letter, Raju revealed he had overstated the company’s reported cash balance by \$1 billion.

Satyam (renamed Mahindra Satyam in 2009), a foreign private issuer, is a large information technology services company incorporated in the Republic of India that provides back office support functions to organizations around the world.

In April of 2011, the company agreed to a \$10 million penalty to settle the SEC's charges in U.S. Securities and Exchange Commission v. Satyam Computer Services Limited d/b/a Mahindra Satyam.

According to the SEC, a complete failure of internal controls over Satyam's invoice management system, books of account, and financial reporting enabled the company's then-senior managers to intentionally overstate revenue, income, earnings per share, cash, and interest-bearing deposits from 2003 through September 2008 by over \$1 billion, or more than half of the company's total assets.

More specifically, the SEC alleged that Satyam's then-senior management falsified the company's reported revenues by creating more than 6,000 false invoices for services never provided, as well as for nonexistent customers. Certain employees were given administrative logins and passwords to the invoice management system so that they could record the false invoices, ensuring that the invoices were used in the calculation of revenue but concealed from Satyam's business unit heads so they would not spot the suspicious invoices. Forged bank statements were created by Satyam's employees to reflect "payment" on the false invoices, inflating the company's cash balances.

In confirming Satyam's cash balance, the auditors relied on management to send confirmation requests to the company's banks and to return alleged confirmation responses from the banks to the auditors. This was in direct conflict with standard audit procedures, which require that (1) cash balances be independently confirmed with the financial institutions in which the accounts are held, and (2) the auditors retain control over the confirmation documents to reduce the risk of tampering. Had this basic procedure been performed in accordance with standards, it is likely that the auditors would have caught the fraud themselves.

Fictitious sales schemes are not always elaborate, however. Less complex methods include shipments of false or defective products. In one instance, a company shipped goods to a customer and recorded revenue, even though the customer had agreed only to evaluate the product, not purchase it. In some extreme cases, goods are shipped and booked as revenue to customers who did not order them.

Fraud examiners should be skeptical about large revenue transactions recorded near the end of the period. Because the company might be trying to meet sales targets, careful examination of supporting documentation is essential to determine the sales are legitimate.

In reviewing purchase orders, auditors should look for cancellation clauses that could contradict the sale. Auditors should read sales contracts and look for cancellation privileges and lapse dates. Revenue should not be recorded until the cancellation privilege lapses. The absence of a requested shipping date on a purchase order might indicate that the customer will notify the seller when shipment is to occur, which might mean that no exchange is presently being requested.

What Red Flags Are Associated with Fictitious Revenues?

The following red flags are associated with fictitious revenues:

- An unusually large amount of long overdue accounts receivable
- Outstanding accounts receivable from customers that are difficult or impossible to identify and contact
- Rapid growth or unusual profitability, especially compared to that of other companies in the same industry
- Recurring negative cash flows from operations or an inability to generate positive cash flows from operations while reporting earnings and earnings growth
- Significant transactions with related parties or special purpose entities not in the ordinary course of business or where those entities are not audited or are audited by a separate firm
- Significant, unusual, or highly complex transactions, especially those close to the period's end that pose difficult "substance over form" questions
- Unusual growth in the days' sales in receivables ratio (receivables/average daily sales)
- A significant volume of sales to entities whose substance and ownership is not known
- An unusual increase in sales by a minority of units within a company or in sales recorded by corporate headquarters

Timing Differences (Including Improper Revenue Recognition)

Financial statement fraud might also involve timing differences—that is, the recording of revenues or expenses in improper periods. This can be done to shift revenues or expenses between one period and the next, increasing or decreasing earnings as desired. This practice is also referred to as *income smoothing*.

Premature Revenue Recognition

Historically, accounting standards related to revenue recognition were so complex and detailed that application of the rules resulted in different industries using different accounting methods for similar transactions. This complexity in recording revenue sometimes led to comparability issues across entities, industries, and jurisdictions.

To provide a more robust framework for standardizing how companies should recognize revenue, the U.S. Financial Accounting Standards Board (FASB) and the International Accounting Standards Board (IASB) jointly revised their respective revenue-recognition accounting standards in May 2014, resulting in a converged revenue-recognition standard that is called *Revenue from Contracts with Customers*. For the International Financial Reporting Standards (IFRS), the new statement has been issued as IFRS 15; for U.S. GAAP, the new standard is codified in ASC (Accounting Standards Codification) 606 and replaced ASC 605. Public companies using U.S. GAAP were required to adopt this new standard for annual reporting periods beginning after December 15, 2017, including interim reporting periods within that time. For nonpublic companies, ASC 606 is effective for fiscal years ending on or after December 15, 2018, and for quarterly and interim financial statements with fiscal years ending on or after December 15, 2019. Under the new revenue-recognition standards for both U.S. GAAP and IFRS, revenue is recognized when (or as) an entity satisfies a performance obligation by transferring a promised good or service (asset) to a customer. An asset is transferred when (or as) the customer obtains control of the asset.

The core principle of the revised revenue recognition standard is that an entity should recognize revenue to depict the transfer of promised goods or services to a customer in an amount that reflects the consideration to which the entity expects to be entitled in exchange for those goods or services. A performance obligation may be satisfied at a point in time (typically for promises to transfer goods) or over time (typically for promises to transfer services). For a performance obligation satisfied over time, an entity would select an appropriate measure of progress to determine how much revenue should be recognized as the performance obligation is satisfied. This measure is in line with accrual accounting, which states that revenue should not be recognized for work that is to be performed in subsequent periods, even though the work might currently be under contract.

To achieve compliance with this standard, an entity should apply the following steps:

1. Identify the contract(s) with a customer. A *contract* is an agreement between two or more parties that creates enforceable rights and obligations. All of the following criteria must be met for a contract with a customer to exist:
 - The parties in the contract have approved the contract and are committed to perform their respective obligations.
 - The entity can identify each party's rights regarding the goods or services to be transferred.
 - The entity can identify the payment terms for the goods or services to be transferred.

- The contract has commercial substance.
 - It is probable that the entity will collect substantially all of the consideration to which it will be entitled in exchange for the goods and services that will be transferred to the customer.
2. Identify the performance obligations in the contract. A contract includes promises to transfer goods or services to a customer. If those goods or services are distinct, the promises are considered performance obligations and are to be accounted for separately.
 3. Determine the transaction price. The transaction price is the amount of consideration in a contract that an entity expects to be entitled to in exchange for transferring promised goods or services to a customer.
 4. Allocate the transaction price to the performance obligations in the contract. An entity usually allocates the transaction price to each performance obligation based on the comparative stand-alone selling prices of each distinct good or service promised in the contract. If a stand-alone selling price is not easily observable, it will need to be estimated.
 5. Recognize revenue when (or as) the entity satisfies a performance obligation. An entity recognizes revenue when (or as) it satisfies a performance obligation by transferring a promised good or service to a customer (which is when the customer obtains control of that good or service). The amount of revenue recognized is the amount allocated to the satisfied performance obligation.

One or more of these criteria is typically not met when managers recognize revenues prematurely. Examples of common problems with premature revenue recognition are set out as follows:

- Persuasive evidence of an arrangement does not exist.
- No written or verbal agreement exists.
- A verbal agreement exists, but a written agreement is customary.
- A written order exists, but it is conditional upon sale to end users (such as a consignment sale).
- A written order exists but contains a right of return.
- A written order exists, but a side letter alters the terms in ways that eliminate the required elements for an agreement.
- The transaction is with a related party, which has not been disclosed.
- Delivery has not occurred or services have not been rendered.
- Shipment has not been made, and the criteria for recognizing revenue on bill-and-hold transactions set out in FASB ASC 605-10-S99 have not been met.

- Shipment has been made, but it was made to the seller's agent, an installer, or to a public warehouse instead of the customer.
- Some, but not all, of the components required for operation were shipped.
- Items of the wrong specification were shipped.
- Delivery is not complete until installation, customer testing, and customer acceptance has occurred.
- Services have not been provided at all.
- Services are being performed over an extended period, and only a portion of the service revenues should have been recognized in the current period.
- The mix of goods and services in a contract has been misstated to improperly accelerate revenue recognition.
- The entity falsely records revenue for a satisfied performance obligation before control of the asset has been transferred to the customer.

EXAMPLE

ABC, Inc. sells products that require engineering and adapting work before they are acceptable to customers. However, the company records sales revenue before completing the engineering, testing, evaluation, and customer acceptance stages of production. In some cases, sales do not take place for weeks or months. In other cases, the sales are specifically contingent upon the customer's trial and acceptance of the product.

EXAMPLE

Another company is engaged in the design, development, manufacture, marketing, and servicing of computer peripheral subsystems. The company recognized revenue prior to a time when collection of the sales price was reasonably assured and at a time prior to completion of the underlying sales transaction.

It was the company's policy to recognize revenue when the products were shipped. However, the sales were not complete as of the time of shipment because customers were not obligated to pay for the equipment until it had been installed; the company had substantial obligations to the customers for installation and adjustments; and there remained major uncertainties concerning the customers' true willingness to complete the transaction because of the volatile nature of the high-tech product.

Sales with Conditions

Sales with conditions are those that have terms that have not been completed and those with rights and risks of ownership that have not passed to the purchaser. In most cases, such sales cannot be recorded as revenue. These types of sales are similar to schemes involving the recognition of revenue in improper periods, since the conditions for sale might become satisfied in the future, at which point revenue recognition would become appropriate.

External pressures to succeed that are placed on business owners and managers by bankers, stockholders, families, and even communities often provide the motivation to commit fraud. For example, in addition to other charges, General Electric (GE) was alleged by the SEC to have manipulated earnings for two years in a row (2002 and 2003) to meet performance targets by recording \$381 million in “sales” of locomotives to financial partners. Since GE had not relinquished ownership of the assets and had agreed to maintain and secure them on its property, the transactions were, in reality, more like loans than sales. GE settled the SEC’s charges in 2009 for \$50 million, neither admitting nor denying guilt.

Long-Term Contracts

Long-term contracts can cause special problems for revenue recognition. In some jurisdictions, for example, revenues and expenses from long-term construction contracts can be recorded using either the completed-contract method or the percentage-of-completion method, depending partly on the circumstances. The completed-contract method does not record revenue until the project is 100% complete. Construction costs are held in an inventory account until completion of the project. The percentage-of-completion method recognizes revenues and expenses as measurable progress on a project is made, but this method is particularly vulnerable to manipulation. Managers can often easily manipulate the percentage-of-completion and the estimated costs to complete a construction project to recognize revenues prematurely and conceal contract overruns.

Multiple Deliverables

Product and service sales sometimes involve multiple deliverables (or multiple-element arrangements). For example, a cell phone company provides a discounted or free cell phone to a customer who signs up for a two-year service agreement; in this situation, the deliverables include both the product (cell phone) and the service, which spans two years. In multiple-element arrangements, the seller completes the earnings process—and thus must recognize revenue—over a period of time.

Manipulating the allocation of performance obligation satisfaction among the individual components of a multiple-element arrangement to accelerate revenue recognition (by allocating more to the components to be recognized early and less to components that must be deferred to future periods) could lead to improper revenue recognition.

Channel Stuffing

A challenging area of revenue recognition is *channel stuffing*. This term refers to the sale of an unusually large quantity of a product to distributors who are encouraged to overbuy through the use of deep discounts or extended payment terms. This practice is especially attractive to industries with high gross margins—such as tobacco, pharmaceuticals, perfume, soda concentrate, and branded consumer goods—because it can increase short-term earnings. The problem, however, is that stealing from future periods' sales makes it more difficult to achieve sales goals in those future periods. The pressure to meet sales goals can, in turn, lead to increasingly disruptive levels of channel stuffing and, ultimately, to a restatement. Although orders are received, the terms of the order might raise questions about the collectibility of the accounts receivable, and any existing side agreements that grant a right of return might, effectively, turn the sales into consignment sales. Also, there might be a greater risk of returns for certain products if they cannot be sold before their shelf life ends.

This is particularly a problem for pharmaceuticals because retailers will not accept drugs that have a short shelf life remaining. As a result, channel stuffing should be viewed skeptically, since in certain circumstances it may constitute fraud. For example, the SEC filed a complaint against Bausch & Lomb, indicating that the company's internal estimates showed that it might take distributors up to two years to sell the quantity of contact lenses the company was trying to get them to purchase in the last two weeks of its fiscal year.

Recording Expenses in the Wrong Period

The timely recording of expenses is often compromised due to pressures to meet budget projections and goals or due to lack of proper accounting controls. As the expensing of certain costs is pushed into periods other than the ones in which they actually occur, they are not properly matched against the income that they help produce. For example, revenue might be recognized on the sale of certain items, but the cost of goods and services that went into the items sold might not be recorded intentionally in the accounting system until the following period. This might make the sales revenue from the transaction almost pure profit, inflating earnings. In the next period, earnings would have fallen by a similar amount.

What Red Flags Are Associated with Timing Differences (Including Improper Revenue Recognition)?

- Rapid growth or unusual profitability, especially compared to that of other companies in the same industry
- Recurring negative cash flows from operations or an inability to generate positive cash flows from operations while reporting earnings and earnings growth
- Significant, unusual, or highly complex transactions, especially those close to the period's end, that lead to difficult "substance over form" questions
- Unusual increase in gross margin or gross margin in excess of industry peers
- Unusual growth in the days' sales in receivables ratio (receivables/average daily sales)
- Unusual decline in the days' purchases in accounts payable ratio (accounts payable/average daily purchases)

Improper Asset Valuation

One way to commit financial statement fraud is to manipulate the valuation of a company's assets. Typically, a fraudster artificially increases asset accounts to strengthen the company's balance sheet and its financial ratios. In some cases, however, a fraudster might want to record false revenues, and overstated assets are simply a by-product of that scheme.

With the exception of certain securities, asset values are generally not increased to reflect current market value. It is often necessary to use estimates in accounting. For example, estimates are used in determining the residual value and the useful life of a depreciable asset, the uncollectible portion of accounts receivable, or the excess or obsolete portion of inventory. Whenever estimates are used, there is an additional opportunity for fraud by the manipulation of these estimates.

Many schemes are used to inflate current assets at the expense of long-term assets. In the case of such schemes, the net effect is seen in the current ratio, which divides current assets by current liabilities to evaluate a company's ability to satisfy its short-term obligations. By misclassifying long-term assets as short-term, the current ratio increases. This type of misclassification can be of critical concern to lending institutions that often require certain financial ratio minimums to be maintained. This is of particular consequence when the loan covenants are on unsecured or under-secured lines of credit and other short-term borrowings. Sometimes these misclassifications are referred to as *window dressing*.

Most improper asset valuations involve the fraudulent overstatement of inventory or receivables, again with the goal being to strengthen the appearance of the balance sheet. Other improper asset valuations include manipulation of the allocation of the purchase price of an acquired business to inflate future earnings, misclassification of fixed and other assets, or improper capitalization of inventory or start-up costs.

Improper asset valuations usually take the form of one of the following classifications:

- Inventory valuation
- Accounts receivable
- Business combinations
- Fixed assets

Inventory Valuation

Under many countries' accounting standards, including U.S. GAAP and IFRS, inventory should be recorded at the lower of cost, market value, or net realizable value, depending on the inventory costing method used. This means that inventory must be initially valued at its acquisition cost, except when the cost is determined to be higher than the net realizable value, in which case the difference should be recognized as a loss in earnings in the period it occurs. If the utility of the goods is no longer as great as their cost, the difference should be recognized as a loss in earnings in the period in which it occurs. This is generally accomplished by stating such goods at their market value. Failing to write down or write off inventory results in overstated assets and the mismatching of cost of goods sold with revenues.

Other methods by which inventory can be improperly stated include manipulation of the physical inventory count, inflation of the unit costs used to price out inventory, and failure to adjust inventory for the costs of goods sold. Fictitious inventory schemes usually involve the creation of fake documents, such as inventory count sheets and receiving reports. Many inventory reports are kept electronically, which allows the fraud examiner to total columns and perform data analysis techniques to detect these types of inventory fraud schemes.

In some instances, friendly co-conspirators claim to be holding inventory for companies in question. Other times, companies falsely report large values of inventory in transit, knowing that it would be nearly impossible for the auditors to observe. "Bill and hold" items that have already been recorded as sales might be included in the physical inventory count, as might goods owned by third parties but held by companies on consignment or for storage. There have been cases of fraudsters assembling pallets of inventory with hollow centers, placing

bricks in sealed boxes instead of high-value products, and shuttling inventory overnight between locations being observed by auditors on different days so as to double count the inventory. Another possible inventory inflation strategy is for companies to insert phony count sheets during the inventory observation or change the quantities on the count sheets.

Accounts Receivable

Accounts receivable are subject to manipulation in the same manner as sales and inventory, and, in many cases, the schemes are conducted together. The two most common schemes involving overstated accounts receivable are recording fictitious receivables and the failure to properly account for uncollectible customer accounts.

FICTITIOUS ACCOUNTS RECEIVABLE

Fictitious accounts receivable go hand in hand with fictitious sales, as discussed in the previous section. They are common among companies with financial problems, as well as with managers who receive a commission based on sales. The typical entry under fictitious accounts receivable is to debit (increase) accounts receivable and credit (increase) sales. Of course, these schemes are more common around the end of the accounting period, since accounts receivable are expected to be paid in cash within a reasonable time. Fraudsters commonly attempt to conceal fictitious accounts receivable by providing false confirmations of balances to auditors. They get the audit confirmations because the mailing address they provide for the phony customers is typically either a mailbox under their control, a home address, or the business address of a co-conspirator. Such schemes can be detected by using satellite imaging software, business credit reports, public records, or even the telephone book to identify customers who have no physical existence or no apparent business need for the product sold to them.

FAILURE TO ACCOUNT FOR UNCOLLECTIBLE ACCOUNTS

In general, accounts receivable should be reported at net realizable value—that is, the amount of the receivable less the amount expected not to be collected. As such, companies are generally required to write off uncollectible receivables as bad debt expense.

Managers can overstate their company's accounts receivable balance by failing to record bad debt expense. Bad debt expense is recorded to account for any uncollectible accounts receivable. The debit side of the entry increases bad debt expense, and the credit side of the entry increases the allowance (or provision) for doubtful accounts, which is a contra account that is recorded against accounts receivable. Therefore, if the controller fails to record bad debt expense, the allowance (or provision) for doubtful accounts will be understated.

For example, suppose ABC Company has total accounts receivable of \$500,000. However, management has learned one of the company's debtors is filing for bankruptcy and will likely default on its \$15,000 loan. ABC Company would need to record the following journal entry to establish the allowance (or provision) for doubtful accounts:

Date	Description	Ref.	Debit	Credit
12/31/X1	Bad debt expense	515	15,000	
	Allowance for doubtful accounts	125		15,000

Once this journal entry is made, accounts receivable is reported at net realizable value. The allowance (or provision) for doubtful accounts represents the amount expected not to be collected. It is a contra-account to accounts receivable. These two accounts are deducted to arrive at the net realizable value of accounts receivable. The net realizable value of ABC Company's receivables would be \$500,000 less \$15,000 or \$485,000.

Business Combinations

Companies are required to allocate the purchase price they have paid to acquire another business to the tangible and intangible assets of that business. Any excess of the purchase price over the value of the acquired assets is treated as goodwill. In many countries, changes in required methods of accounting for goodwill have decreased the incentive for companies to minimize the amount allocated to goodwill that previously was required to be amortized against future earnings. However, companies might still be tempted to over-allocate the purchase price to in-process research and development assets so that they can then write them off immediately. Alternatively, they might establish excessive reserves for various expenses at the time of acquisition, intending to release those excess reserves into earnings at a future date.

Fixed Assets

Fictitious fixed assets can be created by a variety of methods. They are subject to manipulation through several different schemes. Some of the more common schemes involve booking fictitious assets, misrepresenting asset values, and capitalizing non-asset costs.

BOOKING FICTITIOUS ASSETS

One of the easiest methods of asset misrepresentation is the recording of fictitious assets. This false creation of assets affects account totals on a company's balance sheet. The corresponding account commonly used is the owners' equity account. Because company

assets are often physically found in many different locations, this fraud can sometimes be easily overlooked. One of the most common fictitious asset schemes is to simply create fictitious documents. In other instances, the equipment is leased, not owned, and this fact is not disclosed during the audit of fixed assets. Fictitious fixed assets can sometimes be detected because the fixed asset addition makes no business sense.

MISREPRESENTING THE VALUE OF FIXED ASSETS

Fixed assets should be recorded at historical cost. Although assets might appreciate in value, this increase in value should generally not be recognized on company financial statements unless recognizing a gain upon sale in a separate balance sheet account. Many financial statement frauds involve the reporting of fixed assets at higher market values rather than the lower historical (acquisition) costs, or at even higher inflated values with unreasonable valuations to support them. Misrepresentation of asset values is frequently linked with other schemes.

EXAMPLE

In October 2002, the U.S. SEC filed a civil enforcement action against former Enron CFO Andrew S. Fastow, who also faced criminal charges, relating to an alleged self-enriching scheme to defraud Enron's security holders through the use of certain off-balance sheet entities. One of the six transactions in the SEC's complaint against Andrew Fastow involved Raptor I and Avici. According to the complaint, Enron and the Fastow-controlled partnership LJM2 engaged in complex transactions with an entity called Raptor I. Raptor I was used to manipulate Enron's balance sheet and income statement and to generate profits for LJM2 and Fastow at Enron's expense. In September 2000, Fastow and others used Raptor I to create a fraudulent hedging transaction and thus avoid a decrease in the value of Enron's investment in the stock of a public company called Avici Systems Inc. Specifically, Fastow and others back-dated documents to make it appear that Enron had locked in the value of its investment in Avici in August of 2000, when Avici's stock was trading at its all-time high price.

CAPITALIZING NON-ASSET COSTS

Interest and finance charges incurred in the purchase are excluded from the recorded cost of a purchased asset. For example, when a company finances a capital equipment purchase, monthly payments include both principal liability reduction and interest payments. On initial purchase, only the original cost of the asset should be capitalized. The subsequent interest payments should be charged to interest expense and not to the asset. Without a reason for intensive review, this type of fraud can go unchecked.

Understating Assets

In some cases, as with some government-related or government-regulated companies, it is advantageous to understate assets. Additional funding is often based on asset amounts. This understatement can be done directly or through improper depreciation.

Misclassifying Assets

To meet budget requirements—and for various other reasons—assets are sometimes misclassified into general ledger accounts in which they don't belong. For example, fixed assets might be fraudulently reclassified as current assets. The manipulation can create misleading financial ratios and help the company comply with loan covenants or other borrowing requirements.

What Red Flags Are Associated with Improper Asset Valuation?

The following red flags commonly indicate improper asset valuation schemes:

- Recurring negative cash flows from operations or an inability to generate positive cash flows from operations while reporting earnings and earnings growth
- Significant declines in customer demand and increasing business failures in either the industry or the overall economy
- Assets, liabilities, revenues, or expenses based on significant estimates that involve subjective judgments or uncertainties that are difficult to support
- Nonfinancial management's excessive participation in or preoccupation with the selection of accounting principles or the determination of significant estimates
- Unusual increase in gross margin or margin in excess of industry peers
- Unusual growth in the number of days' sales in receivables ratio
- Unusual growth in the number of days' purchases in inventory ratio
- Reduction in allowances (or provision) for bad debts, excess inventory, and obsolete inventory especially if relevant ratios are out of line with those of industry peers
- Unusual change in the relationship between fixed assets and depreciation
- Adding to assets while competitors are reducing capital tied up in assets

Concealed Liabilities and Expenses

Understating liabilities and expenses is one of the ways financial statements can be manipulated to make a company appear more profitable than it actually is. Because pre-tax income will increase by the full amount of the expense or liability not recorded, this financial statement fraud method can significantly affect reported earnings with relatively

little effort by the fraudster. It is much easier to commit this scheme than to falsify sales transactions. Missing transactions can also be harder for auditors to detect than improperly recorded ones since the missing transactions leave no audit trail.

There are three common methods for concealing liabilities and expenses:

- Omitting liabilities and/or expenses
- Improperly capitalizing costs rather than expensing them
- Failing to disclose warranty costs and product-return liabilities

Liability/Expense Omissions

The preferred and easiest method of concealing liabilities or expenses is to simply fail to record them. Large monetary judgments against a company from a recent court decision might be conveniently ignored. Vendor invoices might be thrown away or stuffed into drawers rather than posted into the accounts payable system, thereby increasing reported earnings by the full amount of the invoices. In a retail environment, debit memos might be created for chargebacks to vendors, supposedly to claim permitted rebates or allowances, but sometimes solely to create additional income. Whether these items are properly recorded in a subsequent accounting period does not change the fraudulent nature of the current financial statements.

Often, perpetrators of liability and expense omissions believe they can conceal their frauds in future periods. They frequently plan to compensate for their omitted liabilities with visions of other income sources, such as profits from future price increases.

Just as they are easy to conceal, omitted liabilities are probably one of the most difficult schemes to uncover. A thorough review of all post-financial-statement-date transactions, such as accounts payable increases and decreases, can aid in the discovery of omitted liabilities in financial statements, as can a computerized analysis of expense records. Additionally, if the auditor requested and was granted unrestricted access to the client's files, a physical search could turn up concealed invoices and unposted liabilities. Investigative interviews of accounts payable and other personnel can reveal unrecorded or delayed items as well.

Current accounting standards require entities to record provisions for contingent liabilities on their financial statements if a present obligation has arisen as a result of a past event, the amount of the liability can be reasonably estimated, and the likelihood of payment is probable.³

EXAMPLE

In July 2002, the U.S. SEC filed suit in the United States District Court for the Southern District of New York, charging major cable television producer Adelphia Communications Corporation (“the Company” or “Adelphia”); its founder John J. Rigas; his three sons, Timothy J. Rigas, Michael J. Rigas, and James P. Rigas; and two senior executives at Adelphia, James R. Brown and Michael C. Mulcahey, in one of the most extensive financial frauds ever to take place at a public company. The SEC charged that Adelphia, at the direction of the individual defendants, (1) fraudulently excluded over \$2.3 billion in liabilities from its consolidated financial statements by hiding them in off-balance sheet affiliates; (2) falsified operations statistics and inflated Adelphia’s earnings to meet Wall Street’s expectations; and (3) concealed rampant self-dealing by the Rigas Family, including the undisclosed use of corporate funds for Rigas Family stock purchases and the acquisition of luxury condominiums in New York and elsewhere.

With respect to the concealed liabilities, the complaint alleged that between mid-1999 and the end of 2001, John J. Rigas, Timothy J. Rigas, Michael J. Rigas, James P. Rigas, and James R. Brown, with the assistance of Michael C. Mulcahey, caused Adelphia to fraudulently exclude from the Company’s annual and quarterly consolidated financial statements over \$2.3 billion in bank debt by deliberately shifting those liabilities onto the books of Adelphia’s off-balance sheet, unconsolidated affiliates. Failure to record this debt violated financial reporting requirements and precipitated a series of misrepresentations about those liabilities by Adelphia and the defendants, including the creation of (1) sham transactions backed by fictitious documents to give the false appearance that Adelphia had actually repaid debts when, in truth, it had simply shifted them to unconsolidated Rigas-controlled entities, and (2) misleading financial statements by giving the false impression through the use of footnotes that liabilities listed in the Company’s financials included all outstanding bank debt.

³ Under U.S. GAAP, a company’s potential liability must only be disclosed in the notes to the financial statements if it is reasonably possible that a change in an entity’s estimate of its probable liability could occur in the near term. Under IAS 37, *Provisions, Contingent Liabilities and Contingent Assets*, contingent liabilities are disclosed unless the possibility of an outflow of economic benefits is remote.

In November 2002, in exchange for his testimony against the Rigas men, James Brown was released from prosecution by consenting to an entry of a permanent injunction against him for U.S. securities law violations. Additionally, Brown has been permanently barred from becoming an officer or director of a public corporation.

In July 2004, after a three-month trial, a federal jury convicted John and Timothy Rigas of conspiracy, securities fraud, and bank fraud. John Rigas received a 15-year prison sentence and was fined \$2,300, and Timothy Rigas was sentenced to 20 years in prison. James Rigas was never criminally charged by the Court. In November 2005, Michael Rigas pleaded guilty to a charge of making a false entry in a financial record.

In April 2005, the SEC filed permanent injunctions against John, Timothy, Michael, and James Rigas, as well as James Brown, Michael Mulcahey, and Adelphia Communications Corporation. The defendants were charged with violating anti-fraud, periodic reporting, recordkeeping, and internal control provisions of U.S. securities laws. In addition, the Rigas family members were barred from ever holding officer or director positions in a public company.

Improperly Capitalized Costs

All organizations incur costs. How to record these costs on the books, however, is not always clear. Suppose ABC Company has a piece of property in need of some repairs. If the work performed simply fixes any problems and brings the property back to its original state, then the costs associated with the repair would appear as an expense on the income statement in the year they were incurred. Net income would be reduced by this amount, and the balance sheet would remain unaffected.

However, suppose work is done that not only repairs but increases the value of the property. Any expenditures made that increase the book value of the property would need to be capitalized. In other words, these costs would be added to the asset value on ABC's balance sheet and then depreciated as an expense over time.

Either way, the costs associated with repairs or improvements are on ABC's income statement as an expense. The difference is in the timing. Capitalizing an expenditure and depreciating it over a number of years makes a significant difference in the bottom line of the financial statements in the year the work was done. Conversely, expensing the same amount of costs in the same year results in a much lower net income that year.

Improperly capitalizing expenses is another way to increase income and assets and make the entity's financial position appear stronger. If ineligible expenditures are capitalized as assets and not expensed during the current period, income will be overstated. As the assets are depreciated, income in following periods will be understated.

EXAMPLE

In November 2002, the U.S. SEC filed an amended complaint against WorldCom, Inc., broadening its charges to allege that WorldCom misled investors from at least as early as 1999 through the first quarter of 2002. The complaint stated that the company had acknowledged that during that period WorldCom materially overstated the income it reported on its financial statements by approximately \$9 billion, mainly using two methods. First, WorldCom reduced its operating expenses by improperly releasing as a credit to operating expenses certain provisions previously established for line costs and for taxes. Second, the company improperly reduced its operating expenses by reassigning certain expenses as capital assets. Much of the \$9 billion related to improper accounting for "line costs," which were among WorldCom's major operating expenses. The SEC complaint alleges that, in a scheme directed and approved by members of senior management, WorldCom concealed the true extent of its "line costs." By improperly reducing provisions held against "line costs" and by transferring certain "line costs" to its capital asset accounts, WorldCom falsely portrayed itself as a profitable business when it was not and concealed large losses. These improper accounting practices were designed to inflate income to correspond with estimates by Wall Street analysts and to support the price of WorldCom's stock.

In March 2005, former WorldCom chief executive officer (CEO) Bernard Ebbers was convicted of one count of conspiracy, one count of securities fraud, and seven counts of false regulatory filing, and was later sentenced to 25 years in prison. He also agreed to forfeit nearly all of his personal assets to settle a civil suit filed by angry WorldCom investors.

Scott Sullivan, the former CFO under Ebbers and "the architect" behind the fraud scheme, pled guilty to fraud charges and agreed to testify against Ebbers. Due to his cooperation during the investigation, he was sentenced to only five years in prison. He also agreed to forfeit the proceeds from the sale of his \$10 million home, along with his investment holdings, to settle the civil suit brought by shareholders.

Former WorldCom Controller David F. Myers and former Director of General Accounting Buford "Buddy" Yates, Jr., pled guilty to criminal charges prosecuted by the U.S. Attorney's

Office for the Southern District of New York. Myers received a sentence of one year and one day in prison. Yates was also sentenced to one year and one day in prison and ordered to pay a \$5,000 fine. Additionally, each man was permanently enjoined from acting as an officer or director of any public company and was suspended from practicing before the SEC as an accountant, under Rule 102(2) of the Commission's Rules of Practice.

The SEC also brought civil actions against Betty L. Vinson, certified public accountant (CPA), and Troy M. Normand, former members of the WorldCom General Accounting Department. Both were permanently charged with securities violations. Vinson was suspended from appearing or practicing before the SEC as an accountant. In addition, she pled guilty to one count of securities fraud and one count of conspiracy to commit securities fraud, which led to a sentence of five months in prison and five months of house arrest. Normand pled guilty to similar charges and received three years of probation for his role in the fraud.

EXPENSING CAPITAL EXPENDITURES

Just as capitalizing expenses is improper, so is expensing costs that should be capitalized. The organization might want to minimize its net income due to tax considerations or to increase earnings in future periods. Expensing an item that should be depreciated over a period of time helps to accomplish just that—net income is lower and, therefore, so are taxes.

Unrecorded and Undisclosed Warranty Costs and Product-Return Liabilities

Improper recording of warranty and product-return liabilities occurs when a company fails to accrue the proper expenses and related liabilities for potential product returns or warranty repairs. It is inevitable that a certain percentage of products sold will, for one reason or another, be returned.

The accounting treatment for warranties and product-return liabilities differs globally. When products are returned at public companies in the United States, management must record the related expense as a contra-sales account, which reduces the amount of net sales presented on the company's income statement. In countries governed by International Accounting Standards (IAS), management must recognize a provision for the best estimate of the costs of making goods under the warranty products sold before the end of the reporting period. The provision may be estimated based on an analysis of historical data (relation between types of products sold and warranty expenses) or on a subsequent review of quality issues around the reporting date.

Likewise, when a company offers a warranty on product sales, it must estimate the amount of warranty expense it reasonably expects to incur over the warranty period and accrue a liability for that amount. In warranty liability fraud, the warranty liability is usually either omitted altogether or substantially understated. Another similar area is the liability resulting from defective products (product liability).

What Red Flags Are Associated with Concealed Liabilities and Expenses?

The following red flags are indicators of concealed liabilities and expenses schemes:

- Recurring negative cash flows from operations or an inability to generate positive cash flows from operations while reporting earnings and earnings growth
- Assets, liabilities, revenues, or expenses based on significant estimates that involve subjective judgments or uncertainties that are difficult to support
- Nonfinancial management's excessive participation in or preoccupation with the selection of accounting principles or the determination of significant estimates
- Unusual increase in gross margin or margin in excess of industry peers
- Allowances/provisions for sales returns, warranty claims, etc., that are shrinking in percentage terms or are otherwise out of line with industry peers
- Unusual reduction in the number of days' purchases in accounts payable ratio
- Reducing accounts payable while competitors are stretching out payments to vendors

Improper Disclosures

Accounting principles require that financial statements include all the information necessary to prevent a reasonably discerning user of the financial statements from being misled. Clearly, this principle is subject to the professional judgment of the accountants and management preparing the financial statements. Events, transactions, and policy changes that are likely to have a *material impact* on the entity's financial position must be disclosed. The financial statement notes should include narrative disclosures, supporting schedules, and any other information required to avoid misleading potential investors, creditors, or any other users of the financial statements.

Management has an obligation to disclose all significant (material) information appropriately in the financial statements and in management's discussion and analysis (MD&A). In addition, the disclosed information must not be misleading. Improper disclosures resulting in financial statement fraud usually involve the following:

- Contingent liabilities
- Subsequent events

- Management fraud
- Related-party transactions
- Accounting changes

Contingent Liabilities

Typical omissions include the failure to disclose loan covenants or contingent liabilities. Loan covenants are agreements, in addition to or as part of a financing arrangement, that a borrower has promised to keep as long as the financing is in place. The agreements can contain various types of covenants, including certain financial ratio limits and restrictions on other major financing arrangements. Contingent liabilities are potential obligations that will materialize only if certain events occur in the future. A corporate guarantee of personal loans received by a company officer and potential losses from ongoing litigation are examples of contingent liabilities that must be disclosed. Current accounting standards require entities to disclose contingent liabilities in the notes to the financial statements if it is possible that an outflow of cash will be required to settle a present obligation in the future.

Subsequent Events

Events occurring or becoming known after the close of the period that could have a significant effect on the entity's financial position must be disclosed. Fraudsters typically avoid disclosing court judgments and regulatory decisions that undermine the reported values of assets, that indicate unrecorded liabilities, or that adversely reflect upon management's integrity. A review of subsequent financial statements, if available, might reveal whether management improperly failed to record a subsequent event that it had knowledge of in the previous financial statements. Public record searches can also help reveal this information.

Management Fraud

Management has an obligation to disclose to the shareholders significant frauds committed by officers, executives, and others in positions of trust. Withholding such information from auditors would constitute lying to auditors, which is an illegal act.

Related-Party Transactions

Related-party transactions are business deals or arrangements between two parties who hold a pre-existing connection prior to the transaction. These transactions generally occur when a company does business with another entity whose management or operating policies can be controlled or significantly influenced by the company or by some other party in

common. There is nothing inherently wrong with related-party transactions, as long as they are fully disclosed. If the transactions are not fully disclosed, the company might injure its shareholders by engaging in economically harmful dealings without their knowledge.

The financial interest that a company official might have might not be readily apparent. For example, common directors of two companies that do business with each other, any corporate general partner and the partnerships with which it does business, and any controlling shareholder of the corporation with which they do business may be related parties. Family relationships can also be considered related parties, such as all direct descendants and ancestors, without regard to financial interests. Related-party transactions are sometimes referred to as *self-dealing*.

EXAMPLE

In September 2002, the U.S. SEC charged former top executives of Tyco International Ltd., including former CEO L. Dennis Kozłowski, with violating the U.S. securities laws by failing to disclose to shareholders hundreds of millions of dollars of low-interest and interest-free loans they took from the company, and in some cases, never repaid. The SEC complaint, which also charged former Tyco CFO Mark H. Swartz and Chief Legal Officer (CLO) Mark A. Belnick, alleges that the three former executives also sold shares of Tyco stock valued at millions of dollars while their self-dealing remained undisclosed. The complaint alleges numerous improper transactions, such as Kozłowski's use of \$242 million of loans for unauthorized purposes that included funding an extravagant lifestyle. With these undisclosed loans, Kozłowski allegedly amassed millions of dollars in fine art, yachts, and estate jewelry, as well as a \$31 million Park Avenue apartment and a lavish estate in Nantucket. Kozłowski and Swartz allegedly engaged in undisclosed non-arm's-length real estate transactions with Tyco or its subsidiaries and received undisclosed compensation and perquisites, including forgiveness of multimillion-dollar loans, rent-free use of large New York apartments, and use of corporate aircraft for personal purposes at little or no cost.

In July 2004, Belnick was acquitted of all the charges brought against him. In a separate trial, Kozłowski and Swartz were each found guilty of 22 charges, including grand larceny, falsifying business records, conspiracy, and securities fraud, and were sentenced to eight and one-third to 25 years in prison.

Accounting Changes

In general, three types of accounting changes must be disclosed to avoid misleading the user of financial statements: changes in accounting principles, estimates, and reporting entities.

Although the required treatment for these accounting changes varies for each type and across jurisdictions, they are all susceptible to manipulation. For example, fraudsters might fail to properly restate financial statements retroactively for a change in accounting principle if the change causes the company's financial statements to appear weaker. Likewise, they might fail to disclose significant changes in estimates such as the useful life and estimated salvage values of depreciable assets or the estimates underlying the determination of warranty or other liabilities. They might even secretly change the reporting entity by adding entities owned privately by management or by excluding certain company-owned units to improve reported results.

Backdating Stock Options

As a supplement to salary, companies frequently offer employees stock options, which grant the recipient the privilege to purchase a share of the company's stock at a future date for a specific price called the *strike price*. A strike price is the value of a share at a particular date. Generally, the strike price is set at the price of the underlying stock on the day the option is granted; therefore, the option becomes valuable only with future increases in the stock price.

In this way, companies grant stock options as an incentive for employees to enhance company performance and thus raise the stock price. The practice of backdating stock options, however, gives the employee a chance to profit by purchasing stock at past low prices, providing an immediate payoff. Backdating stock options occurs when a company alters the date of the grant to a time when the stock was trading at a lower price in the interest of making the option instantly valuable and further increasing the employee's gain if the stock price continues to rise.

EXAMPLE

On June 1, 20X1, Company XYZ grants its CEO a stock option that provides the executive the right to purchase one hundred shares of XYZ stock on January 1, 20X2 for the strike price. Per its usual policy, the strike price is set at the price of the company stock on the date of the option grant. On June 1, 2008 (the grant date), XYZ stock was trading at \$40 per share. Therefore, if the stock price increases to \$45 per share by January 1, 20X2, the CEO could exercise the option and purchase the shares for \$40 per share, and then sell them immediately on the market for \$45 per share, resulting in a gain of \$5 per share. However, the company has recently experienced a dramatic increase in its share price. On May 24,

20X1, the stock was trading for \$15 per share. To provide the CEO with an opportunity to exploit this increase in share price, the company chooses to backdate the stock options to make it appear that they were granted on May 24, 20X1. Because the strike price is set at the price of the stock on the option grant date, the strike price is effectively changed to \$15 per share. As a result, the CEO now has the option to buy one hundred shares of XYZ stock on January 1, 20X2 for \$15 per share. Thus, the CEO has immediately gained \$25 per share (the difference between the stock price on the actual grant date of June 1 and the stated grant date of May 24) based solely on the manipulation of the grant date used.

Backdating is not necessarily illegal but can be if not handled appropriately. To be legal, the practice typically must be explicitly reported to shareholders and the government; failure to do so could constitute securities fraud. To help address the possibility of this type of illegal activity, auditors should assess the information obtained from the audit to determine if there is a need for further audit procedures to test for stock option backdating.

What Red Flags Are Associated with Improper Disclosures?

The following red flags might indicate improper disclosures:

- Domination of management by a single person or small group (in a nonowner-managed business) without compensating controls
- Ineffective board of directors or audit committee oversight over the financial reporting process and internal control
- Ineffective communication, implementation, support, or enforcement of the entity's values or ethical standards by management or the communication of inappropriate values or ethical standards
- Rapid growth or unusual profitability, especially compared to that of other companies in the same industry
- Significant, unusual, or highly complex transactions, especially those close to a period's end that pose difficult "substance over form" questions
- Significant related-party transactions not in the ordinary course of business or with related entities either not audited or audited by a different firm
- Significant bank accounts or subsidiary or branch operations in tax-haven jurisdictions for which there appears to be no clear business justification
- Overly complex organizational structure involving unusual legal entities or managerial lines of authority

- Known history of violations of securities laws or other laws and regulations, or claims against the entity, its senior management, or board members alleging fraud or violations of laws and regulations
- Recurring attempts by management to justify marginal or inappropriate accounting on the basis of materiality
- Formal or informal restrictions on the auditor that inappropriately limit access to people or information, or limit the auditor's ability to communicate effectively with those charged with governance

What Red Flags Are Associated with Financial Statement Fraud in General?

Red flags associated with particular financial statement fraud schemes have been discussed previously. There are many red flags associated with financial statement fraud generally. An extensive list of such red flags can be found in the appendix to both AU-C Section 240, *Consideration of Fraud in a Financial Statement Audit*, and ISA 240, *The Auditor's Responsibilities Relating to Fraud in an Audit of Financial Statements*, where they are called "fraud risk factors." Some red flags indicate increased vulnerability to financial statement fraud; others indicate a greater likelihood that financial statement fraud has occurred.

Some of the more significant red flags are:

- Domination of management by a single person or small group (in a nonowner-managed business) without compensating controls
- Profitability or trend level expectations of investment analysts, institutional investors, significant creditors, or other external parties (particularly expectations that are unduly aggressive or unrealistic), including expectations created by management in, for example, overly optimistic press releases or annual report messages
- Ineffective communication, implementation, support, or enforcement of the entity's values or ethical standards by management, or the communication of inappropriate values or ethical standards
- Recurring negative cash flows from operations or an inability to generate positive cash flows from operations while reporting earnings and earnings growth
- Rapid growth or unusual profitability, especially compared to that of other companies in the same industry
- Significant, unusual, or highly complex transactions, especially those close to a period's end that pose difficult "substance over form" questions

- Significant related-party transactions not in the ordinary course of business or with related entities not audited or audited by another firm
- Recurring attempts by management to justify marginal or inappropriate accounting on the basis of materiality
- Formal or informal restrictions on the auditor that inappropriately limit access to people or information, or limit the ability of the auditor to communicate effectively with those charged with governance

Detection of Fraudulent Financial Statement Schemes

To better understand basic accounting concepts and to see how an analysis of accounting records and procedures can reveal a fraud, consider the following example:

EXAMPLE

Jackson Hardware Supply is a medium-sized plumbing and electrical wholesale distributor. On December 31, the balance sheet and income statement were as follows:

***Jackson Hardware Supply
Balance Sheet
As of December 31***

<u>Assets</u>		<u>Liabilities and Owners' Equities</u>	
Cash	\$2,427,000	Liabilities	
Accounts Receivable	300,000	Accounts Payable	\$ 300,000
Inventory	300,000	Salaries Payable	70,000
Supplies	11,000	Rent Payable	50,000
Prepaid Insurance	44,000	Deferred Taxes Payable	<u>438,000</u>
Equipment	<u>440,000</u>	Total Liabilities	858,000
		Owners' Equities	
		Common Stock	\$2,000,000
		Retained Earnings	<u>664,000</u>
		Total Owners' Equity	<u>2,664,000</u>
Total Assets	<u>\$3,522,000</u>	Total Liabilities and Owners' Equity	<u>\$3,522,000</u>

Jackson Hardware Supply
Income Statement
For the Year Ending December 31

Revenues

Sales Revenue	\$3,470,000	
Cost of Goods Sold	<u>(2,100,000)</u>	
Gross Profit from Sales	1,370,000	
Rent Revenue	<u>10,000</u>	
Gross Profit		\$1,380,000

General and Administrative Expenses

Insurance Expense	\$4,000	
Salary Expense	220,000	
Supplies Expense	14,000	
Rental Expense	<u>40,000</u>	
Total General and Administrative Expenses		<u>(278,000)</u>
Net Income Before Taxes		1,102,000
Income Taxes		<u>(438,000)</u>
Net Income		<u>\$664,000</u>

An anonymous tip was received that the paymaster, a long-time trusted employee, is stealing cash from the company. Lately, he has been seen driving a new BMW and has taken expensive vacations. The president of the company wants to follow up on the tip and asks the fraud examiner to determine if the paymaster has been stealing. Although there are several ways to proceed with the investigation, the fraud examiner with accounting knowledge decides to first compare this year's total salary expense with last year's balance. He theorizes that if the paymaster is dishonest, he might be concealing the theft in the salaries expense account. Past experience has taught the fraud examiner to look in the most obvious place first.

The fraud examiner notes that the balance of \$220,000 in the salary expense account this year is significantly larger than the \$180,000 balance last year. He asks the owner if there was an increase in the number of employees and how large across-the-board raises were this year. He discovers that the workforce did not increase and all employees, including the owner, received 10% raises. He recalculates this year's salaries by increasing last year's salaries 10% and determines that the balance in the salary expense account should be approximately \$198,000 ($\$180,000 \times 1.10 = \$198,000$). He now believes that excess salaries went to someone.

The next step is to follow the overstatement in salary expense backward from the income statement through the accounts and journal entries to the source documents—the payroll checks, in this case. He finds that there are 12 checks payable to John Doe, an employee who quit in January of last year. He compares the endorsements on John Doe's checks with those on the paymaster's checks and notices distinct similarities in the signatures. Armed with this evidence, he interviews the paymaster, who confesses that he has stolen \$22,000 and concealed the theft by issuing payroll checks to a nonexistent employee, checks that he subsequently endorsed and cashed.

Obviously, this example is relatively simple; but most fraud schemes are simple, especially for a fraud examiner who understands concealment techniques and accounting concepts.

Other detection techniques are available for determining if the paymaster is stealing. These include running a report of all employees who do not elect insurance coverage and other payroll withholdings (withholdings on fictitious employees create additional concealment problems for perpetrators), having someone else distribute the checks, and examining identification numbers of all active employees. Any of these methods might have revealed the false paychecks to John Doe. The approach shows, however, how an understanding of accounting can be invaluable for detecting fraud.

Financial Statement Analysis

Comparative financial statements provide information for current and past accounting periods. Accounts expressed in whole dollar amounts yield a limited amount of information. The conversion of these numbers into ratios or percentages allows the reader of the statements to analyze them based on their relationship to each other; in addition, it allows the reader to more readily compare current performance with past performance. In fraud detection and investigation, the determination of the reasons for relationships and changes in amounts can be important. These determinations are the red flags that point a fraud examiner in the direction of possible fraud. If large enough, a fraudulent misstatement can affect the financial statements in such a way that relationships between the numbers become questionable. Many schemes are detected because the financial statements do not make sense when analyzed closely. Financial statement analysis includes the following:

- Vertical analysis
- Horizontal analysis
- Ratio analysis

Vertical Analysis

Traditionally, there are two methods of percentage analysis of financial statements: horizontal and vertical analysis. *Vertical analysis* is a technique for analyzing the relationships among the items on an income statement, balance sheet, or statement of cash flows during a specific accounting period by expressing components as percentages of a specified base value within the statement being analyzed. This method is often referred to as *common sizing* financial statements because it allows an analyst to compare entities of different sizes more easily. In the vertical analysis of an income statement, total sales are the base value and are assigned 100%. This means that every line item on the income statement is stated as a percentage of total sales. On the balance sheet, total assets are assigned 100% on the asset side and total liabilities and equity are expressed as 100%. In turn, each line item on the balance sheet is stated as a percentage of total assets (or total liabilities and equity). Vertical analysis of a cash flow statement shows each cash inflow or outflow as a percentage of the total cash inflows. Vertical analysis emphasizes the relationship of statement items within each accounting period. These relationships can be used with historical averages to determine statement anomalies.

Horizontal Analysis

Horizontal analysis is a technique for analyzing the percentage change in individual financial statement line items from one accounting period to the next. The first period in the analysis is considered the base period, and the changes in the subsequent period are computed as a percentage of the base period. If more than two periods are presented, each period's changes are computed as a percentage of the preceding period. The resulting percentages are then studied in detail. As is the case with vertical analysis, this technique does not work for small, immaterial frauds.

The following is an example of financial statements that are analyzed using both horizontal and vertical analysis:

BALANCE SHEET*Vertical Analysis**Horizontal Analysis*

	<u>Year One</u>		<u>Year Two</u>		<u>Change</u>	<u>%Change</u>
Assets						
Current Assets						
Cash	45,000	14%	15,000	4%	(30,000)	-67%
Accts Receivable	150,000	45%	200,000	47%	50,000	33%
Inventory	75,000	23%	150,000	35%	75,000	100%
Fixed Assets (net)	60,000	18%	60,000	14%	-	0%
Total	<u>330,000</u>	100%	<u>425,000</u>	100%	<u>95,000</u>	29%
Acc'ts Payable	95,000	29%	215,000	51%	120,000	126%
Long-term Debt	60,000	18%	60,000	14%	-	0%
Stockholder's Equity					-	
Common Stock	25,000	8%	25,000	6%	-	0%
Paid-in Capital	75,000	23%	75,000	18%	-	0%
Retained Earnings	<u>75,000</u>	23%	<u>50,000</u>	12%	<u>(25,000)</u>	-33%
Total	<u>330,000</u>	100%	<u>425,000</u>	100%	<u>95,000</u>	29%

INCOME STATEMENT*Vertical Analysis**Horizontal Analysis*

	<u>Year One</u>		<u>Year Two</u>		<u>Change</u>	<u>%Change</u>
Net Sales	250,000	100%	450,000	100%	200,000	80%
Cost of Goods Sold	<u>125,000</u>	50%	<u>300,000</u>	67%	<u>175,000</u>	140%
Gross Margin	125,000	50%	150,000	33%	25,000	20%
Operating Expenses						
Selling Expenses	50,000	20%	75,000	17%	25,000	50%
Administrative Expenses	<u>60,000</u>	24%	<u>100,000</u>	22%	<u>40,000</u>	67%
Net Income	<u>15,000</u>	6%	<u>(25,000)</u>	-6%	<u>(40,000)</u>	-267%

Additional Information

Average Net Receivables	155,000	210,000
Average Inventory	65,000	130,000
Average Assets	330,000	425,000

In the example, we can observe that accounts payable makes up 29% of total liabilities in Year One. Historically, we might find that this account averages slightly over 25% of total liabilities. In Year Two, accounts payable, as a percentage of total liabilities, increased to 51%. Although this increase might be explainable through a correlation with a rise in sales, such a significant increase could also be the starting point of a fraud examination. Source documents should be examined to determine the reason for the rise in this percentage. With this type of examination, fraudulent activity might be detected. The same type of change can be seen as selling expenses decline as a percentage of sales in Year Two from 20% to 17%. Again, this change might be explainable, but close examination could point a fraud examiner to uncover fictitious sales since there was not a corresponding increase in selling expenses.

It is important to consider the dollar amount of change as well as the percentage when conducting a horizontal analysis. A 5% change in an account with a very large dollar amount could actually be much more of a change than a 50% change in an account with much less activity.

In the example, it is obvious that the 80% increase in sales has a much greater corresponding increase in cost of goods sold, which rose 140%. These accounts are often used to hide fraudulent expenses, withdrawals, or other illegal transactions.

Ratio Analysis

Ratio analysis is a means of measuring the relationship between any two different financial statement amounts. The relationship and comparison are the keys to the analysis. Many professionals, including bankers, investors, and business owners, as well as major investment firms, use this method. Ratio analysis allows for internal evaluations using financial statement data. Traditionally, financial statement ratios are compared to an entity's industry averages. The ratios and comparisons can be very useful in detecting red flags for a fraud examination.

If the financial ratios present a significant change from one year to the next or over a period of years, it becomes obvious that there could be a problem. As in all other analyses, specific changes are often explained by changes in the business operations. If a change in specific ratios is detected, the appropriate source accounts should be researched and examined in detail to determine if fraud has occurred. For instance, a significant decrease in a company's current ratio might point to an increase in current liabilities or a reduction in assets, both of which could be used to cover fraud.

In financial statement analysis, each reader of a statement will determine which portions are most important. Like the financial statement analysis discussed previously, the analysis of ratios is limited by its inability to detect fraud on a smaller, immaterial scale. Some of the types of financial ratio comparisons are shown in the following section.

Many of the possible ratios are used in industry-specific situations, but the nine comparisons described here are ratios that might lead to the discovery of fraud. The following calculations are based on the financial statement example presented earlier:

Common Financial Ratios

CURRENT RATIO

$$\frac{\text{Current assets}}{\text{Current liabilities}}$$

The current ratio—current assets divided by current liabilities—is probably the most commonly used liquidity ratio in financial statement analysis. This comparison measures a company's ability to meet present obligations from its liquid assets; specifically, the current ratio measures the amount of times current assets would be able to pay back current liabilities.

In detecting fraud, this ratio can be a prime indicator that the accounts involved have been manipulated. Embezzlement will cause the ratio to decrease, and liability concealment will cause a more favorable ratio.

In the case example, the drastic change in the current ratio from Year One (2.84) to Year Two (1.70) should cause a fraud examiner to look at these accounts in more detail. For instance, a check-tampering scheme will usually result in a decrease in cash, a current asset, which will in turn decrease the ratio.

QUICK RATIO

$$\frac{\text{Cash} + \text{securities} + \text{receivables}}{\text{Current liabilities}}$$

The quick ratio, commonly referred to as the *acid test ratio*, compares quick assets (i.e., those that can be immediately liquidated) to current liabilities. This calculation divides the total of cash, securities, and receivables by current liabilities to yield a measure of a company's ability to meet sudden cash requirements. It is important to note that while the current ratio includes inventory in its current assets, the quick ratio does not. Thus, the quick ratio offers a more conservative view of a company's liquidity because it excludes inventory and other current assets that are more difficult to rapidly turn into cash.

A fraud examiner will analyze the quick ratio for fraud indicators. In Year One of the example, the company balance sheet reflects a quick ratio of 2.05. This ratio drops to 1.00 in Year Two. In this situation, a closer review of accounts receivable shows it is increasing at an unusual rate, which could indicate that fictitious accounts receivable have been added to inflate sales. Of more concern, perhaps, is the increase in accounts payable, which at a minimum might require a closer review to determine why this increase took place.

ACCOUNTS RECEIVABLE TURNOVER

$$\frac{\text{Net sales on account}}{\text{Average net receivables}}$$

Accounts receivable turnover is defined as net sales on account—total sales on account less cost of returns, allowances, and discounts—divided by average net receivables. It measures the number of times accounts receivable is turned over during the accounting period. In other words, it measures a firm's effectiveness in extending credit and in collecting debts on that credit. This ratio is one that uses both income statement and balance sheet accounts in its analysis. If the fraud includes fictitious sales, this fraudulent income will never be collected. As a result, the turnover of receivables will decrease.

COLLECTION RATIO

$$\frac{365}{\text{Receivable turnover}}$$

Accounts receivable aging is measured by the collection ratio. It divides 365 days by the receivable turnover ratio to arrive at the average number of days it takes to collect receivables. In general, the lower the collection ratio, the faster receivables are collected. A fraud examiner might use this ratio as a first step in detecting fictitious receivables or larceny and skimming schemes. Normally, this ratio will stay fairly consistent from year to year, but changes in billing policies or collection efforts could cause a fluctuation. The example shows a favorable reduction in the collection ratio from 226.3 in Year One to 170.33 in Year Two. This means that the company is collecting its receivables more quickly in Year Two than in Year One.

INVENTORY TURNOVER

$$\frac{\text{Cost of goods sold}}{\text{Average inventory}}$$

The relationship between a company's cost of goods sold and average inventory is shown through the inventory turnover ratio. This ratio measures the number of times inventory is sold during the period. This ratio is a good determinant of purchasing, production, and sales efficiency. In general, a higher inventory turnover ratio is considered more favorable. For example, if cost of goods sold has increased due to theft of inventory (ending inventory has declined, but not through sales), then this ratio will be abnormally high. In the case example, inventory turnover increases in Year Two, signaling the possibility that an embezzlement is buried in the inventory account. A fraud examiner should investigate the changes in the ratio's components to determine where to look for possible fraud.

AVERAGE NUMBER OF DAYS INVENTORY IS IN STOCK

$$\frac{365}{\text{Inventory turnover}}$$

The average number of days inventory is in stock ratio is a restatement of the inventory turnover ratio expressed in days. This rate is important for several reasons. An increase in the number of days that inventory stays in stock causes additional expenses, including storage costs, risk of inventory obsolescence, and market price

reductions, as well as interest and other expenses incurred due to tying up funds in inventory stock. Inconsistency or significant variance in this ratio is a red flag for fraud investigators. Fraud examiners might use this ratio to examine inventory accounts for possible larceny schemes. Purchasing and receiving inventory schemes can affect the ratio. Understating the cost of goods sold will result in an increase in the ratio as well. Significant changes in the inventory turnover ratio are good indicators of possible fraudulent inventory activity.

DEBT-TO-EQUITY RATIO

$$\frac{\text{Total liabilities}}{\text{Total equity}}$$

The debt-to-equity ratio is computed by dividing total liabilities by total equity. This financial leverage ratio is one that is heavily considered by lending institutions. It provides a better understanding of the relative risk assumed by the creditors and owners. The higher the ratio, the more difficult it will be for the owners to raise capital by increasing long-term debt. Debt-to-equity requirements are often included as borrowing covenants in corporate lending agreements. The example displays a very favorable Year One ratio of 0.89. Year Two, however, shows a ratio of 1.84, which indicates that debt is greatly increasing. In this case, the increase in the ratio corresponds with the rise in accounts payable. Sudden changes in this ratio might signal a fraud examiner to look for fraud.

PROFIT MARGIN

$$\frac{\text{Net income}}{\text{Net sales}}$$

The profit margin ratio is defined as net income divided by net sales. This ratio is often referred to as the efficiency ratio in that it reveals profits earned per dollar of sales. This percentage of net income to sales relates not only the effects of gross margin changes, but also changes to sales and administrative expenses. As fraud is committed, net income will be artificially overstated, and the profit margin ratio will be abnormally high. False expenses and fraudulent disbursements will cause an increase in expenses and a decrease in the profit margin ratio. Over time, this ratio should be fairly consistent.

ASSET TURNOVER

$$\frac{\text{Net sales}}{\text{Average total assets}}$$

The asset turnover ratio is used to determine the efficiency with which assets are used during the period. The asset turnover ratio is typically calculated by dividing net sales by average total assets (net sales / average total assets). However, average operating assets can also be used as the denominator (net sales / average operating assets). The case example displays a greater use of assets in Year Two than in Year One.

By performing a financial statement analysis, the fraud examiner might be directed toward the direct evidence to resolve an allegation of fraud. After the analysis, the fraud examiner can

select statistical samples in the target account and eventually examine the source documents. If an irregularity of overstatement is suspected, the fraud examiner should begin the examination with the financial statements. If, however, an irregularity of understatement is suspected, the fraud examiner should begin the examination with a review of the source documents. This rule of thumb is especially effective in the area of omission of liabilities, such as litigation, contingent liabilities, leases, and some product warranties.

The asset turnover ratio is one of the more reliable indicators of financial statement fraud. A sudden or continuing decrease in this ratio is often associated with improper capitalization of expenses, which increases the denominator without a corresponding increase in the numerator.

Inflating revenue is the most common form of financial statement fraud, but overstated sales are most often accompanied by inflated assets (e.g., phony accounts receivable). This adds equal amounts to both the numerator and denominator of the total asset turnover, which affects the ratio, but not as strongly as when just a numerator or denominator are affected. Accordingly, increases in the total asset turnover have less of a correlation with overstatement of sales than do decreases with false capitalization of costs.

Tax Return Review

Tax returns are good sources of additional and comparative information on the business's operations. A complete review and comparison to the financial statement could provide information unknown to the lender or disclose unexplained discrepancies. Again, the lack of properly prepared or timely filed tax returns could be a method of stalling by not providing the required information. Most perpetrators of fraud are reluctant to continue the deception and falsify a tax return. Year-after-year extensions and filing of the tax returns on the last possible date could be a ploy to cover up financial statement and tax return differences.

Interviews in Fraudulent Financial Statement Cases

For in-depth interviewing techniques, please refer to the "Interview Theory and Application" chapter in the Investigation section of the *Fraud Examiners Manual*.

Financial statement fraud does not occur in an isolated environment. People in organizations who have both motive and opportunity are the prime candidates to commit fraudulent misstatement. In the overwhelming majority of situations, two key managers participate actively

in the fraud: the chief executive officer (CEO) and the chief financial officer (CFO). Others become involved largely out of necessity. Those who are not directly involved most often are not aware that anything is wrong.

Investigations of financial statement frauds are unique in that they almost always involve interviewing the executive management of the organization. To detect or deter financial statement fraud, it is absolutely necessary that top management be interviewed by a competent and experienced fraud examiner who possesses the ability to solicit honest answers to tough—but vital—questions about whether anyone has tampered with the books.

Interviewing Techniques

Situations in which accountants are tempted to misstate financial statements most often involve pressure connected with financial performance. The following is a fictitious conversation between upper managers of a corporation. The example shows how the pressure to commit financial statement fraud can greatly influence accounting personnel.

CFO: (To CEO) "Boss, it looks like we will not have a good year financially. We told the shareholders (or bank) that our earnings would be \$4 a share, and it looks like we'll be very lucky to even make \$3."

CEO: "Well, what are we going to do about it? If we miss the earnings projections (or don't get the loan) it won't look good for the company; we'll both lose our jobs. We must get those earnings up to where they should be."

CFO: "What do you mean?"

CEO: "What I mean is that it is your job to bring in the numbers. You're going to have to find a way to get them up. I'm sure we can probably make up the difference next year, but for now, you get our earnings/assets/equity up however you have to. All financial statements are essentially estimates anyhow. So you figure out how to 'estimate' the numbers more in our favor. I don't know how to do it, and I don't want you to tell me. But get it done."

The CFO faces the dilemma of either falsifying the records or losing her job. The CFO's actions are very hard to predict. If she chooses to falsify the records, chances are she will need to enlist the aid of accounting and clerical personnel to execute her plan, even if these

employees do not know what they are actually doing. For example, the CFO might tell the chief accountant to book certain receivables and income, which would produce the needed effect—pumping up the equity. Such a scheme might only be apparent to the real insiders.

To detect financial statement frauds through interviews, management and key support staff must be interviewed. Fraud examiners and auditors (collectively referred to as “examiners”) must consider many important issues when conducting interviews. One important issue examiners should keep in mind is that there is generally no liability in asking questions in which they have a legitimate interest, no matter how insulting the questions might be to the respondents. Examiners, therefore, have the legal right to be fearless in asking questions, as long as the questions are asked privately and under reasonable circumstances. This legal right does not extend to accusations—only to questions. “Are you still manipulating the records?” is an accusation, whereas, “Are you manipulating the records?” is a question. It is important to know the difference and to frame questions accordingly.

Examiners should also be sure to interview only one person at a time. Groups of people should not be interviewed together because members tend to influence each other. The interviews should always be conducted under private conditions, which permit the respondent to answer candidly.

It is important that examiners aim to be nonthreatening in their interview approaches. The less threatening the interviewer appears, the less reluctant the respondent will be to answer questions. An interviewer should not be judgmental or show surprise or disgust; such actions can inhibit the flow of information.

Examiners should warm up respondents thoroughly before asking sensitive questions. It is best to obtain all of the procedural information and information pertaining to internal controls prior to discussing fraud. Fraud should usually be the last thing covered in an interview.

To reduce the possibility of offending respondents, examiners can explain the nature of their interest before asking sensitive questions. For example, an examiner can say, “As you know, as an auditor, I am required to actively look for fraud. This means I must ask you some direct questions about the subject. Do you understand?” Then, after obtaining a positive response, the examiner can proceed to ask questions about fraud. It is best to ask the least difficult questions first.

Another approach examiners can take to make tough interview questions more palatable is to phrase them hypothetically, especially during the beginning of the interview. For example, rather than asking a CFO, “Have you committed fraud?” an examiner can say to the executive, “Suppose someone in the position of CFO decided to increase the financials. How would they do it?” The latter question is far more likely to elicit specific information than the former. Later in the interview, the executive should be asked specifically if they have committed the fraud. The examiner can say something along the lines of “My professional responsibilities require me to ask you one particularly sensitive direct question: Have you committed fraud or other illegal acts against the company?” The vast majority of respondents will answer “no” to such a question without hesitation, whether they have or not; however, simply asking the question places the examiner in a much more favorable position if attacked professionally for not detecting a fraud.

The Interview

Fraud examiners and auditors should ask questions designed to elicit the most specific information possible in a professional manner.

THE CHIEF EXECUTIVE OFFICER

Generally, the CEO should be interviewed first in any proactive or reactive fraud situation. There are several good reasons for this approach. First, the auditor or fraud examiner must have a thorough understanding with members of management as to what their responsibilities in this area are. Second, it is unwise to conduct sensitive inquiries within any organization without first advising the CEO. If the CEO discovers that the auditor or fraud examiner is making discreet fraud-related inquiries from some other source, the CEO is more likely to misunderstand their objectives and take such inquiries as a personal affront. Third, if there is any significant manipulation of the financial records, the CEO is almost always involved. The fraud-related questions that a fraud examiner or auditor should ask in connection with a regular audit should include the following, at a minimum. Note how the questions are for set-up purposes.

1. *As you know, we are required to assess the risk that material fraud exists in every company, not just yours. This is sort of a sensitive area for everyone, but our professional responsibilities dictate that we address this area. Do you understand? (Wait for an affirmative response before proceeding.)*
2. *Do you have any reason to believe that material fraud is being committed at any level within the organization?*

3. *One trend in fraud is that small frauds are committed by employees with little authority, which means that the largest frauds are usually committed with upper management's knowledge. Do you understand that? (Wait for an affirmative response before proceeding.)*
4. *Because of that, we are required to at least look at the possibility that all CEOs, including you, might commit significant fraud against customers, investors, or shareholders. Do you understand our situation? (Wait for an affirmative response.)*
5. *During this audit (examination), we need to ask direct questions about this subject to you and your staff. As a matter of fact, we will at least discuss the possibility of fraud with every employee we talk with in connection with this audit (examination). Do you have any problem with that? (Wait for a negative response. If the CEO protests, satisfy the objections. If the CEO cannot be satisfied, assess the risk of whether the CEO is attempting to obstruct the audit or examination.)*
6. *First, let's look at your CFO. Can you think of a reason she might have to get back at you or the company by committing fraud?*
7. *Has the CFO ever asked you to approve any financial transaction you thought might be improper or illegal?*
8. *Do you know whether the CFO has any outside business interests that might conflict with her duties here?*
9. *Does the CFO employ any friends or relatives in the company? (Look for possible conflicts or sweetheart deals.)*
10. *What information do you have about the CFO's lifestyle? (Look for expensive homes, cars, toys, and habits.)*
11. *What is your general impression of how the CFO gets along with her staff? (Look for abuses of authority or any other reasons that would motivate employees directly below the CFO to participate in fraud.)*
12. *How do you think fraud in your company compares with others in the same industry?*
13. *Of course, I must ask you many of the same questions about yourself. Is there any reason that anyone below you might claim you are committing fraud against the company?*

14. *I must also ask you some personal financial questions. Do you have any problem with this? (Wait for a negative response.)*
15. *Please give me a current estimate of your personal assets, liabilities, income, and expenses. (List.) What percentage of your net worth is tied directly to this company? (Look for highly leveraged individuals whose company holdings are a significant portion of their net worth.)*
16. *Are you currently experiencing any personal financial problems? (Look for lawsuits, liens, judgments, or other indicators.)*
17. *Do you have friends or relatives working for this company? (Look for conflicts of interest.)*
18. *Do you have friends or relatives working for major suppliers or vendors to this company? (Look for conflicts of interest.)*
19. *Do you own any portion of a company that does business with this organization? (Look for conflicts of interest.)*
20. *Hypothetically, if you wanted to pump up your company's profits, what would be the easiest way to do it?*
21. *As I said, we will be required to ask many questions of your staff. Is there any reason why someone who works for you would say you are at risk to commit significant fraud against the company or its shareholders?*
22. *This is the last question, and it should be obvious why I have to ask it. Have you committed fraud or other illegal acts against the company? (Do not apologize for asking the question; it is your job to ask.)*

THE CEO'S TOP STAFF

CEOs of corporations, both large and small, are busy individuals. Because they tend to focus on the broad aspects of the business, they rely heavily on their staffs—principally their personal assistants—to take care of details. But personal assistants do not usually become closely tied to the boss without a demonstrated history of loyalty and discretion. In short, making the boss's assistant mad will result in any fraud-related questions being interpreted in the worst possible light, thus making the interview much more difficult.

The key to interviewing the CEO's top staff, therefore, is to approach the interviewing process correctly from the outset. This involves making conversation and asking general questions

before moving to more sensitive questions. Start with procedural matters, or some other non-sensitive topic, and ask the fraud-related questions toward the end of the conversation.

1. *Part of my job as an auditor (fraud examiner) is to assess the risk that the company's books are not materially correct as a result of fraud by employees or management. I have already talked about these issues with your boss. Your boss understands their importance and is aware that, as part of the audit, I will be talking to everyone about the subject to some extent. Do you have any problem with this? (Wait for a negative response.)*
2. *Do you think fraud is a problem for business in general? (Icebreaker.)*
3. *How do you think this company stacks up to others in terms of its employees' and managers' honesty?*
4. *Have you ever heard rumors in the company that someone is committing fraud, especially someone high up in the organization?*
5. *Is the company in any kind of financial trouble that would motivate management to misstate the company's profits?*
6. *Do you think your coworkers are essentially honest?*
7. *Has anyone you work with ever asked you to do something you felt was not legal or ethical?*
8. *How would you handle such a situation? (Solicit information on the company's fraud reporting program.)*
9. *If someone in a position of authority in the company wanted to commit fraud, what would be the easiest way to do it?*
10. *As your auditor, may I ask you to report any instances in the future of anyone asking you to do anything to the books and records that you feel is not right? (Solicit future cooperation.)*

THE CHIEF FINANCIAL OFFICER

In the vast majority of cases, the CFO is an integral part of any financial statement fraud. As a result, the interview with the CFO should concentrate not only on possible motivations to commit fraud but also on the opportunity to do so. Since most CFOs are accountants, they should more readily understand the interviewer's mission to uncover fraud. This can be good

or bad—good if the CFO is honest and bad if they aren't. Among all financial personnel, the CFO is in the best position to know how to manage the books and keep a fraud from being uncovered. As if that weren't enough, many CFOs are hired directly from the firms that audit the company. Is there any other person more likely to be at the center of the fraud?

The following are recommended fraud-related questions for a company's CFO.

1. *You now know that audit standards require us to actively assess the risk that material fraud could be affecting the financial statements. We have talked with the CEO, who is fully aware that we will be asking most everyone we speak with about the possibility of fraud or irregularities. You understand this, don't you? (Wait for an affirmative response.)*
2. *Of the accounts on the company's books, which do you suspect might be the most vulnerable to manipulation, and why?*
3. *What kind of history does the company have with fraud in general, including defalcations and employee thefts? (Look for signs of a weak corporate culture.)*
4. *We know that fraud usually exists to some extent—even if it is small—in most companies. How do you think your company compares to others?*
5. *What is your overall impression of the company's ethics and corporate culture?*
6. *During our assessment of fraud risk in your company, are there any specific areas you'd like to discuss with us?*
7. *Is there any reason that anyone in the company might say that management had a motive to misstate the financials?*
8. *Has anyone you work with ever asked you to do anything with the books that you thought was questionable, unethical, or illegal?*
9. *Are you involved in the personal finances of the CEO? If so, is there anything about them that might make you think the CEO is under personal financial pressure?*
10. *Do either the CEO's lifestyle or habits give you any reason to think he might be living beyond his means?*

11. *Has anyone in a position of authority ever asked that you withhold information from the auditors, alter documents, or make fictitious entries in the books and records?*
12. *Is there anything about your own background or finances that would cause someone to suspect that you had a motive for committing fraud?*
13. *Because of your importance as CFO, I must ask you one final question: Have you, yourself, committed fraud or illegal acts against this company? (Remember that you should not apologize.)*

THE ACCOUNTING STAFF

If a CFO orders the commission of financial statement fraud, this executive will likely either be the one to do the actual illegal work or will task staff members with the crime. In some cases, staff members will understand the overall plan, but in most situations, the employees are told only what they need to know. It is uncommon for a CFO to admit to cooking the books to a lower staff member.

As a result, the fraud examiner generally must complete the audit work before beginning the interviews of the accounting staff. This will allow specific transactions to be discussed with the people who actually entered them into the company's records. For example, all thorough audits will examine the major journal entries. Frequently, these journal entries will be ordered by the CFO but actually entered by a staff member. There would generally be no record of the CFO requesting the entry, so this fact must be established through interviews.

Interviews of the accounting staff will allow for sufficient examination of procedures and controls over assets. After these questions are answered, you can generally pursue the line of inquiry suggested previously for the CEO's assistant.

It should be noted that there are similarities and differences in the questions asked of the CEO, the CFO, and their staffs. In the case of the CEO and the CFO, both were specifically asked if they had committed fraud against the company, although in a nice way. The staffers were not asked that specific question.

The reasoning is this: significant financial statement fraud, as previously stated, generally originates with one or both of these two executives. Staffers have less motivation to engage in financial statement fraud and are, therefore, at less risk to do so. They are also less likely to have the financial authority to enter transactions into the books without higher approval.

Thus, absent any specific information to the contrary, asking employees directly if they have committed fraud is less likely to produce information and more likely to offend them. But with the CFO and the CEO, asking the direct question will add measurably to the prevention of fraud. There are few defenses to not asking the question, other than the possibility of embarrassing the executives being audited. And that will, of course, sound rather weak in a court of law where the fraud examiner's professional credibility is in question.

Prevention of Financial Statement Fraud

Prevention and deterrence of financial statement fraud consists of those actions taken to discourage the perpetration of fraud and limit the exposure if fraud does occur. Since financial statements are the responsibility of management, preventing financial statement fraud requires minimizing the pressures, incentives, and opportunities unique to management for manipulating the company's financial position.

Management and the Board of Directors

Financial statements are management's presentation of the financial position of the entity. Setting the ethical tone of the organization is the responsibility of management and the board of directors. As with other types of occupational fraud and abuse, reducing the three factors that contribute to fraud (the Fraud Triangle) as they specifically relate to management and the board can mitigate the risk of financial statement fraud. Reducing existing pressures to commit fraud, removing potential opportunities to commit fraud, and relieving possible rationalizations for committing fraud will greatly aid in the prevention of financial statement fraud.

Reduce the Situational Pressures That Encourage Financial Statement Fraud

- Avoid setting unachievable financial goals.
- Eliminate external pressures that might tempt accounting personnel to prepare fraudulent financial statements.
- Remove operational obstacles that block effective financial performance, such as working capital restraints, excess production volume, or inventory restraints.
- Establish clear and uniform accounting procedures that do not contain exception clauses.

Reduce the Opportunity to Commit Fraud

- Maintain accurate and complete internal accounting records.
- Carefully monitor the business transactions and interpersonal relationships of suppliers, buyers, purchasing agents, sales representatives, and others who interface in the transactions between financial units.
- Establish a physical security system to secure company assets, including finished goods, cash, capital equipment, tools, and other valuable items.
- Segregate duties between employees, ensuring that no single individual has total control of one area.
- Maintain accurate personnel records, including background checks (where permitted by law) on new employees.
- Encourage strong supervisory and leadership relationships within groups to ensure enforcement of accounting procedures.

Reduce the Rationalization of Fraud—Strengthen Employee Personal Integrity

- Managers should set an example by promoting honesty in the accounting area. It is important that management practice what it preaches. Dishonest acts by management, even if they are directed at someone outside of the organization, create a dishonest environment that can spread to other business activities and other employees, both internal and external.
- Honest and dishonest behavior should be defined in company policies. Organizational accounting policies should clear up any ambiguity in accounting procedures.
- The consequences of violating the rules, including the punishment of violators, should be clear.

Internal Auditors

Internal auditors are responsible for helping to deter fraud by examining and evaluating the adequacy and effectiveness of controls, along with the extent of the potential exposure in the various segments of an entity's operations. The internal auditing standards state that the principal mechanism for deterring fraud is internal control. Primary responsibility for establishing and maintaining internal control rests with management. The Treadway Commission addresses this issue by recommending that internal audit departments or staffs have not only the support of top management, but also the necessary resources available to carry out their mission. The internal auditors' responsibility is to aid management in the deterrence of fraud by evaluating the adequacy and effectiveness of the company's internal control system, as well as the company's potential exposure to fraud, with particular

consideration given to the five elements of internal control laid out by the Committee of Sponsoring Organizations (COSO). The five elements of internal control are discussed in more detail in the Fraud Prevention and Deterrence section of the *Fraud Examiners Manual*.

External Auditors

External auditors inspect clients' accounting records and independently express an opinion as to whether financial statements are presented fairly in accordance with the applicable accounting standards of the entity, such as generally accepted accounting principles (GAAP) or International Financial Reporting Standards (IFRS). They must assert whether financial statements are free of material misstatement, whether due to error or fraud.

Independence is the cornerstone of the auditing function. The only way external auditors can uncover and rectify instances of fraud is if they view the financial statements objectively. However, external auditors are not required to uncover all instances of fraud that might be occurring, as this would be a difficult and nearly impossible task.

The responsibilities of the external auditor as they relate to fraud detection are clearly outlined in both the American Institute of Certified Public Accountants (AICPA) Auditing Standard AU-C Section 240, *Consideration of Fraud in a Financial Statement Audit*, and the International Standard on Auditing (ISA) 240, *The Auditor's Responsibilities Relating to Fraud in an Audit of Financial Statements*. According to this guidance:

The auditor is responsible for maintaining professional skepticism throughout the audit, considering the potential for management override of controls, and recognizing the fact that audit procedures that are effective for detecting error may not be effective in detecting fraud. The requirements in this [standard] are designed to assist the auditor in identifying and assessing the risks of material misstatement due to fraud and in designing procedures to detect such misstatement.

Audited financial statements are examined by a variety of external users, including investors, creditors, and government bodies. These users depend on the integrity of the statements for a variety of decision-making purposes. Therefore, external auditors have a professional obligation to evaluate the financial statements as thoroughly and objectively as possible. Furthermore, if management and the accountants know that external auditors conduct sensible audits, they might be deterred from committing financial statement fraud.

ASSET MISAPPROPRIATION: CASH RECEIPTS

Asset misappropriations are the most common of all occupational frauds by a considerable degree. There are three major categories of asset misappropriation schemes. Cash receipts schemes are discussed in this section, fraudulent disbursements of cash are addressed in the next section, and the following section covers schemes involving the theft of inventory and other noncash assets.

Cash is the focal point of most accounting schemes. Cash, both on deposit in banks and on hand as petty cash, can be misappropriated through many different schemes. These schemes can be either on-book or off-book, depending on where they occur.

Cash receipts schemes fall into two categories: *skimming* and *larceny*. The difference in the two types of fraud depends completely on when the cash is stolen. Cash larceny is the theft of money that has *already appeared* on a victim organization's books, while skimming is the theft of cash that has *not yet been recorded* in the accounting system. The way in which an employee extracts the cash might be exactly the same for a cash larceny or skimming scheme.

Skimming

Skimming is the removal of cash from a victim entity prior to its entry in an accounting system. Employees who skim from their companies steal sales or receivables before they are recorded in the company books. Skimming schemes are known as *off-book frauds*, meaning cash is stolen before it is recorded in the victim organization's accounts. This aspect of skimming schemes means they leave no direct audit trail. Because the stolen funds are never recorded, the victim organization might not be aware that the cash was ever received. Consequently, it can be difficult to detect that the cash has been stolen. This is the primary advantage of a skimming scheme to the fraudster.

Skimming is one of the most common forms of occupational fraud. It can occur at any point where cash enters a business, so almost anyone who handles cash might be able to skim money. This includes salespeople, tellers, waitpersons, and others who receive cash directly from customers.

In addition, many skimming schemes are perpetrated by employees whose duties include receiving and logging payments made by customers through the mail. These employees slip

customer payments out of the incoming mail instead of posting the payments to the proper revenue or receivables accounts. Those who work directly with customers or who handle customer payments are obviously the most likely candidates to skim funds.

Sales Skimming

The most basic skimming scheme occurs when an employee sells goods or services to a customer and collects the customer's payment but makes no record of the sale. The employee simply keeps the money received from the customer instead of turning it over to their employer. (See the "Unrecorded Sales" flowchart.)

Consider one of the simplest and most common sales transactions: a sale of goods at the cash register. In a normal transaction, a customer purchases an item and an employee enters the sale on the register. The register log reflects that the sale has been made and shows that a certain amount of cash (the purchase price of the item) should have been placed in the register. By comparing the register log to the amount of money on hand, it might be possible to detect thefts. For instance, if there were \$500 worth of sales recorded on a particular register on a given day, but only \$400 cash in the register, it would be obvious that someone had stolen \$100 (assuming no beginning cash balance).

If the employee is skimming money, however, it will be impossible to detect theft simply by comparing the register log to the cash drawer. Returning to the example in the previous paragraph, assume that an employee wants to steal \$100. Throughout the workday, there is \$500 worth of sales at their register; one sale is for \$100. When the \$100 sale is made, the employee does not record the transaction on the register. The customer pays \$100 and takes the merchandise home, but the employee keeps the money instead of placing it in the cash drawer. To create the appearance that the sale is being entered in the register, the employee might ring a "no sale" or some other noncash transaction. Since the employee did not record the sale, at the end of the day, the register log will only reflect \$400 in sales. There will be \$400 on hand in the register (\$500 in total sales minus the \$100 that the employee stole), so the register will balance. Thus, by not recording the sale, the employee is able to steal money without the missing funds appearing on the books. Of course, the theft will show up indirectly in the company's records as inventory shrinkage. But the books will provide no direct evidence of the theft.

Unrecorded Sales

The most difficult part in skimming at the register is that the employee must commit the overt act of taking money. If the employee takes the customer's money and shoves it into their pocket without entering the transaction on the register, the customer will probably suspect that something is wrong and might report the conduct to another employee or a manager. It is also possible that a manager, a fellow employee, or a surveillance camera will spot the illegal conduct. Therefore, it is often desirable for perpetrators to act as though they are properly recording a transaction while they skim sales.

Register Manipulation

Some employees might ring a "no sale" or other noncash transaction to mask the theft of sales. The false transaction is entered on the register so that it appears that a sale is being made. The perpetrator opens the register drawer and pretends to place the cash they have just received in the drawer, but in reality, they put it in their pocket. To the casual observer, it looks as though the sale is being properly recorded.

Some employees might also manipulate their registers so that a sale can be entered on the register keys but will not appear on the register logs. The employee can then safely skim the sale. Anyone observing the employee will see the sale entered, the register drawer open, etc., yet the register log will not reflect the transaction.

EXAMPLE

A service station employee hid stolen gasoline sales by simply lifting the ribbon from the printer on their register. They collected and pocketed the sales, which were not recorded on the register log. The fraudster would then roll back the tape to the point where the next transaction should appear and replace the ribbon. The next transaction would be printed without leaving any blank space on the tape, apparently leaving no trace of the fraud.

When the ribbon is removed from the register, the result is a blank space on the register log where the skimmed sale should have been printed. Unusual gaps between transactions on a register log might mean that someone is skimming sales.

Fraudsters will often manually roll back the tape when they replace the ribbon on their registers so that there is no gap between transactions. Most register transactions, however, are sequentially numbered. If a transaction has been omitted from the register log, the result is a break in the sequence. For instance, if an employee skimmed sale #155, then the

register log would only show transactions #153, #154, #156, #157, and so on. The missing transaction numbers, omitted because the ribbon was lifted when the transactions took place, would indicate fraud.

Skimming During Nonbusiness Hours

Another way to skim unrecorded sales is to conduct sales during nonbusiness hours. For instance, some employees will open stores on weekends or after hours without the owners' knowledge. They can keep the proceeds of all sales made during these times because the owners have no idea that their stores are even open for business.

EXAMPLE

A manager of a retail facility went to work two hours early every day, opening their store at 8:00 a.m. instead of 10:00 a.m., and kept all the sales made during those two hours. They rang up sales on the register as if it were business as usual, but then removed the register log and all the cash they had accumulated. The manager then started from scratch at 10:00 as if the store was just opening. The tape was destroyed so there was no record of the before-hours revenue.

To this point, skimming has been discussed in the context of cash register transactions, but skimming does not have to occur at a register. Some of the costliest skimming schemes are perpetrated by employees who work at remote locations or without close supervision. This can include on-site salespersons who do not deal with registers, independent salespersons who operate off-site, and employees who work at branches or satellite offices. These employees have a high level of autonomy in their jobs, which often translates into poor supervision and, in turn, fraud.

Skimming of Off-Site Sales

Several industries rely on remote salespersons to generate revenue. The fact that these employees are largely unsupervised puts them in a good position to skim revenues. For example, consider the apartment rental industry, where apartment managers handle the day-to-day operations without much oversight. A common scheme is for an on-site employee to identify the tenants who pay in currency and remove them from the books. This causes a particular apartment to appear as vacant on the records when, in fact, it is occupied. The manager can skim the rental payments from the "vacant" unit, and the revenue will never be missed. As long as no one physically checks the apartment, the perpetrator can continue skimming indefinitely.

Another rental-skimming scheme occurs when apartments are rented out without a lease being signed. On the books, the apartment will still appear to be vacant, even though there are tenants on the premises. The perpetrator can skim the rental payments from these tenants without fear that they will show up as past due in the company records. Sometimes the employees in these schemes work in conjunction with the renters and give them a “special rate.” In return, the renters’ payments are made directly to the employee and any complaints or maintenance requests are directed only to that employee so the tenant’s presence in the apartment remains hidden.

Instead of skimming rent, some property managers focus on less predictable forms of revenue like application fees and late fees. Ownership might know when rent is due and how many apartments are occupied, but often there is no control in place to track the number of people who fill out rental applications or how many tenants pay their rent a day or two late. Property managers can make thousands of dollars by skimming these small payments.

Off-site skimming is by no means limited to the apartment rental industry. The schemes described previously can easily translate into any position where those who generate or collect revenues operate in an independent fashion. A prime example is the insurance agent who sells policies to customers, and then neglects to file the policies with the carrier. Most customers do not want to file claims on a policy, especially early in the term, for fear that their premiums will rise. Knowing this, the agent keeps all documentation on the policies instead of turning it over to the carrier. The agent is able to skim the customer’s payments because the carrier does not know the policy exists. The customer continues to make payments, thinking that they are insured when in fact the policy is a ruse.

Poor Collection Procedures

Poor collection and recording procedures can make it easy for an employee to skim sales or receivables.

EXAMPLE

A government authority that dealt with public housing was victimized because it failed to itemize daily receipts. This agency received payments from several public housing tenants, but at the end of the day, monies received from tenants were listed as a whole. Receipt numbers were not used to itemize the payments made by tenants, so there was no way to pinpoint which tenant had paid how much. Consequently, the employee in charge of collecting money

from tenants was able to skim a portion of their payments. The employee simply did not record the receipt of over \$10,000. This action caused certain accounts receivable to be overstated where tenant payments were not properly recorded.

Understated Sales

The previous discussion focused on purely off-book sales—those which are never recorded. Understated sales work differently because the transaction in question is posted to the books but for a lower amount than what the perpetrator actually collected. (See the “Understated Sales” flowchart that follows.) One way that employees commit understated sales schemes is by altering receipts or preparing false receipts that misstate sales amounts.

EXAMPLE

An employee wrote receipts to customers for their purchases but removed the carbon paper backing on the receipts so that they did not produce a company copy. The employee then used a pencil to prepare company copies that showed lower purchase prices. For example, if the customer had paid \$100, the company copy might reflect a payment of \$80. The employee skimmed the difference between the actual amount of revenue and the amount reflected on the fraudulent receipt.

Understated sales schemes are commonly undertaken by employees who work at the cash register. In a typical scheme, an employee enters a sales total that is lower than the amount paid by the customer. The employee skims the difference between the actual purchase price of the item and the sales figure recorded on the register. For instance, if an item is sold for \$100, the employee could ring up the sale of an \$80 item and skim the excess \$20.

Rather than reduce the price of an item, an employee might record the sale of fewer items. If one hundred units are sold, for instance, an employee might only record the sale of fifty units and skim the excess amount paid for the additional fifty units.

A similar method is used when sales are made on account. The bill to the customer reflects the true amount of the sale, but the receivable is understated in the company books. For instance, a company might be owed \$1,000, but the receivable is recorded as \$800. (Sales are correspondingly understated by \$200.) When the customer makes payment on the account, the employee can skim \$200 and post the \$800 to the account. The account will appear to have been paid in full.

Understated Sales

FALSE DISCOUNTS

Those employees with the authority to grant discounts might use this authority to skim sales and receivables. In a false discount skimming scheme, an employee accepts full payment for an item but records the transaction as if the customer had been given a discount. The employee skims the amount of the discount. For example, on a \$100 purchase, if an employee granted a false discount of 20%, the employee could skim \$20 and leave the company's books in balance.

Theft of Checks Received Through the Mail

Checks received through the mail are a frequent target of employees seeking illicit gains. Theft of incoming checks usually occurs when a single employee is in charge of opening the mail and recording the receipt of payments. This employee simply steals one or more incoming checks instead of posting them to customer accounts. (See the "Theft of Incoming Checks" flowchart that follows.) When the task of receiving and recording incoming payments is left to a single person, it is all too easy for that employee to make off with an occasional check.

EXAMPLE

A mailroom employee stole over \$2 million in government checks arriving through the mail. This employee simply identified and removed envelopes delivered from a government agency known to send checks to the company. Using a group of accomplices acting under the names of fictitious persons and companies, this individual was able to launder the checks and divide the proceeds with the accomplices.

The theft of checks is not usually complicated, but it is sometimes more difficult to conceal a check theft scheme than other forms of skimming. If the stolen checks were payments on the victim company's receivables, then these payments were *expected*. As receivables become past due, the victim company will send notices of nonpayment to its customers. Customers are likely to complain when they receive a second bill for a payment they have already made. In addition, the cashed check will serve as evidence that a customer made the payment in question. The methods used to conceal check theft schemes will be discussed later in this section.

Theft of Incoming Checks

Check for Currency Substitutions

A criminal generally prefers to steal currency rather than checks if given the opportunity. The reasons why are obvious. First, currency is harder to trace than a check. A cashed check eventually returns to the person who wrote it and might provide evidence of who cashed it or where it was spent. Endorsements, bank stamps, and so forth might indicate the thief's identity. Currency, on the other hand, disappears into the economy once it is stolen.

The second reason that currency is preferable to a check is the difficulty in converting the check. When currency is stolen, it can be spent immediately. A check, however, must be endorsed and cashed or deposited before the thief can access the money it represents. To avoid this problem, employees who steal unrecorded checks will frequently substitute them for receipted currency. If, for example, an employee skims an incoming check worth \$500, the employee can add the check to the day's receipts and remove \$500 in currency. The total receipts will match the amount of cash on hand, but payments in currency are replaced by the check.

EXAMPLE

An employee responsible for receipting ticket and fine payments on behalf of a municipality abused their position and stole incoming revenues for nearly two years. When payments in currency were received by this individual, they issued receipts, but when checks were received, they did not. The check payments were therefore unrecorded revenues—ripe for skimming. These unrecorded checks were placed in the days' receipts and an equal amount of cash was removed. The receipts matched the amount of money on hand except that payments in currency had been replaced with checks.

The check for currency substitution is very common. While these substitutions make it easier for a crook to convert stolen payments, the problem of concealing the theft still remains. The fact that the stolen checks are not posted means that some customers' accounts are in danger of becoming past due. If this happens, the perpetrator's scheme is in danger because these customers will almost surely complain about the misapplication of their payments. However, the misapplied payments can be concealed on the books by forcing account totals, stealing customers' account statements, lapping, and making other fraudulent accounting entries. These concealment techniques will be discussed in more detail in the "Skimming Receivables" section.

Checks for currency substitutions are especially common when an employee has access to some unexpected source of funds, such as a manufacturer's refund that arrives outside the regular stream of sales and receivables payments. In these cases, the check can be swapped for cash and there is usually no additional step required to conceal the crime. The refund check, an unexpected source of funds, will not be missed by the victim organization, and the party who issued the check expects no goods or services in return.

Skimming Receivables

It is generally more difficult to conceal the skimming of receivables than the skimming of sales because receivables payments are *expected*. The victim organization knows the customer owes money and it is waiting for the payment to arrive. When unrecorded sales are skimmed, it is as though the sale never existed. But when receivables are skimmed, the absence of the payment appears on the books as a delinquent account. To conceal a skimmed receivable, a perpetrator must somehow account for the payment that was due to the company but never received. There are several common techniques that fraudsters use to conceal the skimming of receivables.

Forcing Account Balances or Destroying Transaction Records

Among the most dangerous receivables skimming schemes are those in which the perpetrator is in charge of collecting and posting payments. If fraudsters are involved in both ends of the receipting process, they can falsify records to conceal the theft of receivables payments. For example, a fraudster might post the customer's payments to the company's receivables accounts, even though the payments will never be deposited. This keeps the receivable from aging, but it creates an imbalance in the cash account. The perpetrator hides the imbalance by forcing the total on the cash account, overstating it to match the total postings to accounts receivable.

EXAMPLE

The chief financial officer (CFO) of a small corporation stole approximately \$100,000 from their company by diverting customer checks. This individual controlled all the books and records for the victim company. The CFO stole checks from customers and deposited them in their personal bank account. The customers' payments were still posted to keep the receivables from aging.

The perpetrator stole checks in an amount equal to the victim company's tax liability. To keep the books in balance, they would prepare checks payable to the national tax authority but would not mail them. The checks were recorded in the victim's records and the false disbursements offset the amount of false postings to accounts receivable. The scheme was uncovered when the government notified the victim company that its taxes were delinquent.

Some fraudsters simply destroy all records that might prove that they have been stealing. Destroying records does not prevent the victim organization from realizing that it is being robbed, but it might help conceal the thief's identity.

Lapping

Lapping customer payments is one of the most common methods used to conceal receivables skimming. *Lapping* is the crediting of one account through the abstraction of money from another account. It is the fraudster's version of "robbing Peter to pay Paul."

Suppose a company has three customers, A, B, and C. When A's payment is received, the fraudster steals it instead of posting it to A's account. Customer A expects that their account will be credited with the payment they have made. If the payment has not been posted by the time A's next statement is mailed, A will see that the payment was not applied to their account and will almost certainly complain. To avoid this, the thief must take some action to make it appear that the payment was posted.

When B's payment arrives, the thief posts this money to A's account. Payments now appear to be up to date on A's account, but B's account remains outstanding. When C's payment is received, the perpetrator applies it to B's account. This process continues indefinitely until one of three things happens: (1) someone discovers the scheme, (2) restitution is made to the accounts, or (3) some concealing entry is made to adjust the accounts receivable balances.

EXAMPLE

A clerk working for a government agency committed a lapping scheme that involved the theft of more than 150 customer payments, causing a total misappropriation of more than \$30,000 in government funds. This individual stole taxes, fees, and other incoming payments from customers to cover personal expenses. When a customer's payment was stolen, the documentation on that payment would be hidden until a later payment was received. The later payment would be applied to the earlier customer's records.

As the rotating schedule of applying and misapplying payments became more and more complicated, the perpetrator insisted on exerting more and more control over the receipting process. The fraudster insisted on handling all incoming mail, preparing the deposit, and delivering the deposit to the bank so that they could continue to delay the posting of payments. The fraud was detected in large part because several consumers complained that they had not received confirmation of their payments, even though their checks had cleared months earlier.

Because lapping schemes can become very intricate, fraudsters sometimes keep a second set of books that detail the true nature of the payments received. In many skimming cases, a search of the fraudster's work area will reveal a set of records tracking the actual payments and how they have been misapplied to conceal the theft. It might seem odd that people would keep records of their illegal activity, but many lapping schemes become extremely complicated as more and more payments are misapplied. The second set of records helps the perpetrator keep track of the funds that were stolen and which accounts need to be credited to conceal the fraud. Uncovering these records, if they exist, will greatly facilitate the investigation of a lapping scheme.

While lapping is more commonly used to conceal receivables skimming, it can also be used to disguise the skimming of sales. Employees sometimes steal all or part of one day's receipts and replace them with the receipts from the following day. This type of concealment requires the employee to delay making the company deposit until enough money can be collected to recoup the stolen funds. If an organization rigidly adheres to a deposit schedule, it is unlikely that lapping will be effective in concealing this type of fraud.

Stolen Statements

When employees skim receivables, they might let the targeted accounts age instead of attempting to force the balances. In other words, they steal an incoming check intended as payment on a receivable, and they simply act as if the check never arrived. This method keeps the victim organization's cash account in balance because the stolen payment is never posted.

Of course, if the customer's payment is not posted, the receivable will eventually become past due. The customer will have proof in the form of a canceled check that a payment was made on the account. The question will arise: Where did the payment go? The answer, of course, is that it went into the fraudster's pocket. So the fraudster's goal must be to keep the customer from realizing that their account was not credited with the payment. If this

can be accomplished, the customer will not complain about the missing payment, and the victim organization will not realize that skimming has occurred.

One way that fraudsters attempt to conceal the fact that they have skimmed a payment from a customer is to intercept the customer's account statement and/or late notices. In some cases, the perpetrator intercepts the account statement by changing the customer's address in the billing system so that statements are sent directly to the perpetrator's home or to another address where the perpetrator can retrieve them. In other instances, the perpetrator physically intercepts the statements before they are mailed.

Once the real statement indicating that the payment was not received has been intercepted, the fraudster usually alters the statement or produces a counterfeit. The false statements indicate that the customer's payment was properly posted. This leads the customer to believe that their account is up to date and keeps the customer from complaining about stolen payments.

False Account Entries

Intercepting the customer's statements will keep them unaware of their account's status, but as long as the customer's payments are being skimmed, their account is slipping further and further past due. The perpetrator must bring the account back up to date to conceal their crime. Lapping is one way to keep accounts current as the employee skims from them. Another way is to make false entries in the victim organization's accounting system.

DEBITS TO EXPENSE ACCOUNTS

An employee might conceal the skimming of funds by making unsupported entries in the victim company's books. If a payment is made on a receivable, for instance, the proper entry is a debit to cash and a credit to the receivable. Instead of debiting cash, the employee might choose to debit an expense account. This transaction still keeps the company's books in balance, but the incoming cash is never recorded. In addition, the customer's receivable account is credited, so it will not become delinquent.

DEBITS TO AGING OR FICTITIOUS RECEIVABLES

The same method discussed previously is used when employees debit existing or fictitious accounts receivable to conceal skimmed cash. For example, an employee who has skimmed one customer's payments might add the stolen amounts to aging accounts that will soon be written off as uncollectible or to very large accounts where a small debit might go unnoticed.

Some perpetrators also set up completely fictitious accounts and debit them for the cost of skimmed receivables. The employees then simply wait for the fictitious receivables to age and be written off as uncollectable. In the meantime, the fictitious receivables carry the cost of a skimming scheme where it will not be detected.

WRITING OFF ACCOUNT BALANCES

Some employees cover their skimming by posting entries to contra revenue accounts such as discounts and allowances. If, for instance, an employee intercepts a \$1,000 payment, the employee would create a \$1,000 “discount” on the account to compensate for the missing money. Another account that might be used in this type of concealment is the bad debts expense account.

EXAMPLE

A billing manager was authorized to write off certain patient balances as hardship allowances. This employee accepted payments from patients and then instructed billing personnel to write off the balance in question. The payments were never posted; they were intercepted by the billing manager. The billing manager stole approximately \$30,000 by using their authority to write off patients' balances.

Inventory Padding

A problem for fraudsters in some skimming schemes is the victim organization's inventory. Off-book sales of goods (skimming schemes) will always leave an inventory shortage and a corresponding rise in the cost of goods sold.

When a sale of goods is made, the physical inventory is reduced by the amount of merchandise sold. For instance, when a retailer sells a pair of shoes, there is one less pair of shoes in the stockroom. If this sale is not recorded, however, the shoes are not removed from the perpetual inventory records. Thus, there is one less pair of shoes available than in the perpetual inventory. A reduction in the physical inventory without a corresponding reduction in the perpetual inventory is known as *shrinkage*.

There is no shrinkage when an employee skims sales of services (because there is no inventory for services), but when sales of goods are skimmed, shrinkage always occurs. Some shrinkage is expected due to customer theft, faulty products, and spoilage, but high levels of shrinkage can be a warning that a company could be a victim of occupational fraud. The general methods

used to conceal inventory shrinkage are discussed in detail in the “Asset Misappropriation: Inventory and Other Assets” chapter in this section of the *Fraud Examiners Manual*.

Short-Term Skimming

Short-term skimming is not a distinct method for stealing sales and receivables but rather a distinct way of using skimmed money. The peculiar aspect to short-term skimming is that the fraudster keeps the stolen money only for a short while before eventually passing the payment on to their employer. The employee merely delays the posting. In a short-term skimming scheme, an employee steals an incoming payment and then places the skimmed funds in an interest-bearing account or in a short-term security. The employee earns interest on the skimmed payments while they remain under their control. Eventually, they withdraw the principal and apply it to the customer’s account but retain the interest for themselves.

Detection of Skimming Schemes

The following are some detection methods that might be effective in detecting skimming schemes.

Receipt- or Sales-Level Detection

Key analytical procedures, such as vertical and horizontal analysis of sales accounts, can be used for skimming detection on a grand scale. These procedures analyze changes in the accounts and can possibly point to skimming problems, including understated sales.

Ratio analysis can also provide keys to the detection of skimming schemes. These procedures are discussed in detail in the “Financial Statement Fraud” chapter.

Detailed inventory control procedures can also be used to detect inventory shrinkage due to unrecorded sales. Inventory detection methods include statistical sampling, trend analysis, reviews of receiving reports and inventory records, and verification of material requisition and shipping documentation, as well as actual physical inventory counts. These procedures are reviewed in the “Asset Misappropriation: Inventory and Other Assets” chapter.

Journal Entry Review

Skimming can sometimes be detected by reviewing and analyzing all journal entries made to the cash and inventory accounts. Journal entries involving the following topics should be examined:

- False credits to inventory to conceal unrecorded or understated sales
- Write-offs of lost, stolen, or obsolete inventory

- Write-offs of accounts receivable accounts
- Irregular entries to cash accounts

Detecting Lapping of Sales or Receivables

A skimming scheme that involves lapping can be detected by comparing the dates of customers' payments with the dates that those payments are posted to the books. This requires an examination of the source documents, such as canceled check copies, bank statements, and deposit slips. Any significant discrepancies between these two dates might indicate that a customer's payment was skimmed, and the fraudster had to wait until another customer paid to post payment to the victim's account. Any significant discrepancies between deposit date and posting date should be investigated. Confirmation of customers' accounts is another method that might detect lapping.

Confirmations are especially effective on large accounts where the time value of money is an issue. However, customers who pay on invoice rather than on balance might not know the exact balance of their account. If this is the case, it might be more effective to confirm by invoice and reconstruct the account balance using the source documents in the files and the results of the confirmation. If fraud is suspected, ask the customer or the bank to return a copy of both the front and the back of the check(s) used to pay specific invoices. Match the data on the check copies with the posting dates in the customer's account.

Prevention of Skimming Schemes

Receipt- or Sales-Level Control

As with most fraud schemes, internal control procedures are a key to the prevention of skimming schemes. An essential part of developing control procedures is management's communication to employees. Controlling whether an employee will not record a sale, understate a sale, or steal incoming payments is extremely difficult.

General Controls

Sales entries and general ledger access controls should include documented policies and procedures, which are communicated directly from management. The control procedures will generally cover the following subjects:

- Appropriate separation of duties and access control procedures regarding who makes ledger transactions will be followed.
- Transactions must be properly recorded as to amount, date of occurrence, and ledger account.

- Proper safeguard measures will be adopted to ensure physical access to the accounting systems. Additional measures should ensure the security of company assets.
- All areas where employees handle cash should be monitored with visible video cameras.
- Independent reconciliations, as well as internal verification of accounts, will be performed on ledger accounts.¹

It is important to note that since skimming is an off-book fraud, routine account reconciliation is not likely to prevent or detect a skimming scheme. If such a scheme is taking place, reconciling the register records to the cash in the drawer will not indicate there is anything amiss. Reconciling the physical inventory count with the perpetual inventory records, however, might reveal that there is shrinkage, and therefore a skimming scheme.

Skimming Controls

The discovery of thefts of checks and cash involves proper controls on the receipt process. Deficiencies in the answers to these typical audit-program questions might be red flags.

- Is mail opened by someone independent of the cashier, accounts receivable bookkeeper, or other accounting employees who may initiate or post journal entries?
- Is the delivery of unopened business mail prohibited to employees having access to the accounting records?
- Does the employee who opens the mail:
 - Place restrictive endorsements (“For Deposit Only”) on all checks received?
 - Prepare a list of the money, checks, and other receipts?
 - Forward all remittances to the person responsible for preparing and making the daily bank deposit?
 - Forward the total of all remittances to the person responsible for comparing it to the authenticated deposit ticket and amount recorded?
- Is a lockbox used?
- Do cash sales occur? If yes:
 - Are cash receipts prenumbered?
 - Is an independent check of prenumbered receipts done daily and reconciled to cash collections?
- Do cash refunds require approval?
- Are cash receipts deposited intact daily?
- Are employees who handle receipts bonded?

¹ George Georgiades, *Audit Procedures* (New York: Harcourt Brace Professional Publishing, 1995).

- Is the accounts receivable bookkeeper restricted from:
 - Preparing the bank deposit?
 - Obtaining access to the cash receipts journal?
 - Having access to collections from customers?
 - Are banks instructed not to cash checks drawn to the order of the company?
- Is the cashier restricted from gaining access to the accounts receivable records and bank and customer statements?
- Are areas where physical handling of cash takes place reasonably safeguarded?
- Is the person who makes postings to the general ledger independent of the cash receipts and accounts receivable functions?
- Does a person independent of the cashier or accounts receivable functions handle customer complaints?

Cash Larceny

The second type of cash receipts scheme is cash larceny. In the occupational fraud setting, *cash larceny* is the intentional taking of an employer's cash (the term *cash* includes both currency and checks) without the consent and against the will of the employer. However, recall that skimming also involves the intentional taking of an employer's cash. The difference between skimming and cash larceny is that skimming is the theft of cash *before* it appears on the books. Cash larceny schemes involve the theft of money that has *already appeared* on a victim company's books. Accordingly, cash larceny schemes are easier to detect than skimming schemes because they leave an audit trail.

A cash larceny scheme can take place in any circumstance in which an employee has access to cash. Note, however, that cash larceny schemes do not include theft of cash on hand (i.e., cash located in a bank vault or other secure area). Every company must deal with the receipt, deposit, and distribution of cash, so every company is potentially vulnerable to a cash larceny scheme. While the circumstances in which an employee might steal cash are nearly limitless, most larceny schemes involve the theft of incoming cash, currency available (in a cash register, cash box, etc.), or theft of cash from the victim organization's bank deposits.

Incoming Cash

Theft of Cash from the Register

A large percentage of cash larceny schemes occur at the cash register, and for good reason—the register is usually where the cash is. The register (or similar cash collection points like cash

drawers or cash boxes) is usually the most common point of access to cash for employees, so it is understandable that this is where larceny schemes frequently occur. Furthermore, there is often a great deal of activity at the register—numerous transactions that require employees to handle cash. This can serve to prevent cash theft from being discovered. In a flurry of activity, with money being passed back and forth between customer and employee, an employee can often sneak cash out of the register and into their pocket undetected.

The most straightforward cash larceny scheme is to simply open the register and remove currency or checks. (See the “Cash Larceny from the Register” flowchart that follows.) The theft is often committed while a sale is being conducted so that it appears to be part of the transaction. In other circumstances, perpetrators wait for a moment when no one is around to notice them reaching into the cash drawer.

Recall that the difficulty in detecting skimming schemes comes from the fact that the stolen funds are never entered on the victim organization’s accounts. In a larceny scheme, however, the funds that the perpetrator steals have already been reflected on the register log. As a result, an imbalance will result between the register log and the cash drawer.

A register is balanced by comparing the transactions on the register log to the amount of cash on hand. Sales, returns, and other register transactions that are recorded on the register log are added to or subtracted from a known balance to determine the total for the period in question. The actual cash is then counted, and the two totals are compared. If the register log shows that there should be more cash in the register than what is present, the discrepancy might be due to larceny.

Cash Larceny from the Register

The actual method for taking money at the register—opening the register and removing currency—rarely varies. It is the methods that perpetrators use to avoid getting caught that distinguish larceny schemes. Oddly, in many instances the perpetrators have no plan for avoiding detection. A large part of fraud is rationalization; employees convince themselves that they are somehow entitled to what they are taking or that what they are doing is not actually a crime. Register larceny schemes frequently begin when perpetrators convince themselves that they are only borrowing the funds to cover a temporary monetary need. These people might carry the missing currency in their registers for several days, deluding themselves in the belief that they will one day repay the funds they have stolen.

Employees who do nothing to camouflage their crimes are easily caught. More dangerous is the person taking active steps to hide their crimes. One basic way for employees to disguise the fact that they are stealing currency is to take money from someone else's register.

In some retail organizations, employees are assigned to certain registers. Alternatively, one register is used, and each employee has a different access code. When cash is missing from a certain cashier's register, that cashier is obviously the most likely suspect for the theft. Therefore, by stealing from a coworker's register, or by using someone else's access code to enter the register, the perpetrator makes sure that another employee will be the prime suspect in the theft.

EXAMPLE

A teller for a retail sales company simply signed onto a register, rang a "no sale," and took currency from the drawer. Over a period of time, the teller took approximately \$6,000 through this simple method. To get away with the theft, the teller waited until a coworker was on break and then logged onto that person's register, rang a "no sale," and took the cash. The resulting cash shortage therefore appeared in an honest employee's register, deflecting attention from the true thief.

A very unsophisticated way to avoid detection is to steal currency in very small amounts over an extended period of time. Because the missing amounts are small, the shortages might be dismissed as accounting errors rather than theft. Typically, the employee becomes dependent on the extra money and begins stealing more frequently or taking larger amounts, which causes the scheme to be uncovered. Most retail organizations track overages or shortages by employee, making this method largely ineffective.

REVERSING TRANSACTIONS

Some employees conceal cash larceny by processing reversing transactions, which cause the register log to reconcile to the amount of cash on hand after the theft. By processing false voids or refunds, an employee can reduce the cash balance reflected on the register log.

EXAMPLE

A cashier received payments from a customer and recorded the transactions on their system. The cashier stole the payments from the customers and then destroyed the company's receipts that reflected the transactions. To complete the cover-up, the cashier went back and voided the transactions that they had entered at the time the payments were received. The reversing entries brought the receipt totals into balance with the cash on hand.

REGISTER MANIPULATION

Instead of using reversing entries, an employee might manually alter the register log. Again, the purpose of this activity is to force a balance between the cash on hand and the actual cash received. An employee might use correction fluid to cover up a sale where the proceeds were stolen or might simply cross out or alter the numbers on the tape so that the register total and the cash drawer balance. This type of concealment is not common because the alterations will generally be noticeable.

ALTERING CASH COUNTS

Another method for concealing cash larceny is to alter the cash counts on registers. When cash from a register is totaled and prepared for deposit, an employee simply records the wrong amount so that the cash on hand appears to balance with the total on the register log. Obviously, employees who deal with the receipt of cash should not be charged with verifying the amount of cash on hand in their own register, but this control is often overlooked.

DESTROYING REGISTER LOGS

If the fraudster cannot make the cash and the tape balance, the next best thing is to prevent others from computing the totals and discovering the imbalance. Employees who are stealing from the register sometimes destroy detail tapes that would implicate them in a crime. When detail tapes are missing or defaced, it might be because someone is trying to conceal a fraud.

Other Larceny of Sales and Receivables

Not all receipts arrive via the cash register. Employees can just as easily steal money received at other points. One of the more common methods is to take checks received through the mail and post the payments to the accounting system but steal the checks. (See the “Other Cash Larceny” flowchart that follows.) Obviously, this type of scheme leaves the cash account out of balance. From a perpetrator’s perspective, it would make much more sense to take checks that have not yet been posted to customer accounts. Often, this type of cash larceny scheme is committed by an employee who claims to only be “borrowing” the funds for a short while—one of the classic rationalizations in occupational fraud schemes.

Those employees who have total control of a company’s accounting system can overcome the problem of out-of-balance accounts. It is common, especially in small businesses, for a single person to control all of a company’s deposits and ledgers. These employees can steal incoming

cash that has already been posted and then conceal the crime by making unsupported entries in the victim organization's books. Poor separation of duties is often the weakness that allows cash larceny schemes to go undetected.

EXAMPLE

An employee posted customer payments to the accounts receivable journal but stole the cash received. This resulted in an imbalance in the victim company's cash account. But the perpetrator had control over the company's deposits and all its ledgers. This allowed the employee to conceal the crime by making unsupported entries in the company's books that produced a fictitious balance between receipts and ledgers.

In circumstances in which payments are stolen but nonetheless posted to the cash receipts journal, reversing entries are sometimes used to balance the victim company's accounts. The incoming payment is initially credited to the customer's account, but the entry is later reversed with an unauthorized adjustment such as a "courtesy discount."

A less elegant way to hide a crime is to simply destroy all records that might prove that the perpetrator has been stealing. This "slash-and-burn" concealment technique does not prevent the victim company from realizing that it has been robbed, but it might help conceal the thief's identity.

Cash Larceny from the Deposit

At some point in every revenue-generating business, someone must physically take the company's currency and checks to the bank. Any individual(s) left alone in possession of the currency and checks will have an opportunity to take a portion of the money prior to depositing it into the company's accounts.

Typically, when a company receives cash, someone is assigned to tabulate the receipts, list the form of payment (currency or check), and prepare a deposit slip for the bank. Then another employee takes the cash and deposits it in the bank. The person who made out the deposit generally retains one copy of the slip. This copy is matched to a receipted copy of the slip, which the bank stamps when the deposit is made.

Other Cash Larceny

This procedure is designed to prevent the theft of funds from the deposit, but thefts still occur, often because companies do not adhere to the process. (See the “Cash Larceny from the Deposit” flowchart that follows.) For example, when one person is in charge of preparing the deposit slips, making the deposit, and reconciling the bank statement, that person can pilfer money from the day’s receipts and conceal it by falsifying the deposit slips. If the day’s receipts are \$1,000, the perpetrator might fill out a deposit slip for \$500 and steal the other \$500. The employee then makes correspondingly false entries in the books, understating the day’s receipts. This process creates a false balance in the victim organization’s records.

A failure to reconcile the bank copy of the deposit slip with the office copy can result in fraud. When the person making the deposit knows their company does not reconcile the two copies, they can steal cash from the deposit on the way to the bank and alter the deposit slip so that it reflects a lesser amount. In some cases, sales records are also altered to match the diminished deposit.

When cash is stolen from the deposit, the receipted deposit slip will of course be out of balance with the company's copy of the deposit slip (unless the perpetrator also prepared the deposit). To correct this problem, some perpetrators alter the bank copy of the deposit slip after it has been validated. This brings the two copies back into balance.

EXAMPLE

An employee altered 24 deposit slips and validated bank receipts in the course of a year to conceal the theft of over \$15,000. These documents were altered with correction fluid and ink to match the company's cash reports.

One common-sense issue that organizations sometimes overlook is the handling of the deposit on the way to the bank. Once prepared, the deposit should immediately be put in a safe place until it is taken to the bank. Unfortunately, some organizations leave their deposits carelessly unattended. For example, some companies prepare the daily deposit, and then leave it in the office overnight to be taken to the bank the next morning. Employees familiar with this routine have little trouble pilfering checks and currency from the deposit after hours.

As with all cash larceny schemes, stealing from the company deposit can be rather difficult to conceal. In most cases, these schemes are only successful in the long term when the person who counts the cash also makes the deposit. In any other circumstance, the scheme's success depends primarily on the inattentiveness of those charged with preparing and reconciling the deposit.

Cash Larceny from the Deposit

Deposit Lapping

One method that fraudsters sometimes use to conceal cash larceny from the deposit is *lapping*. Lapping occurs when an employee steals the deposit from day one and then replaces it with day two's deposit. Day two's deposit is then replaced with money received on day three, and so on. The perpetrator is always one day behind, but as long as no one demands an immediate reconciliation of the deposits to the bank statement—and if daily receipts do not drop precipitously—they might be able to avoid detection for a period of time. Lapping is discussed in more detail in the “Skimming” section.

Deposits in Transit

A final concealment strategy used for stolen deposits is to carry the missing money as *deposits in transit* on the bank reconciliation, which is money that has been recorded in the company's cash account in its general ledger but hasn't yet cleared the bank. This is one of the ways to account for discrepancies between the company's records and the bank statement. Although usually reasonable, deposits in transit can be used to conceal a cash larceny from the deposit. The deposit in transit amount should be traced to subsequent bank statements to ensure its legitimacy.

EXAMPLE

An employee was responsible for receiving collections, issuing receipts, posting transactions, reconciling accounts, and making deposits. This employee took over \$20,000 in collections from their employer over a five-month period. To hide the theft, the perpetrator carried the missing money as deposits in transit, meaning that the missing money would appear on the next month's bank statement. Of course, it never did. The balance was carried for several months as deposits in transit (d.i.t.) until an auditor recognized the discrepancy and put a halt to the fraud.

Detection of Cash Larceny

As mentioned previously, cash larceny involves the theft of cash that appears on a company's books or records, whether it's theft of cash in a cash register or theft of cash from a deposit. Cash larceny schemes are easier to detect than skimming schemes because they leave an audit trail.

Receipt Recording

In-depth analysis of the cash receipts and recording process is the key to detecting a cash larceny scheme. Areas of analysis might include:

- Mail and register receipt points
- Journalizing and recording of the receipts
- Security of the cash from receipt to deposit

Control Objectives

In analyzing the cash receipt process, it is important to meet the following control objectives:

- Cash receipts must be complete. Each day's receipts must be promptly collected and deposited in full.
- Each receivable transaction recorded must be legitimate and have supporting documentation.
- All information included in the transaction must be correctly verified as to amount, date, account coding, and descriptions.
- The cash must be safeguarded while in the company's physical possession.
- There must be appropriate personnel responsible for overseeing cash control processes.
- Cash register log totals should be reconciled to the amount of cash in the drawer.
- An independent listing of cash receipts should be prepared before the receipts are submitted to the cashier or accounts receivable bookkeeper.
- An independent person should verify the listing against the deposit slips.
- Authenticated deposit slips should be retained and reconciled to the corresponding amounts in the cash receipts records.
- The bank deposit should be made by someone other than the cashier or the accounts receivable clerk. A person independent of the cash receipts and accounts receivable functions should compare entries to the cash receipts journal with:
 - Authenticated bank deposit slips
 - The deposit per the bank statements
- Areas where physical handling of cash takes place should be reasonably safeguarded.

Analytical Review

Analyzing the relationship among sales, cost of sales, and the returns and allowances can detect inappropriate refunds and discounts.

- If a large cash fraud is suspected, a thorough review of these accounts might enlighten the fraud examiner as to the magnitude of the suspected fraud.
- An analysis of refunds and returns and allowances with the actual flow of inventory might reveal some fraud schemes. The refund should cause an entry to inventory, even if it is damaged inventory. Likewise, a return will cause a corresponding entry to an inventory account.

- There should be a linear relationship between sales and returns and allowances over a relevant range. Any change in this relationship might point to a fraud scheme unless there is another valid explanation, such as a change in the manufacturing process, change in product line, or change in price.

Detection at the Register

As cash is received, whether at a register or through the mail, it is important to ensure that the employees responsible for completing these important tasks are informed of their responsibility and properly supervised.

- Access to the register must be closely monitored and access codes must be kept secure.
- All employees should have unique access codes to the cash registers. The time periods that each access code is used should be checked against employee work schedules to ensure an employee's access code was not used in their absence.
- An employee other than the register worker should be responsible for preparing register count sheets and reconciling them with register totals.
- Popular concealment methods must be watched for. These methods, discussed earlier, include checks for cash, reversing transactions, register log destruction or alteration, and sales cash counts.
- Complete register documentation and cash must be delivered to the appropriate personnel in a timely manner.
- Cash thefts are sometimes revealed by customers who have either paid money on an account and have not received credit or, in some cases, have noticed that the credit they have been given does not agree with the payment they have made. Complaints and inquiries are also received frequently from banks.

Cash Account Analysis

Cash larceny can be detected by reviewing and analyzing all journal entries made to the cash accounts. This review and analysis should be performed regularly. If an employee is unable to conceal the fraud by altering the source documents, such as the cash register log, then the employee might resort to making a journal entry directly to cash. Except in financial institutions, there are generally very few instances in everyday business activity where an independent journal entry is necessary for cash. One of these exceptions is the recording of the bank service charge. However, this is an easy journal entry to trace to its source documentation, namely the bank statement. Therefore, all other entries directly to cash are

suspect and should be traced to their source documentation or explanation. Suspect entries will generally credit the cash account and correspondingly debit various other accounts such as a sales contra account or bad debt expenses.

Prevention of Cash Larceny

Cash larceny can be prevented through the implementation of certain controls by management. These controls include the following:

- Separation of duties
- Assignment rotation and mandatory vacations
- Surprise cash counts and procedure supervision
- Physical security of cash

Separation of Duties

The primary means of preventing cash larceny is separation of duties. Whenever one individual has control over the entire accounting transaction (e.g., authorization, recording, and custody), the opportunity is present for cash fraud. Ideally, each of the following duties and responsibilities should be separated:

- Cash receipts
- Cash counts
- Bank deposits
- Deposit receipt reconciliation
- Bank reconciliations
- Posting of deposits
- Cash disbursements

If any one person has the authority to collect the cash, deposit the receipts, record that collection, and disburse company funds, the risk of fraud is high.

Assignment Rotation and Mandatory Vacations

Many internal fraud schemes are continuous in nature and require ongoing efforts by the employee to conceal the fraud. Mandatory vacations are an excellent method of detecting cash fraud. If mandatory vacations are within the company's policies, it is important that during an employee's absence, that employee's normal workload be performed by another individual. The purpose of mandatory vacations is lost if the work is allowed to remain undone during the employee's time off.

Surprise Cash Counts and Procedure Supervision

Surprise cash counts and supervisory observations are a useful fraud prevention method if properly used. It is important that employees know that cash will be counted on a periodic and unscheduled basis. These surprise counts must be made at all steps of the process, from receiving the check, to reconciling the register log to the cash in the drawer, to depositing the funds in the bank.

Physical Security of Cash

Physically securing cash is a measure used to help prevent theft of cash. The following are examples of ways cash can be properly and adequately secured:

- Ensure proper separation of duties of key personnel.
- Review the check and cash composition of the daily bank deposit during unannounced cash counts and during substantive audit tests of cash receipts.
- Review the entity's records of the numerical series of printed prenumbered receipts, and verify that these receipts are used sequentially (including voided documents).
- Review the timeliness of deposits from locations to the central treasurer function.
- Observe locations' cash receipting operations.
- Prepare and review a schedule of all cash receipting functions from a review of revenue reports, from cash receipt forms at the central treasurer function, and from discussion with knowledgeable employees.
- Prepare and analyze an inventory of all imprest and change funds by purpose, amount, custodian, date, and location.
- Audit all revenue sources on a cycle.
- Periodically use comparative analytical reviews to determine which functions have unfavorable trends.
- Determine reason(s) why revenue has changed from previous reporting periods.
- Confirm responses obtained from managers by using alternative records or through substantive audit tests.
- Adhere to a communicated policy of unannounced cash counts.

Theft of Cash on Hand

Another way cash can be misappropriated involves the theft of cash on hand. This type of fraud scheme differs from cash larceny and skimming in that it relates to cash that is kept in a secure place, such as a vault or safe. Employees who have access to this stored cash might have the ability to misappropriate or steal these funds.

ASSET MISAPPROPRIATION: FRAUDULENT DISBURSEMENTS

In fraudulent disbursement schemes, an employee makes a distribution of company funds for a dishonest purpose. Examples of fraudulent disbursements include forging company checks, the submission of false invoices, altering timecards, and so forth. Outwardly, the fraudulent disbursements do not appear any different from valid disbursements of cash. In many cases, the fraudster tricks the victim company into remitting payment. For instance, when an employee runs a fake invoice through the accounts payable system, the victim organization cuts a check for the bad invoice right along with all the legitimate payments it makes. The perpetrator has taken money from their employer in such a way that it appears to be a normal disbursement of cash. Someone might notice the fraud based on the amount, recipient, or destination of the payment, but the *method* of payment is legitimate.

Register Disbursement Schemes

Fraudulent disbursements at the cash register are different from the other schemes that often take place at the register, such as skimming and cash larceny. When cash is stolen as part of a register disbursement scheme, the removal of the cash is recorded.

There are two basic register disbursements schemes: *false refunds* and *false voids*. While the schemes are largely similar, there are a few differences between the two that merit discussing them separately.

False Refunds

A refund is processed at the register when a customer returns an item of merchandise that was purchased from the store. The transaction that is entered on the register indicates that the merchandise is being replaced in the store's inventory and the purchase price is being returned to the customer. In other words, a refund shows cash being disbursed from the register to the customer. (See the "False Refunds" flowchart that follows.)

False Refunds

Fictitious Refunds

In a fictitious refund scheme, an employee processes a transaction as if a customer were returning merchandise, even though there is no actual return. Then the employee takes cash from the register in the amount of the false return. The customer might or might not be aware of the scheme taking place.

For instance, if an employee processes a fictitious return for a \$100 pair of shoes, they remove \$100 from the register. Two things result from this fraudulent transaction. First, the register log indicates that the shoes were returned, so the disbursement appears to be legitimate. The register log balances with the amount of cash in the register, because the money that was taken by the fraudster is supposed to have been removed and given to a customer as a refund.

The second repercussion is that a debit is made to the inventory system showing that the merchandise has been returned to the inventory. Since the transaction is fictitious, no merchandise is actually returned. The result is that the company's inventory balance on the books is overstated by the amount of the excess refund.

EXAMPLE

A manager created \$5,500 worth of false returns, resulting in a large shortage in the company's inventory. The manager was able to carry on the scheme for several months because (1) inventory was not counted regularly and (2) the perpetrator (i.e., the manager) was one of the people who performed inventory counts.

Overstated Refunds

Rather than create an entirely fictitious refund, some employees merely overstate the amount of a legitimate refund and steal the excess money. For example, if a customer returns \$100 worth of merchandise, the employee might ring up a \$200 return. The employee gives the customer \$100 in return for the merchandise and then keeps the remaining \$100. This will result in shrinkage of \$100 worth of inventory.

Credit Card Refunds

When purchases are made with a credit card rather than cash, refunds appear as credits to the customer's credit card rather than as cash disbursements. Some dishonest employees process false refunds on credit card sales in lieu of processing a normal cash transaction. One benefit of the credit card method is that the perpetrator does not have to physically take cash from

the register and carry it out of the store. By processing the refunds to a credit card account, a perpetrator reaps a financial gain and avoids the potential embarrassment of being caught taking cash.

In a typical credit card refund scheme, the perpetrator rings up a refund on a credit card sale even though the merchandise is not actually being returned. The employee credits their own credit card number rather than the customer's. The result is that the item's cost is credited to the perpetrator's credit card account.

A more creative and wide-ranging application of the credit card refund scheme occurs when employees process refunds to other people's accounts and receive a portion of the refund as a kickback in return. Suppose a person is \$100 short on the rent. That person goes to the retail store where their friend is a teller and has the teller process a credit of \$150 to their account. The "customer" then goes to an automated teller machine (ATM) and withdraws \$150 in cash. They pay \$50 to the teller and keep \$100.

Refund schemes are more difficult to perpetrate in many high-tech retail stores where the cash registers have anti-fraud controls that require the refund to be made to the original credit card used for the purchase or that only allow for refunds in the form of a store credit for the current value of the item purchased.

False Voids

Fictitious voids are similar to refund schemes in that they make fraudulent disbursements from the register appear to be legitimate. When a sale is voided on a register, a copy of the customer's receipt is usually attached to a void slip, along with the signature or initials of a manager indicating that the transaction has been approved. (See the "False Voids" flowchart that follows.) To process a false void, the first thing the perpetrator needs is the customer's copy of the sales receipt. Typically, when an employee sets about processing a fictitious void, the employee simply withholds the customer's receipt at the time of the sale. In many cases, customers do not notice that they are not given a receipt.

With the customer's copy of the receipt in hand, the culprit rings a voided sale. Whatever money the customer paid for the item is removed from the register as though it is being returned to a customer. The copy of the customer's receipt is attached to the void slip to verify the transaction's authenticity.

Before the voided sale will be perceived as valid, a manager generally must approve the transaction. In many instances, the manager in question simply neglects to verify the voided sale's authenticity. A number of managers will sign almost anything presented to them and thus leave themselves vulnerable to voided sales schemes. It is not a coincidence that the perpetrators of these crimes present their void slips to managers who are lackadaisical about authorizing them. These kinds of managers are generally targeted by the fraudsters and are essential to the schemes' success.

EXAMPLE

An employee processed fraudulent voids, kept customer receipts, and presented them to supervisors for review at the end of the workday, long after the alleged transactions had taken place. The supervisors approved the voided sales and the accounts receivable department failed to notice the excessive number of voided sales processed by this employee.

Obviously, not all managers give unquestioned approval to voided sales. Some employees must therefore take other routes to get their voided sales approved. In most of these cases, the perpetrator simply forges their supervisor's authorization on the fraudulent void slips. It is also possible that managers will conspire with register employees and approve false voids in return for a share of the proceeds from the scheme.

False Voids

Concealing Register Disbursement Schemes

As has already been discussed, two things happen when a false refund or void is entered into the register. The first is that the employee committing the fraud removes cash from the register, and the second is that the item allegedly being returned is debited back into the perpetual inventory. Of course, there really is no merchandise being returned. This leads to inventory shrinkage, a situation in which there is less inventory actually on hand than the perpetual inventory records reflect. A certain amount of shrinkage is expected in any retail industry, but too much of it raises concerns of fraud. It is therefore in the perpetrator's best interest to conceal the appearance of shrinkage on the books.

Inventory is essentially accounted for by a two-step process. The first part of the process is the perpetual inventory, which is a running tabulation of how much inventory *should be on hand*. When a sale of merchandise is made, the perpetual inventory is credited to remove this merchandise from the records. The amount of merchandise that should be on hand is reduced. (Conversely, when merchandise is returned, the perpetual inventory is debited.) Periodically, someone from the company takes a physical count of the inventory, going through the stockroom or warehouse and counting the amount of inventory that *is actually on hand*. The two figures are then compared to see if there is a discrepancy between the perpetual inventory (what should be on hand) and the physical inventory (what is on hand).

In register disbursement schemes, shrinkage is often concealed by overstating inventory during the physical count, especially if taking inventory is one of the perpetrator's duties. The perpetrator simply overstates the amount of inventory on hand so it matches the perpetual inventory. For a more detailed analysis of methods used to conceal inventory shrinkage, please see the "Asset Misappropriation: Inventory and Other Assets" chapter.

Small Disbursements

Another way for employees to avoid detection in a refund scheme is to keep the sizes of the disbursements low. Many companies set limits below which management review of a refund is not required. Where this is the case, employees simply process numerous refunds that are small enough that they do not have to be reviewed.

EXAMPLE

An employee created over one thousand false refunds, all under the review limit of \$15. The employee was eventually caught because they began processing refunds before store hours and another employee noticed that refunds were appearing on the system before the store opened. Nevertheless, the employee made off with over \$11,000 of their employer's money before their scheme was detected.

Destroying Records

One final means of concealing a register scheme is to destroy all records of the transaction. Most concealment methods are concerned with keeping management from realizing that fraud has occurred. When employees resort to destroying records, however, they typically have conceded that management will discover their theft. The purpose of destroying records is usually to prevent management from determining *who* the thief is.

Detection of Register Disbursement Schemes***Fictitious Refunds or Voided Sales***

Fictitious refunds or voided sales can often be detected when closely examining the documentation submitted with the cash receipts.

- One detection method is to evaluate the refunds or discounts given by each cashier or salesperson. This analysis might indicate that a single employee or group of employees has a higher incidence of refunds or discounts than others. Further examination is then necessary to determine if the refunds are appropriate and properly documented.
- Signs in the register area asking customers to ask for and examine their receipts employ the customer as part of the internal control system. This helps ensure that the cashier or salesperson is properly accounting for the sale and prevents employees from using customer receipts as support for false void or refunds.
- Random service calls to customers who have returned merchandise or voided sales can be used to verify the legitimacy of transactions.

Review and Analysis of Decreases in Gross Sales or Increases in Returns and Allowances

Analyzing the relationship between sales, cost of sales, and the returns and allowances can detect inappropriate refunds and discounts. If a large cash fraud is suspected, a thorough review of these accounts might enlighten the examiner as to the suspected fraud's magnitude. An analysis of refunds and returns and allowances with the actual flow of inventory might reveal some fraud schemes. The refund should cause an entry to inventory, even if it is damaged inventory. Likewise, a return will cause a corresponding entry to an inventory

account. There should be a linear relationship between sales and returns and allowances over a relevant range. Any change in this relationship might point to a fraud scheme unless there is another valid explanation, such as a change in the manufacturing process, change in product line, or change in price.

Register Disbursement Scheme Red Flags

Red flags of fraudulent register disbursements include the following:

- There is inappropriate employee separation of duties. For example, register counting and reconciling should not be done by the cashier.
- Cashiers, rather than supervisors, have access to the control keys necessary for refunds and voids.
- Register employees have the authority to void their own transactions.
- Register refunds are not carefully reviewed.
- Multiple cashiers operate from a single cash drawer without separate access codes.
- Personal checks from cashiers are found in the register.
- Voided transactions are not properly documented or approved by a supervisor.
- Voided cash receipt forms (manual systems) or supporting documents for voided transactions (cash register systems) are not retained on file.
- There are missing or obviously altered register logs.
- There are gaps in the sequence of transactions on the register logs.
- An excessive number of refunds, voids, or no-sales appear on the register records.
- Inventory totals appear forced.
- There are multiple refunds or voids for amounts just under the review limit.

Prevention of Register Disbursement Schemes

The following are preventive controls that can reduce the risk of register disbursement schemes:

- Review the separation of duties of key employees who staff the register, as well as the duties of their supervisors.
- As cash is received, ensure that the employees responsible for completing these important tasks are informed of their responsibilities and properly supervised.
- Ensure that an employee other than the register worker is responsible for preparing register count sheets and reconciling them with register totals.
- Make sure that complete register documentation and cash are delivered to the appropriate personnel in a timely manner.

- Be aware that cash thefts are sometimes revealed by customers who have paid money on an account and have not received credit or have been credited for an amount that does not agree with the payment they have made. Complaints and inquiries are also received frequently from banks.
- Closely monitor access to the register and keep access codes secure.
- Analyze the quantity of refunds to detect multiple small refunds.
- Communicate and adhere to the company policy of performing unannounced cash counts.
- Maintain the presence of a manager or supervisor near the area of the cash register as a deterrent to theft.
- Review supporting documents for voided and refunded transactions for propriety (i.e., legitimacy and approvals).
- Review the numerical sequence and completeness of cash register logs.

Check Tampering Schemes

Check tampering is unique among the fraudulent disbursement schemes because it is the one group in which the perpetrator physically prepares the fraudulent check. In most fraudulent disbursement schemes, the culprit generates a payment to themselves by submitting some false document to the victim organization, such as an invoice or a timecard. The false document represents a claim for payment and causes the victim organization to issue a check that the perpetrator can convert.

Check tampering schemes are fundamentally different. In these schemes, the perpetrator takes physical control of a check and makes it payable to themselves through one of several methods. Check tampering frauds depend upon factors such as access to the company checkbook, access to bank statements, and the ability to forge signatures or alter other information on the face of the check. Most check tampering crimes fall into one of four categories: forged maker schemes, forged endorsement schemes, altered payee schemes, and authorized maker schemes.

Because many business payments are currently still made by check, the bulk of this section will focus on how traditional check-based payments can be manipulated by dishonest employees. However, businesses are increasingly using electronic forms of payment—such as wire transfers, automated clearing house (ACH) debits, and online bill-pay services—to pay vendors and other third parties. Consequently, the specific implications and considerations of these types of payments are discussed in the “Electronic Payment Tampering” section at the end of this chapter.

Forged Maker Schemes

Forgery can include not only the *signing of another person's name* to a document (such as a check) with a fraudulent intent, but also the fraudulent *alteration* of a genuine instrument. This definition is so broad that it would encompass all check tampering schemes. For the purposes of this text, the definition of forgery has been narrowed to fit the fraud examiner's needs. To properly distinguish the various methods used by individuals to tamper with checks, the concept of *forgeries* will be limited to those cases in which an individual signs another person's name on a check.

The person who signs a check is known as the *maker* of the check. A forged maker scheme can thus be defined as a check tampering scheme in which an employee misappropriates a check and fraudulently affixes the signature of an authorized maker thereon. (See the "Forged Maker Schemes" flowchart that follows.) Frauds that involve other types of check tampering, such as the alteration of the payee or the changing of the amount, are classified separately.

To forge a check, an employee must have access to a blank check, be able to produce a convincing forgery of an authorized signature, and be able to conceal their crime. Concealment is a universal problem in check tampering schemes; the methods used are basically the same whether one is dealing with a forged maker scheme, an intercepted check scheme, or an authorized maker scheme. Therefore, concealment issues will be discussed as a group later in this section.

Obtaining the Check

EMPLOYEES WITH ACCESS TO COMPANY CHECKS

One cannot forge a company check unless one first possesses a company check. Most forgery schemes are committed by accounts payable clerks, office managers, bookkeepers, or other employees whose duties typically include the preparation of company checks. These are people who have access to the company checkbook on a regular basis and are therefore in the best position to steal blank checks.

EMPLOYEES LACKING ACCESS TO COMPANY CHECKS

If perpetrators do not have access to the company checkbook through their work duties, they will have to find other means of misappropriating a check. The method by which a person steals a check depends largely on how the checkbook is handled within a particular company. In some circumstances, the checkbook is poorly guarded and left in unattended

areas where anyone can get to it. In other companies, the check stock might be kept in a restricted area, but the perpetrator might have obtained a key or combination to this area or might know where an employee with access to the checks keeps their own copy of the key or combination. An accomplice might provide blank checks for the fraudster in return for a portion of the stolen funds. Perhaps an administrative assistant sees a blank check left on a manager's desk or a custodian comes across the check stock in an unlocked desk drawer.

In some companies, checks are computer-generated. When this is the case, an employee who knows the password for preparing and issuing checks can usually obtain as many unsigned checks as they desire. There is an unlimited number of ways to steal a check, each dependent on the way in which a particular company guards its blank checks. In some instances, employees go as far as to produce counterfeit checks.

EXAMPLE

An employee had an accomplice who worked for a check-printing company. The accomplice was able to print blank checks with the account number of the perpetrator's company. The perpetrator then wrote over \$100,000 worth of forgeries on these counterfeit checks.

To Whom Is the Check Made Payable?

TO THE PERPETRATOR

Once a blank check has been obtained, the perpetrator must decide to whom it should be made payable. In most instances, forged checks are made payable to the perpetrator so that they can be easily converted. Canceled checks that are payable to an employee should be closely scrutinized for the possibility of fraud.

If the perpetrator owns their own business or has established a shell company, they will usually write fraudulent checks to these entities rather than themselves. These checks are not as obviously fraudulent on their faces as checks made payable to an employee. At the same time, these checks are easy to convert because the perpetrator owns the entity to which the checks are payable.

TO AN ACCOMPLICE

If a fraudster is working with an accomplice, the fraudster can make the forged check payable to that person. The accomplice then cashes the check and splits the money with the employee-fraudster. Because the check is payable to the accomplice in their true identity, it is easily converted. An additional benefit to using an accomplice is that a canceled check payable

to a third-party accomplice is not as likely to raise suspicion as a canceled check to an employee. The obvious disadvantage to using an accomplice in a scheme is that the employee-fraudster usually has to share the proceeds.

Forged Maker Schemes

TO “CASH”

The perpetrator might also write checks payable to “cash” to avoid listing themselves as the payee. Checks made payable to cash, however, must still be endorsed. The perpetrator will have to sign their own name or forge the name of another to convert the check. Checks payable to cash are usually viewed more skeptically than checks payable to persons or businesses. Some institutions might refuse to cash checks made payable to cash.

TO VENDORS

Not all fraudsters forge company checks to obtain cash. Some employees use forged maker schemes to purchase goods or services for their own benefit. These fraudulent checks are made payable to third-party vendors who are uninvolved in the fraud. For instance, an employee might forge a company check to buy a home computer. The computer vendor is not involved in the fraud at all. Furthermore, if the victim organization regularly does business with this vendor, the person who reconciles the company’s accounts might assume that the check was used for a legitimate business expense.

Forging the Signature

After the employee has obtained and prepared a blank check, they must forge an authorized signature to convert the check. The most obvious method, and the one that comes to mind when one thinks of the word *forgery*, is to simply sign the name of an authorized maker.

FREE-HAND FORGERY

The difficulty a fraudster encounters when physically signing the authorized maker’s name is in creating a reasonable approximation of the true signature. If the forgery appears authentic, the perpetrator will probably have no problem cashing the check. In truth, the forged signature might not have to be particularly accurate. Many fraudsters cash forged checks at liquor stores, grocery stores, or other institutions that are known to be less than diligent in verifying signatures and identification. Nevertheless, a poorly forged signature is an obvious red flag of fraud. The maker’s signature on canceled checks should be reviewed for forgeries during the reconciliation process.

PHOTOCOPIED FORGERIES

To guarantee an accurate forgery, some employees make photocopies of legitimate signatures. The signature of an authorized signer is copied from some document (such as a

business letter) onto a transparency, and then the transparency is laid over a blank check so that the signature copies onto the maker line of the check. The result is a check with a perfect signature of an authorized maker.

AUTOMATIC CHECK-SIGNING MECHANISMS

Companies that issue a large number of checks sometimes use automatic check-signing mechanisms in lieu of signing each check by hand. Automated signatures are produced with manual instruments, such as signature stamps, or they are printed by computer. Obviously, a fraudster who gains access to an automatic check-signing mechanism will have no trouble forging the signatures of authorized makers. Even the most rudimentary control procedures should severely limit access to these mechanisms.

EXAMPLE

A fiscal officer maintained a set of manual checks that were unknown to other persons in the company. The company used an automated check signer and the custodian of the signer let the officer have uncontrolled access to it. Using the manual checks and the company's check signer, the fiscal officer was able to write over \$90,000 worth of fraudulent checks in their own name over a period of approximately four years.

The same principle applies to computerized signatures. Access to the password or program that prints signed checks should be restricted, specifically excluding those who prepare checks and those who reconcile the bank statement.

Converting the Check

To convert the forged check, the perpetrator must endorse it. The endorsement is typically made in the name of the payee on the check. Since identification is typically required when one seeks to convert a check, the perpetrator usually needs fake identification if they forge checks to real or fictitious third persons. As discussed earlier, checks payable to "cash" require the endorsement of the person converting them. Without a fake ID, the perpetrator will likely have to endorse these checks in their own name. An employee's endorsement on a canceled check is obviously a red flag.

Forged Endorsement Schemes

Forged endorsements are those check tampering schemes in which an employee intercepts a company check intended to pay a third party and converts the check by endorsing it in the third party's name. In some cases, the employee also signs their own name as a second endorser. (See the "Forged Endorsement Schemes" flowchart that follows.)

A fraudster's main dilemma in a forged endorsement scheme (and in all intercepted check schemes, for that matter) is gaining access to a check after it has been signed. The fraudster must either steal the check between the point where it is signed and the point where it is delivered, or they must re-route the check, causing it to be delivered to a location where they can retrieve it. The manner used to steal a check depends largely upon the way the company handles outgoing disbursements. Anyone who is allowed to handle signed checks might be in a good position to intercept them.

Intercepting Checks Before Delivery

EMPLOYEES INVOLVED IN DELIVERY OF CHECKS

Obviously, the employees in the best position to intercept signed checks are those whose duties include the handling and delivery of signed checks. The most obvious example is a mailroom employee who opens outgoing mail containing signed checks and steals the checks. Other personnel who have access to outgoing checks might include accounts payable employees, payroll clerks, and administrative assistants.

POOR CONTROL OF SIGNED CHECKS

Unfortunately, employees are often able to intercept signed checks because of poor internal controls. For instance, many employees simply find signed checks left unattended in the work areas of the individuals who signed them or the people charged with their delivery. In these cases, it is easy for the perpetrator to steal the check. Another common breakdown occurs when the person who prepares a check is also involved in the delivery of that check once it has been signed.

Forged Endorsement Schemes

EXAMPLE

A high-level manager with authority to disburse employee benefits instructed accounts payable personnel to return signed benefits checks to them instead of immediately delivering the checks to the intended recipients. These instructions were not questioned due to the manager's level of authority within the company. The perpetrator simply took the returned checks and deposited them into their personal bank account, forging the endorsements of the intended payees.

In addition to the preceding example, administrative assistants or clerks who prepare checks for their bosses to sign are often responsible for mailing those checks. It is very simple for those employees to make out a fraudulent check and obtain a signature, knowing that the boss will give the signed check right back to them. This scheme is indicative of the key problem with occupational fraud: trust. For an office to run efficiently, high-level employees must be able to rely on their subordinates. Yet this reliance is precisely what puts subordinates in a position to defraud their employer.

Theft of Returned Checks

Checks that have been mailed and are later returned to the victim for some reason, such as an incorrect address, are often targeted for theft by fraudsters. Employees with access to incoming mail are able to intercept these returned checks and convert them by forging the intended payee's endorsement.

EXAMPLE

A manager took and converted approximately \$130,000 worth of checks that were returned due to noncurrent addresses (also stealing outgoing checks, cashing them, and then declaring them lost). The fraudster was well known at their bank and was able to convert the checks by claiming that they were doing it as a favor for the real payees, who were "too busy to come to the bank." The fraudster was able to continue with the scheme because the nature of their company's business was such that the recipients of the misdelivered checks were often not aware that the victim company owed them money. Therefore, they did not complain when their checks failed to arrive. In addition, the perpetrator had complete control over the bank reconciliation, so they could issue new checks to those payees who did complain and then force the reconciliation, making it appear that the bank balance and book balance matched when they actually did not.

Re-Routing the Delivery of Checks

Employees might also misappropriate signed checks by altering the addresses to which those checks are mailed. These perpetrators usually replace the payee's legitimate address with an address where the employee can retrieve the check, such as the employee's home or a PO Box the employee controls. In other instances, the perpetrator might purposely misaddress a check so that it will be returned as undeliverable. The employee steals the check after it is returned to the victim organization.

Obviously, proper separation of duties should preclude anyone who prepares disbursements from being involved in their delivery. Nevertheless, the person who prepares a check is often allowed to address and mail it as well. In some instances where proper controls are in place, employees are still able to cause the misdelivery of checks.

EXAMPLE

A clerk in the customer service department of a mortgage company was in charge of changing the mailing addresses of property owners. They were assigned a password that gave them access to make these changes. The clerk was transferred to a new department where one of their duties was the issuance of checks to property owners. Unfortunately, their supervisor forgot to cancel the clerk's old password. When the clerk realized this oversight, they would request a check for a certain property owner and then sign onto the system with the old password to change the address of that property owner so that the check would be sent to their own address. The next day, the employee would use their old password to re-enter the system and replace the proper address so that there would be no record of where the check had been sent. This fraudster's scheme resulted in a loss of over \$250,000 to the victim company.

Converting the Stolen Check

Once a check has been intercepted, the perpetrator can cash it by forging the payee's signature, hence the term *forged endorsement scheme*. Depending on where they try to cash the check, the perpetrator might or might not need fake identification at this stage. If a perpetrator is required to produce identification to cash their stolen check, and if they do not have a fake ID in the payee's name, they might use a dual endorsement to cash or deposit the check. In other words, the perpetrator forges the payee's signature as though the payee had transferred the check to them, and then the perpetrator endorses the check in their own name and converts it. When the bank statement is reconciled, dual endorsements on checks should always raise suspicions, particularly when the second signer is a company employee.

Altered Payee Schemes

The second type of intercepted check scheme is the altered payee scheme. This is a form of check tampering in which an employee intercepts a company check intended for a third party and alters the payee designation so that the employee or an accomplice can convert the check. (See the “Altered Payee Schemes” flowchart that follows.) The employee inserts their own name, the accomplice’s name, or a fictitious entity’s name on the check’s payee line. The alteration essentially makes the check payable to the employee (or an accomplice), so there is no need to forge an endorsement and no need to obtain false identification.

Altering Checks Prepared by Others: Inserting a New Payee

The method used to alter the payee designation on a check depends largely on how that check is prepared and intercepted. (Incidentally, the *amount* of the check might also be altered at the same time and by the same method as the payee designation.) Checks prepared by others can be intercepted by any of the methods discussed in the forged endorsements section. When the perpetrator intercepts a check that has been prepared by someone else, there are basically two methods that can be employed to change the payee. The first is to insert the false payee’s name in place of the true payee’s name. The true name might be scratched out with a pen or covered up with correction fluid. Another name is then entered on the payee designation line. These kinds of alterations are usually simple to detect.

A more sophisticated method occurs when the fraud perpetrator enters the accounts payable system and changes the payees’ names before checks are generated. Anyone with a password that permits access to the accounts payable address file can accomplish this.

EXAMPLE

An accounts payable employee was so trusted that they were allowed to use the manager’s computer password when the manager was out of the office. The password permitted access to the accounts payable address file. This employee waited until the manager was absent to select a legitimate vendor with whom the company did a lot of business. The employee stalled the vendor’s invoices for the day and used the manager’s log-in code to change the vendor name and address to that of a fictitious company after work. The new name and address were run through the accounts payable cycle with an old invoice number, causing a fraudulent check to be issued. The victim company had an automated duplicate invoice test, but the perpetrator circumvented it, substituting “1” for “I” and “0” (zero) for capital “O.” The next day, the employee would replace the true vendor’s name and address and manipulate the check register so that the check payable to the fictitious vendor was concealed. Approximately \$300,000 in false checks was issued using this method.

Altered Payee Schemes

Altering Checks Prepared by Others: Tacking On

The other method that can be used by perpetrators to alter checks prepared by others is tacking on additional letters or words to the end of the real payee designation. For instance, checks payable to “ABC” company might be altered to read “A.B. Collins.” The employee then cashes the checks in the name of A.B. Collins. In these cases, the simple inclusion of a filler line after the payee designation would prevent the loss.

In addition to altering the payee designation, the amount of the check can be altered by tacking on extra numbers if the person preparing the check is careless and leaves space for extra numbers in the amount section of the check.

Altering Checks Prepared by the Fraudster: Erasable Ink

When the perpetrator prepares the check that is to be altered, the schemes tend to be a bit more sophisticated. The reason for this is obvious: If the perpetrator is able to prepare the check themselves, the perpetrator can prepare it with the thought of how the payee designation will be changed. One of the most common ways to prepare a check for alteration is to write or type the payee’s name (and possibly the amount) in erasable ink. After an authorized maker signs the check, the perpetrator retrieves the check, erases the payee’s name, and inserts their own name.

EXAMPLE

A bookkeeper printed small checks to a local supplier and had the company’s owner sign them. The bookkeeper then put the checks back in the printer so that they could alter the payee and check amount. For instance, the owner might sign a \$10 check that later became a \$10,000 check. These checks were entered in the disbursements journal as payments for aggregate inventory to the company’s largest supplier, who received several large checks each month. The bookkeeper stole over \$300,000 from their employer in this scheme.

Where a proper separation of duties is in place, a person who prepares a check should not be permitted to handle the check after it has been signed. Nevertheless, this is exactly what happens in most altered payee schemes. The person who prepares the check knows that the maker of the check will return it to them after it has been signed.

Altering Checks Prepared by the Fraudster: Blank Checks

The most egregious example of poor controls in the handling of signed checks is one in which the perpetrator prepares a check, *leaves the payee designation blank*, and submits it to an

authorized maker who signs the check and returns it to the employee. Obviously, this makes it quite easy for the perpetrator to designate themselves or an accomplice as the payee. Common sense should prevent anyone from giving a signed, blank check to another person. Nevertheless, this is a fairly common occurrence, especially when the perpetrator is a trusted long-time employee.

Converting Altered Checks

As with all other types of fraudulent checks, conversion is accomplished by endorsing the checks in the payee's name. Conversion of fraudulent checks has already been discussed in previous sections and will not be re-examined here.

Authorized Maker Schemes

The final check tampering scheme, the authorized maker scheme, might be the most difficult to defend against. An authorized maker scheme occurs when an employee with signature authority on a company account writes fraudulent checks for their own benefit and signs their own name as the maker. (See the "Authorized Maker Schemes" flowchart that follows.) Perpetrators in these schemes can write and sign fraudulent checks themselves. They do not have to alter a pre-prepared document or forge the maker's signature.

Overriding Controls Through Intimidation

When a person is authorized to sign company checks, preparing the checks is easy. The employee simply writes and signs the documents the same way they would with any legitimate check. In most situations, check signers are owners, officers, or otherwise high-ranking employees and thus have or can obtain access to all the blank checks they need. Even if company policy prohibits check signers from handling blank checks, the perpetrator can normally use their influence to overcome this impediment. What employee is going to tell the chief executive officer (CEO) that they can't have a blank check?

The most basic way an employee accomplishes an authorized maker scheme is to override controls designed to prevent fraud. Most authorized signatories have high levels of influence within their companies. The perpetrators use this influence to deflect questions about fraudulent transactions.

A common authorized maker scheme is one in which a majority owner or sole shareholder uses their company to pay personal expenses directly out of company accounts. Instead of paying personal expenses, the perpetrator might cut checks directly to themselves, their

friends, or their family. Using fear of job security as a weapon, the owner can maintain a work environment in which employees are afraid to question these transactions.

High-level managers or officers might also use their authority to override controls in companies with absent or inattentive owners. Intimidation can play a large part in the commission and concealment of occupational fraud schemes involving powerful individuals.

EXAMPLE

The manager of a sales office stole approximately \$150,000 from their employer over a two-year period. This manager had primary check-signing authority and abused this power by writing company checks to pay their personal expenses. The manager's fraudulent activities were well known by certain members of the staff, but these employees' careers were controlled by the perpetrator. Fear of losing their jobs combined with lack of a proper whistleblowing structure prevented the manager's employees from reporting the fraud.

Poor Controls

Although overriding controls is the most obvious way to execute an authorized maker scheme, it is not the most common. Far more of these schemes occur because no one is paying attention to the accounts and few controls are present to prevent fraud. Some employees who write checks to themselves or to purchase items for themselves simply code the checks to expense accounts that they know are not likely to be reviewed.

The failure to closely monitor accounts is supplemented by lack of internal controls, specifically the absence of separation of duties in the cash disbursements process. Employees who commit authorized maker fraud are often in charge of reconciling the business's bank accounts. This is especially common in small businesses. Employees with total control over the disbursements process are in a perfect position to write fraudulent checks for their own benefit.

EXAMPLE

The bookkeeper of a medium-sized company was charged with paying all bills and preparing the company payroll. They had access to an automatic check signer and total control over company bank accounts. The bookkeeper wrote extra checks in their own name coded the expenditures to payroll, and destroyed the canceled checks when they were returned with the bank statement.

Authorized Maker Schemes

Concealing Check Tampering Schemes

Most check tampering schemes do not consist of a single occurrence; they continue over time. Therefore, concealing the fraud is arguably the most important aspect of the scheme. If an employee intended to steal a large sum of money and escape to another country, hiding the fraud might not be so important. But the vast majority of occupational fraudsters remain employees of their companies as they continue to steal from them, which makes concealment the key to the crime.

Concealment of the fraud means not only hiding the criminal's identity, but also hiding the fact that a fraud has even occurred. The most successful frauds are those in which the victim organization is unaware that it is being robbed. Obviously, once a business learns that it is being victimized, it will take steps to find the source and put a stop to the scheme.

Check tampering schemes can present especially complex concealment problems for dishonest employees. In other types of fraudulent disbursements, such as invoice or payroll schemes, someone other than the perpetrator enters the fraudulent payment in the books as a legitimate transaction. The payments in those schemes are generated by the production of false documents that cause accounts payable personnel to think that money is owed to a particular person or vendor. When accounts payable issues a disbursement for a fake invoice, it does so because it believes the invoice to be genuine. The payment is then entered in the books as a legitimate payment. In other words, the perpetrator generally does not have to worry about concealing the payment in the books because someone else unintentionally does it for them. But in forgery and authorized maker schemes, the perpetrator is the one writing the check, and they are usually the one coding the check in the disbursements journal. They must "explain" the check on the books.

Forged endorsement schemes and altered payee schemes are different because they involve the alteration of checks that were already prepared and coded by someone else. Nevertheless, they create a problem for the perpetrator because the intercepted check was intended for a legitimate recipient. Someone is out there waiting for the check that the perpetrator has taken. The culprit in these schemes must worry not only about hiding the fraud from their employer but also about appeasing the intended payee.

The Fraudster Reconciling the Bank Statement

A large percentage of those who perpetrate check tampering frauds are involved in reconciling the company's bank statement. The bank statement that a company receives

normally includes the canceled checks that have been cashed in the preceding period. A person who reconciles the accounts is therefore in a position to hide the existence of any fraudulent checks they have written to themselves. They can remove the fraudulent checks, alter the bank statement, or both.

In forged maker and authorized maker schemes, the perpetrator usually has to code the check in the disbursements journal. The most basic way to hide the check is to code it as void or to include no listing at all in the journal. Then, when the bank statement arrives, perpetrators remove the fraudulent check from the returned checks and destroy it or alter the bank statement. Now there is no record of the payment in the journal and no physical evidence of the check. Of course, the bank will have a copy of the check, but unless someone questions the missing check, it is unlikely that the company will discover the problem. And since the perpetrator is the one who reconciles the account, it is unlikely that anyone will even notice that the check is missing.

The problem with simply omitting the fraudulent check from the disbursements journal is that the bank balance will not reconcile to the book balance. For instance, if the perpetrator wrote a \$25,000 check to themselves and did not record it, then the book balance will be \$25,000 higher than the bank balance (\$25,000 was taken out of the bank account by the perpetrator, but it was not credited out of the company's cash account). Perpetrators usually omit their illegal checks from the disbursements journal only in situations in which they personally reconcile the bank statement and no one reviews their work, thus allowing fraudsters to force the reconciliation. In other words, fraudsters report that the bank balance and book balance match when in fact they do not.

Some victim organizations simply do not regularly reconcile their accounts. This makes it easy for employees to write checks without recording them. In a system in which controls are so lax, almost any concealment method will be effective to disguise fraud. In fact, it might not be necessary to make any effort at all to conceal the crime.

Some fraudsters physically alter the bank statement to cause it to match the company's book balance. For instance, a person engaging in a forged maker scheme might decide to steal blank checks from the bottom of the check stock. These checks are out of sequence and therefore will be listed last on the bank statement. This employee can delete the clump of fraudulent checks at the end of the statement and alter the balance to match the victim company's books.

Re-Alteration of Checks

In altered payee schemes, remember that it is common for the perpetrator to take a check intended for a legitimate recipient and then alter the check so that the perpetrator becomes the designated payee. But a canceled check payable to an employee will obviously raise suspicions of fraud. Therefore, some employees re-alter their fraudulent checks when the bank statement arrives. It has already been discussed how employees can alter checks by writing the payee's name in erasable ink when the check is prepared. These employees obtain a signature for the check and then erase the true payee's name and insert their own. When the fraudulent checks return with the bank statement, the employee erases their own name and re-enters the proper payee's name. Thus, there will be no appearance of mischief.

Miscoding Fraudulent Checks

Rather than omit a fraudulent check from the disbursements journal or list it as void, perpetrators might write a check payable to themselves but list a different person as the payee on the books. Usually, the fake payee is a regular vendor—a person or business that receives numerous checks from the victim company. Employees tend to pick known vendors for these schemes because one extra disbursement to a regular payee is less likely to be noticed than a check to an unknown person.

The fraudster can also conceal a fraudulent check by overstating the amounts of *legitimate* disbursements in the journal to absorb a fraudulent check's cost. For instance, assume that a company owes \$10,000 to a particular vendor. The fraudster would write a check to the vendor for \$10,000 but would enter the check in the disbursements journal as a \$15,000 payment. The company's disbursements are now overstated by \$5,000. The fraudster can write a \$5,000 check to themselves and list that check as void in the disbursements journal. The bank balance and the book balance will still match because the cost of the fraudulent check was absorbed when the amount of the legitimate check was overstated. Of course, the fact that the canceled checks do not match the entries in the journal should indicate potential fraud. This type of concealment is really only effective when the bank accounts are not closely monitored or where the employee is in charge of reconciling the accounts.

If possible, fraudsters will try to code their fraudulent checks to existing accounts that are rarely reviewed or to accounts that are very active. Most of these checks are coded to expense accounts or liability accounts. This particular method can be very effective in concealing fraud, particularly when the victim company is not diligent in reconciling its bank accounts. For instance, some organizations reconcile their accounts by cross-referencing check numbers with

the amounts of the checks, but they do not verify that the payee on the actual check matches the payee listed in the disbursements journal. These organizations will be unable to detect checks that have been coded to the wrong payee in the disbursements journal.

Re-Issuing Intercepted Checks

In intercepted check schemes, the fraudster faces detection not only through their employer's normal control procedures but also by the intended recipients of the stolen checks. When the real payees do not receive their checks, they are likely to complain. These complaints, in turn, could trigger a fraud investigation. One way for a fraudster to avoid this problem is to issue new checks to the intended payees.

EXAMPLE

An accounts payable troubleshooter was in charge of auditing payments to all suppliers, reviewing supporting documents, and mailing checks. Every once in a while, they would purposely fail to mail a check to a vendor. The vendor, of course, called accounts payable about the late payment and was told that the invoice had been paid on a certain date. Since accounts payable did not have a copy of the canceled check (because the fraudster was still in possession of it), it would call the troubleshooter to research the problem. Unfortunately for the company, the troubleshooter was the one who had stolen the check and told accounts payable to issue another check to the vendor while they stopped payment on the first check. Thus, the vendor received their payment, and instead of stopping payment on the first check, the troubleshooter deposited it into their own account.

Fraudulent Supporting Documents

Whereas some perpetrators attempt to wipe out all traces of their fraudulent disbursements by destroying the checks, forcing the bank reconciliation, and so on, others opt to justify their checks by manufacturing fake support for them. These individuals prepare false payment vouchers, including false invoices, purchase orders, or receiving reports, to create an appearance of authenticity. This concealment strategy is only practical when the employee writes checks payable to someone else (such as an accomplice or a shell company). A check made payable to an employee might raise suspicions regardless of any supporting documents that they manufacture.

Detection of Check Tampering Schemes

Account Analysis Through Cut-Off Statements

Bank cut-off statements should be requested for 10 to 15 days after the balance sheet's closing date. These statements may be used to detect cash fraud during periods between monthly bank statements. Auditors often use cut-off statements to ensure that income and expenses are reported in the proper period. If employees know that a cut-off statement might be ordered at any time during the month and reviewed independently, cash fraud will be less likely.

A cut-off statement is generally ordered from the bank, delivered unopened to the auditor (or outsider), and reconciled. It can be ordered at any time during the accounting cycle. If cut-off bank statements are not ordered or received, obtain the following period bank statement and perform account analysis and investigation.

Bank Reconciliations

Copies of the bank reconciliations and account analysis should be obtained along with the complete set of bank statements on all checking and savings accounts, as well as certificates of deposit (CDs) and other interest-bearing and non-interest-bearing accounts. From the reconciliations, perform the following tests:

- Confirm the mathematical accuracy of the reconciliation.
- Examine the bank statement for possible alterations.
- Trace the balance on the statement back to the bank cut-off and bank confirmation statements.
- Compare the sum of the balance to the company's ledger.
- Trace the deposits in transit to the bank cut-off statement to ensure recording in the proper period.
- Examine canceled checks and compare them to the list of outstanding checks.
- Sample supporting documentation of checks written for a material amount.
- Verify supporting documentation on outstanding checks written for a material amount.
- Verify accuracy of nonoperational-cash or cash-equivalent accounts (CDs and other investment accounts). Analysis should include the verification of the institution holding the funds, interest rate, maturity date, beginning and ending balances, and current period activity. Book and bank balances should be compared and any accruals of interest analyzed.

Bank Confirmation

Another method related to the cut-off statement is the bank confirmation request. Unlike the cut-off statement, this detection method is merely a report of the balance in the account as of

the date requested. This balance should be requested to confirm the statement balance, as well as any other necessary balance date. If fraud is occurring at the bank reconciliation stage, this independent confirmation might prove to be very helpful.

Check Tampering Red Flags

The following irregularities might indicate fraud:

- Voided checks might indicate that employees have embezzled cash and charged the embezzlement to expense accounts. When the expense is paid (from accounts payable), fraudulent checks are marked and entered as void and removed from distribution points. An account-balancing journal entry is then made. The list of voided checks should be verified against physical copies of the checks. Bank statements should be reviewed to ensure that voided checks have not been processed.
- Missing checks might indicate lax control over the physical safekeeping of checks. Stop payments should be issued for all missing checks.
- Checks payable to employees, with the exception of regular payroll checks, should be closely scrutinized. Such an examination might indicate other schemes, such as conflicts of interest, fictitious vendors, or duplicate expense reimbursements.
- Altered endorsements or dual endorsements of returned checks might indicate possible tampering.
- Returned checks with obviously forged or questionable signature endorsements should be verified with the original payee.
- Altered payees on returned checks should be verified with the intended payee.
- Duplicate or counterfeit checks more than likely indicate fraud. These checks might be traceable to the depositor through bank check coding.
- An examination of all cash advances might reveal that not all advances were properly documented and, therefore, inappropriate payments have been made to employees.
- A questionable payee or payee address on a check should trigger review of the corresponding check and support documentation.

Prevention of Check Tampering Schemes

Check Disbursement Controls

The following list of activities will help tighten controls and possibly deter employees from giving in to the temptation to commit check fraud.

- Check “cutting” and preparation is not done by a signatory on the account.
- Checks are mailed immediately after signing.
- Theft control procedures are adhered to.

- Accounts payable records and addresses are secure from possible tampering. Changes in vendor information should be verified.
- Bank statements should be reviewed diligently to ensure that amounts and signatures have not been altered.
- Bank reconciliations should be completed immediately after monthly statements are received.
- Bank reconciliations are not performed by signatories on the account.
- Bank statements should be reconciled and reviewed by more than one person.
- Appropriate separation of duties should be documented and adhered to.
- Detailed comparisons are routinely made between check payees and the payees listed in the cash disbursements journal.
- Personnel responsible for handling and coding checks are periodically rotated, keeping total personnel involved to a minimum.

Bank-Assisted Controls

Companies should work in a cooperative effort with banks to prevent check fraud. Consider the following control measures that might be taken in regard to a firm's checking accounts.

- Establish maximum amounts above which the company's bank will not accept checks drawn against the account.
- Use positive pay banking controls. Positive pay allows a company and its bank to work together to detect fraudulent items presented for payment. The company provides the bank with a list of checks and amounts that are written each day. The bank verifies items presented for payment against the company's list and rejects items that are not on the list. Investigations are conducted as to the origin of the unlisted items.

Physical Tampering Prevention

The following list details check tampering prevention techniques that are being used today by some institutions to secure businesses' check integrity. These methods can be used individually or in combination.

- Signature line void safety band—The word *VOID* appears on the check when photocopied.
- Rainbow foil bar—A horizontal colored bar placed on the check fades and is shaded from one bar to the next. Photocopied foil bars appear solid.
- Holographic safety border—Holographic images are created in a way that reflects light to reveal a three-dimensional graphic.
- Embossed pearlescent numbering—Checks are numbered using a technique that is revealed by a colored highlighter pen or by a bright light held behind the check.

- Other chemical voids—Checks reveal an image or the word *VOID* when treated with an eradicator chemical.
- Micro line printing—Extremely small print is too small to read with the naked eye and becomes distorted when photocopied.
- High-resolution microprinting—Images are produced on the check in high resolution. This technique is very difficult to reproduce.
- Security inks—Checks contain inks that react with eradication chemicals, reducing a forger's ability to modify the check.
- Watermark backers—Hidden images can only be seen when the check is held at an angle. This image is very difficult to reproduce.

Check Theft Control Procedures

It is very important to provide internal controls that will minimize the possibility of check tampering and theft. The following is a list of items that should be incorporated into companies' policies and procedures to help deter check tampering.

- New checks should be purchased from reputable, well-established check producers.
- Unused checks should be stored in a secure area, such as a safe, vault, or other locked area. Security to this area should be restricted to authorized personnel only. Routinely change keys and access codes to storage areas.
- Review all hiring procedures. One of the most important means of fighting fraud is to not hire people with questionable backgrounds. Develop a distinct separation of duties in the accounts payable department, including written policies and procedures for all personnel who have the opportunity to handle checks, from mailroom clerks to the CEO.
- Use electronic payment services to handle large vendor and financing payments, eliminating the use of paper checks.
- Report lost or stolen checks immediately.
- Properly and securely store canceled checks.
- Destroy unused checks for accounts that have been closed.
- Printed and signed checks should be mailed immediately after signing.

Electronic Payment Tampering

As businesses move to using electronic payments—such as automated clearing house (ACH) payments, online bill payments, and wire transfers—in addition to or instead of traditional checks, fraudsters are adapting their methods to manipulate these payments as well. Some of these fraudsters abuse their legitimate access to their employer's electronic payment system;

these schemes are similar to traditional check tampering frauds carried out by authorized makers. Others gain access through social engineering, password theft, or by exploiting weaknesses in their employer's internal control or electronic payment system. Regardless of the means by which they log in to the system, the dishonest employees use this access to fraudulently initiate or divert electronic payments to themselves or their accomplices.

As with other schemes, once the fraudulent payment has been made, the employee must cover their tracks. However, the lack of physical evidence and forged signatures can make concealment of fraudulent electronic payments less challenging than other check tampering schemes. Some fraudsters attempt to conceal their schemes by altering the bank statement, miscoding transactions in the accounting records, or sending fraudulent payments to a shell company with a name similar to that of an existing vendor. Others merely rely on the company's failure to monitor or reconcile its accounts.

Prevention and Detection of Electronic Payment Tampering

Internal Controls

The most important practice for preventing and detecting electronic payment fraud is separation of duties. For example, in the case of online bill payments, such as those made through a bank's website or a third-party business-to-business payment service, separate individuals should be responsible for maintaining payment templates, entering payments, and approving payments. For wire transfers, duties for creating, approving, and releasing wires should be segregated. And to prevent attempts to conceal fraudulent electronic payment activity, no individual involved in the payment process should reconcile the bank statement or even have access to it. In addition to separating duties, companies should consider segregating their bank accounts to maintain better control over them—for example, separate accounts can be used for paper and electronic transactions.

Account monitoring and reconciliation should be performed daily so as to quickly spot and notify the bank of any unusual transactions. Depending on the accounting software in use at the company and the account reconciliation offerings of its bank, much of the reconciliation process can be automated. Additionally, many banks are able to provide daily itemized reports of outstanding payments in addition to a list of those payments that have already cleared.

In guarding against improper access to electronic payment systems, proper management and protection of user access and account information are essential. All log-in information, such as usernames and passwords, should be heavily guarded, with passwords changed frequently and

user access immediately deactivated for any user who no longer has a need for it (e.g., a terminated employee or an employee who has changed roles). Although most electronic payment systems will eventually time out, users should log off immediately when they are finished using the system or if they need to leave their computer unattended, even if only for a short time. Unattended computers that are logged on to a payment system provide fraudsters with a free pass to the company's bank account. In one instance, an employee who was working in the company's electronic payment system left their computer unattended for less than ten minutes so that they could grab a cup of coffee. During that time, another employee who shared the office was able to wire \$3,273 to an existing vendor with whom the employee was in collusion. Because the victim company performed daily account reconciliations, the fraud was caught the next day. The fraudster was fired immediately, and the individual who left their computer unattended while logged on to the system was reprimanded.

Bank Security Services

Most large banks offer multiple security services that can help business account holders mitigate fraud through early detection and prevention of fraudulent electronic payments. For example, ACH blocks allow account holders to notify their banks that ACH debits—whether authorized or not—should not be allowed on specific accounts. ACH filters enable account holders to provide their banks with a list of defined criteria (such as the sending company ID, account number, and transaction code) against which banks can filter ACH debits and reject any unauthorized transactions. Positive pay for ACH is another security feature offered by banks to their account holders. With positive pay, banks match the details of ACH payments with those on a list of legitimate and expected payments provided by the account holder. Only authorized electronic transactions are allowed to be withdrawn from the account; exceptions are reported to the customer for review.

Organizations can also set up their commercial banking software to restrict access to specific banking activities—such as viewing transactions, viewing bank statements, initiating electronic payments, or setting up ACH blocks or filters—to designated individuals. Companies should incorporate this feature into their internal control system to enhance separation of duties. For example, any individual authorized to make payments should not be permitted to set up ACH blocks or filters or submit positive pay information. In addition, businesses can customize their banking software to incorporate features such as dual authorization for certain transactions and daily or individual transaction limits.

Companies can further enhance their protection against unauthorized access to an electronic payment system through the use of their banks' multifactor authentication tools, mechanisms that combine two or more methods to validate the identity of the person attempting to access the system. These tools—such as tokens (physical devices that authorized users provide in addition to their passwords to prove their identities electronically), digital certificates, smart cards, and voiceprint recognition software—can help businesses overcome the problem of compromised credentials, such as usernames and passwords.

Billing Schemes

The asset misappropriation schemes discussed up to this point—skimming, larceny, register schemes, and check tampering—all require the scheme's perpetrator to physically take cash or checks from their employer. The next three sections will cover a different kind of asset misappropriation scheme, one which allows the perpetrator to misappropriate company funds without ever actually handling cash or checks while at work. These schemes succeed by making a false claim for payment upon the victim organization. This group consists of *billing schemes* (which attack the company's purchasing function), *payroll schemes*, and *expense reimbursement schemes*. The most common of these is the billing scheme.

Billing schemes are a popular form of employee fraud mainly because they offer the prospect of large rewards. Since most businesses' disbursements are made in the purchasing cycle, larger thefts can be hidden through false-billing schemes than through other kinds of fraudulent disbursements. There are three principal types of billing schemes: false invoicing via shell companies, false invoicing via nonaccomplice vendors, and personal purchases made with company funds.

Invoicing Via Shell Companies

Forming a Shell Company

Shell companies are business entities that typically have no physical presence (other than a mailing address), no employees, and generate little, if any, independent economic value. Shell companies are not necessarily illegal or legitimate, but for the purposes of this text we will assume that shell companies are formed for committing and concealing fraud. They might be nothing more than a fabricated name and address that an employee uses to collect disbursements from false billings. However, since the checks received will be made out in the

shell company's name, the perpetrator will normally also set up a bank account in their new company's name, so they can deposit and cash the fraudulent checks. (See the "False Billings from Shell Companies" flowchart that follows.)

A person will probably have to present a bank with a certificate of incorporation or an assumed-name certificate in order to open a bank account for a shell company. These are documents that a company must obtain through the government. The documents can be forged, but it is more likely that the perpetrator will simply file the requisite paperwork and obtain legitimate documents from the relevant jurisdiction. This can usually be accomplished for a small fee, the cost of which will be more than offset by a successful fraud scheme.

If it is discovered that a vendor is falsely billing a company, investigators for the victim company might be able to identify the suspicious company's owner by reviewing its business registration filings, which are a matter of public record in many countries.

To avoid being detected through a records search, some perpetrators form their shell companies under another name. It is common, for instance, for employees to set up shell companies in the name of a spouse or other close relative. Male fraudsters often establish shell companies under their wives' maiden names. An employee might also form the company under a completely fictitious name.

EXAMPLE

An employee used a coworker's identification to form a shell vendor. The fraudster then proceeded to bill their employer for approximately \$20,000 in false services. They deposited the resulting checks in the shell company's account and withdrew currency through an automated teller machine (ATM).

False Billings from Shell Companies

Another issue involved in forming a shell company is the entity's address—the place where fraudulent checks will be collected. Often, an employee rents a PO Box and lists it as the shell company's mailing address. Some employees list their home address instead. A comparison of employee addresses to vendor addresses might reveal shell companies in an accounts payable system.

EXAMPLE

A department head set up a fake company using their residence as the mailing address. Over a two-year period, they submitted over \$250,000 worth of false invoices. Eventually, a newly hired clerk detected the scheme. The clerk was processing an invoice when they noticed that the vendor's address was the same as their boss's address. (By a lucky coincidence, the clerk had typed a personal letter for their boss earlier that day and remembered the address.) Had the department head used a PO Box instead of their home address on the invoices, their scheme might have continued indefinitely.

Employees often use their home addresses to collect fraudulent disbursements because many businesses are wary of sending checks to vendors that have a PO Box for a mailing address. Other common collection sites for shell company schemes are the addresses of relatives, friends, or accomplices.

Submitting False Invoices

Once a shell company has been formed and a bank account has been opened, the corrupt employee begins billing their employer. Invoices can be easily generated on a personal computer. False invoices do not have to be of professional quality to generate fraudulent disbursements.

Self-Approval of Fraudulent Invoices

The difficulty in a shell company scheme is not usually in producing the invoices, but in getting the victim organization to pay them. Authorization for the fictitious purchase (and therefore payment of the bill) is the key. In a large percentage of shell company cases, perpetrators are in a position to approve payment on the very invoices they are fraudulently submitting. The duties of preparing and approving vouchers should be separated to avoid this kind of scheme.

In companies where a proper separation of duties exists, the employee with approval authority sometimes creates fraudulent vouchers or purchase orders and forges the signature

of the person who is in charge of preparing these documents. Then the perpetrator approves payment on the fraudulent vouchers they have generated. This makes it appear that two employees have signed off on the voucher as mandated by the victim organization's controls.

Not all companies require the completion of payment vouchers before they will issue checks. In some enterprises, checks are written based on less formal procedures, such as the submission of check requests. These requests simply list the payee's name, the amount to be paid, and a brief narrative stating the reason for the check. Obviously, this is not a very thorough procedure for preventing fraud. Dishonest employees have little trouble running shell company schemes in organizations that operate this way.

Negligent Supervisors

If employees cannot authorize payments themselves, the next best thing is if the person who has that authority is inattentive or overly trusting. Negligent supervisors are often targeted by unethical employees. In some cases, supervisors are attentive to the purchase orders they are asked to authorize, but they lack the technical knowledge to spot fraud as it is happening. For instance, a manager or administrator might not completely understand the costs associated with upgrading computer software to modernize a work area. This manager will have to rely on their subordinates who have the necessary technical expertise to determine that costs are being kept in line. The subordinates might be able to take advantage of this situation to cause the company to overpay for the equipment required to upgrade the system.

Reliance on False Documents

When employees do not have approval authority for purchases and do not have the benefit of a negligent supervisor, they must run their vouchers through the normal accounts payable process. The success of this kind of scheme depends on the apparent authenticity of the false voucher they create. If the perpetrator can generate purchase orders and receiving reports that corroborate the information on the fraudulent invoice from their shell company, they can fool accounts payable into issuing a check.

Collusion

Collusion is a type of fraud where two or more individuals agree to commit an act designed to deceive or gain an unfair advantage. Collusion among several employees is sometimes used to overcome well-designed internal controls. For example, in a company with proper separation of duties, the functions of purchasing goods or services, authorizing the purchase, receiving the goods or services, and making the payment to the vendor should all be separated. If this

process is strictly adhered to, it will be extremely difficult for any single employee to commit a false-billing scheme. But if several employees work together, they can overcome the internal controls of their employer.

EXAMPLE

A warehouse supervisor and a parts-ordering clerk conspired to purchase approximately \$300,000 worth of nonexistent supplies. The clerk initiated the false transactions by obtaining approval to place orders for parts they claimed were needed. The orders were then sent to a vendor who, acting in conjunction with the two employee fraudsters, prepared false invoices that were sent to the victim company. Meanwhile, the warehouse supervisor verified receipt of the fictitious shipments of incoming supplies. The perpetrators were therefore able to compile complete vouchers for the fraudulent purchases without overstepping their normal duties.

Even if all internal controls are observed, at some point a company must rely on its employees to be honest. One of the purposes of separating duties is to prevent any one person from having too much control over a particular business function. It provides a built-in monitoring mechanism where every person's actions are in some way verified by another person. But if *everyone* is corrupt, even proper controls cannot prevent fraud.

Purchases of Services Rather than Goods

Most shell company schemes involve the purchase of services rather than goods. The primary reason for this is that services are not tangible. If an employee sets up a shell company to make fictitious sales of goods to their employer, these goods will obviously never arrive. By comparing its purchases to its inventory levels, the victim organization might detect the fraud. It is much more difficult for the victim organization to verify that the services were never rendered. For this reason, many employees involved in shell company schemes bill their employers for things like “consulting services.”

Pass-Through Schemes

In most shell company schemes, victim organizations are billed for completely fictitious purchases of goods or services. However, there is a subcategory of shell company schemes in which actual goods or services are sold to the victim company. These are known as *pass-through schemes*.

Pass-through schemes are usually undertaken by employees in charge of purchasing on the victim company's behalf. Instead of buying merchandise directly from a vendor, the employee

sets up a shell company and purchases the merchandise through that fictitious entity. They then resell the merchandise to their employer from the shell company at an inflated price, thereby making an unauthorized profit on the transaction.

EXAMPLE

A department director was put in charge of purchasing computer equipment. Because of their expertise on the subject and high standing within the company, they were unsupervised in this task. The director set up a shell company in another state/province, bought used computers through the shell company, and then turned around and sold them to their employer at a greatly exaggerated price. The money from the victim company's first installment on the computers was used to pay the shell company's debts to the real vendors. Subsequent payments were profits for the fake company. The scheme cost the victim company more than \$1 million.

Invoicing Via Nonaccomplice Vendors

Pay and Return Schemes

Instead of using shell companies in their overbilling schemes, some employees generate fraudulent disbursements by using the invoices of legitimate third-party vendors who are not a part of the fraud scheme. In a *pay and return* scheme, an employee intentionally mishandles payments that are owed to legitimate vendors. (See the “Pay and Return Schemes” flowchart that follows.) One way to do this is to purposely double pay an invoice. For instance, a clerk might intentionally pay an invoice twice and then call the vendor to request that one of the checks be returned. The clerk then intercepts the returned check.

Another way to accomplish a pay and return scheme is to intentionally pay the wrong vendor. In this type of scheme, an employee sends Vendor A's check to Vendor B. After the checks are mailed, the employee calls the vendors to explain the “mistake” and requests that they return the checks to the employee's attention. When the checks arrive, the employee converts them and keeps the money. The employee usually runs the vouchers through the accounts payable system a second time so that the vendors eventually get their money.

An employee might also pay the proper vendor but intentionally overpay them. Once again, the employee contacts the vendor, this time to request that the excess payment be returned. Finally, an employee might intentionally purchase excess merchandise, return the excess, and keep the refund.

Pay and Return Schemes

Overbilling with a Nonaccomplice Vendor's Invoices

In most instances where an employee creates fraudulent invoices to overbill their employer, they use a shell company. It is not as common for an employee to submit an existing vendor's invoice. Nevertheless, in some instances an employee will undertake such a scheme by altering an existing vendor's invoice or by creating a counterfeit copy of a vendor's invoice form.

Personal Purchases with Company Funds

Instead of undertaking billing schemes to generate cash, many fraudsters simply purchase personal items with their company's money. Company accounts are used to buy items for employees, their businesses, their families, and so on. This type of scheme is classified as a fraudulent billing scheme rather than theft of inventory. The heart of the scheme is not the theft of the items but rather the purchase of them. The perpetrator causes the victim company to purchase something it did not actually need, so the damage to the company is the money lost in purchasing the item.

Personal Purchases Through False Invoicing

Employees who undertake personal purchases schemes might do so by running fraudulent invoices through the accounts payable system. The perpetrator in this type of scheme buys an item and submits the bill to their employer as if it represented a legitimate company expense. The victim company ends up unknowingly buying goods or services for a dishonest employee. (See the "Invoice Purchasing Schemes" flowchart that follows.)

THE FRAUDSTER AS AUTHORIZER OF INVOICES

The person who engages in a personal purchases scheme is often the very person in the company whose duties include *authorizing* purchases. Obviously, proper controls should stop anyone from approving their own purchases. Such poorly separated functions leave little other than conscience to discourage an employee from fraud. Fraud arises in part because of a perceived opportunity. An employee who sees that no one is reviewing their actions is more likely to turn to fraud than one who knows their company works diligently to detect employee theft.

EXAMPLE

A manager of a remote location of a large, publicly traded company was authorized to order supplies and approve vendor invoices for payment. For over a year, the manager routinely added personal items and supplies for their own business to orders made on behalf of their employer. The orders often included a strange mix of items. For instance, technical supplies and home furnishings might be purchased in the same order. Because the manager was in a position to approve their own purchases, they could get away with such obvious frauds. In addition to ordering personal items, the perpetrator changed the delivery address for certain supplies so that they would be delivered directly to their home or side business. This scheme cost the victim company approximately \$300,000 in unnecessary purchases.

In some situations, the perpetrator is authorized to approve purchases, but controls prevent them from also initiating purchase requests. This procedure is supposed to prevent an employee from purchasing personal items with company funds. Unfortunately, those with authority to approve purchases often have a good deal of control over their subordinates. These individuals can use their influence to force subordinates to assist in purchasing schemes. In other cases, the manager might simply initiate the purchase order by forging the subordinate's signature.

EXAMPLE

Purchases for under \$1,000 at a certain utility company could be made with limited value purchase orders (LPOs), which required the signatures of two people: the originator of a purchase request and the approver of the request. An LPO attached to an invoice for less than \$1,000 would be paid by the accounts payable department. In this case, a manager bought goods and services on company accounts and prepared LPOs for the purchases. (In some cases, the LPO would falsely describe the item to conceal the nature of the purchase.) Once the LPO was prepared, the manager forced a clerk in their department to sign the document as the originator of the transaction. The clerk, intimidated by their boss, did not question the authenticity of the LPOs. With two signatures affixed, the LPO appeared to be legitimate and the bills were paid. The scheme cost the victim company at least \$25,000.

FALSE PURCHASE REQUISITIONS

If an employee does not have purchasing authority, they might get approval for a fraudulent purchase by misrepresenting the nature of the acquisition. In many companies, those with the power to authorize purchases are not always attentive to their duties. If a trusted subordinate says that the company needs to buy a certain item or items, busy supervisors

often give unquestioned approval to the purchase requisition. Additionally, employees sometimes misrepresent the nature of the items they are purchasing in order to pass a cursory review by their superiors.

EXAMPLE

An engineer bought over \$30,000 worth of personal items. The engineer dealt directly with vendors and was also in charge of overseeing the receipt of the materials they purchased. They were therefore able to misrepresent the nature of the merchandise they bought, listing it as “maintenance items.” Vendor invoices were altered to agree to this description.

Invoice Purchasing Schemes

If the perpetrator falsifies their purchase requisition in this manner, the fraud should be detected when delivery occurs. For example, if the purchase requisition is requesting “maintenance items,” but the vendor delivers home furnishings, it will be obvious that the perpetrator has committed fraud. The problem of delivery can be avoided if the perpetrator is in charge of receiving incoming shipments. They can verify that the delivery of “maintenance items” was received. This is a breach of separation of duties, but unfortunately, it is fairly common for purchasing agents to verify delivery of their own orders. Even if the victim organization enforces a centralized delivery point, the perpetrator might enlist the aid of an accomplice in the receiving department to falsify the organization’s receiving reports.

Another way to avoid detection at the delivery stage is to change the delivery address for purchases. Instead of being shipped to the victim organization, the items that the employee buys are sent directly to their home or business. The perpetrator might also order the goods to be shipped to a remote location.

Personal Purchases on Credit Cards or Other Company Accounts

Instead of running false invoices through accounts payable, some employees make personal purchases on company credit cards or on running accounts with vendors. (See the “Purchases on Credit Card or Company Account” flowchart that follows.) Unlike invoicing schemes, prior approval for these purchases is not required. An employee with a company credit card can buy an item merely by signing their name (or forging someone else’s) at the time of purchase. Later review of the credit card statement, however, might detect the fraudulent purchase. Unfortunately, many high-level employees approve their own credit card expenses, making it very easy to carry out a purchasing scheme.

Of course, only certain employees are authorized to use company credit cards. Employees without this privilege can only make fraudulent purchases with a company card if they first manage to get hold of one. To this end, company cards are sometimes stolen or “borrowed” from authorized users.

Purchases on Credit Card or Company Account

EXAMPLE

An accountant falsely added their name to a list of employees to whom cards were to be issued. The accountant used their card to make fraudulent purchases but forged the signatures of authorized cardholders to cover their tracks. Since no one knew the accountant even had a company card, they would not be a prime suspect in the fraud even if someone questioned the purchases. This employee continued their scheme for over five years, racking up a six-figure bill on their employer's account. In addition, they had control of the credit card statement and were able to code their purchases to various expense accounts, thereby further delaying detection of the crime.

Another way to conceal a credit card purchasing scheme is to alter the credit card statement so that fraudulent purchases do not show up. Some employees go so far as to destroy the real credit card statement and produce counterfeit copies on which their fraudulent purchases are omitted.

Returning Merchandise for Cash

The fraudulent purchase schemes discussed to this point have all involved false purchases of merchandise for the sake of obtaining the merchandise. In some cases, however, an employee buys items and then returns them for cash.

EXAMPLE

An employee made fraudulent gains from a business travel account. The employee's scheme began by purchasing a personal ticket, as well as tickets for family members, through the employee's company travel budget. Poor separation of duties allowed the fraudster to order the tickets, receive them, prepare claims for payments, and distribute checks. The only review of the employee's activities was made by a busy and rather uninterested supervisor who approved the employee's claims without requiring support documentation. Eventually, the employee's scheme evolved. They began to purchase airline tickets and return them for their cash value. An employee of the travel agency assisted in the scheme by encoding the tickets as though the fraudster had paid for it using their own funds. That caused the airlines to pay refunds directly to the fraudster rather than to their employer. In the course of two years, this employee embezzled over \$100,000 through their purchase scheme.

Detection of Billing Schemes

Because there are many variations of billing schemes, there are also several detection methods. Detection methods are most effective when used in combinations. Each detection

method is likely to uncover anomalies that can then be investigated further to determine if a fraud scheme has occurred or is currently underway. Additionally, the detection methods will highlight the weaknesses in internal controls and alert the auditor to potential opportunities for future fraud schemes.

Analytical Review

A review of the various general ledger accounts might reveal unusual or unexpected events. These events could be undetected purchasing fraud. For example, a comparison of inventory purchases in relationship to net sales might indicate that purchases are too high or too low for that level of sales. This might be a red flag that indicates excess purchasing schemes or fictitious sales schemes.

Another analytical method uses a comparison of the inventory purchases of prior years with those of the current year. This comparison might indicate that an overbilling scheme or a duplicate-payment scheme is in progress.

Analyses such as those described previously can be performed for any acquisition of a company's goods or services. Analytical reviews are most effective in detecting fraud schemes that are large because the anomalies will be apparent. Other detection methods are more effective for fraud schemes that are smaller in relationship to the financial statements taken as a whole. Regardless of fraud size, examination of source documentation will be necessary. When an anomaly is detected, further investigation is required, which will demand an examination of source documentation.

Computer-Assisted Analytical Review

The computer can assist the auditor in determining the presence of unusual patterns in the acquisition or purchasing function. The computer can provide the auditor with a matrix of the purchasing activity to determine the presence of unusual patterns. An analysis of the following data might uncover billing schemes.

Fraud Scheme	Detection Method
Fictitious vendors	• Vendors and employees with matching addresses • More than one vendor with the same address • Vendors with only PO Box addresses
Overbilling	• Unusual or one-time extra charges
Conflict of interest	• Vendors with employees who are employee family members • An unusually high occurrence of complaints • Complaints about specific vendors • Higher prices or substandard quality

Statistical Sampling

As with inventory, the source documentation for purchases can be statistically sampled and examined for irregularities. Statistical samples can be drawn to test specific attributes. This detection method is particularly effective if a single attribute is suspected, such as fictitious vendors. A listing of all PO Box addresses might reveal fictitious vendors.

Vendor or Outsider Complaints

Fraudulent schemes will often unravel because a vendor or other outsider complains to the employer or company. Complaints from customers, vendors, and others are good detection tools that can lead the fraud examiner to further inquiry.

Site Visits—Observation

A site visit will often reveal much about the internal control, or lack thereof, for any location. The observation of how the accounting transactions are actually recorded will sometimes alert the fraud examiner to potential problem areas.

Sample Audit Program

The following audit program might be beneficial in detecting red flags of billing schemes:

- Does the company have a purchasing department? If yes, is it independent of (1) the accounting department, (2) the receiving department, or (3) the shipping department?
- Are purchases made only after the respective department heads sign purchase requisitions?
- Are purchases made by means of purchase orders sent to vendors for all purchases or only for purchases over a predetermined limit?
- Do purchase orders specify a description of items, quantity, price, terms, delivery requirements, and dates?

- Is a list of unfilled purchase orders maintained and reviewed periodically?
- Are purchase order forms prenumbered and is the sequence accounted for periodically?
- Does the client maintain an approved vendors list?
- Are items purchased only after competitive bids are obtained? If so, are competitive bids obtained for all purchases or only for purchases over a predetermined limit?
- Is a log maintained of all receipts?
- Does the receiving department prepare receiving reports for all items received? If yes, are receiving reports (1) prepared for all items, (2) prepared only for items that have purchase orders, or (3) renumbered?
- At the time the items are received, does someone independent of the purchasing department check the merchandise before acceptance as to description, quantity, and condition?
- Are copies of receiving reports (1) furnished to the accounting department, (2) furnished to the purchasing department, or (3) filed in the receiving department?
- Are receipts under blanket purchase orders monitored, and are quantities exceeding the authorized total returned to the vendor?
- Are procedures adequate for the proper accounting of partial deliveries of purchase orders?
- Are purchasing and receiving functions separate from invoice processing, accounts payable, and general ledger functions?
- Are vendors' invoices, receiving reports, and purchase orders matched before the related liability is recorded?
- Are invoices checked as to prices, extensions, footings, freight charges, allowances, and credit terms?
- Are controls adequate to ensure that all available discounts are taken?
- Are purchases recorded in a purchase register or voucher register before being processed through cash disbursements?
- Does a responsible employee assign the appropriate general ledger account distribution to which the invoices are to be posted?
- Are procedures adequate to ensure that invoices have been processed before payment and to prevent duplicate payment (e.g., a block stamp)?
- Does a responsible official approve invoices for payment?
- Are procedures adequate to ensure that merchandise purchased for direct delivery to customers is promptly billed to the customers and recorded as both a receivable and a payable?
- Are records of goods returned to vendors matched to vendor credit memos?

- Are unmatched receiving reports, purchase orders, and vendors' invoices periodically reviewed and investigated for proper recording?
- Is the accounts payable ledger or voucher register reconciled monthly to the general ledger control accounts?
- Are statements from vendors regularly reviewed and reconciled against recorded liabilities?
- Do adjustments to accounts payable (e.g., writing off of debit balances) require the approval of a designated official?
- Are budgets used? If yes, are budgets approved by responsible officials, and are actual expenditures compared with budgeted amounts and variances analyzed and explained?
- Is excess inventory purchasing suspicious? If so, was all inventory that was purchased received (see receiving report) at the proper location? An examination of receiving reports or invoices might reveal alternate shipping sites.

Prevention of Billing Schemes

The prevention of billing schemes can be especially difficult. Purchasing personnel are often held to a different standard than other employees of a company. For example, sales people often are given incentives or certain privileges to persuade potential customers. These same incentives are offered to the purchasing personnel of the company from the company's vendors. And yet, the company expects the purchasing personnel to perform their function without partiality and to make decisions that are in the company's best interest, without regard to the incentives offered by suppliers. Additionally, the personnel involved in the purchasing and payment functions are generally not compensated on a basis commensurate with their performance, as are salespeople. Therefore, there is a reverse incentive to perform in the company's best interest.

Probably the most effective prevention measure for billing schemes is education and training of the purchasing and accounts payable personnel. The second most effective prevention measure is an objective compensation arrangement with people responsible for purchasing decisions.

Education (Training)

Purchasing personnel should be trained thoroughly in ethical situations. As an additional deterrent to fraud, companies might consider enrollment and certification in a program for purchasing managers and employees.

Compensation

People responsible for the purchasing decisions (buyers) should be paid well enough to reduce the motive and rationalization for fraud. Auditors can examine the compensation of purchasers and determine if any buyers were recently passed over for raises. This might be an indication of discontent that could lead to the formation of a fraudulent scheme against the employer.

Proper Documentation

Proper documentation for purchasing should include prenumbered and controlled purchase requisitions, purchase orders, receiving reports, and checks.

Proper Approvals

Before adding a vendor to the list, there should be an investigation of the proposed vendor, performed by someone other than the personnel in purchasing and accounts payable. If a vendor number is required before payment is made and the personnel responsible for the investigation assigns the vendor that identification number, then the buyer cannot place fictitious vendors on the list. Large or unusual purchases should be approved by someone independent of the purchasing department.

Separation of Duties

For the best results and accountability, each company sufficient in size should have a separate purchasing department. Regardless of the company size, the purchasing function should be separate from the payment function.

Hotlines

When possible, companies should implement a hotline function to provide a forum for complaints and fraud tips by employees and outsiders.

Competitive Bidding

Ensure that bid policies and procedures are thoroughly reviewed. Whenever possible, enforce competitive bidding. *Competitive bidding* is a transparent procurement method in which bids from competing contractors, suppliers, or vendors are invited by openly publicizing the scope, specifications, and terms and conditions of the proposed contract as well as the criteria by which the bids will be evaluated. Competitive bidding aims to obtain goods and services at the lowest prices by stimulating competition and preventing partiality and fraud.

After the bidding process has been completed, a questionnaire can be sent to successful and unsuccessful bidders. This questionnaire can reveal areas that will make the bidding process more effective and can provide a forum for bidders to express concerns over questionable or fraudulent activities.

Prevention Checklist

The following is a list of billing scheme prevention methods that might be helpful in the deterrence of billing fraud:

- Authorization procedures of purchase orders, invoicing, and payments should be documented and adhered to.
- The accounts payable list of vendors should be periodically reviewed for strange vendors and addresses.
- Payment codings should be reviewed for strange descriptions.
- Vendor purchases should be analyzed for odd levels on both a monthly and yearly basis.
- Purchases and inventory levels should be compared and analyzed. (See the “Asset Misappropriation: Inventory and Other Assets” chapter.)
- Control methods to check for duplicate invoices and purchase order numbers should be in place.
- A separation of duties between authorization, purchasing, receiving, shipping, and accounting should be in place.
- Payment of vouchers should be periodically reviewed to ensure integrity of proper documentation.
- Receiving and shipping reports should be reviewed for completeness and accuracy.
- Asset information should include purchasing trails and other information.
- Journal entries to inventory accounts should be strictly scrutinized.
- Appropriate bank reconciliation and review procedures should be performed periodically, checking for out-of-place vendors and endorsements.
- Credit card and purchasing card statements should be reviewed often for irregularities.
- The validity of invoices with a PO Box address should be verified.
- Proper controls should be installed for the receipt and handling of checks that are to be returned to the sender.

Payroll Fraud Schemes

Payroll schemes are similar to billing schemes. The perpetrators of these frauds produce false documents, which cause the victim company to unknowingly make a fraudulent

disbursement. In billing schemes, the false document is usually an invoice (coupled, perhaps, with false receiving reports, purchase orders, and purchase authorizations). In payroll schemes, the perpetrator typically falsifies a timecard or alters information in the payroll records. The major difference between payroll schemes and billing schemes is that payroll frauds involve disbursements to employees rather than to external parties. In general, payroll schemes fall into three categories: ghost employee schemes, falsified hours and salary schemes, and commission schemes.

Ghost Employees

The term *ghost employee* refers to someone on the payroll who does not actually work for the victim company. Through the falsification of personnel or payroll records, a fraudster causes paychecks to be generated to a non-employee, or *ghost*. The fraudster or an accomplice then converts these paychecks. (See the “Ghost Employees” flowchart that follows.) The ghost employee might be a fictitious person or a real individual who simply does not work for the victim employer. When the ghost is a real person, it is often the perpetrator’s friend or relative.

For a ghost employee scheme to work, four things must happen: (1) the ghost must be added to the payroll, (2) timekeeping (for an hourly employee) and wage rate information must be collected, (3) a paycheck must be issued to the ghost, and (4) the check must be delivered to the perpetrator or an accomplice.

Adding the Ghost to the Payroll

The first step in a ghost employee scheme is entering the ghost on the payroll. In some businesses, all hiring is done through a centralized personnel department, while in others the personnel function is spread over the managerial responsibilities of various departments. Regardless of how hiring of new employees is handled within a business, it is the person or persons with authority to add new employees and remove terminated employees that are in the best position to put ghosts on the payroll.

EXAMPLE

A manager who was responsible for hiring and scheduling janitorial work added over eighty ghost employees to their payroll. The ghosts in this case were actual people who worked at other jobs for different companies. The manager filled out time sheets for the fictitious employees and authorized them, and then took the resulting paychecks to the ghost employees, who cashed them and split the proceeds with the manager. It was this manager’s authority in the hiring and supervision of employees that enabled them to perpetrate this fraud.

Ghost Employees

Employees in payroll accounting also sometimes create ghost employees. In a perfect world, every name listed on the payroll would be verified against personnel records to make sure that those individuals receiving paychecks actually work for the company, but in practice this does not always happen. Thus, people in payroll accounting might be able to create fictitious employees by simply adding a new name to the payroll records. Access to these records is usually restricted, with only high-level employees having the ability to make changes to the payroll. These individuals would therefore be among the most likely suspects in a ghost employee scheme. On the other hand, lower level employees sometimes gain access to restricted payroll information and should not be disregarded as possible suspects.

EXAMPLE

An employee in the payroll department was given the authority to enter new employees into the payroll system, make corrections to payroll information, and distribute paychecks. This employee's manager gave unquestioned approval to the employee's actions because of a trusting relationship between the two. The lack of separation of duties and the absence of review made it simple for the culprit to add a fictitious employee into the payroll system.

One way perpetrators try to conceal a ghost's presence on the payroll is to create a ghost with a name very similar to that of a real employee. The name on the fraudulent paycheck will therefore appear to be legitimate to anyone who glances at it. For instance, if a victim organization has an employee named John Doe, the ghost might be named "John Doer."

Instead of adding new names to the payroll, some employees undertake ghost employee schemes when they fail to remove terminated employees' names. Paychecks to the terminated employee continue to be generated even though the employee no longer works for the victim organization. The perpetrator intercepts these fraudulent paychecks and converts them for personal use.

Collecting Timekeeping Information

The second thing that must occur for a paycheck to be issued to a ghost employee, at least in the case of hourly employees, is the collection and computation of timekeeping information. The perpetrator must provide payroll accounting with a timecard or other document showing how many hours the fictitious employee worked over the most recent pay period. This information, along with the wage rate information contained in personnel or payroll files, will be used to compute the fraudulent paycheck's amount.

Timekeeping records can be maintained in a variety of ways. In many organizations, computer systems are used to track employees' hours. Alternatively, employees might manually record their hours on timecards or might punch time clocks that record the time at which employees start and finish their work.

When a ghost employee scheme is in place, someone must create documentation for the ghost's hours. This essentially amounts to preparing a fake timecard showing when the ghost was allegedly present at work. Depending on the normal procedure for recording hours, a fraudster might log into the computerized system and record the ghost employee's hours, create a timecard and sign it in the ghost's name, punch the time clock for the ghost, or so on. Preparation of the timecard is not a great obstacle to the perpetrator. The real key to the timekeeping document is obtaining approval of the timecard.

A supervisor should approve the timecards of hourly employees before paychecks are issued. This verifies to the payroll department that the employee actually worked the hours that are claimed on the card. A ghost employee, by definition, does not work for the victim organization, so approval will have to be fraudulently obtained. Often, the supervisor is the one who creates the ghost. When this is the case, the supervisor fills out a timecard in the ghost's name and then affixes their own approval. The timecard is thereby authenticated, and a paycheck will be issued. When a non-supervisor is committing a ghost employee scheme, they will typically forge the necessary approval and then forward the fraudulent timecard directly to payroll accounting, bypassing their supervisor.

In computerized systems, a supervisor's signature might not be required. In lieu of the signature, the supervisor inputs data into the payroll system, and the use of their password serves to authorize the entry. If an employee has access to the supervisor's password, they can input data for the ghost, which will appear in the payroll system with a seal of approval.

If the perpetrator creates ghosts who are salaried rather than hourly employees, it is not necessary to collect timekeeping information; salaried employees are paid a certain amount each pay period regardless of how many hours they work. Because the timekeeping function can be avoided, it might be easier for a perpetrator to create a ghost employee who works on salary. However, most businesses have fewer salaried employees and they are more likely to be members of management. The salaried ghost might therefore be more difficult to conceal.

Issuing the Ghost's Paycheck

Once a ghost is entered on the payroll and their timecard has been approved, the third step in the scheme is the actual issuance of the paycheck. The heart of a ghost employee scheme is in the falsification of payroll records and timekeeping information. Once this falsification has occurred, the perpetrator does not generally take an active role in the issuance of the check. The payroll department issues the payment—based on the false information provided by the perpetrator—as it would any other paycheck.

Delivery of the Paycheck

The final step in a ghost employee scheme is the distribution of the checks to the perpetrator. Paychecks might be hand-delivered to employees while at work, mailed to employees at their home addresses, or direct-deposited into the employees' bank accounts. If employees are paid in currency rather than by check, the distribution is almost always conducted in person and on site.

Ideally, those in charge of payroll distribution should not have a hand in any of the other payroll cycle functions. For instance, the person who enters new employees in the payroll system should not be allowed to distribute paychecks because this person can include a ghost on the payroll and then simply keep the fraudulent check when paychecks are disbursed. Obviously, when the perpetrator of a ghost employee scheme is allowed to mail checks to employees or pass them out at work, they are in a perfect position to ensure that the ghost's check is delivered to themselves.

In most instances, the perpetrator does not have the authority to distribute paychecks and thus must make sure that the victim organization sends the checks to a place from which they can recover them. When checks are not distributed in the workplace, they are usually mailed to employees or deposited directly into those employees' accounts.

If the fictitious employee was added into the payroll or personnel records by the perpetrator, the problem of distribution is usually minor. When the ghost's employment information is entered, the perpetrator simply lists an address or bank account to which the payments can be sent. In the case of purely fictitious ghost employees, the address is often the perpetrator's own (the same goes for bank accounts). The fact that two employees (the perpetrator and the ghost) are receiving payments at the same destination might indicate payroll fraud. Some fraudsters avoid this duplication by having payments sent to a post office box or to a separate bank account.

Remember that a ghost employee is not always a fictitious person; it might be a real person who is conspiring with the perpetrator to defraud the company. For example, some employees place their relatives or spouses on the company payroll. When real people conspiring with the fraudster are falsely included on the payroll, the perpetrator typically sees to it that checks are sent to these individuals' homes or bank accounts, thereby avoiding the problem of duplicate addresses on the payroll.

Distribution is a more difficult problem when the ghost is a former employee who was simply not removed from the payroll. If paychecks are distributed through the mail or by direct deposit, the perpetrator will have to enter the terminated employee's records and change their delivery information. In companies in which paychecks are distributed by hand or are held at a central location for employees to collect, the perpetrator can ignore the payroll records and simply pick up the fraudulent paychecks.

Falsified Hours and Salary

The most common method of misappropriating funds from the payroll is the overpayment of wages. For hourly employees, the size of a paycheck is based on two factors: the number of hours worked and the rate of pay. Therefore, for hourly employees to fraudulently increase the size of their paycheck, they must either falsify the number of hours they have worked or change their wage rate. (See the "Falsified Hours and Salary" flowchart that follows.) Because salaried employees do not receive compensation based on their time at work, in most cases these employees generate fraudulent wages by increasing their rates of pay.

When discussing payroll frauds that involve overstated hours, one must first understand how an employee's time at work is recorded. Time is generally kept by one of three methods. Time clocks might be used to mark the time when an employee begins and finishes work. The employee inserts a card into the clock at the beginning and end of work, and the clock imprints the current time on the card. In more sophisticated systems, computers might automatically track the time employees spend on the job based on login codes or some other similar tracking mechanism. Finally, paper or computerized timecards showing the number of hours an employee worked on a particular day are often prepared manually by the employee and approved by their manager.

Falsified Hours and Salary

Manually Prepared Timecards

When hours are recorded manually, an employee typically fills out the timecard to reflect the number of hours worked and then presents it to the supervisor for approval. The supervisor verifies the timecard's accuracy, signs or otherwise approves the card to indicate their authorization, and then forwards it to the payroll department so that a paycheck can be issued. Most of the payroll frauds encountered in our study stemmed from abuses of this process.

Obviously, if an employee fills out their own timecard, it might be easy to falsify their hours worked. They simply record the wrong time, showing that they arrived at work earlier or left later than they actually did. The difficulty is not in falsifying the timecard, but in getting the fraudulent card approved by the employee's supervisor. There are basically three ways for the employee to obtain needed authorization.

FORGING A SUPERVISOR'S SIGNATURE

When using this method, an employee typically withholds their paper timecard from those being sent to the supervisor for approval, forges the supervisor's signature or initials, and then adds the timecard to the stack of authorized cards that are sent to the payroll department. In an electronic payroll environment, an employee who learns their supervisor's password can log into the system and authorize their own timecard surreptitiously. The fraudulent timecard then arrives at the payroll department with what appears to be a supervisor's approval, and a paycheck is subsequently issued.

COLLUSION WITH A SUPERVISOR

The second way to obtain approval of a fraudulent timecard is to collude with a supervisor who authorizes timekeeping information. In these schemes, a supervisor knowingly approves false timecards on the employee's behalf. As an incentive to the supervisor, the employee might kick back a portion of the overpaid wages to the supervisor. In some cases, the supervisor might take the entire amount of the overpayment. It might be particularly difficult to detect payroll fraud when a supervisor colludes with an employee because managers are often relied upon as a control to ensure proper timekeeping.

EXAMPLE

A supervisor assigned employees to better work areas or better jobs but demanded payment in return. The payment was arranged via the falsification of the employees' timecards, which the supervisor authorized. The employees were compensated for fictitious overtime, and these funds were then kicked back to the supervisor.

RELYING ON A NEGLIGENT SUPERVISOR

The third way to obtain approval of fraudulent timecards is to rely on a supervisor to approve them without reviewing their accuracy. The “lazy manager” method seems risky—so much so that one would think that it would be uncommon—but it actually occurs quite frequently. A recurring theme in occupational fraud schemes is the perpetrators’ reliance on the inattentiveness of others. When an employee sees an opportunity to make a little extra money without getting caught, that employee is more likely to be emboldened to attempt a fraud scheme. The fact that a supervisor is known to approve timecards without prior review or simply ignore them can be a factor in an employee’s decision to begin stealing from their company.

EXAMPLE

A temporary employee noticed that their manager did not reconcile the expense journal monthly. Thus, the manager did not know how much was being paid to the temporary agency. The fraudster completed fictitious time reports, which were sent to the temporary agency and which caused the victim company to pay over \$30,000 in fraudulent wages. Because the fraudster controlled the mail and the manager did not review the expense journal, this extremely simple scheme went undetected for some time.

Poor Custody Procedures

One form of control breakdown that often occurs is the failure to maintain proper control over timecards. In a properly run system, timecards that have been authorized by management should be sent directly to payroll. Those who prepare the timecards should not have access to them after they have been approved. Similarly, computerized timesheets should be blocked from modification by the employee once supervisor authorization has been given. When these procedures are not observed, the person who prepared a timecard can alter it after the supervisor has approved it but before it is delivered to payroll.

Another way hours are falsified is in the misreporting of leave time. This is not as common as timecard falsification, but it does occur with some frequency. Incidentally, it is one instance in which salaried employees commit payroll fraud by falsifying their hours. A leave time scheme is very simple. An employee takes a certain amount of time off from work as paid leave or vacation but does not report this leave time. Employees typically receive a certain amount of paid leave per year. If a person takes a leave of absence but does not report it, those days are not deducted from their allotted days off. In other words, they get more leave time than they are entitled to. The result is that the employee shows up for work less, yet still receives the same pay.

Time Clocks and Other Automated Timekeeping Systems

In companies that use time clocks to collect timekeeping information, payroll fraud is usually uncomplicated. In the typical scenario, the time clock is located in an unrestricted area, and a timecard for each employee is kept nearby. The employees insert their timecards into the time clock at the beginning and end of their shifts, and the clock imprints the time. The length of time an employee spends at work is therefore recorded. Supervisors should be present at the beginning and end of shifts to ensure that employees do not punch the timecards of absent coworkers, yet this simple control is often overlooked. Without proper supervision, employees can punch the timecards of absent coworkers so that it appears the absent employee was at work that day. The absent employee is therefore overcompensated on their next paycheck.

Rates of Pay

An employee can also receive a larger paycheck by changing their pay rate. An employee's personnel or payroll records reflect their rate of pay. If an employee can gain access to these records or has an accomplice with access to them, they can adjust them so that they receive a larger paycheck.

Commission Schemes

Commission is a form of compensation calculated as a percentage of the amount of transactions a salesperson or other employee generates. It is a unique form of compensation that is not based on hours worked or a set yearly salary, but rather on an employee's revenue output. A commissioned employee's wages are based on two factors: the amount of sales they generate and the percentage of those sales they are paid. In other words, there are two ways an employee on commission can fraudulently increase their pay: (1) falsify the amount of sales made or (2) increase their rate of commission. (See the "Commission Schemes" flowchart that follows.)

Commission Schemes

Fictitious Sales

Establishing unattainable sales quotas that employees think are unreasonable will increase the pressure to establish fictitious performance levels. If the pressure becomes significant, the employee might resort to adding fictitious sales and accounts receivable to meet the sales quotas.

An employee can falsify the amount of sales they have made in one of two ways, the first being the creation of fictitious sales. The manner in which fictitious sales are created depends on the industry in which the perpetrator operates. Fictitious sales might be constructed by the creation of fraudulent sales orders, purchase orders, credit authorizations, packing slips, invoices, and so on. Alternatively, a culprit might simply ring up a false sale on a cash register. The key is that a fictitious sale is created, that it appears to be legitimate, and that the victim organization reacts by issuing a commission check to the perpetrator.

EXAMPLE

A dishonest insurance agent took advantage of their company's incentive commissions, which paid \$1.25 for every \$1.00 of premiums generated in the first year of a policy. The agent wrote policies to fictitious customers, paid the premiums, and received their commissions, which created an illegal profit on the transaction. For instance, if the fraudster paid \$100,000 in premiums, they would receive \$125,000 in commissions, a \$25,000 profit. No payments were made on the fraudulent policies after the first year.

If a salesperson's primary compensation is based on sales, without regard to collection, then there is an incentive to produce quantity rather than quality sales. It is natural for companies to push for higher sales levels to sustain growth. If the salespersons' compensation is based solely on quantity and not on a combination of quantity *and* quality, however, then the compensation incentive is misplaced. This might create an atmosphere which, if coupled with opportunity, will produce inflated or fictitious sales.

Altered Sales

The second way for a fraudster to overstate the amount of sales they have made is to alter the prices listed on sales documents; in other words, the perpetrator charges one price to a customer, but records a higher price in the company books. This causes the victim company to pay a larger commission than the perpetrator deserves. To make these schemes work, the employee might have to intercept and alter the invoices that are sent to the customer. (The invoices the company sends out will reflect a higher purchase price than

the customer agreed to, so if the customer receives these invoices they are likely to complain about the discrepancy.) The employee might also overstate the revenue received from their customers.

Altering Commission Rates

As mentioned previously, the other way to manipulate the commission process is to change the employee's rate of commission. This would likely necessitate the alteration of payroll or personnel records, which should be off-limits to the sales staff.

Detection of Payroll Schemes

Independent Payroll Distribution

Ghost employee schemes can be uncovered by having personnel (other than the payroll department) distribute the payroll checks or paystubs, and by requiring positive identification of the payee. However, as more and more companies are moving to a direct-deposit payroll with pay stubs available for viewing online, hand-delivering paychecks or paystubs is becoming an obsolete method of detecting ghost employees.

Analysis of Payee Address or Accounts

If payroll checks are either mailed or deposited automatically, then a list of duplicate addresses or deposit accounts might reveal ghost employees or duplicate payments.

Duplicate Identification Numbers

Because each employee is required to have a government-issued identification number (such as a Social Security or Social Insurance number), a listing of duplicate numbers might reveal ghost employees.

Overtime Authorization

Requiring employees to have overtime authorized by a supervisor, having the supervisor be responsible for the timecards, and having the supervisor refer the timecards directly to payroll will aid in reducing overtime abuses. In addition, the payroll department should scan the time reports and question obvious abuses, such as only one employee working overtime in a department or excessive overtime on a timecard. By examining the source documentation, one might detect unauthorized overtime and falsified hours.

Commissions

Commission schemes can often be detected with the following techniques:

- Compare commission expenses to sales figures to verify linear correlation.
- Prepare a comparative analysis of commission earned by salesperson, verifying rates and calculation accuracy. Excessively high earnings by an individual could signal fraud.
- Analyze sales by salesperson for uncollected sales amounts.
- Determine proper separation of duties in calculation of commission amounts. Commissions should be independently provided by personnel outside the sales department.
- Contact a random sample of customers to confirm sales.

TREND ANALYSIS ON WRITTEN-OFF ACCOUNTS RECEIVABLE

Stratify the written-off accounts receivable data and examine it for possible trends and patterns. For example, do any of the following trends appear?

- Same salesperson
- Same accounting period (unless only an annual review of accounts receivable is performed)
- Same collector
- Collection rates by agency or collector

Any of these trends might indicate fictitious accounts receivable, or that only new or good accounts are being assigned to collectors or collection agencies.

Analysis of Deductions from Payroll Checks

An analysis of the payroll withholdings might reveal either ghost employees or trust account abuses. Ghost employees will often have no withholding taxes, insurance, or other normal deductions. Therefore, a listing of any employee without these items might reveal a ghost employee.

An analysis of withholding-tax deposits might reveal that trust account taxes have been “borrowed,” even for a short period, before the taxes are deposited. Comparing the disbursement date with the deposit date should reveal if the trust account taxes have been borrowed. Additionally, any delinquent payroll tax notices from the taxing authorities should serve as a red flag to potential trust account tax “borrowings.”

Other Detection Methods

Other methods for detecting ghost employees include:

- Reviewing company email address directories to ensure that all employees receiving paychecks have a company email address issued by the IT Department
- Comparing employee names, addresses, government identification numbers, and bank account numbers to determine if there are any unexpected duplicates
- Comparing employee payroll records to human resources (HR) employee files to ensure all individuals receiving payroll checks are employees
- Examining payroll checks for dual endorsements

Prevention of Payroll Schemes

There are two basic preventive measures for payroll-related fraud: separation of duties and periodic payroll review and analysis.

Separation of Duties

The following duties should be separated:

- Payroll preparation
- Payroll disbursement (into payroll and withholding tax accounts)
- Payroll distribution
- Payroll bank reconciliations
- HR departmental functions

If payroll is prepared by personnel not responsible for its distribution and reconciliation, it will be difficult for anyone to successfully add ghost employees. They will also be prevented from “borrowing” the trust account taxes because they will not have access to the disbursing function. In smaller companies, this function is often handled outside the firm at pennies per employee.

After the payroll checks are prepared, the transfer of funds from the general accounts to the payroll accounts should be handled by accounting. The personnel department should distribute checks and require identification in exchange for the payroll checks. This will curtail the opportunity to add ghost employees to the payroll. A suggested form of identification might be company-issued access passes, if available.

If the bank reconciliation function for the payroll account is assigned to someone other than those in the previously described functions, then all the payroll functions have been segregated. No one is able to add ghost employees or “borrow” the withholding taxes without the opportunity for discovery by someone else.

Periodic Review and Analysis of Payroll

Periodically, an independent review of the payroll might reveal that internal controls are not working as designed. Comparing deposit dates with dates of payroll disbursement or transfer might reveal ghost employees, as could an occasional independent payroll distribution.

The existence of the following might indicate the presence of ghost employees:

- More than one employee with the same address
- More than one employee with the same government identification number
- More than one employee with the same account number (automatic deposit)
- Employees with no withholding

Indicators of Payroll Fraud

In addition, the following audit program will help spot red flags to payroll distribution fraud and help with installing control procedures:

- Are personnel records maintained independently of payroll and timekeeping functions?
- Is the payroll accounting function independent of the general ledger function?
- Are changes to payroll not made unless the personnel department sends approved notification directly to the payroll department?
- Are references and backgrounds checked for new hires?
- Are all wage rates authorized in writing by a designated official?
- Are signed authorizations on file for employees whose wages are subject to special deductions?
- Are bonuses, commissions, and overtime approved in advance and reviewed for compliance with company policies?
- Are sick leave, vacations, and holidays reviewed for compliance with company policy?
- Are appropriate forms completed and signed by employees to show authorization for payroll deductions and withholding exemptions?
- Is the payroll periodically checked against the personnel records for terminated employees, fictitious employees, etc.?
- Is a time clock used for office employees as well as factory workers?

- If a time clock is used, are timecards (1) punched by employees in the presence of a designated supervisor and (2) signed by a supervisor at the end of the payroll period?
- Are timecards and production reports reviewed and compared with payroll distribution reports and production schedules?
- Are payroll registers reviewed and approved before disbursements are made for (1) names of employees, (2) hours worked, (3) wage rates, (4) deductions, (5) agreement with payroll checks, and (6) unusual items?
- Are all employees paid by check out of a separate bank payroll account?
- Are payroll checks pre-numbered and issued in numerical sequence?
- Is access restricted to unissued payroll checks and signature plates?
- Are checks drawn and signed by designated officials who do not (1) prepare payroll, (2) have access to the accounting records, or (3) have custody of cash funds?
- Are payroll checks distributed by someone other than the department head or the person who prepares the payroll?
- Is the distribution of the payroll rotated periodically to different employees without prior notice?
- Is the payroll bank account reconciled by a designated employee who (1) is not involved in the preparing of payroll, (2) does not sign the checks, or (3) does not handle the check distributions?
- Do payroll bank account reconciliation procedures include comparing the paid checks to the payroll and scrutinizing canceled check endorsements?
- Are the payroll registers reconciled to the general ledger control accounts?
- Is a liability account set up for all wages that have remained unclaimed for a certain period of time? If yes, (1) have these wages been redeposited in a special bank account and (2) is identification required to be presented at the time of their subsequent distribution?
- Are distributions of hours (direct and indirect) to activity or departments reviewed and approved by supervisory personnel?
- Are actual payroll amounts reviewed and compared to budgeted amounts, and are variances analyzed regularly?
- Do adequate procedures exist for timely and accurate preparation and filing of payroll tax returns and related taxes?
- Are employee benefit plan contributions reconciled to appropriate employee census data?
- Are adequate, detailed records maintained of the entity's liability for vacation pay and sick pay? Are they reconciled to the general ledger control accounts periodically?

Expense Reimbursement Schemes

Employees can manipulate an organization's expense reimbursement procedures to generate fraudulent disbursements. Companies usually pay expense reimbursements in this manner: An employee submits a report detailing an expense incurred for a business purpose, such as a business lunch with a client or airfare and hotel bills associated with business travel. In preparing an expense report, an employee usually must explain the business purpose for the expense, as well as the time, date, and location in which it was incurred. Attached to the report should be support documentation for the expense—typically a receipt. In some cases, canceled checks written by the employee or copies of a personal credit card statement showing the expense are allowed. The report usually must be authorized by a supervisor in order for the expense to be reimbursed. The four most common types of expense reimbursement schemes are mischaracterized expenses, overstated expenses, fictitious expenses, and multiple reimbursements.

Mischaracterized Expense Reimbursements

Most companies only reimburse certain employee expenses. Which expenses a company will pay for typically depends on policy, but in general, business-related travel, lodging, and meals are reimbursed. One of the most basic expense reimbursement schemes is perpetrated by simply requesting reimbursement for a personal expense by claiming that the expense is business related. (See the “Mischaracterized Expenses” flowchart that follows.) Examples of mischaracterized expenses include claiming personal travel as a business trip or listing dinner with a friend as “business development” or “client entertainment.” Employees might submit the receipts from their personal expenses along with their expense reports and concoct business reasons for the incurred costs. The false expense report induces the victim organization to issue a check, reimbursing the perpetrator for personal expenses.

Mischaracterized Expenses

In cases involving airfare and overnight travel, a mischaracterization can sometimes be detected by simply comparing the employee's expense reports to their work schedule. Often, the dates of the "business trip" coincide with a vacation or day off. Detailed expense reports allow a company to make this kind of comparison and are therefore very helpful in preventing expense schemes.

A common element to mischaracterized expense schemes is the failure to submit detailed expense reports, or any expense reports at all. Some companies allow employees to simply turn in receipts without explaining the business purpose of the listed expenses. This makes it exceedingly easy for an employee to turn in a receipt from a restaurant and receive a check to reimburse them for a "business dinner." Other companies provide employees with company credit cards or procurement cards and allow employees to spend company funds without providing detailed information justifying the purchase, sometimes not even requiring receipts. Requiring detailed information means more than just supporting documents; it should mean precise statements of what was purchased, as well as when, where, and for whom the purchase was made.

EXAMPLE

A fraudster submitted credit card statements as support for expenses, but they only submitted the top portion of the statements, not the portion that describes what was purchased. Over 95% of their expenses that were reimbursed were of a personal—rather than a business—nature.

Even when detailed expense reports are required, it might be difficult to detect a mischaracterized expense reimbursement scheme. For example, suppose a traveling salesperson goes on a trip and runs up a large bar bill one night in their hotel, saves the receipt, and lists this expense as "business entertainment" on an expense report. Nothing about the time, date, or nature of the expense would readily point to fraud, and the receipt would appear to substantiate the expense. Short of contacting the client who was allegedly entertained, there might be little a victim organization can do to identify the expense as fraudulent.

Overstated Expense Reimbursements

Instead of seeking reimbursement for personal expenses, some employees overstate the cost of actual business expenses. (See the "Overstated Expenses" flowchart that follows.) This can be accomplished in a number of ways.

Overstated Expenses

Altered Receipts

The most fundamental example of an overstated expense reimbursement scheme occurs when an employee alters a receipt or other supporting documentation to reflect a higher cost than what the employee actually paid. The employee might use correction fluid, a ballpoint pen, or some other method to change the price reflected on the receipt before submitting an expense report. If the company does not require original documents as support, the perpetrator generally attaches a copy of the receipt to the expense report. Alterations are usually less noticeable on a photocopy than on an original document. Businesses should require original receipts and ink signatures on expense reports for precisely this reason.

As with other expense frauds, overstated expense reimbursement schemes often succeed because of poor controls. In companies where supporting documents are not required, for example, fraudsters simply lie about how much they paid for a business expense. With no support available, it could be very difficult to disprove an employee's false expense claims.

Overpurchasing

Another way to overstate a reimbursement form is the “overpurchasing” of business expenses. This method is typically used by employees seeking reimbursement for travel expenses. Assume an employee is scheduled to make a business trip to another city. The employee purchases an airline ticket far in advance of the trip when rates are low. When it is close to the day of the trip, the employee purchases another ticket to the same destination. This ticket will be more expensive than the first one. To further increase the price, the second ticket might include several stops and layovers on a very circuitous route. The employee removes the passenger receipt coupon from the second ticket and then returns it for a full refund. They actually fly on the first (less expensive) ticket they purchased, but they attach the receipt from the more expensive ticket to their expense report.

Overstating Another Employee's Expenses

Overstated expense reimbursement schemes are not just committed by the person who actually incurs the expense. They might be committed by a coworker who handles or processes expense reports.

EXAMPLE

A petty cashier covered up other employees' requests for travel advances with correction fluid and inserted larger amounts. The cashier then passed on the legitimate travel advances and kept the excess.

This kind of scheme is most likely to occur in a system where expenses are reimbursed in currency rather than by check, since the perpetrator would be unable to extract their cut from a single check made out to another employee.

Orders to Overstate Expenses

Finally, some employees knowingly falsify their own reports, but do so at their supervisors' direction. The employees might be threatened with loss of their jobs if they do not go along with the scheme. Sometimes the supervisor splits the proceeds of the fraud with their subordinates. In other cases, the excess money goes into a slush fund or is used for some other business purpose that is not in the company budget. The supervisors who engage in these schemes often believe they are really acting in their companies' best interests.

EXAMPLE

A sales executive instructed their salespeople to inflate their expenses to generate cash for a slush fund. This fund was used to pay bribes and to provide improper forms of entertainment for clients and customers.

Fictitious Expense Reimbursements

Employees sometimes seek reimbursement for wholly fictitious expenses. Instead of overstating a real business expense or seeking reimbursement for a personal expense, an employee invents an expense to request reimbursement. (See the "Fictitious Expenses" flowchart that follows.)

Producing Fictitious Receipts

One way to generate a reimbursement for a fictitious expense is to create fraudulent support documents, such as false receipts. Using basic computer software, it is easy for employees to create realistic-looking counterfeit receipts at home. These counterfeits are often very sophisticated, even including logos of the stores in which the goods or services were allegedly purchased. Computers are not the only means of creating support for a fictitious expense. Some employees use calculator tapes, others cut and paste old receipts from suppliers, and some use software to generate fictitious receipts.

Unfortunately, not all companies require receipts to be attached to expense reports. Checks written by the employee or copies of the employee's personal credit card bill might be allowed as support in lieu of a receipt. Some employees write personal checks that appear to be for business expenses and then photocopy these checks and attach them to

reimbursement requests. In actuality, nothing is purchased with the checks; they are destroyed after the copies are made. The perpetrator ends up receiving a reimbursement from their employer without ever actually incurring a business expense. The same method can be used with credit cards, where a copy of a statement is used to support a purchase. Once the expense report is filed, the perpetrator returns the item and receives a credit to their account.

Obtaining Blank Receipts from Vendors

If the perpetrator does not create receipts, they can be obtained from legitimate suppliers in a number of ways. Some employees request blank receipts from waiters, bartenders, taxi cab drivers, etc. These individuals fill in the blank receipts to “create” business expenses. A fraudster might also have a friend, spouse, relative, or connection who can provide receipts for “business expenses” that never really occur.

EXAMPLE

An employee’s friend worked at a restaurant near the victim organization. This friend validated credit card receipts and gave them to the fraudster so that they could submit them with their expense reports.

In some cases, a fraudster will steal an entire stack of blank receipts from a hotel, restaurant, etc. They will then fill them in and use them to verify fictitious business expenses over time.

Claiming the Expenses of Others

Another way perpetrators use actual receipts to generate unwarranted reimbursements is by submitting expense reports for expenses that were paid by others. For instance, employees might save the receipt from a meal that was paid for by another party and then request reimbursement for the meal themselves.

Multiple Reimbursements

The least common of the expense reimbursement schemes involves multiple reimbursements. This type of fraud involves the submission of a single expense more than one time. The most frequent example of a multiple reimbursement scheme is the submission of several types of support for the same expense.

EXAMPLE

An employee would use an airline ticket stub and a travel agency invoice on separate expense reports so that they could be reimbursed twice for the cost of a single flight. The fraudster would have their division president authorize one report and have the vice president approve the other so that neither would see both reports. Additionally, the perpetrator allowed a time lag of about a month between the filing of the two reports so that the duplication would be less noticeable.

In cases where a company does not require original documents as support, some employees even use several copies of the same support document to generate multiple reimbursements. Rather than file two expense reports, employees might also charge an item to the company credit card, save the receipt, and attach it to an expense report as if they paid for the item themselves. The victim organization therefore ends up paying twice for the same expense.

Detection of Expense Reimbursement Schemes

Detecting expense reimbursement fraud involves two basic methods. The first of these is a review and analysis of expense accounts. The second detection method is a detailed review of expense reports.

Review and Analysis of Expense Accounts

Generally, expense account review uses one of two methods: historical comparisons or comparisons with budgeted amounts. A historical comparison compares the balance expended this period in relation to the balance spent in prior, similar periods. When performing this review, consider changes to the marketing, servicing, or other company operations.

Budgets are estimates of the money or time necessary to complete the task. They are based on past experience with consideration for current and future business conditions. Therefore, when comparing actual and budgeted expenses, determining excessive expenses or inaccurate budget estimates is important.

Detailed Review of Expense Reports

Overall, the best detection method is a detailed review of employee expense reports. This method requires that the fraud examiner have a calendar and a copy of the employee's schedule for the relevant period at the time of the examination. The fraud examiner should be familiar with the company's travel and entertainment policies. Additionally, the following two steps might help to detect and deter employee expense abuses:

- Require employees to submit their expense reports for a detailed review before payment is reimbursed. If an employee knows that their expense report will be thoroughly reviewed, they will be less likely to include fraudulent expenses on the report.
- Periodically audit travel and entertainment accounts. This is particularly effective shortly before employee performance reviews.

Prevention of Expense Reimbursement Schemes

Detailed Expense Reports: Submission and Review

Detailed expense reports should require the following information:

- Receipts or other support documentation
- Explanation of the expense, including specific business purpose
- Time period when the expense occurred
- Place of expenditure
- Amount

When possible, require that employees submit original paper receipts. Given the amount of electronic and internet commerce that happens in today's world, this is not always possible. Keep in mind that electronic copies of receipts are often much easier to forge and alter than paper receipts. Special attention should be paid to any receipts that come via email or email attachment. Consider corroborating prices on internet receipts with those found on the vendor's website.

It is not enough to have the detailed reports submitted if they are not reviewed. A policy requiring the periodic review of expense reports, coupled with examining the appropriate detail, will help deter employees from submitting personal expenses for reimbursement.

ASSET MISAPPROPRIATION: INVENTORY AND OTHER ASSETS

Employees target inventory, equipment, supplies, and other noncash assets for theft in a number of ways. These schemes can range from stealing a box of pens to the theft of millions of dollars' worth of company equipment. The term *inventory and other assets* is meant to encompass the misappropriation schemes involving any assets held by a company other than cash.

Misuse of Inventory and Other Assets

There are basically two ways a person can misappropriate a company asset. The asset can be *misused* (or “borrowed”) or it can be *stolen*. Simple misuse is obviously the less egregious of the two. Assets that are misused but not stolen typically include company vehicles, company supplies, computers, and other office equipment.

EXAMPLE

An employee made personal use of a company vehicle while on an out-of-town assignment. The employee provided false information, both written and verbal, regarding the use of the vehicle. The vehicle was returned unharmed and the cost to the perpetrator's company was only a few hundred dollars. Nevertheless, such unauthorized use of a company asset does amount to fraud when a false statement accompanies the use.

One of the most common examples of the misuse of company assets occurs when employees use company equipment to do personal work on company time. For instance, employees might use their computer at work to write letters, print invoices, or do other work connected with a business they run on the side. In many instances, these side businesses are of the same nature as the employer's business, so the employees are essentially using their employer's equipment to compete with the employer.

The Costs of Inventory Misuse

The costs of inventory misuse are difficult to quantify. To many individuals, this type of fraud is not viewed as a crime but rather as borrowing. In truth, the cost to a company from this kind of scheme is often immaterial. When a perpetrator borrows a stapler for the night or takes home some tools to perform a household repair, the cost to their company is negligible, as long as the assets are returned unharmed.

But misuse schemes can also be very costly. Take, for example, the situation discussed previously in which an employee uses company equipment to operate a side business during work hours. Since the employee is not performing their work duties, the employer suffers a loss in productivity. If the low productivity continues, the employer might have to hire additional employees to compensate, diverting more capital to wages. If the employee's business competes with the employer's, then lost business could be an additional cost. Unauthorized use of equipment can also mean additional wear and tear, causing the equipment to break down sooner than it would have under normal business conditions. Additionally, when employees "borrow" company property, there is no guarantee that they will bring it back. This is precisely how some theft schemes begin. Despite some opinions to the contrary, asset misuse is not always a harmless crime.

Theft of Inventory and Other Assets

Though the misuse of company property might be a problem, the *theft* of company property is obviously of greater concern. Losses resulting from larceny of company assets can run into the millions of dollars. Most schemes where inventory and other noncash assets are stolen fall into one of four categories: larceny schemes, asset requisition and transfer schemes, purchasing and receiving schemes, and false shipment schemes.

Larceny Schemes

The textbook definition of *larceny* is "Felonious stealing, taking and carrying, leading, riding, or driving away another's personal property, with intent to convert it or to deprive owner thereof. The unlawful taking and carrying away of property of another with intent to appropriate it to use inconsistent with latter's rights."¹ This definition is so broad that it encompasses every kind of asset theft. To gain a more specific understanding of the methods used to steal inventory and other assets, the definition of larceny has been restricted. For the purposes of classifying asset misappropriations, the term *larceny* is meant to refer to the most basic type of inventory theft: the schemes in which an employee simply takes inventory from the company premises without attempting to conceal the theft in the books and records. (See the "Theft of Inventory" flowchart that follows.) In other fraud schemes, employees might create false documentation to justify the shipment of merchandise or tamper with inventory records to conceal missing assets. Larceny schemes are more blunt. The culprit in these crimes takes company assets without trying to justify their absence.

¹ *Black's Law Dictionary*. Sixth Edition. St. Paul, MN: West Publishing Co., 1990, 792.

Theft of Inventory

Most noncash larceny schemes are not very complicated. They are typically committed by employees (e.g., warehouse personnel, inventory clerks, shipping clerks) with access to inventory or supplies. Many employees simply carry company assets away in open view of other employees. People tend to assume that their friends and acquaintances are acting honestly. When they see a trusted coworker taking something out of the workplace, most people assume that the culprit has a legitimate reason for doing so.

EXAMPLE

A university faculty member was leaving her office to take a position at a new school. She was permitted to take a small number of items to her new job, but she certainly exceeded the school's intentions when she loaded two trucks full of university lab equipment and computers worth several hundred thousand dollars. The perpetrator simply packed up these stolen assets along with her personal items and drove away.

Unfortunately, in many cases, the perpetrator's coworkers are fully aware that the individual is stealing company assets, yet they refrain from reporting the crime. There are several reasons that employees might ignore illegal conduct, such as a sense of duty to their friends, a management versus labor mentality, poor channels of communication for whistleblowers, or intimidation of honest employees by the thief. When high-ranking personnel are stealing from their companies, employees often overlook the crime because they fear they will lose their jobs if they report it. In some cases, the coworkers might be assisting in the theft.

EXAMPLE

A school superintendent was not only pilfering school accounts but was also stealing school assets. A search of his residence revealed a cellar filled with school property. A number of school employees knew or suspected the superintendent was involved in illegal dealings, but he was very powerful, and people were afraid to report him for fear of retaliation. As a result, the superintendent was able to steal from the school for several years.

Ironically, employees who steal inventory are often highly trusted within their organizations. Because these employees are trusted, they might be given access to restricted areas, safes, supply rooms, or other areas where company assets are kept. This access makes it easy for these employees to steal.

It can be unwise for an employee to physically carry inventory and other assets off company premises. This practice carries with it the inherent risk and potential embarrassment of being caught in possession of stolen goods. Some employees avoid this problem by mailing company assets from the victim organization to a location where they can retrieve them without fear of being observed.

EXAMPLE

A spare-parts custodian took several thousand dollars' worth of computer chips and mailed them to a company that had no business dealings with the custodian's employer. He then reclaimed the merchandise as his own. By taking the step of mailing the stolen inventory, the fraudster allowed the postal service to unwittingly assist in his thievery.

The False Sale

In many cases, corrupt employees use outside accomplices to help steal inventory. The false, or fake, sale is one method that depends upon an accomplice. Like most inventory thefts, the fake sale is not complicated. The employee-fraudster's accomplice pretends to buy merchandise, but the employee does not ring up the sale. The accomplice then takes the merchandise without paying for it. To a casual observer, it will appear that the transaction is a normal sale. The employee places the merchandise in a bag and acts as though a transaction is being entered on the register when in actuality the "sale" is not recorded. The accomplice might even pass a nominal amount of money to the employee to complete the illusion. A related scheme occurs when an employee sells merchandise to an accomplice at an unauthorized discount.

Employees also sometimes enlist accomplices to return goods that the employee has already stolen. This is an easy way for the employee to convert the stolen inventory into cash.

Asset Requisitions and Transfers

Asset requisitions and other documents that allow noncash assets to be moved from one location in a company to another can be used to facilitate the theft of those assets. Employees use internal transfer paperwork to gain access to merchandise that they otherwise might not be able to handle without raising suspicion. These documents do not account for missing merchandise the way false sales do, but they allow a person to move the assets from one location to another. In the process of this movement, the thief steals the merchandise.

The most basic scheme occurs when an employee requisitions materials for some work-related project and then steals those materials. In some cases, employees simply overstate the amount of supplies or equipment it will take to complete their work and pilfer the excess. In more ambitious schemes, employees might invent a completely fictitious project that necessitates the use of certain assets they intend to steal.

EXAMPLE

An employee of a telecommunications company used false project documents to request approximately \$100,000 worth of computer chips, allegedly to upgrade company computers. Knowing that this type of requisition required verbal authorization from another source, the employee set up an elaborate phone scheme to get the “project” approved. The fraudster used her knowledge of the company’s phone system to forward calls from four different lines to her own desk. When the confirmation call was made, it was the perpetrator who answered the phone and authorized the project.

Dishonest employees sometimes falsify asset transfer forms so they can remove inventory from a warehouse or stockroom. The false documents allow the employee to remove merchandise from the warehouse, but instead of using it for a work-related purpose, the perpetrator simply takes it home. The obvious problem with this type of scheme is that the person who orders the merchandise will usually be the primary suspect when it turns up missing.

EXAMPLE

A manager requested merchandise from the company warehouse to be displayed on a showroom floor. The pieces he requested never made it to the showroom because he loaded them into a pickup truck and took them home. In some instances, he took the items during the day, when people can be observed easily, with the help of another employee. This individual thought he was immune from detection because the merchandise was requested via computer using a management-level security code. The code was not specific to any one manager, so there would be no way of knowing which manager had ordered the merchandise. Unfortunately for the thief, the company was able to record the computer terminal from which the request originated. The manager had used his own computer to make the request, which led to his undoing.

Purchasing and Receiving Schemes

Dishonest employees can also manipulate the purchasing and receiving functions of a company to facilitate the theft of inventory and other assets. It might seem that any purchasing scheme should fall under the heading of false billings, which were discussed earlier. There is, however, a distinction between the purchasing schemes that are classified as false billings and those that are classified as noncash misappropriations.

If an employee causes their company to purchase merchandise that the company does not need, this is a false billing scheme. The harm to the company comes in paying for assets for

which it has no use. If, however, the assets were intentionally purchased by the company and later misappropriated by the perpetrator, this is classified as an inventory larceny scheme. Here, the company loses both the value of the merchandise and the *use* of the merchandise.

Falsifying Incoming Shipments

One of the most common examples of an employee abusing the purchasing and receiving functions occurs when a person charged with receiving goods on the victim company's behalf—such as a warehouse supervisor or receiving clerk—falsifies the records of incoming shipments. If, for example, one thousand units of a particular item are received, the perpetrator indicates that only nine hundred were received. By marking the shipment short, the perpetrator can steal the one hundred unaccounted for units.

The obvious problem with this kind of scheme is the fact that the receiving report does not match the vendor's invoice, which will likely cause a problem with payment. In the previous example, if the vendor bills for one thousand units but the accounts payable voucher only shows receipt of nine hundred units of merchandise, then someone will have to explain where the extra one hundred units went.

Some employees avoid this problem by altering only one copy of the receiving report. The copy that is sent to accounts payable indicates receipt of a full shipment, so the vendor will be paid without any dispute. The copy used for inventory records indicates a short shipment so that the assets that are readily available will equal the assets in the perpetual inventory.

Instead of marking shipments short, the perpetrator might reject portions of a shipment as not being up to quality specifications. The perpetrator then keeps the “substandard” merchandise rather than sending it back to the supplier. The result is the same as if the shipment had been marked short.

False Shipments of Inventory and Other Assets

To conceal thefts of inventory and other assets, employees sometimes create false shipping documents and false sales documents to make it appear that the inventory they take was sold rather than stolen. (See the “False Shipments of Inventory” flowchart that follows.) The document that tells the shipping department to release inventory for delivery is usually the packing slip. By creating a false packing slip, a corrupt employee can cause inventory to be

fraudulently delivered to their own residence or that of an accomplice. The “sales” reflected in the packing slips are typically made to a fictitious person, a fictitious company, or the perpetrator’s accomplice.

One benefit of using false shipping documents to misappropriate inventory or other assets is that the product is removed from the warehouse or storeroom by someone other than the perpetrator. The victim organization unknowingly delivers the targeted assets to the perpetrator of the scheme.

False packing slips allow inventory to be shipped from the victim company to the perpetrator, but they do not conceal the fact that inventory has been misappropriated in and of themselves. To hide the theft, fraudsters might record a false sale on the books so it appears that the missing inventory was shipped to a customer. Depending on how the victim organization operates, the perpetrator might have to create a false purchase order from the “buyer,” a false sales order, and a false invoice along with the packing slip to create the illusion of a sale.

The result is that a fake receivable account goes into the books for the price of the misappropriated inventory. Obviously, the “buyer” of the merchandise will never pay for it. How does an employee deal with these fake receivables? In some cases, an employee simply lets the receivable age on their company’s books until it is eventually written off as uncollectible. In other instances, an employee might take affirmative steps to remove the sale—and the resulting delinquent receivable—from the books.

EXAMPLE

An employee generated false invoices and delivered them to the company warehouse for shipping. The invoices were then marked as delivered and sent to the sales office. The perpetrator removed all copies of the invoices from the files before they were billed to the fictitious customer.

Another common way to eliminate delinquent receivables that result from theft schemes is to write off the receivables to accounts such as *discounts and allowances*, *bad debt expense*, or *lost and stolen assets*.

Instead of creating completely fictitious sales, some employees understate legitimate sales so that an accomplice is billed for less than delivered. The result is that a portion of the

merchandise is sold at no cost. In a typical scenario, a salesperson fills out shipping tickets, which are forwarded to the warehouse. After the merchandise is shipped, the salesperson instructs the warehouse employees to return the shipping tickets to them for “extra work” before they are sent to the invoicing department. The salesperson then alters the shipping tickets, reducing either the quantity of merchandise sold or the price per unit sold.

Write-offs are often used to conceal the theft of assets after they have been stolen. In some cases, however, assets are written off to make them available for theft. For instance, an employee with the authority to declare inventory obsolete can write off this inventory as scrap. Once assets are designated as scrap, it is often easier to misappropriate them. Fraudsters might be allowed to take the “useless” assets for themselves, buy them or sell them to an accomplice at a greatly reduced price, or simply give the assets away.

False Shipments of Inventory

Concealing Inventory Shrinkage

When inventory is stolen, the perpetrator's key concealment issue is shrinkage. *Inventory shrinkage* is the unaccounted-for reduction in the company's inventory that results from error or theft. For instance, assume a computer retailer has one thousand computers in stock. After work one day, an employee loads ten computers into a truck and takes them home. Now the company only has nine hundred ninety computers, but since there is no record that the employee took ten computers, the inventory records still show that one thousand units are available. The company has experienced inventory shrinkage in the amount of ten computers.

Shrinkage is one of the red flags that signal fraud. The perpetrator's goal is to proceed with their scheme undetected, so it is in their best interest to prevent anyone from looking for missing assets. This means concealing the shrinkage that occurs from asset theft.

Inventory and other assets are typically tracked through a two-step process. The first step, the perpetual inventory, is an ongoing count that records how much inventory should be available. When new shipments of merchandise are received, for instance, this merchandise is entered into the perpetual inventory. Similarly, when goods are sold, they are removed from the perpetual inventory records. In this way, a company tracks its inventory on a day-to-day basis.

Periodically, a physical count of available assets should be made. In this process, someone actually goes through the storeroom or warehouse and counts everything that the company has in stock. This total is then matched to the amount of assets reflected in the perpetual inventory. A variation between the physical inventory and the perpetual inventory totals is shrinkage. While a certain amount of shrinkage might be expected in any business, large shrinkage totals could indicate fraud.

Altered Inventory Records

One of the simplest methods for concealing shrinkage is to change the perpetual inventory record so that it matches the physical inventory count. This is also known as a *forced reconciliation* of the account. The perpetrator simply changes the numbers in the perpetual inventory to make them match the amount of inventory that is available. For example, the employee might credit (decrease) the perpetual inventory and debit (increase) the cost of sales account to lower the perpetual inventory numbers so that they match the actual inventory count. Instead of using correcting entries to adjust the perpetual inventory, some employees simply delete or cover up the correct totals and enter new numbers.

There are two sides to the inventory equation: the perpetual inventory and the physical inventory. Instead of altering the perpetual inventory, a perpetrator who has access to the records from a physical inventory count can change those records to match the perpetual inventory. Returning to the computer store example, assume the company counts its inventory every month and matches it to the perpetual inventory. The physical count should come to nine hundred ninety computers, since that is what is actually available. If the perpetrator is someone charged with counting inventory, they can simply write down that there are one thousand units available.

Fictitious Sales and Accounts Receivable

When the perpetrator makes an adjusting entry to the perpetual inventory and cost of sales accounts, there is no sales transaction on the books that corresponds to these entries. To fix this problem, a perpetrator might enter a debit to accounts receivable and a corresponding credit to the sales account so that it appears the missing goods have been sold.

Of course, the problem of payment then arises because no one is going to pay for the goods that were “sold” in this transaction. A fraudster has two options in this circumstance. The first is to charge the sale to an existing account. In some cases, employees charge fake sales to existing receivables that are so large that the addition of the assets that the perpetrator has stolen will not be noticed. Other corrupt employees charge the “sales” to accounts that are already aging and will soon be written off. When these accounts are removed from the books, the perpetrator’s stolen inventory effectively disappears. The other adjustment that is typically made is a write-off to *sales discounts and allowances* or *bad debt expense*.

Write-Off Inventory

Writing off inventory as obsolete, damaged, or unsellable is a relatively common way for employees to remove assets from the books before or after they are stolen. This eliminates the problem of shrinkage that inherently exists in every case of noncash asset misappropriation.

Physical Padding

Most methods of concealment deal with altering inventory records, either changing the perpetual inventory or miscounting during the physical inventory. Alternatively, some employees try to make it appear as though there are more assets present in the warehouse or stockroom than there actually are by physically padding the inventory. Empty boxes or boxes filled with bricks or other inexpensive materials, for example, might be stacked on shelves to create the illusion of extra inventory. In one case, employees stole liquor from their

stockroom and restacked the containers for the missing merchandise. This made it appear that the missing inventory was present when in actuality there were empty boxes on the stockroom shelves.

Detection of Inventory Schemes

Statistical Sampling

Companies with inventory accounts typically have enormous populations of source documents. Statistical sampling allows the fraud examiner to inspect key attributes on a smaller portion (or sample) of those documents. For example, the fraud examiner might select a statistically valid, random sample of purchase requisitions to determine that all requisitions in the sample selected were properly approved. Statistical sampling enables the fraud examiner to predict the occurrence rate for the population and, therefore, determine with some accuracy the error rate or the potential for fraud.

Other items that could be sampled on a statistical basis include the following:

- Receiving reports
- Perpetual inventory records
- Raw materials requisitions
- Shipping documents
- Job cost sheets

The attributes tested for on the aforementioned documents might include a specific date, item, or location.

Perpetual Inventory Records

Unexplained entries in the perpetual records might reveal embezzlement losses.

- Are all the reductions to the perpetual inventory records explained by source documents (such as sales invoices, approvals to remove to scrap inventory, or spoilage)?
- Are all increases in perpetual records explained by source documents such as receiving reports?

Shipping Documents

Inventory theft could be uncovered by answers to questions such as:

- Are all sales properly matched with a shipping document?
- Are any shipping documents not associated with a sale?
- Is inventory disappearing from storage?

Physical Inventory Counts

Physical inventory counts can sometimes give rise to inventory theft detection. However, because other explanations satisfy inventory shortages (such as shrinkage), historical analysis of inventory is usually necessary. Furthermore, if the only method used to detect inventory fraud is the year-end physical count, the perpetrators will have had all year to devise concealment methods to circumvent potential detection.

Analytical Review

Inventory fraud might be detected by using an analytical review because certain trends become immediately clear. For example, sales and cost of goods sold should move together since they are directly related. However, if the cost of goods sold increases by a disproportionate amount relative to sales and no changes occur in the purchase prices, quantities purchased, or quality of products purchased, the cause of the disproportionate increase in cost of goods sold might be one of three things: (1) ending inventory has been depleted by theft, (2) someone has been embezzling money through a false billing scheme (i.e., submitting invoices and collecting the payments for inventory that was never delivered), or (3) someone has been skimming sales revenue.

An analytical review of all the component parts of the cost of goods sold should indicate to the fraud examiner where to direct further inquiries. For example, assume that the type of inventory purchased is the same and there is no change in the manufacturing process or purchase price. If sales and cost of sales change from \$5,650,987 and \$2,542,944 to \$6,166,085 and \$2,981,880, respectively, what is the data telling the fraud examiner? For one thing, sales have increased by 9.12%, whereas cost of sales increased by 17.26%. The profit margin has decreased by 3% (from 55 to 52%). Based on this data, the fraud examiner might want to look further at the components of inventory (e.g., beginning inventory, purchases, and ending inventory). If beginning inventory was \$1,207,898, purchases were \$2,606,518 and \$2,604,972, respectively, and ending inventory was \$894,564, then an inventory matrix would look like the following:

	Year 1	Year 2	Percentage Change
Beginning Inventory	\$1,207,898	\$1,271,472	5.26%
Purchases	2,606,518	2,604,972	<0.06%>
Goods Available for Sale	\$3,814,416	\$3,876,444	1.63%
Ending Inventory	<1,271,472>	<894,564>	<29.64%>
Cost of Sales	\$2,542,944	\$2,981,880	17.26%

Inventory purchases, as a percentage of sales, have declined from 46.13 to 42.25%. From this example, one can hypothesize that: (1) inventory purchases were purposely increased in year one only to be liquidated in year two; (2) the increased sales in year two were unexpected and the purchase of inventory did not maintain progression with the sales; or (3) there might be some fraud scheme in inventory. If the fraud examiner is unable to ascertain a reasonable explanation such as (1) or (2) above through an interview, then further examination of the ending inventory might be warranted.

The fraud examiner might next look at the differences in the physical inventory procedures to see if that created a more (or less) accurate inventory count at the end of either year one or year two. If there is no other logical explanation, then further investigation into these and other inventory accounts might be necessary to explain the anomalies occurring in inventory.

Computer-Generated Trend Analysis

The computer can be used to facilitate obtaining lists of items with specified attributes. For example, in a lumberyard operation, the computer can be programmed to list all purchases of four by four cedar fence posts of a certain length. The fraud examiner should check all the source documents that are represented by the listing. By examining the source documents for each of these purchases, the fraud examiner can plot trends to determine the occurrence of the following (or other) patterns:

Searches	Schemes
Purchases by vendor	If the same vendor is receiving favorable treatment
Inventory levels by types and dates	If inventory is being purchased at its reorder point or if excess inventory is being ordered
Inventory shipped by address	If the vendor's address matches either an employee address or the address of another vendor
Cost per item	If discounts are properly credited to purchases
Direct labor by item	If there are excess labor hours being added to a particular job or item
Direct materials by item	If materials are properly charged to the job (too much or the wrong materials)
Overhead per inventory item	If overhead is being properly applied, and applied only once
Disposals then reorders	If usable inventory is being prematurely designated as scrap
Shortages by inventory item	If there is inventory theft or the reorder system is not functioning
Returns and allowances	If there is an unusually high incidence of returns and allowances
Sales allowances	If sales allowances are not properly credited to promotional allowances
Buyer	If the buyer is not acting within the scope of authority

Detailed Audit Checklist

The following audit checklist will also be helpful in establishing inventory control:

- Do adequate, detailed, written inventory instructions and procedures exist? Do inventory procedures give appropriate consideration to the location and arrangement of inventories?
- Do inventory procedures give appropriate consideration to identification and description of inventories?
- Is the method of determining inventory quantities specified (e.g., weight, count)?
- Is the method used for recording items counted adequate (e.g., count sheets, prenumbered tags)?
- Are inventory tags used? If yes: (1) Are they prenumbered? (2) Is accounting for inventory tags adequate and does it include control with respect to tags used, unused, and voided?
- Are adequate procedures in place to identify inventory counted, ensure that all items have been counted, and prevent double counting?

- Are obsolete, slow-moving, or damaged inventories properly identified and segregated?
- Is the inventory reasonably identifiable for proper classification in the accounting records (e.g., description, stage of completion)?
- Are inventory counts subject to (1) complete recounts by persons independent of the ones involved in the initial counts, (2) recounts only of merchandise having substantial value, or (3) spot checks by supervisory personnel?
- Are counts performed by employees whose functions are independent of the physical custody of inventories and recordkeeping functions?
- Do proper accounting controls and procedures exist for the exclusion from inventory of merchandise on-hand that is not property of the client (e.g., customers' merchandise, consignments in)?
- Do proper accounting controls and procedures exist for the inclusion in inventory of merchandise not on-hand, but the property of the client (e.g., merchandise in warehouses, out on repair, consignments out)?
- Will identical inventory items in various areas be accumulated to allow a tie in total counts to a summary listing subsequent to the observation?
- Is the movement of inventory adequately controlled (e.g., shipping and receiving activities suspended) during the physical count to ensure a proper cut-off?
- Are significant differences between physical counts and detailed inventory records investigated before the accounting and inventory records are adjusted to match the physical counts?
- Will inventory at remote locations be counted?
- Will special counting procedures or volume conversions be necessary (e.g., items weighed on scale)?
- How will work-in-process inventory be identified?
- How will the stage of completion of work-in-process inventory be identified?
- Are there any other matters that should be noted for the inventory count?

Prevention of Inventory Schemes

There are four basic measures that might help prevent inventory fraud, if properly installed and implemented. They are proper documentation, separation of duties (including approvals), independent checks, and physical safeguards.

Proper Documentation

The following items should be prenumbered and controlled:

- Requisitions
- Receiving reports
- Perpetual records
- Raw materials requisitions
- Shipping documents
- Job cost sheets

However, not all inventory requires the purchasing of raw materials. In these cases, the proper documentation might take the form of prenumbered and controlled tickets and receipts for sales.

Separation of Duties

The following duties should be handled by different personnel:

- Requisition of inventory
- Receipt of inventory
- Disbursement of inventory
- Conversion of inventory to scrap
- Receipt of proceeds from disposal of scrap

Independent Checks

Someone independent of the purchasing or warehousing functions should conduct physical observation of inventory. The personnel conducting the physical observations should also be knowledgeable about the inventory. For example, internal auditors are responsible for assessing a company's business processes, but they typically have no access to the physical inventory, which makes them a plausible candidate to conduct physical observations of a company's inventory.

Physical Safeguards

All merchandise should be physically guarded and locked; access should be limited to authorized personnel only. For example, strategic placement of security guards might aid in the detection and deterrence of potential theft schemes. Electronic methods might also be used, such as cameras and surveillance devices. The effectiveness of any device will, however, depend on the employee's knowledge that physical safeguard controls are adhered to, as well as the type of inventory available for misappropriation.

Misappropriation of Intangible Assets

Misappropriation of Information

In addition to misappropriation of tangible noncash assets, organizations are vulnerable to theft of proprietary information, which can undermine their value, reputation, and competitive advantages and result in legal liabilities. Companies frequently make sizeable technological investments in protecting their information from external information thieves, but often the biggest threats are internal. Employees are the most likely to be in a position to exploit their employers' information security. After all, who has more insider information and access to proprietary records and data than an employee or former employee?

Information misappropriation schemes commonly include theft by employees of competitively sensitive information, such as customer lists, marketing strategies, trade secrets, new products, or details on development sites. In one case, an employee who felt a sense of entitlement for having contributed to a new product design stole the design in an attempt to get ahead in a new job with a competitor. And in another case, a disgruntled former employee sold a company trade secret to a competitor to retaliate for what the former employee felt was unfair treatment.

Every company will have different intangible assets and different ways to protect them, but identifying and monitoring such assets on a continuous basis will decrease the likelihood of them being compromised. Data, in particular, is an intangible asset that requires special precautions and ongoing diligence. When compromised, data can not only be used to defraud the company itself, but also the company's vendors, clients, or customers—all of which can result in major losses for the company.

Therefore, it is critical that companies identify their most valuable information and take steps to protect it. This process must be a cross-departmental endeavor, involving specialists from corporate security/risk management, information technology, human resources (HR), marketing, research and development, and so on. If in-house capabilities do not exist, companies can bring in information security experts to assist them in designing an effective information security system, including awareness training for employees. An information security system might include measures such as limiting access to networks, systems, or data to those who have a legitimate need for access; protecting company data through the use of

firewalls and virus scanning software; implementing and enforcing confidentiality agreements and restrictive covenants where appropriate; performing adequate background checks on employees; establishing and enforcing a security policy, and much more.

For additional discussions on the misappropriation of sensitive company information, see the “Theft of Data and Intellectual Property” chapter in this section of the *Fraud Examiners Manual*.

Misappropriation of Securities

Although securities are the least likely asset to be misappropriated, the loss of security misappropriation cases has the potential to be extremely high. To avoid being victimized by a securities misappropriation scheme, management must maintain proper internal controls over the company’s investment portfolio, including proper separation of duties, restricted access to investment accounts, and periodic account reconciliations.

In one example, a misappropriation of securities occurred when the director of accounting and finance, who was responsible for making trades, left their computer unattended for a short time while signed into one of the company’s investment accounts. Another employee, a senior accountant, took the opportunity to access the director’s computer to sell \$15,000 worth of investments and have the proceeds mailed to the company. Due to lax internal controls, they were able to intercept the check and deposit it into their own bank account. Because this employee was in charge of reconciling the investment accounts and had the access needed to enter and post journal entries to the general ledger, they were able to easily hide their scheme by writing off a loss on investments to an expense account. It wasn’t until almost a year later, when auditors were reviewing the company’s books, that the scheme was uncovered. By that time, the thief had disappeared.

CORRUPTION

Corruption can be found in any business or organization, and it is one of the three major categories of occupational fraud and abuse (along with asset misappropriation and financial statement fraud). An organization that understands the specific factors involved in corruption schemes can take steps to prevent, detect, and investigate them.

What Is Corruption?

Corruption is a term used to describe various types of wrongful acts designed to cause an unfair advantage. It can take on many forms, including bribery, kickbacks, illegal gratuities, economic extortion, and collusion. Generally, corruption involves the wrongful use of influence to procure a benefit for the actor or another person, contrary to the duty or the rights of others. The various forms of corruption are often used in combination, which reinforces the schemes' potency and makes them more difficult to combat.

Corruption is a significant problem for organizations, particularly due to the drive for growth in international markets. Despite the multitude of anti-corruption legislation and increased enforcement efforts around the world, corruption is still prevalent.

The most common area for corruption in an organization is in the purchasing environment, and most corruption schemes involve employees acting alone or in collusion with vendors or contractors.

Forms of Corruption

Bribery

Bribery may be defined as the offering, giving, receiving, or soliciting of corrupt payments (i.e., items of value paid to procure a benefit contrary to the rights of others) to influence an official act or business decision. Bribes do not necessarily involve direct payments of cash or goods. For a detailed discussion of the legal elements of bribery, please see the "The Law Related to Fraud" chapter in the Law section of the *Fraud Examiners Manual*.

At its heart, a bribe is a business transaction, albeit an illegal or unethical one. Bribery involves collusion between at least two parties. A person "buys" influence over the recipient

of the bribe to procure a benefit that is contrary to the duty or the rights of others. In the employment context, bribery involves a conflict of interest in which the employee's personal interest overwhelms their professional responsibilities.

Though bribery schemes are much less common than other forms of occupational fraud, such as asset misappropriations, they tend to be far more costly.

Bribery schemes are classified into two types: official bribery and commercial bribery.

Official bribery refers to the corruption of a public official to influence an official act of government. The term *official act* stems from traditional bribery statutes that only proscribe payments made to influence the decisions of government agents or employees.

In contrast, *commercial bribery* refers to the corruption of a private individual to gain a commercial or business advantage. In commercial bribery schemes, something of value is offered to influence a business decision rather than an official act, as is the case in official bribery.

Commercial bribery may or may not be a criminal offense. For example, in the United States, there is no general federal law prohibiting commercial bribery in all instances. By contrast, the UK Bribery Act prohibits commercial bribery throughout the United Kingdom. Therefore, the law of the particular jurisdiction and the facts of the case will determine whether bribery in the private sector may be prosecuted criminally.

In most jurisdictions, commercial bribery is also a civil offense—meaning that the aggrieved party can recover damages and other private remedies. Commercial bribery is often pursued in civil actions as a claim for breach of fiduciary duty or conflict of interest. See the Law section of the *Fraud Examiners Manual* for more information.

Kickback Schemes

Bribery often takes the form of kickbacks, a form of negotiated bribery in which a commission is paid to the bribe-taker in exchange for the services rendered. Thus, *kickbacks* are improper, undisclosed payments made to obtain favorable treatment. In the government setting, kickbacks refer to the giving or receiving of anything of value to obtain or reward favorable treatment in relation to a government contract. In the commercial sense, kickbacks

refer to the giving or receiving of anything of value to influence a business decision without the employer's knowledge and consent.

Usually, kickback schemes are similar to the billing schemes described in the "Asset Misappropriation: Fraudulent Disbursements" chapter. They involve the submission of invoices for goods and services that are either overpriced or fictitious. (See the "Kickbacks" flowchart that follows.)

Kickbacks are classified as corruption schemes rather than asset misappropriations because they involve collusion between employees and third parties. In a common type of kickback scheme, a vendor submits a fraudulent or inflated invoice to the victim organization and an employee of that organization helps make sure that a payment is made on the false invoice. For their assistance, the employee-fraudster receives a payment from the vendor. This payment is the kickback.

Most kickback schemes attack the purchasing function of the victim organization; therefore, these frauds are often undertaken by employees with purchasing responsibilities. Purchasing employees usually have direct contact with vendors and therefore have an opportunity to establish a collusive relationship.

EXAMPLE

A purchasing agent redirected a number of orders to a company owned by a supplier with whom he was conspiring. In return for the additional business, the supplier paid the purchasing agent over half the profits from the additional orders.

Kickbacks

Diverting Business to Vendors

In some kickback schemes, an employee-fraudster receives a kickback for directing excess business to a vendor. In these cases, there might not be any overbilling involved; the vendor simply pays the kickbacks to ensure a steady stream of business from the purchasing company.

If no overbilling is involved in a kickback scheme, one might wonder where the harm lies. Assuming the vendor wants to get the buyer's business and does not increase their prices or bill for undelivered goods and services, how is the buyer harmed? The problem is that, having bought off a purchasing company employee, a vendor is no longer subject to the normal economic pressures of the marketplace. This vendor does not have to compete with other suppliers for the purchasing company's business, and thus has no incentive to provide a low price or quality merchandise. In these circumstances, the purchasing company almost always ends up overpaying for goods or services.

EXAMPLE

A travel agency provided free travel and entertainment to the purchasing agent of a retail company, and in return, the purchasing agent agreed to book all of her department's trips through the travel agent. The victim company estimated that it paid \$10,000 more for airfare over a two-year period by booking through the corrupt travel agency than if it had used a different company.

Once a vendor knows it has an exclusive purchasing arrangement, it is motivated to raise prices to cover the cost of the kickback.

Most bribery schemes end up as overbilling schemes even if they do not start that way. This is one reason why most business codes of ethics prohibit employees from accepting undisclosed gifts from vendors. In the end, an organization is sure to pay for its employees' unethical conduct.

Overbilling Schemes

EMPLOYEES WITH APPROVAL AUTHORITY

In most instances, kickback schemes involve overbilling. In these schemes, a vendor submits inflated invoices to the victim organization, and the false invoices either overstate the cost of actual goods and services or reflect fictitious sales. To ensure that the inflated invoices get approved, the corrupt vendor offers kickbacks to an employee of the victim organization who has the authority to approve payment of the fraudulent invoices. By enlisting the help of an employee with such authority, the corrupt vendor ensures that the invoices will be paid without undue hassles.

EXAMPLE

A manager was authorized to purchase fixed assets for his company as part of a leasehold improvement. The materials he ordered were of a cheaper quality and lower price than what was specified, but the contract price he negotiated did not reflect this. Therefore, the victim company paid for high-quality materials, but received low-quality materials. The difference in price between the true cost of the low-quality materials and what the company paid was diverted back to the manager as a kickback.

The ability of the employee to authorize purchases, including the ability to authorize *fraudulent* purchases, is usually a key to kickback schemes. If fraudsters can authorize payments themselves, they do not have to submit purchase requisitions to a superior who might question the transaction's validity.

FRAUDSTERS LACKING APPROVAL AUTHORITY

While the majority of kickback schemes involve individuals with authority to approve purchases, this authority is not an absolute necessity. When employees cannot approve fraudulent purchases themselves, they can still orchestrate a kickback scheme if they can circumvent accounts payable controls. In some cases, they can do this by filing a false purchase requisition. If a trusted employee tells their superior that the company needs certain materials or services, this is sometimes sufficient to get a false invoice approved for payment. Such schemes are generally successful when the person with approval authority is inattentive or is forced to rely on their subordinate's guidance in purchasing matters.

Corrupt employees might also prepare false vouchers to make fraudulent invoices appear legitimate. Where proper controls are in place, a completed voucher is required before accounts payable will pay an invoice. To do this, the fraudster must create a purchase order that corresponds with the vendor's fraudulent invoice. The fraudster might forge the signature of an authorized party on the purchase order to show that the acquisition has been approved. If the company's payables system is computerized, an employee with access can enter the system and authorize payments on fraudulent invoices.

In less sophisticated schemes, a corrupt employee might simply take a fraudulent invoice from a vendor and slip it into a stack of prepared invoices before they are input into the accounts payable system. A more detailed description of how false invoices are processed can be found in the "Billing Schemes" section in the "Asset Misappropriation: Fraudulent Disbursements" chapter in this section of the *Fraud Examiners Manual*.

Kickback schemes can be very difficult to detect. In a sense, the victim organization is being attacked from two directions—externally and internally. Externally, a corrupt vendor submits false invoices that induce the victim organization to pay for goods or services that it does not receive. Internally, one or more of the victim organization’s employees waits to corroborate the false information provided by the vendor.

Other Kickback Schemes

Kickbacks are not always paid to employees to process phony invoices. Some outsiders seek other fraudulent assistance from employees of the victim organization. For instance, inspectors are sometimes paid off to accept substandard materials or to accept short shipments of goods.

Representatives of companies wishing to purchase goods or services from the victim organization at unauthorized discounts sometimes bribe employees with billing authority. The corrupt employees make sales to their accomplices at greatly reduced rates—sometimes even selling items at a loss—and in return, they receive a portion of the discount.

Illegal Gratuities

Illegal gratuities are items of value given to reward a decision, often after the recipient has made the decision. Illegal gratuities are similar to bribery schemes except that, unlike bribery schemes, illegal gratuity schemes do not necessarily involve an intent to influence a particular decision before the fact. That is, an illegal gratuity occurs when an item of value is given for, or because of, some act. Often, an illegal gratuity is merely something that a party who has benefited from a decision offers as an underhanded thank-you to the person who made the beneficial decision.

EXAMPLE

A city commissioner negotiated a land development deal with a group of private investors. After the deal was approved, the private investors rewarded the commissioner and her husband with a free international vacation, all expenses paid.

At first glance, it might seem that illegal gratuities schemes are harmless as long as the business decisions in question are not influenced by the promise of payment. But most organizations’ ethics policies forbid employees from accepting unreported gifts from vendors. One reason for such blanket prohibitions is that illegal gratuities schemes can (and do) evolve into bribery schemes. Once an employee has been rewarded for an act such as directing

business to a particular supplier, they might reach an understanding with the gift giver that future decisions will also be made to benefit the gift giver. Additionally, even though no outright promise of payment has been made in an illegal gratuity, employees might direct business to certain companies in the hope that they will be rewarded with money or gifts.

Economic Extortion

An extortion case is often the other side of a bribery case. *Extortion* is defined as the obtaining of property from another, with the other party's consent induced by wrongful use of actual or threatened force or fear. Economic extortion is present when an employee or official, through the wrongful use of actual or threatened force or fear, demands money or some other consideration to make a particular business decision. That is, economic extortion cases are the "Pay up or else ..." corruption schemes.

To constitute extortion, the threat must be the controlling reason that the victim gives up a right or property. The following types of threats can constitute extortion:

- Physical harm
- Property damage
- Accusing a person of a crime
- Disgracing a person
- Public exposure

Accordingly, a demand for a bribe or kickback, coupled with a threat of adverse action if the payment is not paid, might constitute extortion. In any situation where an employee might accept bribes to favor a particular company or person, the situation could be reversed to a point where the employee extorts money from a potential purchaser or supplier.

EXAMPLE

A plant manager for a utility company started his own business on the side. The manager forced vendors who wanted to do work for the utility company to divert some of their business to his own company. Those who did not comply lost their business with the utility company.

Collusion

Collusion refers to an agreement between two or more individuals to commit an act designed to deceive or gain an unfair advantage. Typically, collusion involves some sort of kickback, which can result in fraudulent billing or inferior goods.

Methods of Making Corrupt Payments

Often, corruption schemes involve corrupt payments—items of value paid to procure a benefit contrary to the rights of others. There are various ways to make corrupt payments, and many do not involve money. Any tangible benefit given or received with the intent to corruptly influence the recipient can be an illegal payment, but there are certain traditional methods of making corrupt payments that fall into the following hierarchical categories.

Gifts, Travel, and Entertainment

Most corruption schemes begin with gifts and favors. Common gifts and favors that are given at an early stage include:

- Wine and liquor (consumable)
- Clothes and jewelry for the recipient or spouse
- Sexual favors
- Lavish entertainment
- Paid vacations
- Free luxury transportation
- Free use of resort facilities
- Gifts of the briber's inventory or services, such as construction of home improvements by a contractor

Cash Payments

Corrupt payments do occur in the form of cash payments, but paying in cash is not a practical method when dealing with large sums. Accordingly, corrupt payers generally avoid using cash when making large payments.

Checks and Other Financial Instruments

Corrupt payments are often made by normal business check, cashier's check, or wire transfer. When such payments are made, they must be disguised. When a payer makes such payments, they might be disguised as some sort of legitimate business expense (e.g., consulting fees). Also, such payments can be made directly or through an intermediary.

Hidden Interests

Additionally, the payer might give the recipient a hidden interest in a joint venture or other profit-making enterprise.

Such corrupt payments are hard to detect for a number of reasons. The recipient's interest might be concealed through a straw nominee, hidden in a trust or other business entity, or included by an undocumented verbal agreement. Also, even if such payments are identified, proving they originated with corrupt intent is also difficult to demonstrate.

Loans

Corrupt payments often take the form of loans. Three types of loans often turn up in corruption cases:

- An outright payment that is falsely described as an innocent loan
- A legitimate loan in which a third party—the corrupt payer—makes or guarantees payments to satisfy the loan
- A legitimate loan made on favorable terms (e.g., an interest-free loan)

Credit Cards

A corrupt payment can be in the form of credit card use or payments toward a party's credit card debt. The payer might use a credit card to pay a recipient's transportation, vacation, or entertainment expenses, or the payer might pay off a recipient's credit card debt. In some instances, the recipient might carry and use the corrupt payer's credit card.

Transfers Not at Fair Market Value

Corrupt payments might occur in the form of transfers for a value other than fair market. In such transfers, the corrupt payer might sell or lease property to the recipient at a price that is less than its market value, or the payer might agree to buy or rent property from the recipient at an inflated price. The recipient might also "sell" an asset to the payer but retain the title or use of the property.

Promises of Favorable Treatment

Corrupt payments might come in the form of promises of favorable treatment. Such promises commonly take the following forms:

- A payer might promise a government official lucrative employment when the recipient leaves government service.
- An executive leaving a private company for a related government position might be given favorable or inflated retirement and separation benefits.
- The spouse or other relative of the intended recipient might also be employed by the payer company at an inflated salary or with minimal actual responsibility.

Detection of Corruption Schemes

Red Flags of Corruption Schemes

Corruption can affect politicians, government officials, management, and procurement staff. It can arise from a sense of entitlement, a thirst for power, or a basic need for money. It is an evasive fraud that is difficult to detect, but knowing the red flags is the first step in combating corruption.

Most corruption schemes are detected through tips from honest and disgruntled coworkers or vendors. These allegations can be evaluated by analyzing the red flags associated with the suspect people or transactions. Fraud examiners can identify numerous red flags in the behavior of employees and third parties, as well as in internal control deficiencies.

Red Flags of Corrupt Employees

Some common red flags of corrupt employees include:

- A high success rate in markets where competitors are known to bribe
- Reputation for regularly accepting inappropriate gifts
- Extravagant lifestyle
- Reputation for taking action without being instructed to do so or directing subordinates to bend, break, or ignore standard operating procedures or rules to benefit the payer
- Tendency of employees to insert themselves into areas in which they are normally not involved
- Propensity to assert authority or make decisions in areas for which the employees are not responsible
- Inclination to make excuses for deficiencies in a third party's products or services, such as poor quality, late deliveries, or high prices
- Circumstances that generate extreme personal pressures, such as ill family members or drug addiction
- History of not filing conflict of interest forms
- Frequent hospitality and travel expenses for foreign public officials
- Friendly social relationship with a third-party contractor

Red Flags of Corrupt Third Parties

Some common red flags of a corrupt third party include a party who:

- Routinely offers inappropriate gifts, provides lavish business entertainment, or otherwise tries to obtain favor with an organization

- Consistently receives contracts without any apparent competitive advantage
- Provides poor-quality products or services but is continually awarded contracts
- Charges unjustified high prices or price increases for common goods or services
- Receives or pays fees in cash
- Receives or pays fees in a country different from where the underlying business takes place
- Offers no apparent value to the organization
- Charges high commissions
- Claims to have special influence with a specific buyer
- Displays any of the following indicators suggesting lack of qualification:
 - Inadequate financial resources
 - Operating in a region with a history of corruption
 - Decentralized operations
 - Lack of qualifications or experience
 - Poor performance record
 - Reputation for dishonesty
 - Past complaints or criminal or civil actions against the third party
 - A history of fraudulent conduct
 - Undisclosed interests in a company or business owned by an employee
 - Family ties with an employee
- Does not relate well to competitors
- Has an address or telephone number that matches an employee's address, the address of an employee's outside business, or an employee's relative's address
- Provides an incomplete address (e.g., a PO Box, no telephone number, or no street address)
- Provides multiple addresses
- Has a reputation for corruption or works in an industry or country with a reputation for corruption
- Works as an independent sales representative, consultant, or other intermediary who does not have the reporting and internal control requirements of their larger, publicly held competitors

Internal Control Red Flags of Corruption

Common red flags of corruption that occur in an organization's internal controls include:

- Poor internal controls over key areas, such as purchasing, inventory receiving, and warehousing

- Poor recordkeeping
- Poorly defined roles and responsibilities
- Insufficient capacity to monitor high-risk employees or units
- Inadequate anti-corruption control plan
- Poor separation of duties in purchasing
- Lack of transparency in expenses and accounting records
- Poor enforcement of existing policies on conflicts of interest or acceptance of gratuities
- Poor documentation supporting award of contracts or subcontracts
- Inadequate monitoring procedures

Methods of Proving Corrupt Payments

There are three basic ways to prove corrupt payments. First, the fraud examiner may seek to prove illicit funds by turning an inside witness. This approach—assuming the testimony can be corroborated—has obvious advantages and should be pursued whenever feasible.

Second, the fraud examiner may engage in a covert sting operation to secretly infiltrate or record ongoing transactions. A covert sting operation might be effective if the scheme is ongoing and the subject is not aware of the investigation. But there are legal and security issues associated with this approach, which requires considerable experience.

Third, the fraud examiner may identify and trace the corrupt payments through audit steps. The remainder of this discussion focuses on proving corrupt payments through audit steps.

When identifying and tracing corrupt payments through audit steps, the fraud examiner might focus on the *point of suspected payment* (i.e., from where the funds are generated, earned, stolen, or otherwise begin their journey), *point of receipt* (i.e., from where the illicit funds are deposited, spent, or invested), or both.

In general, there are two methods used to conceal corrupt payments in a business: on-book schemes and off-book schemes. *On-book schemes* are those that occur within an organization; therefore, these schemes will appear within that entity's financial records. In on-book schemes, illicit funds are drawn from the payer's regular, known bank accounts and recorded on its books and records in a disguised manner as some sort of legitimate trade payable. Usually, such transactions will be disguised as some type of legitimate expense, fee, commission, or payment to a subcontractor. Thus, the records provide a starting point for tracing unknown assets, and once the on-book payments are identified, the fraud examiner

can begin tracing them to their destination. But to do this, the fraud examiner must scrutinize the payer's expenditures to determine which ones are used to hide corrupt payments.

Once the fraud examiner has a starting point, they must pick up the paper trail and follow it from there.

Off-book schemes refer to those in which the suspect transactions do not appear anywhere on the payer's books or records. That is, off-book schemes leave no direct audit trail. Therefore, off-book schemes are more difficult to trace than on-book schemes. Even though off-book schemes do not leave a paper trail, business and financial records might contain indirect evidence of off-book sales or income (e.g., unaccounted-for shipping or warehouse expenses, or discrepancies in particular accounts or ratios between certain accounts).

As a general proposition, suspected on-book schemes are best approached from the point of payment, and off-book schemes are most easily identified at the suspected point of receipt, through the use of an inside witness, or through surveillance. Accordingly, a fraud examiner may seek to prove corrupt payments by focusing on the point of receipt, the point of payment, or both.

The point of payment method seeks to prove corrupt payments by focusing on the accounts and records where the funds are generated, earned, stolen, or otherwise begin their journey. And because on-book schemes leave an audit trail, the point of payment method, which focuses on where the funds are stolen, is the preferred method.

Conversely, the point of receipt method focuses on where the illicit funds are deposited, spent, or invested. This method is preferred if the suspected payer is not known or is inaccessible, or if cash payments are suspected. Accordingly, the point of receipt method is preferred when investigating off-book frauds because they do not leave an audit trail. And because there is no audit trail, the fraud examiner must focus on the records about where the illicit funds are deposited, spent, or invested.

When conducting an investigation that involves corrupt payments moving through business accounts, the fraud examiner should develop business profiles of the involved entities. Creating business profiles will help the fraud examiner gain an understanding of the involved entities and their industries, as well as help the fraud examiner identify any unusual and

noncustomary occurrences that are present in those organizations. Moreover, profiling helps organize and view the information retrieved and assists with the investigation.

The Business Profile—Analysis

The *business profile* begins the examination process. It will contain all the important information about a subject organization, such as its money flow pattern and financial condition, and it will identify prospective witnesses and targets, as well as relevant documents and transactions. It should also provide leads as to whether an on-book or off-book scheme is being used.

To develop the business profile, the fraud examiner should obtain information about the suspect business's organization, personnel, money flow pattern (e.g., source of available funds, related expenditures), bank account location, financial condition, and recordkeeping system. This information can be obtained through interviews of employees, customers, and competitors; business bank account and loan records; financial statements; tax returns; business reporting companies; and business public filings.

To establish a business profile, fraud examiners should seek to answer the questions listed below.

HOW IS THE BUSINESS ORGANIZED, LEGALLY AND STRUCTURALLY?

Determine how the business is legally and structurally organized because this knowledge will help determine what records are available (e.g., corporate, partnership) and where to go to obtain them.

WHO ARE THE KEY PERSONNEL ASSOCIATED WITH THE ENTERPRISE?

Identify the key personnel associated with the subject business because doing so will help to identify potential witnesses and informants, as well as possible subjects. Key positions include the owners of the business; the people directly involved in the suspect transactions, including administrative assistants, clerical staff, and present and former employees; the number crunchers; the bookkeeper, outside accountants, and tax preparers; outside consultants, sales representatives, and independent contractors (a popular conduit for payoffs); and competitors (often eager witnesses who can identify leads to sources of off-book funds such as customers and rebate practices).

WHAT IS THE MONEY FLOW PATTERN INVOLVED IN THE SUSPECT TRANSACTION?

Identify the money flow patterns—where money comes from and where it goes—of the suspected transactions. Information about the source of funds can provide leads as to whether an on-book or off-book scheme is being employed and the location of off-book accounts. Expenditures related to the suspect transactions might cover on-book payments.

Use the following questions to determine all sources of funds:

- What goods or services does the business provide?
- Who are its customers or clients?
- What mode of payment is used: cash or check?
- What other sources of funds are available, such as rebates from suppliers and shippers or proceeds of insurance claims, liquidation sales, sale of assets, and loans?

Use the following questions to identify all expenditures associated with the suspect transactions:

- What disbursements are made to third parties, such as commissioned sales agents, consultants, subcontractors, suppliers, and shippers?
- Did the business have any extraordinary expenses during the suspect time period, such as extra commissions, advertising allowances (payments made by a manufacturer to the retail customer to assist the customer in meeting its advertising expenses), or inventory losses?
- How are the expenses and disbursements paid: by cash or by check? From which accounts?
- Does the business maintain an account or fund used to pay miscellaneous expenses? If so, where is it located, who keeps the records, and who signs the checks or authorizes payments?
- How are travel and entertainment expenses reimbursed? From which account?
- What is the company's policy toward business gifts? What gifts were given to the suspect and/or recipients? How were they paid for? Which records are maintained regarding them?

WHERE ARE THE COMPANY'S BANK ACCOUNTS?

Identify all of the business's bank accounts. Find out where the business deposits its receipts. This is quickly determined from the bank stamp on checks deposited from customers. Identify all company accounts by bank, account number, and authorized signature.

WHAT IS THE FINANCIAL CONDITION OF THE BUSINESS?

Determine the entity's financial condition. This data might provide evidence of a motive for the fraud or the fruits thereof.

WHAT IS THE COMPANY'S RECORDKEEPING SYSTEM?

Become familiar with the business's recordkeeping system, determining what records the company keeps, for how long, where, and the name(s) of the person(s) who maintains them.

Sources of Information for the Business Profile

Information for the business profile can be obtained through the sources listed below.

PRINCIPALS, EMPLOYEES, AND RECORDS OF SUSPECT BUSINESS

Interview people suspected of making illegal payments. Such individuals might submit to an interview, particularly if they are confident that the payments are well hidden.

Also, interview other key employees (including the financial personnel) involved in the suspect transactions, particularly those who have since left the company. Use the business profile as a guide to questioning.

CUSTOMERS AND COMPETITORS

The "customer" is the employer of the person taking payoffs and the victim of the crime. Customers and competitors can provide valuable information about the payer's business operation, particularly concerning the payer's regular bank account, which can be identified through canceled checks. The customer might also have invoices and shipping documents that might lead to off-book funds.

BANKS AND LENDING INSTITUTIONS

The business's banker might have credit applications, financial statements, loan files, and bank account information that might help the fraud examiner.

BUSINESS REPORTING COMPANIES

Dun & Bradstreet (D&B) and other commercial reporting companies disseminate basic information about the size, structure, sales, and employees of a business, and such companies can provide valuable information. Information about larger companies can be found in

Standard & Poor's (S&P) and other business directories. Other information on public record sources is located in the "Sources of Information" chapter in the Investigation section of the *Fraud Examiners Manual*.

Proving On-Book Payments

There are three basic methods for concealing on-book payments of bribes and/or kickbacks: fictitious payables, ghost employees, and overbilling. The following are the examination steps for identifying and tracing these payments.

Fictitious Payables Schemes

In a fictitious payable scheme, a payable is created for a debt that is not owed. Often, fictitious payables are made to entities or persons that do not exist, such as fictitious vendors. Making payments to entities or individuals that do not exist provides an excellent method for hiding corrupt payments.

To examine on-book payments, obtain the following records from the entity suspected of making the illegal payments.

BANK ACCOUNT INFORMATION

- All records of payments, canceled checks, wire transfer receipts, receipts for the purchase of cashier's checks and money orders, and withdrawal slips
- Check registers
- Account statements

SALES BACKUP DOCUMENTATION

- Purchase orders
- Invoices
- Documents showing receipt of goods ordered

ACCOUNTING BOOKS AND RECORDS

Examine the cash disbursement journals and ledgers. The most important of the aforementioned information (and often the only information needed) is the bank account information. Begin by examining the checks, check register, and/or the cash disbursement journal, paying particular attention to the following:

- *Payables and expenses charged to the account (customer) on which the illicit payments were made*—If the fraud examiner suspects that kickbacks were paid on sales to ABC Corporation, for example, look at the payables and expenses charged to that account/customer.
- *Payments for services*—Check payments for services such as sales commissions or consulting fees that do not require the delivery of goods and need relatively little documentation to obtain payment.
- *Anomalous charges*—For the business, an example of anomalous payments can be those for design fees paid by a company that is engaged in business that normally would not require such services.
- *The endorsement on the check*—This might be by signature, or more commonly, by a stamp in the name of the business payee. Note the endorser's identity. (Some corrupt recipients have been known to endorse such checks in their own name.)
- *The location where the check was negotiated*—If it is not obvious from the endorsement, identify the bank where the deposit was made by checking the depository bank's stamp on the back of the check. The geographical location of the depository bank is an important lead that can connect the check to the suspected recipient. Determining the depository bank's identity is critical to obtaining the recipient's bank account information.
- *Checks with a second endorsement*—A typical indication of a phony payable check is one paid to and endorsed by a business, which is then endorsed by an individual, thereby permitting it to be cashed or deposited in a personal account. In a similar fashion, a check payable to a third party can be signed over to the issuer of the check.
- *Cashed (not deposited) checks payable to a business*—Generally, a For Deposit Only stamp appears on the back of deposited checks, although this is not always the case. Most banks have a code stamp that indicates whether the check was cashed. These codes vary and can be obtained from the bank where the check was negotiated.
- *Checks that fall into an unexplained pattern*—An example of a suspicious payable scheme is one where checks are drawn once a month in an amount equal to some percentage of the sales against which they are charged and are not otherwise explained. Such a pattern might indicate a kickback scheme.

If an examination of the checks themselves does not yield any clear leads, compare the various records of payment with the backup documentation. Note the following circumstances in particular:

- *The absence of documentation*—The absence of documentation to support a particular payment can include:

- No invoice appearing in the files for a payment to a supplier or contractor
- No receipt to indicate that materials paid for were delivered
- No consultant's work product to substantiate consulting fees paid
- *Discrepancies*—Discrepancies between payment information and backup documentation can include:
 - A check payable to a supplier in an amount different from the invoice
 - A check payable to a person or entity different from that identified on the invoice
- *Anomalies in support documents*—Anomalies in the backup documentation can include invoices from several suppliers in different names that:
 - Have the same business address
 - Are signed by the same person
 - Are returned to a PO Box
- *Unnumbered or sequentially numbered invoices*—An example of an invoice scam uses invoices numbered 101, 102, and 103, which are dated 30 days apart. Of course, it is highly unlikely that a legitimate business would refrain from issuing invoices in the interim.
- *Alterations*—Copies of originals can be made for concealing alterations of original documents. Examples can include alterations or photocopies of backup papers.
- *Location and other information on the invoices that tie them to the suspected recipient*—If the aforementioned steps still do not yield any suspect payments, return to the check registers and cash disbursement journals to look for discrepancies between the entries and the checks or backup documentation or their absence. The register and journals might also indicate the purpose of payments made by wire, cashier's check, or cash.

TRACING PROCEDURES

When a suspect payment has been isolated, begin the tracing process. Remember that the phony payable might go directly to the recipient (deposited in a shell account) or through an intermediary account, person, or entity. It might even be converted to cash by the payer and the cash could be given to the recipient.

In instances where the identity of the individual recipient is not clear from the face of the check (as in checks payable to a business entity), do the following:

- Examine the back of the check. Note where the check was deposited and the account number, if available. If the check is not endorsed, the bank will still be able to locate the account to which it was deposited through its own internal records.

- Obtain the records of the account where the check was deposited. The signature card and the monthly account statement will show the nominal account holder. In the case of business accounts, the bank should also have a copy of the corporate resolution or partnership agreement authorizing the account.
- If the identity of the individual recipient is still not clear, check the public filings required of business entities to determine ownership. Corporate documents (articles of incorporation, annual reports, and some other basic documents) and limited partnerships might also be filed in some jurisdictions at the local level. The fictitious name index, business license files, telephone billing records, and even utility billing records can also lead to the principals' identity.
- If the original check is missing or has been destroyed, a digital copy can be obtained from the bank on which the check was drawn. (The bank where the check was deposited will also have a digital copy of the check. Unless the exact date of deposit and the identity of the depository bank are known, it will be very difficult to locate it.)
- Payments by wire transfer or cashier's check can be traced to the recipient. A wire transfer from an account appears on that account statement as a *debit memo* (often abbreviated as *DM*). The *wire transfer request* should show the name of the purchaser, the payee, and the bank and account number to which the funds were transferred. The sender receives a copy of this request, and the bank also maintains a copy, which is usually filed by date.
- The bank's retained copy of a cashier's check will identify the payee. The bank also keeps the negotiated check when it is returned for payment. It will contain the endorsement and show where it was negotiated. Banks usually file cashier's checks by number, making it necessary to know the approximate date they were issued to link them to the purchasers. Look for a cashier's check or wire transfer on the dates of suspect cash withdrawals, checks to cash, or checks to the issuing bank. Remember that such instruments can be purchased for cash from any bank, not only from the bank where the payer's account is located.
- If this trail leads to an intermediary, the entire process must be repeated.

Ghost Employee Schemes

Illicit funds can be generated by funneling phony salary payments to fictitious or former employees (i.e., ghost employees), or by making extra payments to presently salaried employees who then either return them to the payer or pass them on to the recipient. To trace such payments, obtain payroll and employee lists, personnel files, employment applications, tax withholding forms, and payroll checks from the suspect payer company.

Attempt to identify the ghost through the following steps:

- Compare a list of all current and former employees from the personnel office to the payroll list. Note discrepancies. Determine whether any employees have failed to execute tax withholding forms or have not elected to receive any health benefits or other optional withdrawals, such as enforced savings plans. The absence of such elections is often an indication that the employee does not exist.
- A regular employee's normal salary might also be inflated or, more commonly, travel and expense reimbursements might be padded to generate illicit funds. Look for unusual disbursements from the accounts in which such checks are deposited.

Once a suspect paycheck has been identified, determine whether the check was cashed or deposited. Note the endorsement, the bank, and the account where the check was deposited. Determine whether there are any second endorsements that might transfer the check to the ultimate recipient.

Overbilling Schemes

In overbilling schemes, the payer adds a corrupt payment to a legitimate business expense or trade payable. And subsequently, a cooperative third party then either forwards the excess payment directly to the intended recipient or returns it, usually in cash, to the payer for distribution.

Thus, illicit funds might be added to legitimate payments for goods or services provided by actual suppliers, subcontractors, engineers, and agents, with the additional amounts being passed on by the supplier or returned to the payer (usually in cash) for distribution.

To trace such payments, obtain the same records required for tracing phony payables—bank account information, backup documentation, and accounting records—from both the original payer and the intermediary. Note the following indicators of suspect payments to the intermediary:

- Notations on invoices or other billing documents breaking out “extra” or “special” charges, particularly those that require no delivery of goods for payment
- Discrepancies between the purchase order or invoice amounts and the amount of payment; note invoices that appear to have been altered or copied
- Unusually large amounts appearing on particular bills, or bills that break a consistent pattern of amounts, schedule, or purpose

Disbursements from the intermediary might be covered in the same ways as in other on-book schemes, such as by means of phony payables, direct cash withdrawals, or disbursements charged to miscellaneous accounts such as travel or entertainment. The tracing process is the same as in any on-book scheme. Remember that the overbilling entity will usually add its own fee for providing such services. Therefore, the disbursements coming from its account might not be in the same amount as the additional payments made to it.

Proving Off-Book Payments

Again, off-book payments refer to those schemes in which the funds used for illegal payments or transfers are not drawn from the regular, known bank accounts of the payer. Thus, off-book payments do not appear anywhere on the payer's books or records.

In contrast to on-book payments, which are proven at the point of payment, off-book payments are typically proven at the point of receipt; that is, they are proven at the point from where the illicit funds are deposited, spent, or invested.

Accordingly, identifying and tracing off-book payments is usually more difficult than locating on-book payments. Success in proving off-book payments generally depends upon identifying the source of the funds or accounts (from which payments can be traced out), using an inside witness, and focusing on the point of receipt. The source of off-book funds might be located through the following indicators.

Indirect Evidence of Unrecorded Sales on the Suspect Company's Books and Records

The suspect company's books and records might reflect unusual costs and expenses not associated with the business's known sales, such as rental payments for an undisclosed warehouse, shipping documents reflecting deliveries to an unlisted customer, and commissions paid to sales agents in a region where sales are not reported. These indicate possible unrecorded sales.

Unbalanced Ratios of Costs to Sales

The cost of producing and selling a particular item usually bears some fixed relationship to the revenue it generates. A significant imbalance in such a ratio, such as in a situation where twice the supplies are ordered than are needed to produce the reported sales (and the extra is not located in inventory), indicates possible unrecorded transactions. This technique is used to identify unreported sales by bars and restaurants.

Investigation in the Marketplace

Customers of the suspect business whose payments might have been diverted to off-book accounts might have records, including canceled checks, that would reflect such sales and the bank and account to which the funds were deposited. Customers might also reveal cash payments that could be used to create a slush fund. Additionally, competitors might be aware of other customers and transactions that could lead to evidence of off-book sales.

Proving Payments in Cash

The following techniques can be used to prove cash payments circumstantially or to corroborate testimony of such payments by an inside witness:

- Match evidence of cash withdrawals or disbursements by the payer with corresponding deposits, expenditures, or visits to a safe deposit box by the recipient.
- Look for the purchase of cashier's checks or wire transfers payable to the recipient at, or shortly after, cash withdrawals or disbursements. Also look for a correlation between cash-generating transactions and money wires or courier services, which are sometimes used to send cash.
- If the scheme is ongoing, consider the use of visual or electronic surveillance (if a member of law enforcement), or try to introduce an undercover agent or implement a sting operation.
- Unexplained or unusual cash disbursements or withdrawals, particularly from a business that does not normally deal in cash, might indicate illicit transactions or corroborate such testimony. To be effective, the fraud examiner must identify and rebut all legitimate explanations, which usually requires interviewing the payer.
- Focus the investigation on the suspected recipient, as discussed in the following sections.

Examining Off-Book Payments by Focusing on the Point of Receipt

Because the point of receipt focuses on where the illicit funds are deposited, spent, or invested, this method is preferred if the suspected payer is not known or is inaccessible, or if cash payments are suspected. Accordingly, the point of receipt method is preferred when investigating off-book payments because they do not leave an audit trail. And because there is no audit trail, the fraud examiner must focus on the records regarding where the illicit funds are deposited, spent, or invested.

Alternatively, off-book payments may be proven through the use of an inside witness or surveillance. Therefore, if there is not a witness and conducting surveillance is not possible, the fraud examiner must prove the illicit transactions by using the point of receipt method.

The personal—financial/behavioral—profile is used when trying to prove illegal payments from the point of receipt.

THE FINANCIAL/BEHAVIORAL PROFILE

The financial/behavioral profile is outlined in the “Tracing Illicit Transactions” chapter in the Investigation section of the *Fraud Examiners Manual*. The financial profile will identify most illicit funds deposited to accounts or expended in significant amounts. It will not reveal relatively small currency transactions, particularly if they were for concealed activities, consumables, or unusual one-time expenses, such as medical bills. The financial profile might give inaccurate or false negative readings unless such activities are identified. This is done through preparation of the behavioral profile.

The behavioral profile contains information about the suspect’s personal characteristics (e.g., carries large amounts of cash, wears expensive clothes, or has club memberships), home and furnishings, automobiles, and leisure activities.

Information for the behavioral profile is gathered from interviews and observation of lifestyle and habits, as well as from documentary sources. When conducting interviews, the fraud examiner should be alert and review documents for signs that the target has:

- A drug and/or alcohol addiction
- A gambling habit
- Loan shark or other private debts
- A girlfriend or boyfriend supported by the target
- Extraordinary medical expenses
- Significant, regular cash expenses for entertainment and/or travel

The behavioral profile might also provide evidence of a possible motive for the crime, such as large debts, as well as additional evidence of illicit funds. For example, if the suspect spent significant amounts of cash and had no corresponding cash withdrawals from disclosed bank accounts or no admitted sources of cash income, there must be other, undisclosed sources of income.

Generally, when trying to prove illegal payments from the point of receipt, the fraud examiner should interview the suspect recipient and any third-party witnesses.

THE SUSPECT RECIPIENT

Again, when trying to prove corrupt payments from the point of receipt, the fraud examiner should almost always request an interview with the target. When interviewing the target, the fraud examiner should use the target's financial/behavioral profile as a guide. The fraud examiner should try to pin down the target's income, assets, and accounts. If, during the interview with the suspect recipient, the witness claims to have legitimate sources of large sums of currency, the fraud examiner should determine the following:

- What was the source of the cash?
- What was the amount of cash on hand at the starting point of the investigation, at the end of each year thereafter, and on the date of the interview?
- Where was the cash kept?
- Why was the cash not deposited in a financial institution or invested?
- Who knew about the cash?
- What records of the cash exist?
- What were the denominations?
- When and for what was any of the cash spent?
- Will the subject consent to an inventory of the remaining cash during the interview? If not, why not? If so, the cash should be counted at least twice in the presence of another fraud examiner. A list of serial and series numbers should also be made.

If, when interviewing the target, the target claims that the suspect funds were proceeds from a legitimate loan, the fraud examiner should ask:

- Who was the lender?
- When was the loan made?
- What was the amount of the loan?
- What was the purpose of the loan?
- Was the loan repaid?
- How was the loan documented?

Also, the fraud examiner should attempt to interview the subject's spouse separately. Spouses can be an important source of lead information—if handled carefully.

THIRD-PARTY WITNESSES

When trying to prove illegal payments from the point of receipt, the fraud examiner should also interview any third-party witnesses. Potential third-party sources include business colleagues, personal associates, bankers, brokers, real estate agents, accountants and tax

preparers, ex-spouses, and romantic interests (particularly former romantic interests). Subjects often boast to their close associates of their new wealth or entertain them with the fruits thereof. Casual remarks by a subject to a colleague (and repeated to a fraud examiner) have undone the suspect, even when intensive audits have failed. Follow the financial/behavioral profile format to the extent feasible. Of course, no single third-party witness is likely to possess all this information, but a complete picture can be assembled from bits and pieces provided by a number of such sources.

TRACING CORRUPT PAYMENTS

Other techniques for tracing corrupt payments can be found in the “Tracing Illicit Transactions” chapter in the Investigation section of the *Fraud Examiners Manual*.

Conflicts of Interest

A *conflict of interest* occurs when an employee or *agent*—someone who is authorized to act on behalf of a principal—has an undisclosed personal or economic interest in a matter that could influence their professional role. These schemes involve self-dealing by an employee or agent and can occur in various ways. For example, a conflict might occur when an employee accepts inappropriate gifts, favors, or kickbacks from vendors, or when an employee engages in unapproved employment discussions with current or prospective contractors or suppliers.

Conflict of interest schemes generally constitute violations of the legal principle that an agent or employee must act in good faith, with full disclosure, and in the best interest of the principal or employer. An *agent* is any person who, under the law, owes a duty of loyalty to a principal or employer. Agents include officers, directors, and employees of a corporation; public officials; trustees; brokers; independent contractors; attorneys; and accountants. A *principal* is an entity that authorizes an agent to act on its behalf. In a principal-agent relationship, the agent acts on behalf of the principal. The agent should not have a conflict of interest in carrying out the act on the principal's behalf.

As with other corruption frauds, conflict schemes involve the exertion of an employee's influence to the principal's detriment. In contrast to bribery schemes, where fraudsters are paid to exercise their influence on behalf of a third party, conflict of interest cases involve self-dealings by employees or agents.

If an employee engages in a transaction that involves a conflict of interest, then the employee might also have breached their *fiduciary duty* to their employer. People in a position of trust or fiduciary relationship—such as officers, directors, high-level employees of a corporation or business, and agents and brokers—owe certain duties imposed by law to their principals or employers, and any action that runs afoul of such fiduciary duties constitutes a breach.

There are two principal fiduciary duties—loyalty and care—but this discussion focuses on the duty of loyalty. An agent (e.g., an employee) owes a duty of loyalty to their principal. The *duty of loyalty* requires that the employee or agent act solely in the best interest of the employer or principal, free of any self-dealing, conflicts of interest, or other abuse of the principal for personal advantage. Thus, an agent cannot seek to advance personal interest to the principal's detriment.

Breach of fiduciary duty is a civil action that can be used to redress a wide variety of conduct that might also constitute fraud, commercial bribery, and conflicts of interest. Establishing a breach of fiduciary duty claim is easier than establishing a claim for fraud because a breach of fiduciary duty claim does not require proof of wrongful intent.

A plaintiff who brings a successful breach of fiduciary duty claim may receive damages for lost profits and recover profits that the disloyal employee or agent earned—in some instances even the salary paid to the employee or agent during the period of disloyalty. The plaintiff may recover profits earned by the disloyal agent even if the principal did not suffer an actual loss. The plaintiff also may void contracts entered into on its behalf that were the result of or were influenced by the employee or agent's disloyalty.

Most conflicts of interest occur because the fraudster has an undisclosed economic interest in a transaction, but a conflict can exist when the fraudster's hidden interest is not economic. In some scenarios, an employee acts in a manner detrimental to their company to provide a benefit to a friend or relative, even though the fraudster receives no financial benefit.

Conflicts of interest do not necessarily constitute legal violations, as long as they are properly disclosed. Thus, to be classified as a conflict of interest scheme, the employee's interest in the transaction must be undisclosed. The crux of a conflict case is that the fraudster takes advantage of their employer; the victim organization is unaware that its employee has

divided loyalties. If an employer knows of the employee's interest in a business deal or negotiation, there can be no conflict of interest, no matter how favorable the arrangement is for the employee.

Any bribery scheme discussed above could occur as a conflict of interest. The only difference in bribery schemes and conflict of interest schemes is the fraudster's motive. For instance, if an employee approves payment on a fraudulent invoice submitted by a vendor in return for a kickback, they have committed bribery. But if an employee approves payment on invoices submitted by their own company (and if their ownership is undisclosed), they have engaged in a conflict of interest.

The distinction between bribery and conflict schemes described above is obvious. In the bribery case, the fraudster approves the invoice in return for a kickback, while in a conflict case they approve the invoice because of their own hidden interest in the vendor. Aside from the employee's motive for committing the crime, the mechanics of the two transactions are practically identical. The same duality can be found in procurement fraud cases, where an employee influences the selection of a company in which they have a hidden interest instead of influencing the selection of a vendor who has bribed them.

Conflict Schemes

Conflict schemes do not always mirror bribery schemes, though. There are a number of ways in which an employee can use their influence to benefit a company in which they have a hidden interest. This section will discuss some of the more common conflict schemes, including conflicts in:

- Purchase schemes
- Sales schemes
- Delayed billings
- Business diversions
- Resource diversions
- Financial interest in companies under perpetrator's supervision
- Financial disclosures

Conflicts in Purchasing Schemes

Many times, conflicts of interest arise in the purchasing process. For example, an employee can have a conflict if they:

- Have an undisclosed financial interest in a supplier or contractor
- Set up a bogus contractor or vendor or buy through a broker or intermediary that the employee controls
- Are involved in other business ventures with a supplier or contractor
- Have an interest in a business that competes with their employer
- Accept inappropriate gifts, travel, entertainment, or “fees” (i.e., kickbacks) from a vendor
- Negotiate for or accept employment with a supplier

Often, such purchasing schemes are very similar to the billing schemes discussed in the “Asset Misappropriation: Fraudulent Disbursements” chapter, so it will be helpful at this point to discuss the distinction drawn between traditional billing schemes and purchasing schemes that constitute conflicts of interest.

While it is true that anytime an employee assists in the overbilling of their company, there is probably some conflict of interest (the employee causes harm to their employer because of a hidden financial interest in the transaction), this does not necessarily mean that every false billing will be categorized as a conflict scheme. For the scheme to be classified as a conflict of interest, the employee (or a friend or relative of the employee) must have some kind of ownership or employment interest in the vendor that submits the invoice.

This distinction is easy to understand if we look at the nature of the fraud. Why does the fraudster overbill their employer? If they engage in the scheme only for the cash, the scheme is a fraudulent disbursement billing scheme. If, however, they seek to better the financial condition of their business at the expense of their employer, this is a conflict of interest. In the second scenario, the fraudster’s *interests* lie with a company other than their employer. When an employee falsifies the invoices of a third-party vendor to whom they have no relation, this is not a conflict of interest scheme because the employee has no interest in that vendor. The sole purpose of the scheme is to generate a fraudulent disbursement.

One might wonder, then, why shell company schemes are classified as fraudulent disbursements rather than conflicts of interest. After all, the fraudster in a shell company scheme owns the fictitious company and therefore must have an interest in it. Remember, though, that shell companies are created for the sole purpose of defrauding the employer. The company is not so much an entity in the fraudster’s mind as it is a tool. In fact, a shell company is usually little more than a PO Box and a bank account. The fraudster has no

interest in the shell company that would cause a division of loyalty; they simply use the shell company to bilk their employer. Shell company schemes are therefore classified as false billing schemes.

A short rule of thumb can be used to distinguish between overbilling schemes that are classified as asset misappropriations and those that are conflicts of interest: If the bill originates from a *real company* in which the fraudster has an economic or personal interest, and if the fraudster's interest in the company is undisclosed to the victim company, then the scheme is a conflict of interest.

Now that we know what kinds of billing schemes are classified as conflicts of interest, the question is, how do these schemes work? The answer, unfortunately, is somewhat anticlimactic. The schemes work the same. A billing scheme's mechanics, whether it is a conflict of interest or a fraudulent disbursement, do not change. (See the "Conflicts of Interest" flowchart that follows.)

A corporate employee or agent who has an undisclosed, potentially adverse interest in a customer or supplier might be tempted to favor their own or the third party's interests over the corporation's interests.

EXAMPLE

A purchasing superintendent defrauded her employer by purchasing items from a certain vendor at inflated prices. The vendor was owned by the purchasing superintendent but established in her husband's name and run by her brother. The perpetrator's interest in the company was undisclosed. The vendor would buy items on the open market and then inflate the prices and resell the items to the victim company. The purchasing superintendent used her influence to ensure that her employer continued doing business with the vendor and paying the exorbitant prices.

Fraudsters with an interest in a customer or supplier might engage in *bid-manipulation schemes*—purchasing schemes in which an employee of a purchasing entity attempts to influence the selection of a contractor by restricting the pool of competitors from whom bids are sought—on behalf of their own companies. The methods used to manipulate bids are discussed in detail in the "Contract and Procurement Fraud" chapter and will not be explained in depth here. Briefly stated, an employee of the purchasing company is in a perfect position to

manipulate bids if they have access to their competitors' bids or help perform the bidding process. With such access or responsibilities, the employee can influence the bidding process to ensure that their own company wins the contract.

In other cases, a fraudster might ignore their employer's purchasing rotation and direct an inordinate number of purchases or contracts to their own company. Any way in which a fraudster exerts their influence to divert business to a company in which they have a hidden interest is a conflict of interest.

Conflicts of Interest

INTEREST IN THE ACQUISITION OF ASSETS

Not all purchasing conflicts occur in the traditional vendor-buyer relationship. Sometimes purchasing conflicts involve employees negotiating for the purchase of some unique, typically large asset such as land or a building in which the employee had an undisclosed interest. It is in the process of these negotiations that the fraudster violates their duty of loyalty to their employer. Because they stand to profit from the sale of the asset, the employee does not negotiate in good faith to their employer; they do not attempt to get the best price possible. The fraudster will reap a greater financial benefit if the purchase price is high.

For example, an employee in charge of negotiating mineral leases on land that they secretly own is obviously in a conflict. On the one hand, they are an employee in charge of negotiating the lease, and it is their responsibility to negotiate the best price for their employer. But on the other hand, they own the land, so it is in their personal interest to lease the land at the highest price possible. And because the employee has a personal interest in the land transaction, they have no financial motive to negotiate a favorable lease on their employer's behalf.

TURNAROUND SALES

A special kind of purchasing scheme sometimes used by fraudsters is called the *turnaround sale*, or the *flip*. In this type of scheme, an employee knows their employer is seeking to purchase a certain asset and takes advantage of the situation by purchasing the asset themselves (usually in the name of an accomplice or shell company). The fraudster then turns around and resells the item to their employer at an inflated price.

EXAMPLE

A chief executive officer (CEO), conspiring with a former employee, sold an office building to the CEO's company. What made the transaction suspicious was that the building had been purchased by the former employee on the same day that it was resold to the victim company, and for \$1.2 million less than the price charged to the CEO's company.

Conflicts in Sales Schemes

There are two principal types of conflict schemes associated with sales of goods or services by the victim company: underselling and writing off sales.

UNDERSELLING

The first and most harmful is the underselling of goods or services. Just as a corrupt employee can cause their employer to *overpay* for goods or services sold by a company in which they have a hidden interest, so, too, can they cause the employer to *undersell* to a company in which they maintain a hidden interest.

Also, many employees who have hidden interests in outside companies sell goods or services to these companies at below-market prices. This results in a diminished profit margin or even a loss for the victim organization, depending upon the size of the discount.

EXAMPLE

An employee disposed of his employer's real estate by selling it below fair market value to a company in which he had a hidden interest, causing a loss of approximately \$500,000.

WRITING OFF SALES

The other type of sales scheme involves tampering with the victim company's books to decrease or write off the amount owed by the company in which the employee has a hidden interest. For instance, after an employee's company purchases goods or services from the victim organization, credit memos might be issued against the sale, causing it to be written off to contra accounts such as Discounts and Allowances. A large number of reversing entries to sales might be a sign that fraud is occurring in an organization.

EXAMPLE

A plant manager assisted favored clients by delaying billing on their purchases for up to sixty days. When the receivable on these clients' accounts became delinquent, the perpetrator issued credit memos against the sales to delete them. The plant manager issued new invoices on the sales after the "old" receivables were taken off the books. In this way, the receivables could be carried indefinitely on the books without ever becoming past due.

Conflicts Influencing Delayed Billings

In other cases, the perpetrator might not write off the scheme, but simply delay billing. This is sometimes done as a favor to a friendly client and is not an outright avoidance of the bill but rather a dilatory tactic. The victim organization eventually gets paid, but loses time value on the payment, which arrives later than it should.

Conflicts in Business Diversions

A number of employees end up starting their own businesses that compete directly with their employers, and when this occurs, such employees might begin siphoning off clients for their own business. This activity clearly violates the employee's duty of loyalty to the employer, and frequently violates the company's internal policies. There is nothing unscrupulous about free competition, but while a person acts as a representative of their employer, it is improper for them to try to take their employer's clients. Normal standards of business ethics require employees to act in the best interests of their employers.

Conflicts in Resource Diversions

Some employees divert the funds and other resources of their employers to the development of their own businesses. This kind of scheme involves elements of both conflicts of interest and fraudulent disbursements.

EXAMPLE

A vice president of a company authorized large expenditures to develop a unique type of new equipment used by a certain contractor. Another firm subsequently took over the contractor, as well as the new equipment. Shortly after that, the vice president retired and went to work for the firm that had bought out the contractor. The fraudster had managed to use his employer's money to fund a company in which he eventually developed an interest.

While these schemes are clearly corruption schemes, the funds are diverted through the use of a fraudulent disbursement. The money could be drained from the victim organization through a check tampering scheme, a billing scheme, a payroll scheme, or an expense reimbursement scheme. For a discussion of the methods used to generate fraudulent disbursements, please refer to the “Asset Misappropriation: Fraudulent Disbursements” chapter in this section of the *Fraud Examiners Manual*.

Conflicting Financial Interest in Companies Under Perpetrator's Supervision

Sometimes employees have a direct or indirect financial interest in a company under their supervision. For example, accountants sometimes hold stock in a company they audit. These problems often occur in government.

Conflicts in Financial Disclosures

Management has an obligation to disclose to the shareholders significant fraud committed by officers, executives, and others in positions of trust, but misplaced loyalties might prevent management from making such disclosures.

The inadequate disclosure of conflicts of interest is among the most serious of frauds. Inadequate disclosure of related-party transactions is not limited to any specific industry; it transcends all business types and relationships.

Appearance of Conflict of Interest

A final type of conflict of interest is the *appearance* of such. The appearance of a conflict is nearly as devastating as the existence of a true conflict. Examples involving the appearance of

a conflict of interest include ownership in a blind trust, in which the employee has no authority to make investment decisions, or an external auditor owning a minority interest in a company that is audited by the auditor's firm. Such matters are rarely prosecuted as criminal offenses.

Detection of Conflicts of Interest

Conflicts of interest are one of the most difficult schemes to uncover. Therefore, there are no fast and easy detection methods for this type of fraud. Some of the more common methods by which conflicts are identified include tips and complaints, comparisons of vendor addresses with employee addresses, review of vendor ownership files, review of exit interviews, comparisons of vendor addresses to addresses of subsequent employers, policies requiring certain employees to provide the names and employers of immediate family members, and interviews with purchasing personnel regarding favorable treatment of one or more vendors.

Review Tips and Complaints

Conflicts are often revealed by tips. If a particular vendor is being favored, then competing vendors may file complaints. Additionally, employee complaints about the service of a favored vendor could lead to the discovery of a conflict of interest. Often, tips include allegations that raise common red flags of conflicts. Such red flags include:

- Unexplained or unusual favoritism of a particular contractor or vendor
- Employee lives beyond their means or displays new wealth
- Employee fails to file conflict of interest or financial disclosure forms or questionnaires
- Employee displays a keen interest in a particular customer, vendor, or supplier
- Employee has discussions about employment with a current or prospective vendor
- Transactions that are not in the best interest of the corporation
- Employee appears to conduct side business
- Vendor address or telephone number matches that of an employee

Compare Vendor Addresses with Employee Addresses

Look for employees posing as vendors by comparing employee and vendor addresses. If nominees or related parties are used as owners of vendors, then the business address of the vendor might match that of the employee. Also, look for PO Box addresses for vendors. This method is similar to that used for locating phony vendors.

Review Vendor Master File

The *vendor master file* is a database that contains a record of all vendors with whom a company conducts business, and it can be used to test for conflict schemes. Review changes to the vendor master file, including new vendors added and address changes. Also, comparing the vendor master file and the employee master file might reveal conflicts of interest. So, match the vendor master file to the employee master file on various key fields, such as address or tax ID number.

Review Exit Interviews and Compare Vendor Addresses to Addresses of Subsequent Employers

If a review of an employee's exit interview yields the name and address of the employee's subsequent employer, compare that employer's name and address with the vendor file to identify any conflicts of interest wherein the employee has obtained employment from a contractor.

Interview Purchasing Personnel Regarding Favorable Treatment of One or More Vendors

Unexplained or unusual favoritism of a particular contractor or vendor is a red flag of a conflict of interest. And because employees are generally the first to observe that a vendor is receiving favorable treatment, purchasing personnel should be interviewed for evidence of such favoritism. By asking employees if any vendor is receiving favorable treatment, the fraud examiner might discover conflicts of interest that would otherwise have gone unnoticed.

Also, because evidence that a company accepts inferior products or services from a vendor is a red flag of corruption, purchasing personnel should be asked whether any vendor's service (or product) has recently become substandard.

Implement Policies Requiring Certain Employees to Provide the Names and Employers of Immediate Family Members

Where acceptable by law, an organization might require members of management, as well as members of the procurement department, to provide detailed information regarding the names and employers of all immediate family members and household members. With such information, an organization can compare the names and employers of family members to the current position of the employee, and such analysis might lead to information about potential conflicts of interest.

Prevention of Conflicts of Interest

Organizations should take steps to prevent conflicts of interest. They should establish policies clearly defining what constitutes a conflict of interest and prohibiting any such entanglements by officers, directors, employees, or other agents of the organization. A policy requiring employees to complete an annual disclosure statement is an excellent proactive approach to dealing with potential conflicts. Furthermore, such policies will reinforce the idea that engaging in conflicts of interest is unacceptable for employees and will result in severe consequences.

Also, managers must establish an ethical tone for the companies they lead. The tone management sets will have a trickle-down effect on employees of the company.

Moreover, organizations must educate their employees about conflicts of interest. In fact, there is no greater tool in the prevention and detection of fraud than a network of employees who are knowledgeable about fraud and look for indicators of their organization's vulnerabilities.

Additionally, organizations should implement monitoring activities to identify red flags of conflicts. For example, comparing the disclosed names and addresses with vendor and customer lists could reveal real conflicts of interest or the appearance of such.

Anti-Corruption Programs

An anti-corruption program is a good strategy to communicate an organization's philosophy regarding fraud and ethical behavior. The program should extend beyond the enactment of a written anti-corruption policy. It should include active support of management, ongoing employee education, a well-publicized reporting mechanism, swift and public action in the case of violations, and monitoring of the overall program's effectiveness.

There is not, however, a one-size-fits-all program. Every organization has different needs and faces different risks. Therefore, an anti-corruption program must be tailored to the organization's specific needs, risks, and challenges.

In October 2016, the International Organization for Standardization (ISO) released its final draft of ISO 37001: *Anti-Bribery Management Systems Standard*.¹ The standard is designed to help organizations create and implement an anti-bribery program. According to the ISO, the standard may be used by small, medium, and large organizations in the public, private, and voluntary sectors.

ISO 37001 contains a number of anti-bribery measures that are internationally recognized as effective in preventing, detecting, and addressing bribery. Those measures include:

- Adopting an anti-bribery policy
- Communicating the policy to all relevant personnel and business associates
- Appointing a person to oversee anti-bribery compliance
- Implementing reporting and investigation procedures
- Requiring an effective tone at the top
- Providing anti-bribery training to personnel
- Performing bribery risk assessments
- Conducting due diligence on projects and business associates
- Implementing financial and commercial controls

Under the standard, those and other measures may be implemented in a manner that is “reasonable and proportionate” based on the following factors:

- The organization’s size and structure
- The locations and sectors in which the organization operates
- The nature, scale, and complexity of the organization’s activities
- The bribery risks faced by the organization

ISO 37001 is designed to be flexible so that it can be integrated into an organization’s existing procedures and controls.

An organization that satisfies the standard can obtain an ISO 37001 certification, which could provide a competitive advantage in the marketplace. In some countries, the certification might also be a mitigating factor if the certified organization is prosecuted for bribery.

THEFT OF DATA AND INTELLECTUAL PROPERTY

Today, information is a valuable asset, and organizations must protect their intellectual property. A business's worth is no longer based solely on tangible assets and revenue-making potential; the information it develops, stores, and collects accounts for a large share of a business's value.

To a considerable degree, businesses, government administrations, and society as a whole have come to depend on the efficiency and security of information technology, resulting in information acquiring a new and distinct value that cannot be protected in the same way as tangible objects.

Information exists in many forms, and its security is achieved by implementing a process of risk assessment and commensurate controls to ensure the preservation of:

- *Confidentiality*—ensuring that information is accessible only to those authorized to access it and that those parties can only use it for specified purposes
- *Integrity*—safeguarding the accuracy and completeness of information and processing methods
- *Availability*—ensuring that authorized users have access to information and associated assets when required

Intellectual property is a catch-all phrase for knowledge-based assets and capital, but it might help to think of it as intangible proprietary information. Intellectual property can include a business's ideas, designs, and innovations, howsoever expressed or recorded.

This chapter addresses the broad issues relating to the vulnerability and criticality of information and other intangible property. It advocates a mix of procedural, logical, and physical protective measures to combat threats posed by opponents who make it their business to try to obtain an advantage by illegally or unethically abusing another party or entity's intellectual property.

Competitive Intelligence Versus Espionage

While competition in business can generate many positive results, such as increased innovation and reductions in costs for consumers, the high risks resulting from competitive business environments also drive organizations to commit corporate espionage as a means to obtain competitive intelligence.

It can be difficult to distinguish between competitive intelligence and espionage. *Competitive intelligence* can be defined as the process by which competitor data are assembled into relevant, accurate, and usable knowledge about competitors' positions, performance, capabilities, and intentions. In contrast, *espionage* refers to the use of illegal, clandestine means to gather information; therefore, it does not cover legitimate intelligence collection and analysis using legal means. Espionage, however, can be further subdivided into two categories: traditional and corporate. *Traditional espionage* refers to government-sponsored or sanctioned espionage conducted to collect protected information from a foreign government. *Corporate espionage* (also known as *industrial espionage*) is the term used to describe the use of illegal, clandestine means to acquire information for commercial purposes.

Competitive intelligence is a legitimate business function that aligns with marketing and research and development (R&D), as well as general business strategy and the newer discipline of knowledge management. It helps businesses to anticipate competitors' R&D strategies and to determine their operating costs, pricing policies, financial strength, and capacity. Knowledge about competitors is one of the advantages that can help companies to succeed and take the lead in their respective marketplaces.

Competitive intelligence has become a growth industry that is practiced by professionals trained to use information in the public domain or to otherwise use legally available resources to compile information. This information is then collated, processed, and disseminated into intelligence that is usable and has strategic value. Some competitive intelligence practitioners work within a code of ethics created by an organization called Strategic and Competitive Intelligence Professionals (SCIP). Among other things, this code requires members to identify themselves and their organization before conducting interviews.

Common Motivations Driving Corporate Espionage

The following are common motivations for committing corporate espionage:

- Sabotage (e.g., destroying hardware or facilities, entering data incorrectly, “crashing” systems, deleting data, holding data hostage, or altering data)

- Revenge
- Financial gain
- Business advantage
- Knowledge
- Ideological reasons
- Challenge or curiosity
- Ego
- Entrance into (or status within) a social group

Targets of Corporate Espionage

Corporate spies seek any information that is critical to target organizations. Such information includes:

- Intellectual property
- Pricing information and strategies
- Future plans
- Research and development data
- Engineering plans and drawings
- Customer information (e.g., customer lists or customer billing information)
- Patents in progress
- Computer source code
- Bidding systems and data
- Business forms
- Formulas
- Manufacturing plans and strategies
- Testing data
- Trade secret status
- Customer survey results
- Prototypes
- Research data
- Blueprints and diagrams
- Confidential documents
- Software
- Technical records
- Marketing plans
- Sales forecasts

- Executive email and voice mail
- Personnel records
- Confidential financial data

Where Intelligence Professionals Get Information

Intelligence professionals employ a variety of techniques to obtain valuable information. This discussion examines some basic sources of competitive intelligence, including:

- Open-source information
- Dumpster diving
- Scavenging
- Surveillance
- Human intelligence
- Government sources
- Industry reports and studies
- Periodicals
- Online sources
- Data analysis
- Job postings
- Environmental impact statements
- Commercial filings (e.g., Uniform Commercial Code [UCC] filings)

Open-Source Information

Open-source information is information in the public domain; according to the U.S. National Open Source Enterprise's Intelligence Community Directive Number 301, it can be defined as publicly available data "that anyone can lawfully obtain by request, purchase, or observation."¹ Open-source information can include:

- Mass media communications (e.g., internet publications, newspaper or magazine articles, radio or television broadcasts)
- Computer-based information
- Public information that a governmental body must maintain and make accessible to the public

¹ <https://fas.org/irp/dni/icd/icd-301.pdf>.

- Information derived from professional and academic sources
- Commercial data
- Information produced by the private sector, government, and academia

The term *open*, however, does not necessarily mean free. Many resources that provide access to open sources of information charge for access.

For further clarification, consider how open-source information differs from nonpublic information. The dividing line between open-source information and other, nonpublic information (such as trade secrets) is the right to access it. Open-source information is available to anyone who wants to collect it, without legal consequences. Nonpublic information, however, is not open to the public. Access to nonpublic records is restricted. Obtaining nonpublic records without appropriate authority violates the law.

According to intelligence professionals, most of the information sought on any topic is open and publicly available.

There is only so much that security professionals can do to limit the availability of open-source information relating to an organization. Some forms of information, such as financial statements of publicly traded companies, are legally required to be published. Other pieces of information, such as product descriptions or job listings, are posted out of business necessity. Corporate security professionals must consider all facets when working with open-source information; the need to protect an organization's secrets must always be balanced against the need or duty to make the information available to the public.

Intelligence professionals can use open-source information for various means, including:

- Obtaining as much information as possible about the target
- Gathering information needed to plan and proceed with an operation
- Locating targets
- Finding legal records about targets
- Obtaining financial or credit information about targets
- Obtaining personal information about targets (e.g., names, ages, positions, contact information, hobbies, telephone listings, interests, addresses, banks, or friends)
- Identifying a target's marital status

- Uncovering a target's litigation history
- Locating a target's assets
- Conducting background research on targets

Dumpster Diving

Intelligence professionals can obtain sensitive information by *dumpster diving*, a practice that involves obtaining sensitive information by looking through someone else's trash (e.g., via dumpsters and other trash receptacles). A company's dumpsters might contain financial statements or other confidential documents.

Scavenging

Scavenging involves collecting information left around computer systems (e.g., on desks or workstations). Searches of such areas might lead to the discovery of usernames and passwords, sensitive documents, and media drives.

Surveillance

Intelligence professionals can conduct *surveillance*—the planned observation of people, places, or objects—to obtain information about targets.

Intelligence gatherers can engage in physical or technical surveillance.

Physical Surveillance

Physical surveillance is the real-time observation of a target's actions or communications. Observing and recording a target's movements is useful for a number of reasons. Such surveillance can be used to identify real property or other assets; additional targets; individuals who might possess valuable information, such as lawyers, accountants, or bankers; businesses; patterns of conduct; and other forms of information that can be exploited for commercial purposes.

There are two general types of physical surveillance: mobile and fixed.

MOBILE SURVEILLANCE

Mobile surveillance involves observing and following persons. When conducting mobile surveillance, an intelligence professional must be flexible and imaginative. For example, placing a reflective stripe on the back of the subject's car makes it more distinctive at night and therefore easier to follow. If legally permissible, an intelligence professional might place a

GPS tracking device on the subject's car so that its path can be traced 24 hours a day. Also, if an intelligence professional follows a subject into a bar or restaurant, the professional should order food or a drink to blend in.

FIXED SURVEILLANCE

Fixed surveillance is a situation in which an individual secretly observes an area or a person from a distance. This method, however, has a key disadvantage: the base from which the surveillance is conducted might be spotted by the target or other people passing by. Therefore, intelligence professionals must camouflage fixed surveillance campaigns, and to do so, they must be familiar with their surroundings and choose a cover that will not draw attention.

Technical Surveillance

Technical surveillance is the practice of covertly acquiring audio, visual, or other types of data from targets through the use of technical devices, procedures, and techniques. Technical surveillance, however, can be costly; it is labor intensive, highly intrusive, and fraught with potential legal problems.

For more information on surveillance, see the discussions on physical and technical surveillance in the “How Information Is Lost or Stolen” section of this chapter.

Human Intelligence

Intelligence professionals might gather data through human intelligence (i.e., through direct contact with people). Generally, human intelligence is gathered from subject-matter experts and informed individuals. Such efforts typically target individuals who can provide the most valuable information. For example, to gain intelligence about a target organization, an intelligence professional might contact the organization's:

- Employees
- Competitors
- Vendors, suppliers, and retailers
- Consultants
- Retired executives
- Former employees

Additionally, an intelligence professional might seek to gain intelligence by contacting:

- Industry experts
- Industry associations
- Reporters who cover the industry

There are various other approaches available for gathering human intelligence. For example, an intelligence professional might gather intelligence by posing as a customer of the target entity. This approach exploits two weaknesses of corporate culture: (1) all salespeople want to make a sale and (2) many salespeople will do almost anything to make a sale. Other approaches include:

- Employment interviews (real and fake)
- False licensing negotiations
- False acquisition or merger negotiations
- Hiring an employee away from a target entity
- Planting an agent in a target organization
- Social engineering

Government Sources

Government entities maintain a lot of information, some of which can be accessed by the public, and thus, government sources can be a valuable information resource for intelligence professionals. They can supply invaluable background information on target organizations, and they can provide information about the lifestyles of individuals.

Some valuable government sources include filings with national securities associations and business filings.

Filings with National Securities Associations

Companies whose stocks are traded on a stock exchange, among others, are required by law to file certain documents with securities regulatory authorities, and such filings might contain valuable information. Often, these filings are available to the public, and in such circumstances, they can provide abundant information about the filing company, including its type of business, history, organizational structure, auditor, balance sheets, and income statements.

For additional information on how such filings work, see the content on “Government Sources” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Business Filings

Most jurisdictions require that public companies, nonprofits, and some private companies submit financial filings and various types of organizational filings to the government. These filings can contain valuable information; for instance, they can reveal the real property, vehicles, equipment, and intellectual property registered in an organization's name.

In the United States, for example, companies are formed by filing articles of incorporation with the secretary of state (or state corporation bureau or corporate registry office) in the state in which the company does business, and these records are publicly available. Articles of incorporation can reveal who owns or controls a particular business and verify the state(s) in which a company is registered as a corporation.

Such business filings can be valuable to intelligence professionals. They can identify the companies within a jurisdiction in which a person serves as an officer or director, and an intelligence professional can use such records to map out the officer's business interests and uncover lesser-known or hidden connections between businesses.

Industry Reports and Studies

Industry reports and studies provide summaries of primary and secondary market research within various industries, and many of these reports and studies can be valuable to intelligence professionals. They often provide statistical benchmarks that can show where a company stands in its industry, and they can be used to estimate a target company's financial status. In addition, they help delineate the standards for evaluating successful companies in specific industries. The basic resources for industry reports and studies are government sources, commercial databases, and directories.

Periodicals

There are thousands of periodicals (e.g., magazines, journals, newsletters, newspapers, directories, and yearbooks) that provide information on businesses, and these publications can be excellent sources of information, particularly for background information on an individual or a business.

Some recognized categories of business periodicals include:

- Trade resources (e.g., association and industry publications, studies, surveys, newsletters, and directories)
- Publications by academic institutions

- Speaker presentations and speeches
- Conference presentations
- Security analysts' reports

Additionally, local newspapers often run profiles of regional businesses and groups, and most newspaper companies provide searchable online databases of their publications.

Moreover, there are a number of commercial database vendors that offer wide access to newspapers and periodicals. These information database providers offer online access to the text of hundreds of newspapers worldwide, and although most providers are available for a fee, many can be accessed for free at most libraries.

Online Sources

A great deal of information can be accessed through the internet for little or no cost, and intelligence professionals can use the internet to obtain valuable information about target entities.

For example, public records maintained by government entities can be obtained online from a number of online databases, but typically, public records can be searched online through:

- Government websites
- Public record vendors

More information about online sources is contained in the “Sources of Information” chapter in the Investigation section of the *Fraud Examiners Manual*.

Data Analysis

Intelligence professionals might use data analysis software for intelligence purposes. The functions performed by analytical software programs can easily be translated to business intelligence needs, uncovering patterns related to corporate filings, corporate officer/director (O/D) searches, patent and trademark applications, and other diverse compilations of data that, when pieced together, can indicate the potential direction in which a competitor is headed.

To illustrate, consider how an intelligence professional might use data analysis to identify hidden relationships between key scientists and companies in a particular industry. To show the companies for which key scientists serve as directors, the intelligence professional can use

an analytic program to cross-check patent authors extracted from a patent database against an O/D search. The intelligence professional can also use the software to generate visual displays of the relationships between the companies.

Job Postings

Job postings can contain valuable information. They can provide information about the job skills that a target company needs and the number of employees it is seeking to hire. With such information, an intelligence professional can infer a target company's success over time, the kinds of projects it is developing, or where it is devoting personnel resources. Moreover, large-scale hiring could indicate that a competitor has signed or expects to sign a large contract. In some cases, employment ads also point out defections of key personnel.

Employment ads also indicate what companies pay their employees, and this could be valuable for competitors in recruiting coveted personnel. It could also help identify employees who might be susceptible to recruitment tactics because of low pay or a high rate of employee dissatisfaction (as evidenced by a high rate of turnover in a particular department).

Environmental Impact Statements

Environmental impact statements are required for certain actions that significantly affect the quality of the human environment, and they contain large amounts of historical, financial, and operational information. The company filing an environmental impact statement not only has to supply these background data but also has to explain its actions in detail. Details on emissions, hazardous materials used, and possible accidents stemming from operations provide a wealth of information that can provide an excellent picture of the size and operational capability of a plant or company. Often, this kind of information can be used to identify the date an organization's project will commence.

Commercial Filings

Commercial filings are records that banks, finance companies, and other lenders generate when they provide loans or leases to borrowers who use property as collateral for the loans.

Commercial filings can provide valuable information about a target's business transactions. They can help identify personal property that an individual or business has financed, and they can provide operational details by describing equipment and materials that have been purchased or pledged for a loan.

The availability of such records largely depends on whether the relevant jurisdiction is a common law or civil law country, however. The majority of countries in which commercial filings are publicly searchable have common law systems in place. Civil law countries rarely have a public registration system for commercial filings.

For additional information on the accessibility of commercial filings in different jurisdictions, see the content on “Commercial Filings” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Favorite Employee Targets of Intelligence Professionals

Again, intelligence professionals might seek out a target organization’s employees during their quest for information. Information provided by employees in the following departments can prove particularly valuable: research and development, marketing, manufacturing and production, human resources (HR), sales, and purchasing.

Research and Development

Organizations that perform research and development (R&D) are at risk of corporate espionage because the value of R&D data depends on its exclusivity.

Often, intelligence professionals target R&D employees because their positions generally involve the communication of information. For example, many R&D employees attend or participate in trade shows, conferences, or other industry functions where it is common to network with other professionals in their field and exchange ideas. Such events provide intelligence spies with the opportunity to learn key product- or project-related details simply by listening to a presentation or asking the right questions.

R&D employees’ publications are also a good source of information for intelligence professionals. Researchers sometimes inadvertently include sensitive project details when writing articles about their findings for industry journals or other mediums. This is particularly true in the case of academic professionals who might be hired by a company to perform research or conduct a study. If a company hires an academician to conduct research, management must ensure that the academician understands the need to keep the results confidential. In addition, management must make sure that the academician’s use of teaching assistants or graduate students is kept to a minimum and that those individuals understand the confidentiality requirements.

Marketing

A company's marketing plan can offer intelligence professionals valuable information. For example, information regarding product release dates, advertising plans, and testing results can be extremely detrimental to the company's success if obtained by a competitor.

Manufacturing and Production

A company's manufacturing and production information can be valuable to its competitors, and production managers are often good sources of such information.

Human Resources

Intelligence professionals often pay close attention to job postings and announcements regarding open positions. Spies might also attempt to obtain a job interview to learn additional information about the target firm and what the job will entail.

Sales

Salespeople are an excellent source for product-related details, including information on marketing strategies and pricing.

Purchasing

Purchasing agents might reveal which products are selling the best, as well as information regarding suppliers and supply and service costs.

How Information Is Lost or Stolen

Information thieves use a wide variety of methods—not all of which are legal—to gain access to an organization's business secrets. The following are common ways for information to fall into the wrong hands:

- Accident and negligence
- Loss of physical media
- Poor information security procedures
- Improper disposal of documents and media
- Malicious insiders
- Insider spies (moles)
- Sleepers
- Computer attacks
- Physical infiltration

- Transactional intelligence
- Social engineering
- Physical surveillance
- Technical surveillance

Accident and Negligence

Employees sometimes inadvertently expose sensitive information due to accident or a lack of awareness. Employees might unknowingly disclose sensitive company information via social media, when talking with friends, or while delivering a speech at an industry conference. It is important that employees are trained to understand what information is considered proprietary so that mistakes of this kind can be more easily avoided.

Additionally, publications such as newsletters or reports to shareholders and speeches or papers that are presented at conferences can inadvertently provide valuable information to competitors. Organizations should implement a system of advance review whereby technical or security staff examine all works prior to their publication or presentation.

Accidental leaks might also occur via the press. Executives eager to brag about their companies often reveal more than they should about research, new products, sales levels, and so on. Furthermore, a company's website might also contain accidental leaks. Corporate spies frequently visit their targets' websites to gather information that these companies have unknowingly made public. Employee telephone and email directories, financial information, key employees' biographical data, product features and release dates, details on research and development (R&D), and job postings can all be found on many corporate websites. In some cases, this information provides direct access to company secrets; in other instances, it can be used to build an intelligence campaign. Businesses should pay attention to information published on their websites and in other marketing materials. Generally, anything that does not forward an organization's marketing mission should be excluded or removed.

Loss of Physical Media

Sensitive data are often loaded onto laptops, USB flash drives, memory cards, tablets, mobile phones, and other portable media devices, any of which can be easily lost. It is important that information on these devices be encrypted, protected by a password, and enabled for remote deletion when possible.

Poor Information Security Procedures

To ensure data security and prevent accidental data loss, organizations should employ and regularly update a system for protecting and disposing of confidential information. Classifying data, limiting logical access, and ensuring that policies are in place for emerging trends are all examples of processes that can be implemented to avoid putting sensitive information at unnecessary risk.

Improper Disposal of Documents and Media

Intelligence professionals might obtain sensitive information from documents and media that are not disposed of using proper means. Documents containing sensitive information are often disposed of without first being shredded. Additionally, a business might sell, return, or dispose of machines such as personal computers, mobile devices, or copy machines without first ensuring that all sensitive data have been removed or sufficiently overwritten.

Malicious Insiders

Insiders—individuals with access or inside knowledge about an organization—represent one of the largest threats to an organization's information, and malicious insiders cause a significant number of breaches.

Employees who feel wronged or taken advantage of at work might seek job satisfaction by sabotaging their employer's data.

Insider Spies (Moles)

Often, a corporate spy will try to obtain information by recruiting an existing insider to act as their agent on the inside. An employee recruited to spy against their employer is known as a *mole*. The mole agrees to betray their employer's trust by handing over confidential information that belongs to the organization.

A corporate spy might recruit a mole through any of the following techniques:

- Bribe the target.
- Extort (blackmail) the target.
- Use romantic or sexual seduction.
- Exploit the target's strong social or political feelings.

- Convince the target that spying is moral or justified. These attacks often target people who feel like victims. An employee who is bitter at having been passed over for a promotion, for example, is a good target. Other typical targets include employees who resent their employers because they feel underpaid or unrecognized.
- Trap a target so that they are essentially forced to spy on their employer.

Because corporate spies use complex methods to turn employees into moles, management must train employees, especially key employees with access to valuable information, to report any suspected recruitment effort made against them as early as possible. Specifically, management must train key employees to be wary of people who:

- Encourage and finance an employee's vice.
- Express a great deal of sympathy for a cause that is important to an employee.
- Offer to help an employee with a serious financial problem.
- Attempt to seduce an employee.
- Attempt to blackmail an employee.

Sleepers

If an information thief has a very long-range interest in monitoring a company, they might place a spy in that target company as a permanent employee. This employee, known as a *sleepers*, keeps a low profile and regularly reports to their control about the company's operations. This kind of spy, especially if they are well versed in corporate espionage, will be extremely difficult to detect.

A sleeper functions like a mole. The difference between the two is that a sleeper is a person who is deliberately planted as an employee in a company to extract information. In contrast, a mole is usually an existing employee of the targeted organization who is somehow compromised and has agreed to turn over their company's secrets to the intelligence professional.

Computer Attacks

Information thieves might access an organization's sensitive information by bypassing its information security mechanisms.

Physical Infiltration

Corporate spies might use physical infiltration techniques to obtain sensitive information. *Physical infiltration* is the process whereby an individual enters a target organization to spy on

the organization's employees. Often, corporate spies use physical infiltration when there is a tight time schedule, a lack of available recruits, or expense constraints; however, spies might also use physical infiltration when they have specialized knowledge that makes them the best for the job. Generally, spies with advanced technical knowledge are the best at committing such campaigns.

One common infiltration technique is to secure a position, or pose, as an employee or contract laborer of the target organization. For example, a spy might obtain work as a security officer or a member of the janitorial crew for the target organization.

Another common physical infiltration technique is to steal or fabricate employee badges belonging to the target organization.

Warning Signs of Physical Infiltrations

Detecting physical infiltration can be difficult, but there are some signs that organizations can look for that might indicate that there is a spy:

- Vendors, janitorial personnel, security guards, trash collectors, and other nonemployees are seen loitering unescorted around file rooms, offices, mail rooms, shipping docks, computer media storage areas, or other sensitive areas.
- Service technicians show up without having been called.
- There are employee reports of lost security badges, access cards, passwords, and so on.
- Data containing sensitive information are missing.
- Employee desks or offices have been tampered with.
- Individuals try to enter a facility without proper identification or authorization.
- Individuals attempt to gain access to a physical area by *piggybacking* (i.e., gaining access to a secured physical area by exploiting a false association with another person who has legitimate access to the area).
- Reports of trespassing or other criminal activity have been made near a secure facility.

Countermeasures to Physical Infiltration

Security officers can implement specific countermeasures to thwart a spy's attempts at infiltrating their company. These countermeasures are as follows:

- Avoid storing proprietary data in areas visible to the public.
- Establish a procedure for tracking and locking up sensitive data.
- Properly bond and identify cleaning personnel and control their access to the facility.

- Verify vendors' credentials and have a company representative escort them during their visit.
- Encrypt any proprietary lists.
- Educate employees to properly store sensitive data and to question the credentials of anyone visiting the site.
- Instruct employees as to what information they may disclose over the telephone.
- Require that employees sign nondisclosure agreements.

Transactional Intelligence

Intelligence professionals can obtain valuable intelligence by observing just about any mundane business transaction. For example, frequent flyer miles document where an executive has traveled. Credit card receipts record a trip's itinerary and goods or services purchased. Any one piece of transactional information by itself has minimal value, but taken together, this type of information can provide an extensive profile on a target.

Spies might develop a network of paid informants who can obtain transactional intelligence on their behalf. These informants come from a wide range of businesses and include:

- Travel agents
- Airline reservation personnel
- Major credit card companies
- Staff at major internet providers
- Employees at video, music, and other entertainment outlets
- Staff of adult entertainment providers that the target frequents
- Telephone company employees with access to telephone records
- Employees of commercial database providers such as Dialog and Dun & Bradstreet (D&B) who have access to transactional records

These informants will, for a fee, provide transactional intelligence on a subject that can tell a corporate spy about:

- A person's vices
- Details of a target's business travel
- Hotels where the target stayed and where they are likely to stay again in the future (this can be useful for setting up surveillance)
- Whom the target has called
- Interests and hobbies (another way to edge into the target's confidence)
- Companies or subjects the target has researched

This type of intelligence is really a hybrid of documentary source intelligence (combining purely open sources available to the public and gray sources) and human intelligence. The corporate spy needs an inside contact to obtain the target information, but once they have the information, they can analyze it without additional assistance.

Transactional intelligence is very helpful in the collection of human intelligence. If, for example, a spy knows a subject's hobbies, they can use that knowledge to strike up a conversation or possibly a friendship with the target.

A spy can also be their own source of transactional intelligence.

Social Engineering

Rather than infiltrate a company to extract needed information, a spy might use social engineering to induce target employees to divulge sensitive information. *Social engineering* is the act of using deceptive techniques to manipulate people into taking certain actions or disclosing information. Corporate spies use social engineering to collect sensitive information about a target.

People are the biggest vulnerability in information security, and social engineering schemes prey on this vulnerability. Social engineering does not exploit technical vulnerabilities in information technology; instead, it exploits social psychological weaknesses in individuals. Consequently, spies do not need a high level of technical expertise to carry out social engineering schemes, but they do need decent social skills.

In social engineering schemes, social engineers use various forms of trickery, persuasion, threats, or cajolery to encourage their targets to release information that the engineers can use and exploit to achieve their goals.

Attackers engage in social engineering for various reasons. Some use social engineering to gain unauthorized access to systems or obtain confidential communication so that they can commit fraud, intrude into networks, gain access to buildings, steal another party's secrets, commit identity theft, or engage in some other nefarious act. In some situations, attackers use social engineering to procure information that will give them a competitive advantage, whereas others might engage in social engineering to find ways in which they can install malware.

Why Social Engineering Attacks Succeed

Social engineering attacks succeed for several reasons. For one thing, these attacks leverage characteristics of human nature, making them hard to prevent. That is, social engineering attacks exploit certain traits of ordinary human nature, such as:

- The tendency to trust people
- The reluctance to be (or seem) disagreeable
- The desire to help
- The desire to avoid appearing paranoid
- The desire to be cooperative
- The fear of consequences for not doing something right or for doing something wrong
- The reluctance to refuse requests
- The desire to be nice
- The tendency to avoid making others feel bad

Social engineering attacks also tend to succeed because combating them is difficult.

How Social Engineering Works

Generally, social engineering attacks involve four phases:

- Gather intelligence about the target.
- Select the tactic.
- Contact and build trust with the target.
- Elicit information by exploiting the relationship.

GATHER INTELLIGENCE ABOUT THE TARGET

To conduct a successful social engineering attack, social engineers must gather information about the target and the target's environment. The more information a social engineer has about their target, the greater the chances that their attack will be successful. For example, a social engineer will have a greater chance of success if they know their target's internal processes, jargon, and organizational structure.

Accordingly, in this phase, the social engineer gathers as much information as possible to obtain the information needed to plan and carry out the attack. That is, the social engineer seeks information regarding the target organization, its employees, and its vulnerabilities. Once the social engineer has obtained this information, they can use it to make the target more susceptible to manipulation.

Often, the social engineer's goal in this stage is to learn as much information as possible about the target organization so they can sound like an employee, contractor, vendor, or other party related to the target organization.

In this phase, the social engineer gathers information passively (i.e., without contacting the target directly) by focusing on finding, selecting, and acquiring publicly available information about a target. The information gathered might include any available personal information, such as employee names, ages, positions, hobbies, interests, addresses, banks, friends, and so on.

SELECT THE TACTIC

Once the social engineer has collected an appropriate amount of information about the target, they will determine which tactic would be most suitable to achieve the desired goals.

Social engineers use various tactics, including:

- Pretexting
- Shoulder surfing
- Spam and chain emails
- Phishing
- Reverse social engineering

PRETEXTING

Pretexting is the act of impersonating someone else or making false or misleading statements to persuade a target to release information or perform some action. Pretexting can occur in-person, over the phone, or through some other form of communication.

Social engineers often engage in pretexting by posing as a person of authority, a member of tech support, someone who has legitimate access to the target's network, an individual who needs help, a government employee, and so on.

SHOULDER SURFING

Shoulder surfing involves observing an unsuspecting target from a nearby location while the target enters a username and password into a system, talks on the phone, fills out financial forms, or performs some other task from which the engineer can obtain valuable information.

SPAM AND CHAIN EMAILS

Social engineers use spam and chain emails to carry out their attacks. Email is a common method used in social engineering attacks because it is widely used, and social engineers can

send emails designed to look like they come from popular, trusted sources. Also, social engineers can include infected attachments or links directing targets to malicious sites in such emails. Moreover, social engineers can design emails to contain specific content particular to target users. Engineers know that emails with personally interesting messages are going to get more attention than those with broad messages.

PHISHING

Phishing is a popular scheme that involves tricking businesses or individuals into providing passwords, account numbers, or other sensitive data by falsely claiming to be from an actual business, bank, internet service provider (ISP), or other entity with which the targets do business. Modern phishing schemes usually occur via email or other electronic communication.

REVERSE SOCIAL ENGINEERING

In reverse social engineering schemes, social engineers make targets think that the engineers can help them by providing security-related services. These schemes involve three phases. First, social engineers sabotage the target's network or make the target think that the network has been sabotaged. This can be done by launching a network attack against a target website or by sending an email from a spoofed email address telling target users that their systems are infected with malware. Thus, in the first step, social engineers create a problem (or give the impression of a problem) in the target's network.

Second, social engineers place themselves in a position to help the target with an actual or perceived problem by advertising their services as security consultants. After seeing the advertisement, the target organization, under the false assumption that the social engineer is a legitimate security consultant, hires the engineer and allows them to work on the network.

Finally, when working on the target's network, the social engineer gives the impression that they are assisting the target with its security issue, but in reality, the engineer is performing some malicious act on the network.

CONTACT AND BUILD TRUST WITH THE TARGET

Once social engineers have collected an appropriate amount of information about their targets and selected the tactic, they will contact their targets, seeking to build trust with them. The trust that social engineers gain will be used to elicit information that can be exploited to reach the goals of their attack.

Building trust serves several purposes, including:

- Putting targets at ease and making them more comfortable
- Making targets more susceptible to listen
- Building the targets' confidence in the social engineer

Social engineers begin building trust by establishing rapport with their targets. Social engineers use their communication skills to develop rapport with targets so that the targets will feel comfortable talking to them. Conversations without rapport tend to fail.

Often, social engineers establish rapport by:

- Having a genuine interest in their target
- Making small talk
- Presenting a professional, trustworthy appearance
- Being a good listener
- Being aware of how they affect other people
- Keeping the conversation on topics other than themselves
- Demonstrating empathy
- Being knowledgeable
- Expressing curiosity
- Finding ways to meet their targets' needs
- Breathing at the same rate as their targets
- Matching their targets' vocal tones and speech patterns

Social engineers also build trust by avoiding suspicious, sensitive questions, and they might use a piecemeal approach by instigating a series of conversations with the target, seeking to gain small pieces of information over time.

Additionally, social engineers can build trust by:

- Projecting confidence and control
- Being likeable (e.g., sharing common interests)
- Being believable
- Making fun of someone together with targets
- Sharing common interests with targets
- Helping targets with their problems
- Using humor

It is important to note that the larger the target organization, the easier it is to establish trust. In smaller organizations, targets are more likely to know whether attackers are who they claim to be.

EXPLOIT THE TARGET'S TRUST TO ELICIT INFORMATION

After building rapport and establishing trust with the target, the social engineer will elicit information that can be used to exploit the target and reach the attack goals. *Elicitation* is the process of extracting information from something or someone.

Thus, in this stage, social engineers use conversational skills and various other tactics to encourage their targets to release information that can be used and exploited to achieve particular goals.

Typically, social engineers elicit information subtly in seemingly normal and innocent conversations. This type of elicitation is preferred because it works well, is low risk, and is hard to detect.

When engaging in elicitation, social engineers want their targets to take action; the more information a social engineer has, the more likely it is that elicitation efforts will succeed.

ELICITATION SKILLS

Although social engineering does not require a high level of technical expertise, it does require social skills and other components. The social skills and components needed to be a successful elicitor include:

- Communication skills
- Adaptability (i.e., ability to adapt communications to fit the environment and situation)
- Relationship and bonding skills (i.e., ability to build bonds or relationships with other people)
- Interrogation skills (i.e., the ability to ask questions that will generate a response)
- Influence skills (i.e., the ability to influence other people)
- Manipulation skills (i.e., the ability to manipulate other people)
- Lack of fear when talking to people in abnormal situations
- Care for other people
- A nonjudgmental ear

COMMON ELICITATION TACTICS

Social engineers use numerous tactics to elicit information. Some common elicitation tactics include:

- *Appealing to the target's ego:* Social engineers often appeal to their targets' egos to coax them into a conversation that otherwise would not take place. Likewise, appealing to a target's ego will tend to make the target more self-assured, which tends to remove logical awareness that a potential breach might be occurring.
- *Expressing mutual interest:* Expressing mutual interest is a valuable tactic because it extends the relationship between the engineer and target beyond the initial conversation.
- *Making deliberate false statements:* During conversations, social engineers can make deliberate false statements to elicit responses containing correct statements.
- *Volunteering information:* Social engineers might volunteer useful information to their targets, which triggers a compulsion in their targets to respond with equally useful information.
- *Assuming knowledge:* This tactic exploits the common assumption that if people have knowledge about a specific topic, it is acceptable to discuss that topic with them. Social engineers exploit this assumption by confidently presenting information about a specific topic to a target and then building a conversation around that topic.
- *Exploiting the desire to be helpful:* Organizations train their people to be helpful, and social engineers can exploit this to further their schemes. In their desire to be helpful, people might try to solve other people's questions and give out sensitive information, and this can give social engineers information with which they can exploit.
- *Exploiting feelings of fear:* Often, social engineers take advantage of human fear. When people experience fear, they often feel panicked and rushed, and such emotions affect the logical functioning of human judgment. Frequently, social engineers will impersonate a person of authority to exploit employees' fear of authority. Likewise, social engineers will exploit employees' fear of getting in trouble. Nobody wants to be the employee that causes problems, and this can be exploited to extract sensitive information.
- *Encouraging action based on a chance for some benefit:* Social engineers might also elicit information by persuading targets that they will likely receive a benefit by complying with the engineers' requests.
- *Encouraging action based on moral duty:* Social engineers can also elicit information by encouraging targets to act based on a sense of moral duty or outrage. In this approach, social engineers try to convince their targets that their act of compliance will mitigate some wrong.

- *Exploiting desires to avoid guilt:* Most people seek to avoid feelings of guilt. Social engineers can exploit this desire by making requests that manipulate empathy or create sympathy, the compliance with which will lead to the avoidance of guilt.
- *Making unreasonable requests:* Some social engineers will elicit information by appealing to targets' desires to compromise. In this tactic, the social engineer knowingly makes an unreasonable request that is likely to be rejected. Once the request is rejected, the social engineer makes a more reasonable follow-up request. Thus, this approach uses an "if you can't help me with this, can you help with something else" tactic. After rejecting the first request, the target will feel more obligated to comply with the follow-up request.
- *Asking well-informed questions:* By asking the right questions, the social engineer can obtain valuable information.

Red Flags of In-Person Social Engineering Schemes

Here are some red flags of in-person social engineering schemes that employees should look for:

- A person makes an unusual request
- A person engages in meandering conversation and then makes an urgent request
- A person making a request:
 - Is overly flattering (e.g., "You are the only person who knows about this type of stuff.")
 - Refuses to provide contact information (e.g., "I will call you back in a few minutes.")
 - Rejects any possibility of a callback
 - Asserts that the request is urgent
 - Claims to have the same interests or a similar background
 - Uses intimidation to drive the request
 - References higher-ups to drive the request
 - Asserts that the request has been approved by management
 - States that negative consequences will result if a request is not complied with
 - Is quick on and off the phone
 - Is chatty even though they have never met
 - Fails to use standard industry jargon or otherwise sounds like an outsider
 - Sounds unnatural or stilted
 - Offers to help with an unknown problem
 - Brags about their authority within the organization
 - Threatens reprimands if requests are not granted

- Overemphasizes details
- Volunteers information
- Answers questions that were not asked

Preventing Social Engineering Schemes

Because social engineering attacks leverage characteristics of human nature, they are hard to defend against. Nevertheless, there are ways organizations can prevent becoming victims of such attacks.

Common ways to combat social engineering schemes include:

- Have clear security policies and procedures.
- Conduct security awareness training.
- Educate employees about how social engineering attacks are tied to psychology and human nature.
- Train employees to identify social engineering attacks and be aware of how social engineering works, the data that social engineers will seek, and the types of information that employees are allowed to disseminate.
- Educate employees so they understand the value of information that social engineers seek.
- Educate employees as to why security protocols are essential.
- Train employees on an ongoing basis to ensure that they remain mindful of security.
- Train employees to focus on the nature of requests, not the context in which requests are made.
- Train help desk employees to ask specific identifying questions before they give out any information over the phone.
- Train employees to verify the identity of people making requests, and give employees a list of minimum identification requirements that people making requests must meet before information can be distributed to them.
- Tailor employee training to the audience.
- Promote employee compliance with security policies.
- Make employees aware of social engineering threats and educate them about actual instances of social engineering attacks (e.g., maintain an internal website or distribute employee newsletters that contain stories about social engineering schemes and prevention tips).
- Prohibit employees from giving out passwords or personal identification information.

- Inform employees that they should not leave confidential information and computers unattended.
- Keep references to key administrative, technical, and billing contacts for the organization's internet domain as anonymous as possible.
- Verify all emails for authenticity.
- Shred all trash containing confidential information before disposal.
- Encrypt all sensitive data.
- Test employees' security readiness (e.g., security personnel might call their own organization's help desk to see what information they can obtain without identifying themselves).
- Train employees to document suspicious events.
- Undertake social engineering audits.
- Issue security alerts when suspicious activity occurs.
- Train employees on how to mitigate problems that occur.
- Conduct penetration tests that use social engineering.

Physical Surveillance

Again, a corporate spy might conduct *physical surveillance*, which is the real-time observation of a target's actions or communications.

Spies sometimes perform surveillance on targets to obtain information on human sources.

There are a number of goals for this kind of surveillance. They include:

- To discover:
 - Who they are
 - Where they live
 - What they do in their spare time
 - What they want to keep secret
 - Who their friends are
 - Who their enemies are
- To look for:
 - Cars
 - Homes
 - Recreational activities
 - Levels of income and debts
 - The subject's importance to the organization

- To uncover what they throw in the trash, such as:
 - Financial papers
 - Information regarding medical problems
 - Information regarding family problems
- To learn about their enemies, such as:
 - Ex-lovers
 - Fired employees
 - Political opponents
 - Competitors
 - People owed money
- To make contact with the target:
 - By finding out what they think about their job, family, or life in general
 - By determining the degree to which the target will confide in others

Technical Surveillance

Again, *technical surveillance* is the practice of covertly acquiring audio, visual, or other types of data from targets through the use of technical devices, procedures, and techniques. When corporate spies resort to the use of technical surveillance, it is usually to gather nondocumentary evidence or information that cannot be found through open sources.

Experienced corporate spies know what they are looking for and devise carefully guarded collection plans before initiating any surveillance campaign. They know that the more time they spend planning, the more likely they will not be detected and the greater their intelligence yield will be.

Also, most intelligence professionals adhere to the following rules for using technical surveillance:

- Any device left on site must not be traceable back.
- Wiretaps and wiretap devices must blend into their surroundings so nothing appears unusual or different from the normal environment.
- Radio transmitters must not send signals in those parts of the electromagnetic spectrum that are in common commercial use.
- Nothing about an intelligence campaign should be revealed to anyone except one's client, even after the job is finished.
- All documentary evidence of an electronic surveillance campaign should be destroyed once a job is finished.

Corporate spies might employ various forms of technological surveillance. Some of those forms are discussed below.

Aerial Photography

Though its origins lie in the military sector, aerial photography has emerged as a valuable tool in business intelligence. Google Earth, a free online tool that enables users to obtain an aerial photo of properties by satellite, has made gathering this type of intelligence quite easy. Additionally, there are private aerial photography firms that have fairly complete negatives for land in their service area. These firms also accept special assignments to photograph specific ground areas on a schedule specified by the client. Aerial photography is used by spies to gather information on a competitor's construction or expansion products, to measure the size of its shipments, or to determine the number of employees that the company has working for it, among other things.

Bugging and Wiretapping Devices

Hidden microphones, wiretaps, and other forms of electronic surveillance equipment have become common means by which intelligence professionals can monitor their competition. The spy has two primary considerations in a wiretapping campaign: where to insert the surveillance equipment and which of the various technologies to employ.

THE INSERTION POINT

In identifying the insertion point, the spy must choose an area where proprietary information is likely to be discussed or displayed and where background noise and electronic interference remain minimal. Spies frequently choose areas with proximity to computers and telecommunications equipment carrying proprietary data as an insertion point.

Spies might also target areas conducive to employee conversations. This can include any place inside or outside the targeted company where key personnel gather and chat. Examples include recreational areas such as bars, lounges, and coffeehouses; employee cafeterias; relaxation areas; exercise rooms; and meeting rooms. To target particular operations such as information services, spies might wire the offices of key managers, which are likely to provide access to a large portion of human information flow.

THE TECHNOLOGY

In determining which technologies to employ, the spy must factor in environmental conditions such as lighting (if video surveillance is employed), noise levels, and distance from the source. Other factors include the risk of the sensing device being discovered, power supply problems, and access to the device for servicing after installation.

Some of the more common forms of electronic eavesdropping devices include:

- Satellite tracking systems
- Carbon microphones
- Electronic and magnetic microphones
- Spike and cavity microphones
- Infinity transmitters
- Shotgun or parabolic microphones
- Wiretaps

SATELLITE TRACKING SYSTEMS

Satellite tracking systems track time and location information. In most satellite tracking systems, a small transmitter is surreptitiously attached to the subject's vehicle. The transmitter communicates with GPS and converts the coordinates of the vehicle onto a map. The spy can view maps that show the vehicle's location and path. These systems are capable of generating event lists and plain-text histories of where the vehicle has traveled. A variation on this tracking design is that in some satellite tracking software, the system creates a trail of electronic clues on the map display. The map can be a powerful tool in tracking the movements of executives and key company employees.

CARBON MICROPHONES

Carbon microphones provide good pick-up if properly hidden and located. They offer excellent coverage of fixed locations, such as employee lounges and other gathering spots. As with other forms of listening equipment, these microphones are usually equipped with a transmitter that relays intercepted conversations off-site to a recorder. From the spy's perspective, this is much safer than maintaining a recorder on-site. With a remote transmitter, even if the microphone is detected, the target cannot locate or recover the recorded material.

ELECTRONIC AND MAGNETIC MICROPHONES

Electronic and magnetic (or dynamic) microphones provide good close-range coverage. Both types of microphones are smaller than the standard carbon microphone, though they tend to offer a lower range of coverage. Magnetic microphones can be very small, and to be useful, the spy must place them close to the speakers and hide them inside something small.

SPIKE AND CAVITY MICROPHONES

Spike and cavity microphones work best when the spy has access to an adjoining area and needs to conduct surveillance in an adjoining room. For example, if a spy can access a utility room that is next door or an adjacent hotel or motel room, a spike microphone can be inserted through the adjoining wall to monitor conversations in the target's room. This type of microphone is so small at its insertion point that it is virtually undetectable to the casual observer.

INFINITY TRANSMITTERS

Infinity transmitters are a special kind of device used to monitor conversations in a room through a telephone line.

SHOTGUN OR PARABOLIC MICROPHONES

Spies can use shotgun microphones, parabolic microphone devices, and laser audio detection equipment to listen to conversations occurring far away.

WIRETAPS

Wiretapping involves splicing a listening or recording device into a wire (such as a telephone wire, a private branch exchange [PBX] cable, an alarm system, or a local area network cable) that the target uses for communication. Standard phone systems, in particular, are very vulnerable to wiretapping. Taps are usually placed at the telephone box in the basements of buildings, on lines outside buildings, or on telephone pole junction boxes near the target's offices. The different types of wiretaps that can be used include hardwired wiretap, soft wiretap, record wiretap, and transmit wiretap.

Video Surveillance

Video surveillance can also be used in corporate espionage campaigns. The role that video cameras play in such campaigns has several dimensions. Cameras can be placed in a room with computers to record passwords, logins, user manuals, text specifics, error messages, document contents, and keyboard overlays. Cameras can be used to monitor activity on

receiving and shipping docks. Planted microcameras can track activity on production lines or presentations in meeting rooms. They can also capture executives or key employees engaging in embarrassing activities.

Video cameras can be used to track security patrols, access to special areas like labs, the emptying of security wastebaskets, and other activities, and such information can aid a spy in penetrating restricted or sensitive areas.

Photographic Cameras

Corporate spies can use cameras to obtain a company's secrets.

DIGITAL CAMERAS

A good digital camera is the mainstay in a spy's surveillance arsenal. Today, most mobile phones are equipped with a high-quality digital camera. Digital photos of things like documents, maps, schematics, diagrams, engineering drawings, signs, configurations of buildings and streets, license plates, and other important details are valuable. Photographs of key target employees can also be valuable in many intelligence campaigns.

To avoid attracting attention when using digital cameras, the intelligence specialist can use telescopic or reflective lenses to zoom in on details from a safe distance. In building a visual file on a plant site, a spy will take ground-level photographs from around the entire circumference of the targeted area. Spies will even photograph computer screens that are visible through windows.

To aid in analyzing photographs at a later date, the specialist will catalogue all photographs as to:

- Subject matter
- Date/time of day
- Direction of a shot
- Number in a sequence of shots
- Important features in a shot

These data can be stored in a database like Microsoft Access, and photographs themselves can be incorporated into the database. Photographic images; excerpts from video surveillance; aerial photographs; and relevant diagrams, document images, or drawings can also be integrated into one database for extensive analysis. Analytical investigative databases like i2

allow for the organization of visual data. A database generates various narrative reports, charts, diagrams, and chronologies. The opportunities for an information multiplier effect are tremendous.

INFRARED CAMERAS

Infrared cameras contain night vision technology that increases visibility without a visible light source, which is a valuable resource when a spy is conducting surveillance under very low light or needs to examine damaged or erased documents. Even the contents of burned documents can be detected under the right conditions with infrared technologies.

Mobile Phone Networks

While analogue mobile phone networks could easily be scanned by anyone with basic tools, modern digital technology is significantly more complicated to monitor. Most analogue mobile phone networks have been shut down or replaced by digital networks, although analogue roaming services are occasionally present in rural areas. The most common mobile phone platform is Global System for Mobile Communications (GSM), which transmits communications that are fully digital and highly encrypted. Despite the relative difficulty of monitoring digital mobile communications, digital networks can be penetrated by someone who is suitably motivated. Additionally, mobile communications are commonly monitored by government agencies and are potentially vulnerable to surveillance at their network's switches and trunks. Employees should always be mindful that someone could be listening to their conversations. Sensitive information should not be conveyed by mobile phone.

Monitoring Computer Emanations

Information professionals can also monitor computer emanations, which form detectable and decodable patterns.

For example, a detector or receiver, known as a Van Eck unit, can reproduce keyboard entries on a computer screen even from a considerable distance. A Van Eck unit consists of a directional antenna, logic circuits, and two adjustable oscillators (one for the vertical and one for the horizontal). With proper adjustments, a van parked across the street that is equipped with a Van Eck receiver can eavesdrop on the contents of a cathode-ray tube (CRT) display or liquid-crystal display (LCD) by detecting its electromagnetic emissions.

To prevent competitors from monitoring computer emanations, organizations can shield their computer equipment and transmission lines using Telecommunications Electronics

Material Protected from Emanating Spurious Transmissions (TEMPEST) procedures. While TEMPEST procedures are used extensively in the military and by certain defense contractors, they are expensive, and their high costs prevent many private sector businesses from employing them.

Computer System Penetrations

In some cases, information thieves will attempt to extract information by penetrating a company's computer defenses. This can be part of an organized intelligence campaign, or in some cases, it is simply a random attack by a hacker. For more information on how outsiders attempt to penetrate computer systems, see the "Cyberfraud" chapter in this section of the *Fraud Examiners Manual*.

Electronic Countersurveillance

If management has a reasonable suspicion that its organization has been bugged or is the target of electronic surveillance, it should consider hiring an expert to conduct a technical surveillance countermeasures (TSCM) survey. A TSCM survey (commonly referred to as *debugging*) is an expert examination designed to detect, identify, and locate electronic eavesdropping devices, security hazards, or security weaknesses in a specific area. A TSCM is designed to help the organization achieve two goals: (1) to detect the presence and location of technical surveillance equipment and (2) to identify existing and potential security weaknesses.

In choosing TSCM professionals, management should make sure that the professionals are competent in electronics and have extensive knowledge of design, engineering, and maintenance. They must also be trained in eavesdropping techniques, practiced in radio frequency (RF) allocation and propagation, and knowledgeable about all techniques of modulation, electrical wiring, and installation principles.

TSCM sweeps are sensitive operations that should be conducted with as much secrecy as possible. It is best to limit the number of people within the organization who are notified of the operation because it is always possible that a mole might exist. TSCM operatives normally operate under a cover story to explain their presence at the facility.

When possible, TSCM sweeps should be scheduled after hours to limit the number of personnel who encounter the survey team. TSCM experts should be accompanied at all times during their sweep.

Insider Threats to Proprietary Information

Insiders represent one of the largest threats to an organization's information resources.

Insiders are individuals with access or inside knowledge about an organization, and such access or knowledge gives them the ability to exploit that organization's vulnerabilities.

Insiders enjoy two critical links in security that put them in a position to exploit organizations' information security vulnerabilities:

- Trust of their employers
- Access to facilities

Information theft by insiders is especially a concern when employees leave an organization. Often, employees leave one organization for another, taking with them the knowledge of how that particular organization operates, as well as its pricing policies, manufacturing methods, customers, and so on.

Types of Insiders

Insiders can be classified into three categories:

- *Employees*: Employee insiders are employees with rights and access associated with being employed by the organization.
- *Associates*: Insider associates are people with physical access to an organization's facilities, but they are not employees of the organization (e.g., contractors, cleaning crews).
- *Affiliates*: Insider affiliates are individuals connected to pure insiders or insider associates (e.g., spouse, friend, client), and they can use the credentials of the insiders with which they are connected to gain access to an organization's systems or facilities.

Categories of Insider Threats

There are many types of insider threats, and they can be organized into the following categories:

- Traitors
- Zealots
- Spies
- Browsers
- Well-intentioned insiders

Traitors

A *traitor* is a legitimate insider who misuses their insider credentials to facilitate malicious acts. When a trusted insider misuses their privileges to violate a security policy, they become a traitor.

Below are some signs that an insider is a traitor:

- Unusual change in work habits
- Seeking out sensitive projects
- Unusual work hours
- Inconsistent security habits
- Mocking security policies and procedures
- Rationalizing inappropriate actions
- Changes in lifestyle
- Living beyond means

Zealots

Zealots are trusted insiders with strong and uncompromising beliefs that are incompatible with their organization's perspectives on certain issues and subjects. Zealots pose a threat because they might exploit their access or inside knowledge in an attempt to "reform" their organizations. Zealots might attempt reform by:

- Exposing perceived shortcomings of the organization by making unauthorized disclosures of information to the public or granting access to outsiders
- Destroying information
- Halting services or products

Zealots believe that their actions are just, no matter how much damage they cause.

Spies

A *spy* is an individual who is intentionally placed in a situation or organization to gather intelligence. A well-placed corporate spy can provide intelligence on a target organization's product development, product launches, and organizational developments or changes.

Spies are common in foreign, business, and competitive intelligence efforts.

Browsers

Browsers are insiders who are overtly curious about information for which they do not need access to, knowledge of, or possession of to carry out their work duties. Their curiosity drives them to review data not intended for them.

Browsers might search through information that they have no specific need to know until they find something interesting or something they can use. Browsers might use such information for personal gain, or they might use it for:

- Obtaining awards
- Supporting decisions about promotions
- Understanding contract negotiations
- Gaining a personal advantage over their peers

Browsers can be the hardest insider threat to identify, and they can be even harder to defeat.

Well-Intentioned Insiders

The *well-intentioned insider* is an insider who, through ignorance or laziness, unintentionally fosters security breaches. Well-intentioned insiders might foster security breaches by:

- Disabling anti-virus software
- Installing unapproved software
- Leaving their workstations or facilities unlocked
- Using easy-to-crack passwords
- Failing to shred or destroy sensitive information

While well-intentioned individuals might be stellar employees when it comes to work production, their ignorance or laziness toward information security practices can be disastrous.

Motivations for Insider Attacks

Motivations for insider attacks include:

- Work-related grievances
- Financial gain
- Challenge
- Curiosity
- Spying for competitors
- Revenge

- Ego
- Opportunity
- Ideology (e.g., “I don’t like the way my organization conducts business.”)

Ways to Combat Insider Threats

There are various ways organizations can combat insider threats. The CERT (Computer Emergency Response Team) Insider Threat Center, which conducts comprehensive and authoritative research on insider threats, published *The CERT Top 10 List for Winning the Battle Against Insider Threats* to help organizations prevent, detect, and respond to malicious insider activity. The ten mitigation strategies recommended by the CERT team are as follows:

- *Create an insider threat program.* To combat insider threats, management should form an insider threat team, create policies, develop processes and implement controls, and regularly communicate the policies across their organizations.
- *Work together across the organization.* To be successful, efforts to combat insider threats should be communicated across management, IT, data owners, software engineers, general counsel, and human resources (HR).
- *Address employee privacy issues with general counsel.* Because employees have certain privacy rights that can affect numerous contexts involving the employer-employee relationship, and because such rights may stem from, and be protected by, various sources of law, management should consult legal counsel in addressing employee privacy issues.
- *Pay close attention at resignation/termination.* Because leaving an organization is a key issue of concern for insider threats, management should be cautious of underperforming employees, employees at risk of being terminated, and employees who will likely resign.
- *Educate employees regarding potential recruitment.* Management should train employees to exercise due diligence in hiring prospective employees.
- *Recognize concerning behaviors as a potential indicator.* Management must train employees to recognize certain behaviors or characteristics that might indicate employees are committing or are at risk of committing a breach. Common behavioral red flags are living beyond financial means, experiencing financial difficulties, having an uncommonly close relationship with vendors or customers, and demonstrating excessive control over their job responsibilities.
- *Mitigate threats from trusted business partners.* Management should subject their organization’s contractors and outsourced organizations to the same security controls, policies, and procedures as their own employees.

- *Use current technologies differently.* Most organizations have implemented technologies to detect network intrusions and other threats originating outside the network perimeter, and organizations with such technologies should use them to detect potential indicators of malicious insider behavior inside the network.
- *Focus on protecting the most valuable assets.* Management should dedicate the most effort to securing the most valuable organizational assets and intellectual property against insider threats.
- *Learn from past incidents.* Past incidents of insider threats and abuse will suggest areas of vulnerability that insiders will likely exploit again.

Additionally, Patrick Reidy, the former Chief Information Security Officer (CISO) at the Federal Bureau of Investigation (FBI), emphasized five strategies for combatting insider threats in a brief at Black Hat USA:

- Focus on deterrence, not detection. In other words, create a culture that deters any aberrant behavior so that those who continue to practice that behavior stand out from the “noise” of normal business and the limited investigative resources that can be focused on them.
- Know your people—know which people are the least reliable and who would most likely be a threat. Use your HR data to narrow down threats.
- Identify information that is most likely to be valuable to someone else and protect it to a greater degree than the rest of your information.
- Monitor ingress and egress points for information (e.g., USB ports, printers, network boundaries).
- Baseline normal activity and look for anomalies.

Other measures organizations can take to combat insider threats include:

- Educate employees as to what information is proprietary and confidential.
- Require that all employees and third-party vendors and contractors sign *nondisclosure agreements*—written agreements providing that all proprietary and confidential information learned during their relationship must be kept confidential and must not be disclosed to anyone—upon the commencement and termination of employment or contracts.
- Ensure that all of an organization’s third-party vendors and contractors perform background checks on all employees that will have access to the organization’s information systems.
- Prohibit employees, contractors, and trusted business partners from printing sensitive documents that are not required for business purposes.
- If possible, avoid connecting information systems with trusted business partners.

Also, when possible, management should conduct exit interviews with departing employees. During these exit interviews, departing employees should be advised about the organization's trade secrets and confidential information, as well as any obligation not to disclose or use such information for their own benefit or the benefit of others without express written consent. Also, employees should be given a form to sign stating that they were informed that any proprietary information is not to be disclosed and that they agree not to disclose any such information without consent.

Finally, when management terminates its relationship with an insider, it should immediately deactivate the insider's access to company tools and resources.

Investigating Corporate Espionage

Investigations into corporate espionage activity can be challenging, but this discussion provides some helpful tips. When an organization is the victim of corporate espionage, management should first determine how the sensitive information was compromised. Knowing how the theft occurred often reveals who stole the information.

When management suspects that confidential information has been misappropriated, it should take the following actions:

- Involve legal counsel.
- Consider engaging any outside consultants that are needed to conduct an effective investigation.
- Secure all of the organization's confidential information (e.g., installing physical barriers, limiting users' access to information, changing locks and other controls used to obtain access to information system components).
- Consider whether to report the incident to government authorities.
- Collect and analyze relevant documents.
- Identify employees with access to confidential information, and interview them about their knowledge of the relevant facts.
- Interview non-suspect employees who are responsible for protecting confidential information.
- Interview any third party who might have relevant information.

But more specifically, when investigating corporate espionage, those responsible should determine how the sensitive information was compromised.

To determine how the sensitive information was compromised, investigators should begin by determining whether the incident was the result of negligence, accident, or some procedural matter (e.g., inadequate security controls).

If the investigators determine that the incident was not caused by negligence or accident, they should look for evidence of insider theft. In most corporate espionage investigations, the investigators should begin looking at the people closest to the sensitive information at issue and then work outward. For example, if a company's marketing list was stolen, the investigators should begin with employees who manage the list. The investigators should perform background investigations on these employees, looking for red flags of corporate spies (e.g., unusual recent financial or lifestyle changes, unusual work hours). After investigating employees closest to the sensitive information, the investigators should move outward to other employees, vendors, customers, and visitors.

If the investigation fails to develop any leads on employees, vendors, or visitors, the investigators should look for signs of an external attack using deception. They should interview employees in the affected areas to find out if they observed any suspicious activities or received any suspicious telephone calls or emails at or near the time of the loss. Also, they should ask employees if anyone has approached them for information.

If an external attack using deception does not appear likely, the investigators should look for evidence of physical penetration. They should review surveillance videos of traffic in and out of the affected area, and they should ask employees if they remember observing anyone who appeared suspicious. They should check internal records for any incidents of criminal activity on site at or near the time of the loss, and they should review security personnel reports for any suspicious activities (e.g., people trying to get into the trash or loitering in the parking lot).

If, after performing these actions, the investigators still do not know how the sensitive information was compromised, they should look for evidence that the information was misappropriated using some form of electronic surveillance.

Program for Safeguarding Proprietary Information

To prevent the loss or misuse of sensitive data or proprietary information, organizations should develop and implement risk-based information-security systems designed to detect and prevent unauthorized access to sensitive information. An information security system

requires controls that are designed to ensure that data are used as intended, and such controls will depend on the combination and coordination of people, processes, technologies, and other resources.

The information security system should be developed and managed by the entity's corporate information officer (CIO), but the entity could also hire a security management consultant to develop the system and maintain it on an annual basis. The CIO should have information management skills and be knowledgeable about trade secret protection.

To be effective, a system for safeguarding sensitive and proprietary information should include the following:

- Task force
- Security risk assessments
- Security policies and procedures
- Awareness training
- Nondisclosure agreements
- Noncompetition agreements
- Data classification
- Data retention and destruction policies
- Data minimization
- Security controls
- Measures to guard manual file systems
- Monitoring of visitor access
- Quiet room
- Incident response plan

The failure to include any of these measures is a poor information security practice that can contribute to the loss of proprietary information.

Task Force

To coordinate a company-wide program for safeguarding proprietary information (SPI), management should establish a task force and charge it with developing the program. The task force should include managers and staff from departments that deal with proprietary information, such as research and development (R&D) and production. The task force should also include representatives from the following departments: corporate security, human resources (HR), records management, data processing, and legal.

Once the task force is assembled, it must identify the information that is to be protected. To make this determination, the task force should identify those areas that give the company its competitive edge (e.g., quality of the product, service, price, manufacturing technology, marketing, and distribution). When doing so, the task force should ask, “What information would a competitor like to know?”

Once the proprietary information has been identified, the task force should focus on the information security procedures for each department. That is, the task force should identify where proprietary information is kept and survey the risk if such information was lost to a competitor.

Security Risk Assessments

Organizations’ information security programs should feature solutions based upon their individual security risk assessments; therefore, organizations should conduct security risk assessments to identify threats to, and vulnerabilities of, their information systems.

A *security risk assessment* is the process whereby responsible parties identify an organization’s security risks, assess the probability that those risks will materialize, calculate the damage that would result if the risks materialized, and determine the costs of applying the necessary safeguards to mitigate the identified risks.

For more information on security risk assessments, see the “Cyberfraud” chapter in this section of the *Fraud Examiners Manual*.

Security Policies and Procedures

To prevent harm to data, organizations must establish security policies and procedures that protect sensitive information and mitigate risks associated with information security breaches.

Generally, a *security policy* is a document that outlines specific requirements or rules designed to provide information security. Security policies should:

- Contain employee responsibilities.
- Require compliance.
- Define consequences for compliance failures.

An organization's security policies should reflect management's commitment to information security. Thus, security policies should contain guiding principles that convey management's over-arching beliefs on information security.

Moreover, security policies provide the foundation for security in an organization. They provide a framework that ensures that informational assets are secured within a governing policy.

However, to be effective, security policies must be:

- Implemented and communicated to all employees in an effective manner
- Easy to understand

Effectively communicated information security policies provide employees with guidance on the proper use of information assets, which allows management to mitigate the risks associated with the inappropriate use of computer systems, software, email, and the internet.

In short, an organization's security policies should state, in writing, what policies and standards must be followed by employees, vendors, and business partners with regard to network and communications security. These policies should outline what must be done, who must do it, and the consequences of not complying.

Also, to help ensure compliance, management should ask every employee to sign an agreement to follow the company's security policies.

In the information security field, security policies are usually topic-specific, covering a single subject. The following is a list of key policies that most organizations need:

- *Information classification policy:* This policy establishes a framework for categorizing information according to the perceived risk to the organization and assigns responsibility for its identification and classification. This policy seeks to ensure that information is properly identified, classified, and handled according to its value, legal requirements, sensitivity, and importance to the organization.
- *Acceptable use policy:* This policy covers the rules establishing the appropriate use of the organization's computer equipment.
- *Minimum access policy:* This policy provides rules based on the principle that individuals should be authorized the minimum amount of access they need to accomplish their job responsibilities.

- *Network access policy*: This policy sets access criteria for all wired and wireless network data ports within any facility owned or operated by the organization.
- *Remote access policy*: This policy outlines and defines acceptable methods of remotely connecting to the organization's internal network.
- *Acceptable encryption policy*: This policy contains standards defining the organization's rules for acceptable encryption.
- *Server security policy*: This policy imposes standards to ensure that basic server security safeguards are used by all server administrators.
- *Extranet policy*: This policy establishes the security requirements and processes pursuant to which users outside the organization, usually partners, vendors, and suppliers, must comply with before connecting to the organization's internal networks.
- *Application service provider policy*: This policy contains the security requirements for the organization's use of software-based services and solutions by any third-party entity that manages and distributes such products and services.
- *Authentication policy*: This policy establishes the rules by which network access is granted to users who request access to the organization's network.
- *Wireless policy*: This policy defines the standards for wireless systems connected to the organization's network.
- *Email security policy*: This policy contains the rules establishing what constitutes acceptable and unacceptable use of the organization's email system.
- *Bring Your Own Device (BYOD) policy*: This policy establishes the guidelines by which employee-owned devices are allowed to access the organization's networks and systems.

The SANS Institute provides downloadable information security policy templates on its website. For more information, visit www.sans.org.

For more information on security policies, see the "Cyberfraud" chapter in this section of the *Fraud Examiners Manual*.

Awareness Training

Educating employees is a key part of preventing data from being compromised. Thus, management should require all personnel to complete awareness training so that they know their role in furthering security. Organizations should strive to make sure that employees understand the importance of information and data security and are trained to protect sensitive information, and they should ensure that employees at satellite offices, temporary help, seasonal workers, contractors, and vendors are included in the training.

Employees must be educated about what information is proprietary. It is difficult to protect information if no one knows that it needs protecting. For example, employees might know that their employer's secret formula is proprietary, but they might not know that certain topics of discussion are trade secrets that would be valuable to competitors.

EXAMPLE

Daniel Harris worked as an engineer for a software company that was developing insurance claims processing software for the health care industry. While attending a trade association conference, Harris entertained other attendees with war stories about his company's software development process, regaling them with stories about what worked and what didn't work in his company's efforts to develop the new software. Later, Harris was reprimanded for his disclosure, but he was genuinely unaware that the information he provided was proprietary and valuable to his company's competitors.

Moreover, organizations must educate their employees about the dangers of electronic communications and how to protect proprietary information when using such methods of communication.

Employees traveling out of the country should be especially knowledgeable about security controls. Many foreign governments operate huge and sophisticated intelligence-gathering operations. Therefore, when traveling abroad, employees should take precautions under the assumption that any mobile electronic devices, such as laptops, mobile phones, and tablets, will be subject to review. The following are some steps an individual can take when traveling abroad:

- Ensure that the software on all devices is patched and up-to-date.
- Password- or passcode-protect all devices.
- Minimize the data contained on any devices.
- Avoid using public computers or connecting to unsecured Wi-Fi.

Moreover, leaders should train their employees on common issues and directives addressing how to identify red flags and how to deal with the high-risk issues the employees are likely to encounter, and training should be based on the organization's operations and needs.

Management should also consider providing advanced instructions for personnel assigned to higher-risk areas or responsibilities, and management should update employees as new risks and vulnerabilities are discovered.

In short, security awareness training should cover points such as:

- The organization's information security policies and procedures and the reasons behind such policies and procedures
- The dangers of data breaches
- Real-world examples of how data have been compromised and what could have been done to prevent such instances
- Social engineering awareness
- Techniques that hackers use to access sensitive data
- How to avoid phishing attacks
- Appropriate measures for handling and protecting sensitive data
- Techniques for safeguarding portable data
- Password construction and management
- Tips for secure web browsing
- The appropriate use of social networking sites
- Guidance on data encryption
- Document and data control
- How to recognize security threats
- Procedures for reporting suspected breaches
- Ways to identify and avoid situations that could lead to data breaches
- Guidance on applicable laws
- Disciplinary measures for violating security policies

Moreover, awareness training should be ongoing, user-friendly, and easily understood.

Management should regularly provide reminders about the importance of information security in company newsletters, bulletin boards, memos, and other form of communication. Also, training must be presented in a manner appropriate for the targeted learners. Such approaches will make it more likely that employees will accept the program, understand it, and appreciate it.

For more information on security policies, see the "Cyberfraud" chapter in this section of the *Fraud Examiners Manual*.

Nondisclosure Agreements

Management should consider making nondisclosure agreements a mandatory part of their information security programs. Generally, a *nondisclosure agreement* is a written agreement providing that signatories must keep all trade secrets and proprietary information learned during their employment confidential.

Nondisclosure agreements serve the following functions:

- They delineate the confidentiality expectations the employer has for its employees.
- They demonstrate that the employer is serious about protecting trade secrets and proprietary information.
- They show the reasonable efforts that the employer takes to maintain the secrecy of its confidential information.

Nondisclosure agreements should be signed at the outset and upon termination of employment.

Lack of employee education concerning nondisclosure agreements is one of the primary reasons employees communicate confidential information to outside parties. Often, employees are willing to abide by nondisclosure agreements, but they do not understand that the information they are communicating might be confidential. To more effectively implement nondisclosure agreements, employees must be clearly informed as to what information is considered confidential upon hiring, upon signing a nondisclosure agreement, and during exit interviews.

Moreover, everyone involved with the organization should sign nondisclosure agreements. This includes all employees, subcontractors and their employees, clerical staff, consultants, suppliers, distributors, and temporary employees.

Nondisclosure agreements are one of the least expensive and most efficient methods for controlling the loss of proprietary information.

Noncompetition Agreements

Management should consider using noncompetition agreements. A *noncompetition agreement* is an agreement whereby employees agree not to work for competing companies within a certain period of time after leaving their current employer.

While noncompetition agreements can be useful in some circumstances, there are a number of legal issues that limit their effectiveness. For example, courts in some jurisdictions have held that such agreements are against public policy because they limit a person's future employment; therefore, in these jurisdictions, noncompetition agreements are unenforceable. Moreover, even in jurisdictions that uphold these agreements, they will only do so if the agreements are part of an otherwise valid employment agreement. That is, the employment

agreement and the noncompetition agreement must be signed at the same time or the noncompetition agreement is unenforceable. Additionally, if the noncompetition agreement is signed by an at-will employee who is not covered by an employment agreement, any noncompetition agreement signed by such an employee would be unenforceable. Furthermore, some noncompetition agreements are drawn in terms of geographic, rather than time, parameters.

Because of these potential legal issues and challenges, and due to differences in employees' geographic locations, job responsibilities, access to proprietary information, and other factors, such agreements should generally be used on an as-needed basis, rather than as a broad requirement for all employees. If management does determine that such an agreement is appropriate for certain employees, it should consult with legal counsel to ensure that the agreement is valid and enforceable under the applicable laws.

If an organization uses a noncompetition agreement, management should remind its employees about the agreement's provisions during exit interviews conducted before the end of their employment. When employees leave a company, it is a good idea to have them sign a statement in which they acknowledge that they understand the noncompetition agreement's terms and that they will abide by its provisions. Noncompetition agreements are typically employed along with a nondisclosure agreement, although nondisclosure agreements are not always tied to a noncompetition agreement.

Data Classification

According to the CERT (Computer Emergency Response Team) Insider Threat Center, organizations should implement a data classification policy that establishes what protections must be afforded to data of different value and sensitivity levels. Data classification allows organizations to follow a structured approach for establishing appropriate controls for different data categories. Moreover, establishing a data classification policy will help employee awareness.

In short, classifying an organization's data involves:

- Organizing the entity's data into different security levels based on the data's value and sensitivity
- Assigning each level of classification different rules for viewing, editing, and sharing the data

For more information on data classification, see the “Cyberfraud” chapter in this section of the *Fraud Examiners Manual*.

Data Retention and Destruction Policies

Organizations should implement data retention and destruction policies that detail how information should be created, obtained, used, saved, and stored, as well as how long information should be maintained and when it should be destroyed. Such policies are especially important given the growing amount, locations, and formats of digital information, which create additional risks and costs for companies that do not have such policies in place.

A data retention and destruction policy formalizes the procedures an organization takes to save and destroy documents received or created in the ordinary course of business, and these policies are an important component of any information security program.

Having such policies in place will help organizations:

- Avoid any adverse consequences resulting from failure to preserve information.
- Minimize the amount of data retained.
- Reduce the cost associated with retaining information.
- Improve information security and reduce the risk of data breaches.
- Minimize the amount of information to produce in response to subpoenas.
- Aid in litigation.
- Minimize the risk of destroying documents that should have been retained.
- Reduce the search, retrieval, and production costs of litigation-related discovery.

Accordingly, organizations without retention and destruction policies or with poorly implemented policies face serious risks and consequences. They could face monetary fines and sanctions, adverse inference jury instruction sanctions, or dismissal of their claims or defenses. Specifically, companies must be aware of preservation and spoliation of evidence. Courts can award sanctions for failing to preserve or mismanaging (spoliation) key documents or data.

Thus, organizations should institute policies and procedures for deciding which documents should be kept and which documents should be deleted.

Data Minimization

Organizations should practice data minimization. *Data minimization* refers to collecting and storing the minimal amount of information necessary to perform a given task. Data minimization is important to data security because thieves cannot steal what an entity does not have.

Data minimization is especially important for personal data. Individual expectations and privacy laws and regulations obligate organizations that collect personal data to maintain data security, and data minimization can be a practical and effective approach for meeting data privacy obligations.

Data minimization has long been enshrined in various privacy principles and related laws. For example, the Organisation for Economic Co-operation and Development (OECD) *Guidelines on the Protection of Privacy and Transborder Flows of Personal Data* (OECD Privacy Guidelines), which sets out general principles for protecting personal information, contains a collection limitation principle: “There should be limits to the collection of personal data and any such data should be obtained by lawful and fair means and, where appropriate, with the knowledge or consent of the data subject.” Likewise, the European Union’s (EU) General Data Protection Regulation (GDPR) addresses data minimization, the restriction of personal data collection, and the instruction for organizations to not collect personal data unless absolutely necessary. For further discussion of the GDPR, see the “Data Privacy” section of the “Individual Rights During Examinations” chapter in the Law section of the *Fraud Examiners Manual*.

Security Controls

Computer networks and communications are inherently insecure and vulnerable to attack and disruption, and it follows that management must use security controls to protect systems against threats such as unauthorized use, disclosure, modification, destruction, or denial of service.

The objective for securing computer systems and communication networks is to provide connectivity with acceptable response times, user-friendly access, and a secure mode at an acceptable cost to the organization.

Common controls used to secure computer systems and communication networks include:

- Physical access controls (e.g., hiring security guards, using locks, and physical access control devices)
- Logical access controls
- Network security
- Encryption
- Application security
- Separation of duties

For more information on information security controls, see the “Cyberfraud” chapter in this section of the *Fraud Examiners Manual*.

Measures to Guard Manual File Systems

Organizations must take reasonable measures to protect manual file systems, which are composed of all human-readable files and documents. These include items like contact lists, schedules, and calendars. To attack a manual file system, an information thief might pilfer trash, act as a cleaning crew member, or commit theft or burglary.

Reasonable measures to protect manual file systems include the following:

- Place sensitive documents in high-grade locked filing cabinets. It is advisable to lock sensitive documents in a safe when not in use.
- Use a cross-cut shredder for sensitive documentary waste, or have sensitive trash disposed of by a bonded waste-disposal company.
- Receive and send mail at a secure site (e.g., mail drops, post office boxes, or locked mailboxes). The key is that the site remains secure.
- Provide reasonable perimeter security for offices by using an alarm system and securing locks to doors and windows.
- Pay attention to securing auxiliary materials such as:
 - Calendars
 - Specialized internal telephone directories
 - Notebooks and expense logs from sensitive cases
 - Works in progress, such as reports, notes, and graphics on sensitive cases

- Mailing lists—all such lists that have proprietary value should have trapped names placed on them as a safeguard. A *trapped name* is a fictitious name with an address that the organization controls. If mail is ever delivered to the trapped name, it will be apparent that the list has been compromised. Furthermore, the nature of the mailing will probably indicate who bought the list, and might help the victim determine where the security breach occurred.
- Dry erase boards or other meeting room displays that might contain diagrams, charts, or sensitive notes (if such displays cannot be easily locked up, take a photo of them and secure these photographs)
- Writing tablets that have impressions from notes on sensitive topics (shred them every day)
- Computer printouts of sensitive data (keep them locked up and use a cross-cut shredder to dispose of them)

Organizations concerned about the possibility of corporate espionage should establish procedures for classifying and marking sensitive items and should have provisions for their short-and long-term storage, as well as their disposal or destruction. Large offices should have a structured log-out procedure for sensitive files so that it is always possible to determine who had what document, as well as where and when they had it.

Monitoring of Visitor Access

Management should monitor and limit visitor access. Visitors should be required to sign in and out of an organization logbook. It is considered a best practice to issue visitors a badge that identifies them as a nonemployee. Also, visitors should be escorted by a host at all times, and visitors should not be allowed into areas containing sensitive information.

Similarly, management should designate security personnel or someone to monitor maintenance work done in areas that might contain sensitive information.

Additionally, locks on doors leading to secure areas should be changed or reprogrammed regularly, especially if an employee has recently quit or been terminated.

Quiet Room

Management can prevent corporate spies from listening in on meetings through the use of a quiet room. A *quiet room* is an area that is acoustically and radio-frequency shielded so that conversations that occur within the room cannot be monitored or heard from outside the room.

Incident Response Plan

When a data breach occurs, the amount of time taken to respond is critical. A timely response can help prevent further data loss, bad publicity, and government penalties. Therefore, all organizations should have an *incident response plan* that describes the actions the organization will take when a data breach occurs. To be effective, an incident response plan must be in place and communicated to all relevant employees *before* a breach occurs.

For more information about incident response plans, see the “Cyberfraud” chapter in this section of the *Fraud Examiners Manual*.

Minimizing the Risks of Misappropriation Claims

Organizations must also prevent their employees from appropriating the proprietary information belonging to others.

A new hire from a competitor, for example, might expose the new employer to liability by using or disclosing secrets obtained from their previous employer in the course of their employment.

Moreover, a company can be held liable for misappropriation of proprietary information even if it is not aware that its employee is using or disclosing secrets in the course of their employment.

EXAMPLE

Novopharm, Inc. was found guilty of stealing trade secrets from its rival, Apotex, Inc. Court documents stated that a biochemist left Apotex and “secretly joined” Novopharm, bringing with him Apotex’s valuable trade secrets. Even though Novopharm’s officers claimed that they were not aware that the employee was using Apotex’s trade secrets, the court held Novopharm liable, finding that its chief executive officer (CEO) “closed his eyes to what was going on around him.”

Management can take various actions to prevent misappropriation by its employees. For one thing, management should carefully screen potential employees during the hiring process. They should seek to determine the potential employee's knowledge about another party's trade secrets, and they should learn about any restrictions on employment. Human resources (HR) personnel should ask potential employees whether they are subject to any agreements that bar them from competing with any current or former employer. If the employee is subject to any such agreement, legal counsel should review the agreement before any hiring decision is made.

For another thing, management should conduct new hire training on the importance of protecting information assets.

IDENTITY THEFT

Identity theft is a common type of fraud that is non-discriminatory in nature. Anyone can be targeted; the victim might be a college student, a retiree, a schoolteacher, or a successful attorney. Even businesses can be victims of identity theft.

Although there is no universal definition of identity theft, most law enforcement organizations use a definition similar to the following:

Identity theft is a crime in which someone wrongfully obtains and uses another person's personal data in some way that involves fraud or deception, typically for economic gain.

Identity thieves use personal information to steal people's identities. Such personal information might include a person's name, government identification number, date of birth, home address, email address, mother's maiden name, telephone number, and other identifying information. Identity thieves can exploit this information in a number of ways, including by opening bank or credit card accounts, taking over existing accounts, or obtaining loans in a victim's name without the victim's knowledge.

Perpetrators of Identity Theft

Unlike fraudsters who steal because of a perceived need, many identity thieves make a living stealing identities for profit or as a way to supplement their incomes. Although identity thieves can be employees, friends, or relatives, they are frequently members of organized crime groups, often based in China, Ghana, Nigeria, or Russia. In addition, many identity thieves are people with criminal records who hope to stay out of prison by committing crimes they deem to be less risky.

Identity theft, however, can be committed by anyone. Perpetrators of identity theft are sometimes the victim's coworkers. In cases involving business identity theft, the perpetrator is often one of the company's employees, vendors, or business associates. Undocumented immigrants frequently use false identities to hide their immigration status. People trying to hide their criminal records also engage in identity theft.

Victims of Identity Theft

Identity theft can happen to anyone. The following groups, however, are favorite targets of identity thieves.

Children

Identity thieves target children because children have no credit histories and neither the child nor the child's parents are likely to monitor the child's credit information. This gives the identity thief plenty of time to build the child's credit, open accounts, and then abscond with as much money as possible. Many of the children will not discover that their credit is ruined until they enter the workforce or apply for credit. Family members often perpetrate child identity theft.

Seniors

Identity thieves target seniors because, compared to younger victims, seniors often have more available cash, check their credit reports less frequently, and are less aware of identity theft and other fraud. Family members and other caregivers often defraud seniors, particularly when they live in residential facilities or have diminished mental capacity. Generally, seniors are less likely to report identity theft than younger victims.

Military

There are several factors that make members of the military vulnerable to identity theft. Military members are often deployed overseas for long periods of time, making it difficult for them to monitor their credit. For this reason, it is common for identity theft against military members to go undetected for years. In addition, military members sometimes have special needs, such as health problems, which can be exploited by fraudsters.

College Students

College students are a favorite target of identity thieves because they are inexperienced in using and managing credit. Many college students are not concerned about identity theft or other types of fraud and therefore do not take steps to protect themselves. Furthermore, most college students do not check their credit reports frequently.

The Deceased

Fraudsters often steal deceased individuals' identities. The obvious advantage is that the deceased do not monitor their credit. Additionally, family members might forget to inform creditors of the death, so the deceased person's financial accounts remain open. Identity

thieves can collect full names and birthdates from tombstones or obituaries, and they can then use various methods to obtain more personal information about the deceased, such as calling the funeral home and impersonating a family member.

Methods of Committing Identity Theft

There are two general methods of committing identity theft:

- Traditional identity theft
- Synthetic identity theft

Traditional Identity Theft

In *traditional identity theft*, a fraudster steals an individual's personal information and pretends to be that individual. For example, a fraudster might use an individual's name, government identification number, and date of birth to impersonate the individual and gain access to the individual's bank account. This is called an *account takeover*. In an account takeover, the fraudster typically changes the address associated with the account so that the victim does not receive immediate notice of new activity.

Another type of traditional identity theft is *true name fraud*, in which a fraudster uses an individual's personal information to open a new account in the individual's name. Unlike an account takeover, which involves an existing account, true name fraud involves a new account.

Synthetic Identity Theft

Unlike traditional identity theft, *synthetic identity theft* involves the use of a fictitious identity. A fraudster might use entirely fabricated personal information or a combination of real and fabricated information to create a new identity.

EXAMPLE

A fraudster creates a fictitious identity by combining a person's real government identification number with a fabricated name and birthdate. The fraudster uses that identity to apply for a credit card with a bank. The bank denies the application after a credit reporting agency informs the bank that the fictitious identity has no credit history. However, as part of its usual procedure, the credit reporting agency creates a new credit file for the fictitious identity with the information provided on the application. The fraudster has now successfully created a credit history for the fictitious identity. Over several years, the fraudster builds the fictitious identity's credit by opening new accounts and making timely payments. The fraudster then uses the fictitious identity to obtain a loan for \$20,000, which is never repaid.

Fraudsters often use children's government identification numbers to commit synthetic identity theft. This is because neither the child nor the child's parents is likely to monitor the child's credit, which gives the fraudster time to complete the scheme without detection. Even when an adult's personal information is used, synthetic identity theft can be difficult to detect because the fraud might not appear on the individual's credit report, or it might only appear in a sub-file.

Types of Identity Theft Schemes

This section discusses the most common types of identity theft schemes.

Financial Identity Theft

Financial identity theft occurs when a fraudster uses an individual's personal information for fraudulent financial transactions. Examples of financial identity theft include:

- Using an individual's stolen credit card or credit card number to purchase goods (account takeover)
- Impersonating an individual to gain access to the individual's bank account (account takeover)
- Using an individual's personal information to open a new credit card account (true name fraud)

Most identity theft involves accessing existing financial accounts or creating new financial accounts. Therefore, most identity theft is financial identity theft.

Criminal Identity Theft

Criminal identity theft occurs when fraudsters falsely identify themselves as other people to law enforcement while being arrested or investigated for a crime. The crime is then incorrectly attributed to the other person instead of the fraudster.

EXAMPLE

Because she is living in Canada illegally, Gloria Hodges purchases a fake ID. The fake ID contains Gloria's photograph and the name and birthdate of a real Canadian citizen, Lauren Beck. Gloria is arrested in Canada for driving while intoxicated (DWI). She identifies herself as Laura Beck and shows the fake ID to the arresting officer. As a result, the real Lauren Beck is mistakenly charged with DWI. Lauren does not discover the criminal identity theft until a year later, when the police stop her for a minor traffic offense, check her criminal record, and arrest her under an outstanding warrant.

Criminal identity theft is usually discovered when the victim is pulled over by law enforcement, attempts to renew a driver's license, or authorizes a criminal background check. Victims of criminal identity theft are at risk of arrest until their criminal records are corrected. Moreover, victims might be terminated or not hired for jobs in which criminal background checks are required.

Medical Identity Theft

Medical identity theft occurs when a fraudster uses another person's identity to obtain medical care, prescription drugs, or payments from the government. The following are examples of medical identity theft:

- A fraudster uses a victim's stolen driver's license and health insurance card to obtain prescription painkillers from multiple pharmacies.
- A pregnant fraudster uses a victim's stolen health insurance information to obtain maternity care at a hospital.
- A fraudster uses a victim's personal information to file claims for government disability benefits.

Medical identity theft can have dire consequences for the victim's health. Often, the victim's medical records are contaminated by the imposter's medical records, which can result in increased cost for medical insurance, denial of medical benefits, misdiagnosis, delayed or improper medical treatment, or even death.

EXAMPLE

A fraudster steals Jack's wallet, which contains his medical insurance card. The fraudster sells Jack's medical insurance information to an imposter, who uses it to obtain medical treatment at a hospital. While at the hospital, the imposter is diagnosed with a serious heart condition. Jack's electronic medical records are updated to include the new diagnosis. Several months later, Jack is rushed to the hospital after an automobile accident. Due to the incorrect diagnosis, his treatment options are limited.

Medical identity theft can be difficult to detect. Victims might not realize they have been defrauded until they are billed for medical services they did not receive or discover unpaid medical bills on their credit reports. In other cases, victims learn of the fraud when they are denied medical insurance benefits.

Insurance Identity Theft

In an *insurance identity theft* scheme, a fraudster impersonates another person to obtain insurance coverage or benefits. If the scheme involves medical insurance, it can also be classified as medical identity theft. However, not all insurance identity theft schemes involve medical insurance. Fraudsters can use identity theft to obtain benefits under many other types of insurance policies, including automobile insurance, homeowner's and rental insurance, life insurance, and liability insurance.

EXAMPLE

A fraudster uses Erin's stolen driver's license and government identification number to obtain an automobile insurance policy on the fraudster's car. Soon after the policy is issued, the fraudster falsely reports the car as stolen and obtains insurance benefits for the value of the car. Erin discovers the fraud when her automobile insurer raises her rates.

Tax Identity Theft

In a *tax identity theft* scheme, a fraudster uses another person's identity to file a tax return and obtain a refund from the government.

EXAMPLE

A fraudster uses John's government identity number to file a fraudulent tax return in John's name. The government accepts the fraudulent return and issues a tax refund to the fraudster. When John files his tax return months later, the government rejects it because a tax return has already been filed in his name.

In some countries, taxpayers can reduce their taxes by claiming their children or other family members as dependents. In those countries, fraudsters sometimes commit tax identity theft by using stolen government identity numbers to claim strangers as their dependents.

Employment Identity Theft

In an *employment identity theft* scheme, a fraudster impersonates another person to secure a job. Fraudsters often commit this type of identity theft because they are not legal citizens or a background check would reveal disqualifying information about them.

EXAMPLE

Petra is incarcerated for embezzlement in the United States. Upon her release, Petra travels to Australia, where she purchases a fake ID to hide her criminal record. The fake ID contains the name and government identification number of Samantha Fell, an Australian citizen. Petra uses the fake ID to obtain a job in Australia under Samantha's name. Later, Petra steals expensive equipment from her employer and flees the country. The Australian government issues a criminal warrant for Samantha Fell.

For most victims of employment identity theft, the government provides notice of the fraud. For example, the government might inform the victim that there are taxes owed for unreported wages or that multiple tax returns have been filed under the victim's government identification number. Another red flag is a credit report that contains the name of an unknown employer.

Business Identity Theft

While individuals are the usual targets of identity theft, identity thieves sometimes target businesses. *Business identity theft* occurs when a fraudster impersonates a business to commit financial fraud.

EXAMPLE

Reko Company is a Delaware corporation that manufactures industrial equipment. As required by law, the company's business filings in Delaware list its president, Kate Winnel. For a \$175 fee, a fraudster files an amendment to the company's business filings, listing a new business address and changing the name of the president from Kate Winnel to George Kitan, a fictitious person. The fraudster uses the George Kitan identity, along with a fake ID, to conduct a number of transactions on the company's behalf, including obtaining a line of credit, purchasing expensive machinery, and filing a fraudulent tax return. The company is unaware of the transactions because all relevant correspondence goes to the new business address.

In addition to impersonating an existing business, fraudsters can use government business filings to reinstate a closed or dissolved business. They can also trick third parties by creating a new business with a name similar to an existing business.

For identity thieves, there are a number of reasons to target a business rather than an individual. First, the potential rewards are greater; businesses tend to have larger bank account balances, easier access to credit, and higher credit limits than individuals. Second, businesses are less likely to notice new or unusual financial transactions because they tend to engage in more transactions than individuals. Finally, the information necessary to commit business identity theft (e.g., business or tax identification numbers) is often publicly available online or in government records.

Small businesses are particularly at risk for business identity theft because they have the lines of credit, capital, and other features desired by fraudsters, while often lacking the resources and technology needed to properly defend against identity theft. Smaller companies and individually owned businesses often rely heavily on the owner's personal credit, making the impact of business identity theft even more destructive. Furthermore, small businesses might be especially wary of revealing identity theft out of fear that consumers will take their business to a larger company that ostensibly offers an increased level of data security.

How Identity Thieves Steal Information

Identity thieves use a number of methods to steal personal and business information. Some of the methods, such as computer hacking, are complex and involve high technology. Other methods, such as dumpster diving, are simple and do not require great skill.

Dumpster Diving

Dumpster diving involves looking through someone else's trash. Fraudsters often engage in dumpster diving to find the personal and business information that makes identity theft possible.

Most people do not destroy their personal financial data; they simply throw the information away with the rest of their trash. Dumpster diving can yield bills, credit card receipts, bank statements, and other items that contain a person's name, address, and telephone number. Solicitations for pre-approved credit cards are especially valuable to identity thieves, but even nonfinancial information can be useful. For example, a discarded birthday card might contain a potential victim's name, birthdate, and address.

In addition to targeting people's trash, identity thieves target the trash of businesses, such as banks, insurance companies, and hospitals. A business's trash can contain sensitive information about the business, as well as its customers.

Discarded Devices

Fraudsters commonly obtain personal and business information from improperly discarded computers, media drives, copiers, printers, mobile phones, and other devices. Like computers, some copiers and printers have internal hard drives that store sensitive data. Because it is possible to recover deleted data, fraudsters might search for sensitive information on second-hand devices that they purchase online or obtain from another source. Data can be permanently erased from such devices with specialized software.

Mail Theft

Mail theft is another method that identity thieves use to obtain personal and business information. Fraudsters can steal mail from public mailboxes or the private mailboxes of individuals and businesses. Private mailboxes are often unsecured, making mail theft easy. Public mailboxes usually have security features, such as locks and specially designed mail slots, but determined thieves can circumvent these features. In addition, mail carriers and other postal workers are sometimes accomplices in mail theft schemes.

Both incoming and outgoing mail can provide useful information for identity thieves. Incoming mail might contain bills, financial statements, insurance information, or solicitations for pre-approved credit cards. Outgoing mail often contains checks or other payments, along with statements that include the customer's account, bank, or credit card number. A lucky fraudster might even find a money order in outgoing mail.

Change of Mailing Address

Another way to obtain personal or business information is to surreptitiously change the victim's mailing address (or email address) to an address selected by the identity thief. In this way, the identity thief receives the victim's mail directly, and no theft is required.

EXAMPLE

A fraudster changes a victim's mailing address by completing a government form and mailing it to the post office. On the form, the fraudster lists a PO Box as the victim's new mailing address. As part of its security protocol, the post office mails a confirmation letter to the original address, stating that the victim's mailing address has changed. However, it takes several days for the letter to arrive. In the meantime, the fraudster receives all of the victim's mail at the PO Box.

In this example, the fraudster changed the victim's mailing address on file with the government, causing all of the victim's mail to be sent directly to the fraudster. The purpose of the fraud was to obtain the personal information necessary to commit identity theft. But fraudsters also change victims' addresses for another purpose—to conceal identity theft. When an account takeover occurs, for example, the fraudster changes the mailing address (or email address) to which monthly statements are sent. This can delay the victim's discovery of the fraud.

Shoulder Surfing

Shoulder surfing is the practice of observing another person (e.g., looking over the person's shoulder) to gather personal information. Shoulder surfing is especially effective in crowded areas where a fraudster can stand close to a victim without being noticed. While in close proximity, the fraudster can eavesdrop on the victim's telephone conversation, view the victim's credit card number, or gather other personal information. Identity thieves often watch victims as they enter their personal identification numbers (PINs) at automated teller machines (ATMs) or fill out bank deposit slips at their banks.

Piggybacking

Piggybacking is a method used to gain access to restricted areas, including computer systems, in which the fraudster exploits another person's access capability. Examples of piggybacking include:

- Following an authorized person into a restricted area, either surreptitiously or by convincing the authorized person that the piggybacker is also authorized
- Pretending to be a member of a large crowd of people authorized to enter a restricted area

Piggybacking can also be used to gain access to a company's secured computer network. Piggybackers might access a computer network while an authorized user is distracted, or they can take advantage of the user's failure to properly log out of the network. In addition, piggybackers might convince authorized users to share their computer log-in information.

Social Engineering

In the context of identity theft, *social engineering* refers to the psychological manipulation of people to trick them into revealing personal or business information. Social engineering exploits the natural tendencies of humans to be cooperative and to trust others. After researching a victim, social engineers often impersonate someone the victim can trust, such as an authority figure or a business associate.

Social engineering often involves *pretexting*, the act of using an invented scenario (i.e., a pretext) to persuade a person to release information or perform an action. Identity thieves often engage in pretexting by impersonating the victim's bank or another financial institution with which the victim has a business relationship. In addition, pretexters commonly impersonate:

- Government employees
- Law enforcement or court personnel
- Representatives of the victim's internet service provider (ISP)
- Strangers in need of help

If the target is a company, pretexters might impersonate the company's high-level employees, IT professionals, or legal department. They might also pretend to be the company's customers or vendors.

Additional discussions of social engineering can be found in the "Cyberfraud" and "Theft of Data and Intellectual Property" chapters of this section of the *Fraud Examiners Manual*.

Phishing

Phishing is a type of social engineering. In modern phishing schemes, fraudsters use electronic communications to impersonate trusted individuals or entities. Phishers typically use emails to direct internet users to imitation websites that look legitimate, such as log-in portals for online banks, retailers, or government agencies. Phishers actually control these sites and use them to steal sensitive information, such as bank account details and passwords. Other phishing schemes involve corrupted files that install malware or allow the attackers access to a computer system once the victim has downloaded and opened the corrupted files.

EXAMPLE

In 2003, many eBay customers received fraudulent emails purporting to be from the company. The emails stated that the customers' accounts had been compromised. The customers were instructed to re-register at the eBay website and were provided a hyperlink. When they clicked on the hyperlink, the customers were directed not to the eBay website, but to a clone site operated by fraudsters. The clone site was carefully designed to look like the eBay website, and it directed customers to enter their personal information, including their credit card numbers, government identification numbers, dates of birth, and mother's maiden names.

In the eBay example, the fraudsters sent out thousands of emails indiscriminately. By contrast, *spear phishing* schemes target specific individuals or businesses. This type of scheme generally requires fraudsters to research the target and compose a highly customized email.

EXAMPLE

In 2016, the German company Leoni AG lost millions to a spear phishing scheme. According to reports, the company's chief financial officer (CFO) received an email asking her to wire \$44 million to a specific bank account. The email appeared to be from one of the company's executives, who frequently requested wire transfers by email. In fact, the email was a clone created by fraudsters, probably after months of researching the company's internal procedures. Because the request followed the company's usual procedure, the CFO approved the \$44 million wire transfer, which went directly to the fraudsters.

The fraud committed against Leoni AG was a type of spear phishing known as *business email compromise* (BEC), which is also discussed in the “Cyberfraud” and “Payment Fraud” chapters of this section of the *Fraud Examiners Manual*. Additional information on phishing can also be found in the “Cyberfraud” and “Theft of Data and Intellectual Property” chapters.

Vishing

While phishing generally uses emails to obtain information for identity theft, *vishing* (or *voice phishing*) schemes use telephone calls or voice messages to trick targets into revealing personal or business information. A more detailed discussion of vishing can be found in the “Cyberfraud” chapter of this section of the *Fraud Examiners Manual*.

SMiShing

SMiShing refers to the use of text messages (also known as *short message service* or *SMS*) to trick targets into revealing personal or business information. SMiShing is discussed in more detail in the “Cyberfraud” chapter of this section of the *Fraud Examiners Manual*.

Pharming

In a *pharming* scheme, internet users are automatically redirected from a legitimate website to an imitation website. The users then unknowingly provide information to identity thieves through the imitation website. A more detailed discussion of pharming can be found in the “Cyberfraud” chapter of this section of the *Fraud Examiners Manual*.

Baiting

In a *baiting* scheme, fraudsters leave malware-infected USB flash drives, CD-ROMs, or similar items in places where people will find them, such as parking lots. The items often have a label designed to elicit curiosity or greed in the victims (e.g., “FREE PRIZE”). Alternatively, the item could be left in a workplace break room with a label that seems relevant (e.g., “Year-End Report”). When the item is inserted into the victim’s computer, the computer or network is infected, giving the identity thief access to information.

Credit Card Skimming

In *credit card skimming* schemes, fraudsters use skimming devices to surreptitiously scan and store credit card numbers. This information can then be sold to identity thieves or used to commit identity theft directly. Identity thieves can use the numbers to make online purchases or to create fake cards for in-store transactions.

Credit card skimming is discussed in more detail in the “Payment Fraud” chapter of this section of the *Fraud Examiners Manual*.

Malware

Identity thieves use malware to steal personal and business information from computers. The type of malware most commonly associated with identity theft is *spyware*, software that collects and reports information about a computer user without the user's knowledge or consent. The presence of spyware is typically hidden from the user and can be difficult to detect. Spyware can perform many different functions, including harvesting private information.

Malware is discussed in more detail in the “Cyberfraud” chapter of this section of the *Fraud Examiners Manual*.

Computer Hacking and Data Breaches

Computer hacking refers to the use of technology to gain unauthorized access to sensitive information on a computer system. Computer hackers target companies' computer networks for a number of reasons.

If the personal information of a company's customers is compromised, this is known as a *data breach*. Personal information stolen in data breaches is often sold on illegal trading websites, where criminals from around the world buy stolen credit card numbers, government identification numbers, and other sensitive information. Sometimes, the company is not aware that a data breach has occurred until it is notified that its information is for sale on such websites.

Computer hacking is discussed in more detail in the “Cyberfraud” and “Theft of Data and Intellectual Property” chapters of this section of the *Fraud Examiners Manual*.

Malicious Insiders

There are different kinds of insiders, including employees, business associates, relatives, and friends, all of whom might have access to sensitive information. Insiders often play a key role in identity theft. Some insiders steal information to further their own identity theft schemes, while others are paid by criminals to steal the information.

Methods of Preventing Identity Theft

Identity Theft Prevention for Individuals

The following are some of the steps individuals can take to protect their personal information and prevent identity theft:

- Do not give out government identification numbers unless absolutely necessary.
- Do not carry government identification cards (or numbers) in purses or wallets.
- Create complex passwords or passphrases that are at least eight characters in length and contain upper- and lowercase letters, numbers, and symbols.
- Do not reuse passwords. Use a different password for every website, account, or device.
- Never send personal information, such as a password or government identification number, via email. Reputable organizations will not request personal information by email.
- When available, use biometric authentication (e.g., fingerprints, voice recognition).
- Create unique answers for security questions. Do not choose answers containing personal information that is publicly available (e.g., name of high school, mother's maiden name).
- Protect computers with strong and regularly updated firewall and antivirus software, and promptly install all security updates and patches.
- Avoid suspicious websites.
- Delete messages from unknown senders without opening them.
- Only download software from trusted websites.
- Avoid using unsecured, public Wi-Fi networks.
- Limit the amount of personal information shared on social media.
- Use software to permanently erase all data from hard drives before disposing of computers, smartphones, copiers, printers, and other electronic devices.
- Secure physical mailboxes with a lock, check physical mail regularly, and instruct the post office to suspend mail during vacations.
- Shred all sensitive documents.
- Opt out of unsolicited offers for pre-approved credit cards or other lines of credit.
- Pay attention to billing cycles and review all bills and statements.
- Check credit reports regularly.

Identity Theft Prevention for Businesses

Any business that collects personal information from its customers or employees is a potential target of identity thieves. Fraudsters want to steal that information and use it to commit identity theft. Therefore, businesses must have procedures in place to protect any personal information in their possession.

The following are some of the steps businesses can take to protect personal information and prevent identity theft:

- Limit the personal information collected from customers. For example, do not collect customers' government identification numbers unless there is a legal requirement to do so.
- Restrict employees' access to the personal information of customers and coworkers.
- Use network-security tools to monitor who accesses personal information.
- Do not retain personal information for longer than necessary.
- Adopt an information-handling policy that governs how personal information is stored, protected, and disposed of. Strictly enforce the policy, and discipline employees who violate it.
- Conduct regular employee training regarding the company's information-handling policy and best practices for preventing identity theft.
- Ensure the security of buildings by using locks, access codes, and other security features.
- Keep physical documents containing personal information in locked rooms or locked file cabinets.
- Secure all computer networks and electronic information.
- Use encryption to protect all personal information stored by the company or sent to third parties. Encryption should also be used to protect information sent over the company's wireless network.
- Restrict the use of laptops to those employees who need them to do their jobs.
- Require employees to use complex passwords or passphrases.
- Where permitted by law, perform background checks on prospective employees.
- Thoroughly investigate contractors and vendors before hiring them.
- Do not use government identification numbers as employee identification numbers or print them on paychecks.
- Perform regular audits of information-handling practices, network security, and other internal controls.
- Create a data breach response plan.

How to Respond to Identity Theft

Victims of identity theft should take the following actions:

- File a police report with local law enforcement authorities, and keep a copy of the report. Many banks and credit agencies require a police report before they will acknowledge that identity theft has occurred.
- If a wallet or purse was stolen, immediately cancel all credit and debit cards and get replacements.
- Put a stop payment on all lost or stolen checks.
- Request a copy of all credit reports and review them for unauthorized account activity.
- Report unauthorized charges and accounts to the appropriate bank, credit card company, or credit reporting agency immediately by phone and in writing.
- Change account numbers or close accounts that are affected by the fraudulent activity.
- Contact all credit reporting agencies to have a security alert or freeze placed on credit reports.

FINANCIAL INSTITUTION FRAUD

External fraud schemes are those committed by outside entities, typically by individuals or groups of individuals against organizations. Fraud schemes committed by outsiders usually occur within specific industries. Therefore, the following chapters are organized by type of industry, starting with financial institution frauds. Because some schemes are committed by collusion between an organizational insider and an outsider, some frauds can be classified as both internal and external schemes.

Financial institutions include banks, savings and loans, credit unions, and other governmentally insured repositories. Financial institution fraud is also known by the more generic term of *bank fraud*. Check fraud and credit card fraud, as applied to both merchants and financial institutions, are discussed in the “Payment Fraud” chapter.

A *bank* is defined as an organization engaged in any or all of many financial functions, such as receiving, collecting, transferring, paying, lending, investing, dealing, exchanging, and servicing (via safe deposit, custodianship, agency, or trusteeship) money and claims to money, both domestically and internationally.

Some additional country-specific information related to financial institution fraud that might not pertain to a global audience can be found in the “Supplemental Regional Information” section of this chapter located on fraudexaminersmanual.com.

Embezzlement Schemes

Embezzlement is the wrongful taking or conversion of the property of another by a person to whom it has been lawfully entrusted (or to whom lawful possession was given). *Misapplication of bank funds* is a type of embezzlement in which bank employees wrongfully take or convert another party’s property, often from customer accounts, for the benefit of the employee or someone else.

Types of Embezzlement Schemes

There are various embezzlement schemes that have been used over time against financial institutions and their customers. The following examples are not an exhaustive list but are rather a summary of the more commonly employed schemes.

False Accounting Entries

Some employees are in positions of trust in which they have the ability to use or relocate funds on behalf of customers or the financial institution itself. In *false accounting entry schemes*, employees debit the general ledger to credit their own accounts or cover up a theft from a customer account. In other words, employees adjust the general ledger to cover the stolen amount.

Suspense Account Schemes

A *suspense account* refers to the section of an organization's books where unclassified debits and credits are recorded. Placing an entry in a suspense account is designed to be a temporary measure, pending the ultimate disposition of the transaction. Employees often use suspense accounts to perpetrate fraud against their employer at both financial institutions and other types of organizations. However, financial institutions make heavy use of various types of suspense accounts, making such schemes a unique fraud risk in this industry.

In a suspense account scheme, the employee makes a fictitious debit entry to a suspense account and offsets the entry with a credit to an end point—a means to remove funds from the financial institution—under the control of the individual (e.g., a checking account, an official check account, or a wire account). These entries are continuously cleared by future, and often increasingly large, fictitious debit entries (similar to a lapping scheme). There are several types of suspense accounts at financial institutions that fraudsters might use, including:

- Loans in process
- Interdepartmental transfers
- Currency in transit
- Refunds on insufficient funds charges
- Due from banks

False or Unauthorized Transfers from Internal Accounts

There are several types of normal transfers using internal accounts, especially in operating account and general ledger account transactions. A person with the ability to make such transactions might substitute a personal account for one of the internal accounts.

Unauthorized Withdrawals

In an *unauthorized withdrawal scheme*, employees simply make unauthorized withdrawals from customer accounts; they do not attempt to cover up the theft by adjusting the financial institution's general ledger. These schemes are hard to conceal because the customer will

complain, but the subject might plan to flee once the funds are transferred or target a customer who is unlikely to notice the missing funds right away.

Unauthorized Disbursement of Funds to Outsiders

Additionally, employees might abuse their authority to approve fraudulent (i.e., counterfeit, forged, stolen) instruments or otherwise make an unauthorized disbursement of funds to an outsider. While the employee often has a financial incentive for doing so, there have been many cases where the employee made an improper disbursement in a misguided attempt to be cooperative with customers.

Paying Personal Expenses from Bank Funds

An officer or employee causes the bank to pay personal bills and then causes amounts to be charged to bank expense accounts.

Theft of Physical Property

Employees or contractors remove office equipment, building materials, and furnishings from bank premises.

Moving Money from Customers' Dormant or Inactive Accounts

Persons with apparent authority create journal entries or transfer orders not initiated by customers to move money among accounts. The accounts used are typically *dormant* or *inactive* accounts, which are those accounts that show little or no activity. Often, contact with the account holder by confirmation, letter, or telephone is not possible. Such accounts are to be transferred to dual control and recorded in an inactive accounts ledger.

Dormant funds are highly susceptible to embezzlement. The rationale is that funds embezzled from active accounts are likely to be missed quickly, while dormant account holders are less likely to report problems. Many financial institutions lock dormant accounts after a certain time period (e.g., one year of inactivity), requiring manual override to conduct additional transactions. However, this process can be manipulated. Typically, the perpetrator first identifies accounts that are or are about to be dormant and somehow manipulates them to make it appear that they are not dormant, such as by creating a nominal and fictitious transaction. Then, the employee creates journal entries or transfer orders to move the funds into an account that the employee controls (often a shell organization).

Unauthorized, Unrecorded Cash Payments

Directors, officers, or employees cause cash to be disbursed directly to themselves or accomplices and do not record the disbursements.

Theft and Other Unauthorized Use of Collateral

Custodians steal, sell, or use collateral or repossessed property for themselves or accomplices.

Skimming of Irregular Receivables

As with any organization, a financial institution's receivables are vulnerable to skimming schemes in which the fraudster intercepts incoming payments before they are entered into the institution's books. The nature of financial accounts creates some unique risks due to the relatively large proportion of irregular accounts receivable. Receivables that are long past due or that have already been written off are prime targets for fraudsters because no one is surprised when those funds never show up in the books.

Detection Methods

There are several methods by which embezzlement can be detected. Generally, if the dollar amount of the embezzlement scheme is small enough such that the financial statements will not be materially affected, embezzlement fraud can be most effectively detected through the review of source documents (e.g., receipts, deposit slips). There can be many types of clues in the source documents, and often the particular situation will determine what the fraud examiner needs to look for. The following are common red flags in source documents that might indicate that embezzlement has occurred:

- Missing source documents
- Unusual amount of out-of-sequence check numbers
- Payees on source documents (e.g., checks) do not match entries in the general ledger
- Receipts or invoices lack professional quality
- Duplicate payment documents
- Payee identification information that matches an employee's information or that of their relatives
- Apparent signs of alteration to source documents
- Lack of original source documents (photocopies only)

If the scheme is so large that the institution's financial statements are affected, then a review of the source documents will serve to confirm or refute an allegation that an embezzlement scheme has occurred or is occurring. Generally, for large embezzlements, the most efficient

method of detection is an analysis of the financial statements (which is also a review of documents). Some common suspicious items in financial statements are:

- An abnormal increase in accounts receivables that are past due or written off
- Master accounts that do not equal the sum of their individual customer accounts
- Excessive voids or credits
- An abnormal increase in reconciling items

Many embezzlement frauds are detected when the financial institution regularly conducts reconciliation. It is also important to conduct independent review of high-risk accounts, such as new customer accounts and suspense accounts.

Loan Fraud

Loan fraud is a multifaceted activity that includes several types of criminal activities. Larger loan fraud schemes often involve real estate lending and collusion between insiders and outsiders. Loan fraud represents the highest risk area for financial institutions. Although the number of occurrences might be small, the dollar amount per occurrence tends to be large.

Common Loan Fraud Schemes

Loans to Nonexistent Borrowers

This type of scheme uses false applications, perhaps with inaccurate financial statements, which are knowingly or unknowingly accepted by loan officers as the basis for loans. This type of loan fraud can be perpetrated by people either external to the lending institution (“external fraud”) or by officers, directors, or employees of the victim institution (“internal fraud”).

Sham Loans with Kickbacks and Diversion

Loan officers will sometimes make loans to accomplices, who then share all or part of the proceeds with the lending officer. In some instances, the loans are charged off as bad debts; in other instances, the fake loans are paid off with the proceeds of new fraudulent loans.

Double-Pledging Collateral

Borrowers pledge the same collateral (i.e., an item of value used to secure or guarantee a loan) with different lenders before liens are recorded and without telling the lenders.

Reciprocal Loan Arrangements

Insiders in different banks cause their banks to lend funds or sell loans to other banks with agreements to buy their loans—all for the purpose of concealing loans and sales.

Swapping Bad Loans—Daisy Chains

In a daisy chain, a bank buys, sells, and swaps its bad loans for the bad loans of another bank, creating new documentation in the process. Its purpose is to mask or hide bad loans by making them look like they are recent and good.

Linked Financing

Large deposits (usually brokered deposits) are offered to a bank on the condition that loans are made to particular individuals affiliated with the deposit broker. High returns are promised, but the loans are of a longer term than the deposits (hot money). Sometimes kickbacks are paid to the broker or banker.

Loan Applications with False Information

Sometimes loan applicants provide false information about their credit situation and/or overstate their assets.

Credit Data Blocking

In some countries, financial institutions largely rely on credit reports to determine whether to extend credit to customers. Fraudsters might attempt to manipulate these reports in order to receive loans that they otherwise could not. In a credit data blocking scheme, the perpetrator first applies for and obtains loans for property, vehicles, etc. but intentionally defaults on them. Rather than allowing their credit report to reflect the defaulted loans, the perpetrator asserts that the initial loans were instances of identity theft. While the validity of the fraud claims is being checked, the perpetrator's negative credit history is temporarily removed from their credit report. This allows the perpetrator to take out more loans, which they will also intentionally default on.

Single-Family Housing Loan Fraud

In this scheme, unqualified borrowers misrepresent personal creditworthiness, overstate their ability to pay, and misrepresent characteristics of the housing unit. Such acts might include reporting inflated income, moving debt into a dependent's name, reporting inflated square footage of the collateral, or even bribing an appraiser to value the home at a higher amount than the market value.

Construction Loans

Construction lending has different vulnerabilities than other permanent or interim lending. More risks are associated with construction projects than with already-built projects. Construction loan fraud schemes are numerous; the more common ones are related to estimates of costs to complete, developer overhead, draw requests, and retainage/holdback schemes.

ESTIMATES OF COSTS TO COMPLETE

When borrowers approach a lending institution for construction financing, they typically have a development plan, complete with an engineering report, appraisal, and budget for construction costs. The construction cost budget is, by definition, an estimate. As the project is built out, the budget will be revised to reflect actual expenses. Budgets are delineated by specific line item, such as slab, exterior glass, grading, landscaping, and tenant improvements. As the project proceeds, certain over- and under-budget costs are incurred. These costs should be represented by a change order.

If the loan agreement has been properly documented and enforced, no material differentiation from the budget should occur without the lender's knowledge and consent. However, the developer/borrower might misrepresent the true nature of the under- or over-budget amount to mislead the lender. The architect/engineer and the lender's inspector should examine all budget changes. The impact of change orders might result in the loan becoming out of balance (cost to complete exceeds available loan and equity funds). Generally, developers hide or conceal their over-budget construction costs in two common places. The first place is contingency and the second is to remove allocations from tenant improvements and apply them to shell construction.

Most budgets contain a contingency line item in the event actual costs exceed the budgeted amounts. Unfortunately, many developers and lenders do not monitor the total impact on removing allocations from the contingency budget. In addition, savings are not allocated to the contingency line item when under-budget costs are realized. It is also common to reallocate funds from one account to make up for a shortfall in another account. Generally, tenant finish is estimated at a particular dollar amount per square foot. This allows the developer considerable latitude in negotiating with tenants.

However, before the entire space has been leased and the construction costs have been incurred, the amount allocated to tenant improvements remains budgetary. If the developer is

allowed to reallocate amounts from this budget line to shell construction, then when it comes time to negotiate leases and finish out the space, the developer might be short of available funds. If the tenant finish is treated as a hold-back and not to be reallocated or disbursed except for its intended purpose, then there is a greater chance of the loan not becoming over-disbursed (cost to complete exceeding the available financing).

DEVELOPER OVERHEAD

It is not uncommon in construction financing to have a budget line item for developer overhead (also called *general conditions*). This is a ripe area for abuse. The purpose of developer overhead is to supply the developer with operating capital while the project is under construction. This overhead allocation should not include a profit percentage, as the developer realizes profit upon completion.

In essence, the overhead budget is as if the lender is making two types of loans: a real estate loan and a working capital loan for the overhead. Unfortunately, there is seldom, if ever, any separate underwriting for the overhead portion. The overhead is merely added as a construction cost, whose ultimate collateral is the property and not some other short-term collateral. Historically, troubled construction loans or foreclosures due to fraud have been totally disbursed in the developer overhead category.

DRAW REQUESTS

Construction loan advances are generally supported by draw requests. A *draw request* is the documentation substantiating that a developer has incurred the appropriate construction expenses and is now seeking reimbursement or direct payment. A typical fraud scheme in this area involves requesting advances on the loan for inappropriate costs, such as personal expenses and/or construction costs for an unrelated project. Draw requests provide the greatest opportunity for a developer to commit fraud against the lender because the lender relies upon the developer's documentation.

Generally, a draw request or pay application is made once a month and is verified by a quantity surveyor (QS) or other authorized entity as agreed to by the financial institution. The request should be accompanied by the following documents:

- Paid invoices for raw materials
- Lien releases from each subcontractor
- Inspection reports
- Canceled checks from previous draw requests

- Bank reconciliation for construction draw account for previous month
- Loan balancing form, demonstrating that the loan remains in balance
- Change orders, if applicable
- Wiring instructions, if applicable
- Proof of developer contribution, if applicable

The documentation required as support for each draw request will vary depending on the payment method (such as direct, dual payment, disbursing agent, wire transfer, or reimbursement). Any missing or altered documentation is a red flag that something is amiss with the draw request. All advances on the loan should be adequately documented.

Some or all of the following steps should be performed before advancing funds on a construction loan. These steps are not represented as being all-inclusive, but rather the preliminary disbursement questions that the disbursing party should address.

- Examine the draw and determine if sufficient supporting documentation has been submitted.
- Reconcile the amounts requested with the approved budget. Account for any differences.
- Determine that the amounts requested have been properly inspected and approved.
- Determine if the proper lien releases have been submitted for work performed.
- Reconcile any change orders with the approved budget. Determine if the change orders have been approved.
- Prove the clerical accuracy of the documentation submitted.
- Ensure that work completed has been inspected by the lender's architect/engineer.
- Determine if there are any requests for soft (nonconstruction) costs and whether they are appropriate.
- Determine if there are any budget changes. If so, what are they for? Have they been approved?
- Prepare a cost-to-complete estimate to determine that the loan remains in balance.
- If tenant improvement funds have been requested, establish that there is a signed lease on file. Is the request appropriate for the terms and conditions of the lease? Has the lease been approved?
- If homeowner option funds have been requested, establish that there is a signed purchase contract on file. Is the request appropriate for the terms and conditions of the contract? Has the contract/purchaser been approved?

- Examine payment requests and determine if there are new or previously undisclosed subcontractors. If so, determine why.
- Ensure that the title update has been received.

RETAINAGE

The final area of major concern in construction lending is retainage (sometimes called the *holdback*). *Retainage* is the amount withheld from each draw request until the construction is complete and the lien period has expired. There are at least two reasons why construction loans contain a retainage provision. The first reason is to keep the contractor's interest in the project until all the work has been completed and accepted by the owner. The amount of the retainage represents part, if not all, of the contractor's profit. Therefore, if the profit is not paid until the project has been completed, then presumably the contractor will complete the assignment on time and on budget.

The second reason for the retainage is to ensure that the work of subcontractors is completed and that the general contractor pays the subcontractor so that no liens are filed. If the general contractor fails to pay the subcontractor, then the subcontractor will probably file a lien on the project. If the retainage will not be released until such time as the lien period has expired, then there are at least some funds available to defray the cost of fighting the lien or making a duplicate payment because the general contractor might have embezzled the first payment without paying the subcontractor.

Loan Collateral Sold Out of Trust

Many loans are secured by the property purchased with the loan proceeds—houses, vehicles, business inventory, etc. Usually, the borrower is not authorized to sell the loan collateral without the lender's permission or without paying the lender the proceeds. However, the borrower might sell the property "out of trust," meaning that they sell it without informing or obtaining authorization from the financial institution. Often, the financial institution does not discover the illicit sale until the borrower defaults, and there is no collateral to recover. These schemes are especially common with loans for rental equipment that is sold out of trust.

Red Flags of Loan Fraud

There are several red flags of loan fraud. Many times the schemes are perpetrated in tandem with other schemes, so what appears to be a red flag for one scheme might in fact lead the fraud examiner to one or more schemes.

Nonperforming Loans

A *nonperforming loan* is a loan that is in default or close to being in default. The interest and principal payments might be overdue, and the creditor has reason to believe the loan will not be collected in full. This is often indicative of a fraud scheme.

Fraud schemes resulting in a nonperforming loan include:

- *Fraudulent appraisals*—The cash flow cannot support an inflated loan and resulting debt amount.
- *False statements*—The loan was made on false or fraudulently presented assumptions.
- *Equity skimming*—The borrower never intended to make the underlying loan payments.
- *Construction over-budget items*—The over-budget amount might be a concealment method for other schemes such as embezzlement, misappropriation, or false statements.
- *Bribery*—The loan was made because the lender received a bribe or a kickback from the borrower.
- *Land flips*—The purpose of the loan was to finance the seller out of a property that has an artificially inflated value.
- *Disguised transactions*—The loans are sham transactions, without substance, made to conceal other ills.

High Turnover in Developer's Personnel

One red flag of loan fraud to look for, particularly in construction lending, is whether the real estate developer is experiencing a higher-than-normal employee turnover. Typically, when a developer experiences a high degree of turnover, something is wrong with the internal operation. This is often a preamble for other problems to come.

High Turnover in Tenant Mix

If the tenant mix in a commercial project (such as a retail center or an office building) is suddenly undergoing a major change, there might be some problem with the management of the project or with the method of allocating the pass-through expenses, such as utilities or maintenance. In addition, a decline in the tenant mix might be an indication that the deferred maintenance for the project is not being properly attended to.

Change Order Abuse

In the course of many projects, such as road repair or building construction, unanticipated changes in conditions can result in the parties agreeing to amend the contract terms after signing, perhaps to increase their scope or cost. This is known as a *change order*.

Change orders can have the same impact on a project as altering the original documents. As with anything that is contracted for on a bid basis, change orders could also be an indication of collusive bidding. A common change order abuse scenario involves collusion between the contractor and personnel from the procuring entity. The corrupt contractor submits an artificially low bid to ensure that they are awarded the contract (often with inside knowledge of competing bid amounts), but after the procuring entity awards the contract, the corrupt contractor increases the contract price with subsequent change orders. Furthermore, change orders might be an indication that the original project was not feasible and that shortcuts are uncovering other problem areas. Change orders should be approved by the architect and engineer on the project in addition to the lender's inspector.

Loan fraud schemes involving project management often involve the use of change orders, so it is important to be able to recognize red flags in this area. The necessity for change orders can vary widely, depending on the type of project. Ultimately, the key characteristic that the fraud examiner should look for in change orders is abnormality, which can come in many forms.

Change orders are often submitted along with draw requests. Although many times the change orders represent legitimate construction changes (for design, cost, or other things), they can also be indicators of fraud schemes. An increasing trend in the number of change orders or amounts on change orders might be an indication that construction changes have taken place that would alter the originally planned project to such an extent as to render the underwriting inappropriate.

Alternatively, some projects—especially large projects—tend to have many change orders. It might be more abnormal in situations like these to have few change orders or none at all than to have many. For instance, a lack of change orders for a large project might suggest that progress is not actually being made. Fraud examiners should discover what the normal trend for change orders is in terms of both quantity and content with the particular type of industry and project, and then they can look for deviations from those trends.

Change orders generally receive less scrutiny than the process used to acquire the underlying contract, making them a popular way to fraudulently access funds or generate funds for kickbacks. Even though change orders are often inevitable and can develop for legitimate reasons (e.g., change in scope, weather delays, building code changes), fraud examiners should review all contract change orders carefully.

Missing Documentation

Missing or altered documentation is a red flag for any type of fraud scheme. Because concealment is a key fraud element, missing documents are a definite giveaway. Missing documents are of particular concern in construction lending.

LOAN FILE

Missing documents in the loan file are another cause for concern. It is important to determine if missing documents have been misplaced or were never received. A waiver of certain documents is one common way for lenders to conceal fraud schemes.

The documentation required to obtain loans for real estate and real estate development is fairly standard. The following are some of the more important documents that should be present in the loan files:

- Appraisal
- Architect's or engineer's report
- Assignment of leases and rents
- Assignment of limited partnership notes
- Assignment of take-out commitment
- Availability of utilities (water, sewer, gas, and electric)
- Budget
- Completion schedule
- Copies of leases (existing or, if project is preleased, commitment letters)
- Disburser's notice, if required
- Easements
- Environmental impact study
- Ingress and egress
- Inspection report (lender's inspector)
- Insurance binder (lender should be loss payee)
- Legal opinion letter
- Letters of credit, if applicable
- List of general contractors and subcontractors
- Loan agreement
- Plans and specifications
- Promissory notes from limited partners to partnership, if applicable
- Road dedications

- Soils report
- Subscription agreements, similar to limited partnership notes, if applicable
- Survey
- Take-out commitment, if applicable
- Title policy, including instruction letter from closing
- Zoning

DISBURSEMENT FILE

- Copies of all checks issued at closing
- Lien releases issued at closing (i.e., architect, engineers)
- Loan closing statement

DRAW REQUESTS

- Draw request form (American Institute of Architects [AIA] form or its equivalent, if applicable in the jurisdiction)
- Bank reconciliation (general contractor disbursement account)
- Canceled checks (if general contractor pays subcontractors, copies of the canceled checks should be included in the following draw)
- Inspection report (lender's inspector)
- Lien releases for each subcontractor for the previous draw
- Loan balancing form (The lender should prepare some form of reconciliation to ensure that the loan remains in balance with each draw. Items of particular concern are interest, tenant finish, and retainage.)
- Receipts (for all items submitted on the draw request form)
- Title updates from the title company
- Wire transfer instructions (from the lender to the general contractor's disbursement account)

In addition to the normal loan files, the lender should require a continuing report from the borrower. For example, the borrower could be required to report its annual financial condition coupled with a tax return. Missing documents in these follow-up files might indicate that the project or the borrower is having difficulty that might be the result of a fraud scheme.

Loan Increases or Extensions, Replacement Loans

Simultaneous loan extensions and loan increases might indicate that the real estate project cannot support the debt service. Typically, the loan increases are to pay for the interest and

extension fee. This red flag might also indicate that the loan was made to a related party or made as a loan to hasten a sale or other transaction. In other words, the loan was not properly underwritten.

If the loan is increased and extended several times, it might indicate that higher appraisals are being obtained on a “made-as-instructed” basis. Loan increases and extensions might be the method used by the lender to conceal a nonperforming loan.

However, according to William T. Thornhill, CFE, a consultant in the field of financial institution fraud, fraud perpetrators tend to write a new loan or credit facility to *replace* an existing or old loan because they are aware of the fact that a rewrite might attract loan review, loan administration, or internal audit attention.¹ Accordingly, replacement loans are now increasingly used rather than a simple rewrite of a loan.

Cash Flow Deficiencies

The actual cash flow of a commercial project is a very telling red flag. If the project is experiencing an unexplained cash flow deficiency, then an internal fraud scheme might be the cause. The project cash flow might reflect any of the previously mentioned schemes.

Change in Ownership Makeup

A change in the ownership makeup, commonly referred to as business divorce, might indicate fraudulent activity. It is not uncommon to have a working partner and an equity (money) partner. When the two partners become disenchanted with their relationship and seek a “separation,” it might suggest things have become unsatisfactory or bad due to the existence of fraud.

Disguised Transactions

Transactions disguised to conceal their true nature often involve the lender and either an existing customer or new customer. Banking personnel will sometimes engage in fraudulent schemes to forego the requirement to record additional loan loss reserves. One method employed is to “sell” other real estate owned (OREO) property to an existing customer or a new customer in exchange for making a new loan on another unrelated project. In other words, the bank is tying one transaction to another, quid pro quo.

¹ William T. Thornhill, *Forensic Accounting: How to Investigate Financial Fraud* (Burr Ridge, IL: Irwin Professional Publishing, 1995).

Another method of concealing a transaction's true nature is to conduct the transaction through nominees. For example, the bank might be required to recognize an additional loan loss reserve due to the lack of performance on a particular loan. The borrower might or might not be a good customer of the bank. Regardless of the customer's status, the bank might request that the project (underlying collateral) be sold to another party, with the financing to be arranged by the bank. The borrower can form a new entity (nominee or shell company) to purchase the property; a new (generally higher) appraisal is obtained and the property is sold. In this illustration, the avoidance of loss required the participation of the bank personnel, the borrower, and the appraiser.

Real Estate Fraud

Losses reported by financial institutions across the globe are in the billions of dollars. Most financial institutions invest heavily in real estate transactions; a substantial portion of these losses relate to real estate fraud. Generally defined, *real estate fraud* is any false representation, coupled with intent to deceive, made in connection with a real estate transaction. There are several real estate fraud schemes that will be examined below, including the real estate loan fraud schemes discussed previously. In addition, there has been a recent growth of mortgage fraud-related incidences due to the rise of subprime lending and the mortgage crisis.

Most real estate transactions require more money than any single individual or entity can provide themselves. Therefore, most of these transactions must be wholly or partially financed. Because these transactions require borrowed money, experts such as appraisers, lenders, underwriters, and auditors are needed.

Loan Falsifications

It is illegal to provide false documents to verify income or assets, to make misrepresentations in a loan application, and to knowingly process a false loan application. The following are common examples of loan falsification:

- Altered bank statements
- Altered or fraudulent earnings documentation
- Fraudulent letters of credit
- Fabricated letters of gift
- Misrepresentation of employment
- Misrepresentation of loan purpose
- Altered credit scores

- False government identification numbers (e.g., Social Security number, national insurance number)
- Failure to fully disclose borrower's debts or assets
- Brokers using the identities of prior customers to obtain loans for customers unable to qualify

The following red flags might identify mortgages containing false or misleading information:

- An item other than cash is used for the down payment (i.e., gift, rent credit, sale of personal property, repayment of loan)
- Borrower purchasing property from employer or landlord
- Borrower has a non-purchasing spouse
- Borrower purchasing investment property does not own current residence
- New home is too small for proposed occupants
- The only listing of employer's address is a post office box
- Borrower, who is purchasing private residence property, has an unreasonable commute from the subject property to their place of employment
- Borrower's level of education is inconsistent with employment
- Borrower's age is inconsistent with the stated employment or the number of years employed
- Borrower is self-employed or their office phone number is the same as their home or personal mobile number
- When compared, borrower's assets and liabilities are inconsistent
- Buyer is downgrading
- Loan application or appraisal is handwritten or incomplete

Forged Documents

Tax documents, bank statements, title commitments, leases, and similar documents other than the loan application are used to verify income and asset information. Thus, these documents are often falsified, altered, or forged to perpetuate mortgage fraud schemes.

Appraisal Fraud

The Role of the Appraiser

The appraiser performs an independent property valuation for the new (or old) owner. Regulated real estate associations generally impose licensing requirements for appraisers. There are several professional associations for real estate appraisers, typically regulated at a national or local level. It is important, particularly in transactions involving complex commercial property, that the appraisers' experience and credentials be carefully scrutinized.

Fundamentals of Real Estate Appraisals

Real estate transactions assume a willing buyer and a willing seller. Fraud can occur when the transaction breaks down or the expert assistance is not at arm's length (i.e., is not immediately attainable). Many fraud schemes have a false appraisal report as a condition precedent. Several different kinds of reports are used by appraisers. They are summarized here.

LETTER FORM REPORT

The letter form report is used when a client is familiar with the area, and, therefore, supporting data are not necessary. The report consists of a brief description of the property, the type of value sought, the purpose served by the appraisal, the date of valuation, the value conclusion, and the signature of the appraiser. Financial institutions do not normally use this form for credit decisions.

SHORT FORM REPORT

Financial institutions typically use the short form report for residential real estate loans (sometimes referred to as consumer loans). The report varies from one to four pages and consists of check sheets or spaces to be filled in by the appraiser about pertinent property data.

NARRATIVE REPORT

The narrative form includes all pertinent information about the area and the subject property, as well as the rationale for the estimated value. It includes maps, photographs, charts, and surveys or plot plans. Financial institutions use narrative reports to support real estate lending and investment decisions on large commercial real estate transactions. Any other type of appraisal report (i.e., letter form or short form) on these complex transactions would likely be considered inadequate.

Determining "Value"

Value is composed of four elements: utility, scarcity, demand, and transferability. Real estate appraisals assign three types of values to property. They are as follows.

FAIR MARKET VALUE

This is the estimated price the property would bring if freely offered on the open market with both a willing seller and a willing buyer.

SALES PRICE

Sales price is the actual price paid for the property. It might be higher or lower than fair market value.

LOAN VALUE

Loan value is the percentage of a property's value (fair market value or sales price) a lender can or might loan a borrower.

Valuation Methods**SALES COMPARISON APPROACH**

The sales comparison approach lends itself to the appraisal of land, residences, and other types of improvements that exhibit a high degree of similarity, and where a ready market exists. Compared to the other approaches, this method has greater influence on residential portfolio valuations. This method is the least complicated to understand and apply.

Subject property is compared with similar property that is either offered for sale or has recently sold. Items evaluated include time of sale, location of sale (or offer for sale), physical characteristics, and improvements. Adjustments are made to the value of comparable properties (either plus or minus) based on the differences between them and the subject property. Relevant items might be an oversized lot, a view, a busy street, or access.

THE COST APPROACH

The cost approach generally does not exert much influence on the appraiser's final value estimate. It serves as a benchmark against which the sales comparison and income approaches are measured. The cost approach is more accurate for new properties. It views the value of a parcel as the combination of the land value if vacant and the cost to construct a new building on the given date, less the accrued depreciation the existing building would suffer in comparison with the new building.

The cost approach has five steps:

- Estimate the land value as though vacant and available for development to its highest and best use. (Use the sales comparison approach.)
- Estimate the replacement or reproduction cost of the existing improvements as of the appraisal date.
- Estimate the accrued depreciation amount suffered by the improvements from all causes (physical deterioration and/or functional or external obsolescence).

- Deduct the accrued depreciation from the replacement cost to find the estimate of value of the depreciated improvements.
- Add the improvements' depreciated value to the land value to arrive at the value of the property.

This is the most frequently used cost approach method. It involves the cost associated with rebuilding with modern methods, design, and materials that would most exactly replace the existing building. Reproduction cost is a cost approach used to estimate the cost to reconstruct a replica of the building. It is generally used only when dealing with unique construction or for testimony in court.

THE INCOME CAPITALIZATION APPROACH

Under this approach, the property value is based on its capacity to continue producing income. This method is particularly effective in the valuation of complex commercial properties. The net income the property produces is an important consideration. Net income is the amount of money over the remaining life of the property and its improvements that a fully informed person, using good management, is warranted in receiving.

Income capitalization is the mathematical process of estimating the present value of income property based on the anticipated annual net income it will produce. Key to the application of this approach is the capitalization rate that is used. There are three types of capitalization rates: *interest rate*, *recapture rate*, and *overall capitalization rate*. Interest rate is the rate of return earned on investment capital. Recapture rate is the rate of return originally invested funds provided the owner. Overall capitalization rate is a combination of the interest and recapture rates.

Fraudulent Appraisals

Fraudulent appraisals result from any number of situations, some of which are:

- Intentional use of an incompetent appraiser
- Giving the appraiser improper or false assumptions to use in arriving at the value, such as:
 - Assuming zoning will be changed for a higher and better use when in fact zoning will not be changed
 - Assuming unrealistically low vacancy and expense rates (or unrealistically high vacancy and expense rates for a short sale)
 - Assuming unrealistically high income, selling prices, or absorption—the rate at which vacant space will become rented

- Otherwise influencing the appraiser—for example, paying above-market fee or promising future business
- Direct collusion with the appraiser to commit fraud

Uses for Fraudulent Appraisals

There are several reasons that fraudsters might fabricate or falsify appraisals, including:

- To obtain approval on marginal or substandard loans to attain or exceed goals in order to be promoted or receive a commission, bonus, or raise
- To justify extending or renewing a “bad” loan to avoid recognition of a loss that might defer commission, promotion, bonus, or raises
- To avoid adverse publicity and regulatory, management, and shareholder disapproval because of excessive losses
- To avoid recognition of a loss on real estate owned and to permit additional capital infusions
- To criminally gain money

Red Flags of “Made-as-Instructed” Appraisals

Fraud examiners should look for common indicators that an appraisal was performed fraudulently or by parties who were not in close proximity:

- The appraiser used has never been used before, is not on an approved list, has no professional credentials, or those offered are of questionable credibility.
- The appraisal fee is unusually high.
- Invalid comparables are used.
- Supporting information is missing, insufficient, or contradictory.
- Market data does not support the price and absorption figures used to arrive at value.

Detecting Fraudulent Appraisals

To detect unrealistic or fake appraisals, the fraud examiner should address the following:

1. Read the appraisal. Does it match the documents in the file?
 - Leases
 - Comparables
 - Absorption rates
 - Residual values
 - Capitalization rate
 - Legal description

2. Is there sufficient demand for the project to ensure absorption of the property into the marketplace?
3. Are there unique characteristics of the project that will ensure a competitive advantage over other projects?
4. Is the project sensitive to changes in local economic conditions?

Mortgage Fraud

Fraud has always been present in the mortgage industry, as it readily adapts to economic changes and modifications in lending practices. The economic recession of 2008 and the related subprime mortgage crisis, which resulted in the collapse of several major financial institutions, the enactment of significant financial reform legislation, and the adoption of austerity programs in many European countries, only exacerbated the problem. The housing market after the recession recovered slowly in many parts of the world, leading some governments to adopt programs to make it easier for banks to create more mortgages. Of course, these programs also make various fraud schemes available to criminals.

Key Parties in the Mortgage Industry

There are potentially many parties that can be involved in a mortgage transaction, and thus in a mortgage fraud scheme. The following is a list of the key parties in the mortgage process, along with a concise description of each. Commonly used terminology might differ among jurisdictions.

- *Mortgagor* is the borrower; the party borrowing money to purchase real estate.
- *Mortgagee* is the mortgage lender; the party that funds the borrower to make the purchase.
- *Seller* is the party selling the property that is the subject of the mortgage.
- *Mortgage broker* is a party that arranges transactions between borrowers and mortgage lenders for a commission and is licensed to run a real estate business; brokers can represent the borrower or the seller.
- *Real estate agent* is a party that works under a mortgage broker and is licensed to assist parties in purchasing real estate for a commission. The difference between an agent and a broker is that brokers are licensed to run a real estate business and agents are not.
- *Developer* is a party that coordinates real estate projects, ranging anywhere from purchasing undeveloped land and selling it with improvements to buying and re-leasing property. Developers often serve multiple roles in mortgage transactions, such as a developer/broker.
- *Loan officer* is the representative of the mortgage lender that finds and assists borrowers in acquiring a loan.

- *Loan underwriter* is an agent of the mortgage lender who assesses the credit of a potential borrower to determine if the borrower qualifies for a loan.
- *Appraiser* is a state-licensed professional that estimates the value of real property for the purposes of the mortgage; usually, the lender selects the appraiser.
- *Mortgage investor* is a party that purchases mortgages as a security, either from the original mortgage lender or from the secondary market.

The Evolution of Mortgage Lenders and Brokers

MORTGAGE LENDERS

Today, the secondary market has overtaken deposit gathering as the source of funding for mortgage lending. Loans are sold in the secondary market at origination, thereby providing the bank with a steady supply of capital needed to make additional loans. Without the need for a lot of capital (deposits on the books), mortgage lenders started to evolve.

Consequently, a smaller percentage of bankers are keeping their loans than in the past. Even large commercial banks with lending authority and capital now sell the mortgage loan transactions they originate and close. Few banks wish to rely on depositors' money to fund mortgage loans.

Additionally, many mortgage lenders are non-depository institutions rather than locally headquartered depository banks. A *non-depository bank* is one that does not accept deposits (e.g., checking or savings). Mortgage lenders rely on the stability that the secondary market provides to purchase loans at origination and repay monies to use for future mortgage loan originations.

MORTGAGE BROKERS

Mortgage brokers are intermediaries who find and negotiate mortgage loans on behalf of individuals or companies.

Historically, mortgage loans were originated by the loan officer at the bank. Mortgage lenders, however, started relying on third-party originators (TPOs) to broker their loan products. Brokers could be paid a commission rather than a salary, an option that worked well for minimally capitalized mortgage lenders.

As a result, the industry has seen the evolution of mortgage brokers.

As markets for mortgages became more competitive, banks with their own retail loan officers also started employing these third-party wholesale originators. During the boom years, mortgage brokers were the largest distributors of mortgage products for mortgage lenders and banks. While not as prevalent today, mortgage brokers are still major players.

Contributing Factors

A number of factors have contributed to the persistent presence of mortgage fraud in the United States:

- Commission-driven business
- Lender competition
- Loan products
- Loan volume
- Subprime lending market
- Technology
- New players in the industry

COMMISSION-DRIVEN BUSINESS

Because the incomes of mortgage brokers and other third parties are proportional to the number of mortgages they originate, their goal is to produce and close as many loans as possible. When there are multiple players involved with vested interests to close a loan, the pressure can lead to fraud.

LENDER COMPETITION

The mortgage industry is very competitive, forcing some in the industry to cut costs and accept more risk. Consequently, previously unusual approaches to securing borrowers, such as reducing the time from origination to closing and introducing new loan products, have become commonplace.

LOAN PRODUCTS

Competition for loans motivates investors, lenders, and brokers to generate more attractive products for a wider spectrum of borrowers in order to make money and capture market share.

LOAN VOLUME

During boom periods in the real estate industry, high mortgage loan volumes mean an emphasis on production, often at the expense of quality-control efforts. As a result of the

record volume of mortgage transactions in recent years, many lenders have been less than thorough in their pre-funding and quality-control reviews. This lack of controls and due diligence has contributed to increased occurrences of fraud.

SUBPRIME LENDING MARKET

While there is no industry-accepted definition of *subprime*, generally a *subprime loan* is one offered to people who have credit problems or who have demonstrated excessive use of credit. The loan's interest rate is higher than the prevailing rate available to those with more balanced credit histories.

TECHNOLOGY

Because most loan applications are received and processed electronically, the faceless nature of these transactions creates an environment ripe for fraud.

- Loan documentation is easy for the fraudster to fabricate using readily obtainable photo-editing software.
- Prepaid mobile phones and mail drops are used for false verification since it is difficult to trace the owner. To falsify current employment, a fraudster might rent a mailbox to be used as an employer's address and use a prepaid cell phone to intercept any reference checks or employment verification calls.
- Electronic closings allow for completely electronic notarization and mortgage closing with e-recording.

NEW PLAYERS IN THE INDUSTRY

Traditionally, finance-related occupations, including accountants, mortgage brokers, and lenders, are the most common suspect occupations associated with reported mortgage fraud. Perpetrators in mortgage industry occupations are familiar with the mortgage loan process and therefore know how to exploit vulnerabilities in the system.

However, organized crime is an increasing problem. In an environment where the opportunity for profit is high, the crimes are not as dangerous, and the sentencing is light, the criminal element has moved into mortgage fraud. The Federal Bureau of Investigation (FBI) reports mortgage schemes involving terrorists, drug dealers, street gangs, and the mafia.

Emerging Fraud Schemes

BUILDER BAILOUT

A builder bailout scheme flourishes in a downturned economy. It usually occurs when a builder is left with stagnant inventory. The builder might be suffering from financial difficulties with these lingering homes and might need to sell them quickly to pay off delinquent debts. To dispose of the remaining properties, the builder might undertake a variety of schemes that could include, but are not limited to, the use of hidden seller financing and inflated property values. This scheme is also unfolding in the condo-conversion market, in which developers converted apartment buildings into condos at the same time the market turned and fell behind in debts owed. This scheme might not produce any ill-gotten gains to the builder, but the builder is able to unload their inventory and pay off their debt.

Some builders include lavish incentives in the transaction to lure buyers. Such incentives usually involve a form of down-payment assistance so that a borrower can purchase a home without any equity contribution. Other concessions or incentives that might be offered to potential buyers include managing the properties as income-generating investment properties, absorbing any negative cash flow for the first 12–36 months, guaranteeing mortgage payments for the first 12–36 months, or providing other turnkey services and guarantees even though the properties might remain vacant. Builders might also agree to pay the buyer a substantial rebate that is not disclosed to the lender.

Getting concessions from the seller is common and is not necessarily fraudulent. The simple test to determine whether the transaction might be fraudulent is to ask: Are these concessions disclosed, and have they been approved by the lender?

Some builders engaging in builder bailout schemes find marginal, legitimate buyers whose intent is to occupy the property and make the payments. These schemes typically involve some form of undisclosed down-payment assistance. Other builders seek straw borrowers who are often induced with no-risk investment property ownership.

EXAMPLE OF A BUILDER BAILOUT SCHEME

A builder bailout scheme might unfold like this:

- The builder (or third party) recruits a straw borrower to purchase the property for no money down and cash back at closing.

- The builder obtains an inflated appraisal that is used as a basis for the loan amount. This inflated loan amount will allow the builder to recoup the expense of the incentives, pay a fee to the straw, and keep the loan current for two to four years.
- The builder (or third party) fails to disclose these monetary incentives to the lender.

CHARACTERISTICS OF A BUILDER BAILOUT

The following characteristics are common in builder bailout schemes:

- New construction or renovated condo conversions in an overbuilt market
- Slight decrease in sales and volume, followed by a spike in both volume and sales price
- Non-local borrowers with no knowledge of the local market are recruited to purchase the homes at the inflated sales prices
- Inflated commissions or unusual disbursements to non-lien holders listed on the settlement statement if one exists (in the United States, the U.S. Department of Housing and Urban Development [HUD] provides a standardized form known as HUD-1)
- Missing the purchase contract addendums disclosing the incentives
- Originated as second homes
- Mortgage payments are made by the builder to avoid detection and prosecution
- Loan remains current for a period of time, but then goes into delinquency
- Property might remain vacant and the neighborhood might be deteriorating

AIR LOANS

Some builders might have debt on vacant land for which they do not have sufficient capital to construct a home. To get out from under the debt, the builder, in collusion with other industry insiders, might undertake an air loan scheme.

An *air loan* is a loan for a nonexistent property—with *air* symbolizing the loan's fraudulent absence of collateral. Most or all of the documentation is fabricated, including the borrower, the property ownership documents, and the appraisal. This type of scheme involves a high level of collusion, and perpetrators might even set up a fictitious office with people pretending to be participants in the transaction, such as the borrower's employer, the appraiser, and the credit agency. Usually, air loans go into early payment default, and, since there are no actual properties on which to foreclose, the losses on these loans can be enormous. However, these schemes are typically short-lived because the detection rate is high.

IDENTITY FRAUD SCHEMES

Identity fraud is defined as the misrepresentation of data underpinning one's identity (such as using another person's government identification number). Mortgage fraud is not immune to schemes involving the improper use of identifying data.

The individuals in the best position to use a person's identifying information for purposes of committing mortgage fraud are industry insiders. For example, mortgage brokers with access to personal identifying information provided by legitimate borrowers can engage in identity fraud schemes.

"Investment club" organizers can also perpetrate identity fraud schemes by collecting personal information from members and using it without their knowledge to purchase properties.

In other cases, real estate agents, mortgage brokers, criminals, and other industry insiders provide the stolen identification information of an individual with good credit to an individual with bad credit who wishes to purchase a home. They help create a credit history under the bad credit borrower's name.

Finally, straw borrowers are often provided with stolen or falsified identification information to use in originating loans. This scenario involves a high level of collusion between all parties involved in defrauding the lender.

IDENTITY THEFT SCHEMES

An *identity theft* scheme is defined as the assumption of someone else's identity, which is then used to steal something that individual owns, like their home. Identity theft schemes can be far more troubling than identity fraud schemes.

Two examples of identity theft schemes involving mortgage fraud include the fraudulent acquisition of a person's home and the fraudulent origination of a loan on a property belonging to another person.

Fraudulent Sale

Fraudulent sale scams are particularly harmful because they involve the fraudulent acquisition of real estate by filing a fraudulent deed or respective real estate document that makes it

appear that the property legally belongs to the criminal. This scam does not happen at the origination of the loan, but rather it might occur without the homeowner's knowledge decades after the property was originally sold.

The perpetrator identifies a property—typically belonging to an estate or non-resident owner—that is owned free and clear. They then create fictitious property transfer documents that purport to grant all rights and title on the property to the fraudster. The true owner's signature is forged on the documents, and the scammer files them in the jurisdiction's real property records. Once the ownership documents are filed, they apply for and execute a loan on the property (using a straw borrower). Often, the value is inflated. The perpetrator absconds with 100% of the loan proceeds.

FRAUDULENT SECOND LIEN

In a variation of the fraudulent sale scheme, a person assumes a homeowner's identity and takes out an additional loan or a second mortgage in the homeowner's name. If there is not enough equity in the home to warrant a second loan, an inflated appraisal is obtained. This scheme involves a high level of collusion between a loan officer, an appraiser, and a title agent (or other real estate document service provider).

UNAUTHORIZED DRAW ON HOME EQUITY LINE OF CREDIT

In this variation, a hacker draws on an individual's home equity line of credit (HELOC) without their knowledge. The hacker typically obtains the HELOC owner's password or personal identification number (PIN) via phishing or social engineering.

Some jurisdictions are enlisting preventive measures to combat this type of fraud, including:

- Using cameras at recording offices
- Sending out notices to the grantor (seller) on quit claim and warranty deed filings to verify intent of the transaction
- Using thumbprints or other biometric methods to authenticate customers
- Collecting \$1 per deed to fund prosecution and investigation of this crime
- Passing legislation to make this a crime

Foreclosure Rescue Scams

There are legitimate foreclosure assistance programs in which the homeowner is offered short-term financing that pays off the delinquent debt. This allows homeowners to stay in their homes as tenants until they can repair their credit and obtain long-term financing. These

legitimate programs are offered by government nonprofit counseling agencies, which typically provide their services for free. However, there are fraudulent programs that prey on homeowners who are struggling with potential foreclosure.

Foreclosure rescue scams come in two primary variations: phantom-help scam and lease-back scheme.

PHANTOM-HELP SCAM

The scammer promises to save the homeowner's credit or get them low monthly payments. Instead, the homeowner pays thousands of dollars in fees, and the scammer either does nothing or files bankruptcy on behalf of the borrower and absconds with the fees.

LEASE-BACK SCHEME

The homeowner is tricked into conveying the deed to their house to the fraudster, who promises to allow the homeowner to lease the property and remain living there. Upon conveyance of the deed, the homeowner gives ownership of the house to the fraudster, no lease is offered, and the homeowner ultimately loses both the house and any equity.

Loan Modification Programs

In response to the global financial crisis of 2008, some governments instituted loan modification programs, such as the Making Home Affordable Program (MHA) in the United States and the Assisted Voluntary Sale (AVS) program in the United Kingdom, to provide relief to homeowners struggling to pay their mortgages and facing the risk of foreclosure, help stabilize the housing market, or generally improve the economy. Many of these programs have expired, but the expiration might not affect individuals who are already involved in the programs.

LOAN MODIFICATION SCAMS

There are many ways that people have abused loan modification programs, such as feigning hardship, occupancy misrepresentation, or understating income and assets on the enrollment applications. The lender relies on misrepresentation when deciding to modify the agreement with less profitable terms.

SHORT SALES AND SHORT SALE FRAUDS

Short sales occur when the lender agrees to accept a lesser amount than the balance on the real estate loan. Many lenders will accept a short sale because, for the lender, the foreclosure

process is time consuming and expensive. They would rather avoid the costs associated with a foreclosure so that the bank does not have to take the property in as a nonperforming asset and try to sell it.

While short sales have long been a viable option to foreclosure, the volume of short sales increased dramatically after the real estate decline in the late 2000s. The growth in short sale abuses has hatched a new “cottage industry” that is generally unrecognized—called the short sale *facilitator* or *negotiator*. Many of these facilitators or negotiators are parties that are familiar with the industry and have migrated from the origination boom: mortgage brokers, loan officers, real estate agents, and title agents.

Many jurisdictions do not recognize this industry and, therefore, these facilitators and negotiators are not regulated. Because most borrowers do not understand the short sale process, they might look to a facilitator for help. Unfortunately, there are some facilitators who are dishonest and fail to act in the best interest of the distressed homeowner, to the homeowner’s and lender’s detriment. These fraudulent and frivolous short sales are clogging an overtaxed system. One major lender estimates that when a third party is involved in a short sale, the potential for fraud increases by 60%. Also, servicing personnel are not trained to identify red flags of fraud.

Short sale fraud schemes include:

- Charge an upfront fee to negotiate with the lender or servicer on behalf of the borrower and then abscond with the fee and do nothing to assist.
- Coach the borrower to use a family member as a straw borrower to purchase the home, thereby allowing the distressed homeowner the ability to keep their home and lower their debt obligation.
- Prey on distressed borrowers to acquire property and then flip it immediately at a profit.

FEE-FOR-SERVICE SHORT SALE SCAMS

Short sale facilitators have seized on the overtaxed system to advertise a value-added service, for an upfront fee, to negotiate on behalf of the borrower with their lender. Distressed borrowers may be drawn to these services due to their general lack of sophistication or frustration in dealing with their servicer. A dishonest facilitator will abscond with the fee without providing any service to the distressed borrower.

While these facilitators advertise the need for this fee service, borrowers are not required to use a fee service to negotiate a short sale. Short sales conducted via government-sponsored loan modification programs and other servicers are generally free.

NON-ARM'S-LENGTH SHORT SALE

Fraudulent short sales are sometimes used by homeowners facing foreclosure as a ploy to keep their homes and lower their monthly obligations. The following scenario is an example of what such a scheme might look like:

- The borrower, either acting alone or with an industry insider, lines up a straw or family member who poses as a legitimate buyer via a short sale.
- This straw borrower is typically qualified based on loan-level misrepresentations.
- This scheme is incumbent on the undervaluation of the property.
- The borrower temporarily compromises the property—"reverse staging."
- A colluding real estate agent low-balls a broker's price opinion relied upon by the lender.
- The lender agrees to the short sale based on the misrepresentation of the borrower's "hardship" and undervalued property estimate.
- The homeowner stays in the home, the debt is forgiven via the payoff of the old debt, and the new debt is based on a lower loan amount, resulting in a lower monthly payment.
- The alleged misrepresentation is that the original lender loses out on a legitimate recovery of the asset as the lender extinguished the debt based on the reliance of a misrepresentation made in regard to the true market value of the property.

To prevent and detect this scheme, many lenders and servicers require the distressed borrower to sign forms documenting the loss of income. Also, the lender or servicer might require both the buyer and seller to sign an arm's-length affidavit indicating there are no hidden relationships or terms between the parties.

Property Flipping and Flopping

Property flipping is the process by which an investor purchases a home and then resells it at a higher price shortly thereafter. For example, an investor buys a house in need of work for \$250,000 in July, renovates the kitchen and bathrooms, and landscapes the yard at a cost of \$50,000. The investor then resells the house two months later (the time it takes to make the renovations) for a price that is reflective of the market for a house in that condition. This is a legitimate business transaction, and many individuals and groups make an honest living flipping properties.

Property flipping is not intrinsically illegal or fraudulent, but it becomes so when a property is purchased and resold within a short period of time at an artificially or unjustly inflated value, often as the result of a fraudulent appraisal. In a flipping scheme, the property is sold twice in rapid succession at a significant increase in value (also known as an *ABC transaction*, where the property moves from party A to party B to party C very quickly).

In traditional property flipping schemes, it was not unusual for a title agent to close the second transaction (the B/C transaction) first, thereby using the lender's funds to C to fund the acquisition of the property in the A/B transaction. Because this effectively allowed the scheme to be perpetrated without an outlay of capital, property flipping flourished. Today, many title insurers require their agents to close the A/B transaction first.

To circumvent the need for capital to close the first transaction (A/B transaction) before conducting the second transaction, a perpetrator might rely on a short-term loan company for funding. This allows the perpetrator to close the first transaction before the second (albeit only by minutes).

Property flopping is a variation on property flipping, but it generally involves a property subject to a short sale (meaning the owner sells the property at a lower value than the unpaid mortgage amount on the property). This variation is typically conducted by industry insiders or unscrupulous entrepreneurs rather than the homeowner. Property flopping involves a rapid transfer of property with an unjustified, significant change in value (like the ABC transaction in flipping schemes), but instead of inflating the value on the second transaction, the value on the first transaction is deflated. Short sales have provided fraudsters a plentiful supply of inventory to flop, and because lenders are motivated to move nonperforming loans off the books, they can be vulnerable to let property go for less than what it is really worth.

Examples of property flopping include:

- The perpetrator targets a distressed homeowner with an alternative to foreclosure by offering to purchase the property via a short sale.
- The perpetrator then receives third-party authorization to negotiate a short sale with the lender.
- A colluding real estate agent is used to satisfy the lender's requirement to list the property to find what price the market will bear; however, the real estate agent fails to list the property or holds back higher offers.

- The perpetrator influences the broker price opinion ordered by the lender in an attempt to deceive the lender into accepting less than market value for the property.
- At the same time, the perpetrator is recruiting an end buyer to purchase the property in a separate transaction.
- The marketing of the property occurs before the perpetrator takes legal title and purchases the property.
- Once the lender agrees to the short sale price, the perpetrator closes on the transaction at the lower amount and immediately flips the property to the straw at a higher price.
- Because lenders and title agents require that the first transaction close before a second can be conducted, a perpetrator might rely on a short-term lender (one which issues loans for as little as one day) for funding for the first transaction (which will often close just minutes before the second transaction).
- The title company might conceal the rapid transfer of title to evade seasoning requirements and anti-flip rules.
- The alleged misrepresentation is that the subsequent, immediate second transaction at the higher sales price is not disclosed to the original lender, who then loses out on a legitimate recovery of the property.
- Many facilitators and negotiators think there is nothing wrong with this process and claim they have no duty to disclose the second transaction to the lender or other parties.

Many lenders and title insurers have no *seasoning requirements*—meaning that a buyer can qualify for a mortgage on a property that the seller has owned without any seasoning of title.

To prevent problematic short sale flopping, some lenders are starting to require all interested parties to sign an affidavit requiring disclosure of an immediate subsequent sale. In addition, government mortgage assistance programs, such as the MHA program in the United States, might prohibit short sales approved under their program from being re-conveyed within a short period of time (e.g., ninety days).

Home Equity Conversion Mortgage, or Reverse Mortgages

A *reverse mortgage*, such as a Home Equity Conversion Mortgage (HECM) in the United States, is a negative-amortization loan—interest accrues throughout the life of the loan. Expenses and costs added to the loan have to be repaid if owners decide to sell. Because reverse mortgages don't require regular monthly mortgage payments, homeowners can use their additional cash flow for renovations that allow them to stay in their home (such as wheelchair accessibility), in-home nursing care, travel, or other expenses.

Origination fees can be higher for a reverse mortgage than for a traditional mortgage. In the United States, Federal Housing Administration (FHA)-insured reverse mortgages have a service fee of a percentage of the first \$200,000 of home value and a percentage of the amount above \$200,000, capped at \$6,000. The mortgage insurance premium is 2% upfront and .5% monthly. Also, interest rates are typically .25–.50% higher.

Qualifications for a reverse mortgage vary among jurisdictions, but they might include:

- Borrowers over a certain age
- Owner-occupied property/single-family dwelling
- Borrowers must not be delinquent on any federal debt
- Loan-to-value ratio must be less than conventional mortgages
- Mandatory counseling with a third-party, government-approved counselor
- Underwritten solely on collateral

Payout options for a reverse mortgage include term payments, a line of credit, or a combination of these two options. Maturity of the mortgage is triggered by death of the borrower or the permanent relocation of the borrower into an assisted living facility or nursing home. When the estate liquidates the asset, the loan balance includes the total amount borrowed plus accrued interest and mortgage insurance premiums. Generally, if the liquidated amount is more than the loan amount, the profit goes to estate, but if the liquidated amount is less than the loan amount, the lender forgives the difference.

Reverse mortgages are subject to the following potential abuses and fraud:

- Inflated values
- ID theft/fraudulent powers of attorney
- Occupancy misrepresentation
- Convincing seniors to purchase a home using a reverse mortgage and using the proceeds to invest in fraudulent securities
- “Free homes” to homeless seniors

Equity Skimming

Equity skimming is a scheme whereby an individual, entity, or group of individuals purchase one or several single-family homes. Typically, the financing is for a percentage of the purchase price (e.g., 80–90%) and the owner invests the balance of the purchase price as equity. The home(s) is/are then rented.

The owners collect the rent from the tenants but fail to make the mortgage payment(s). When the owners have withheld mortgage payments that equal the amount of the invested equity, they can then either resume payments or allow the mortgage to be foreclosed.

Although the mortgage might eventually be foreclosed, the owners have recouped their original investment plus any rental payments not applied to the mortgage. This scheme is most successful with non-recourse mortgages.

An equity skimming scheme eventually collapses, putting the purchasers at risk of being sued for deficiencies (if the loans were recourse). Regardless, fraudsters continue to practice the scheme.

Mortgage Pulling

To disguise loans exceeding a bank's legal limits, loans are made to a partnership's members who then invest in a single risky venture in a total amount exceeding the lending limit. In reality, the single borrower is the partnership, and the collateral is the partnership's property. Mortgage pulling might involve fraudulent loan applications and payoffs to the individual partners for participating.

New Account Fraud Schemes

Fraud is much more likely to occur in new accounts than in established accounts. *New account fraud* is generally defined as fraud that occurs on an account within the first ninety days that it is open; often, perpetrators open these accounts with the sole intent of committing fraud. Special efforts must be taken to properly identify the potential new customer. Screening criteria should be enforced by everyone handling new accounts. Prompt, decisive action is necessary to manage and/or close apparent problem accounts.

False Identification

New account criminals are actors. They use false identification to open new accounts and steal money before funds are collected by the bank. False identification is easily purchased.

Business Accounts Using Stolen Checks

Some bank customers defraud business institutions by opening a new business account using checks stolen from another business. The fraudsters then withdraw the funds and close the account.

Personal Accounts Using Fraudulent Checks

A similar scheme is to open a new personal account with two checks drawn by other people. The checks are either forged or stolen. The fraudster then deposits one and takes cash for the other. Shortly thereafter, the fraudster writes checks to overdraw the deposited amount.

Mobile Deposit Fraud

Financial institutions are increasingly allowing mobile deposits, which typically involve a person sending a digital image of a check or similar payment order to the depository institution so that the paper document never has to be received or processed. There is a relatively high risk of new account fraud with mobile deposits for two main reasons. First, there is no face-to-face transaction required, which fraudsters prefer in order to maintain anonymity. Second, the digital image is often taken by a camera or a scanner, so it is easier to make forged or counterfeit deposits.

Security features in physical checks, such as water marks and magnetic ink, are not effective for preventing such schemes. However, financial institutions have had success in limiting fraud by setting relatively low daily deposit limits for consumer accounts. Additionally, imposing wait limits on new accounts can reduce the fraud risk. Some financial institutions share depository information with each other, which can help detect duplicate items.

Automated Teller Machine Deposits

Financial institutions should also consider the increased risk of new account fraud when offering automated teller machines (ATMs) that accept deposits. Like with mobile deposits, the fact that ATM deposits do not require in-person transactions with a teller is ideal for fraudsters. Many ATMs have cameras to help identify users, but ATMs are often enticing targets.

Prevention

A relationship with a financial institution should never be established until a potential customer's identity is satisfactorily established. If the customer's identity cannot be verified, the relationship should not be established.

Personal Accounts

No account should be opened without satisfactory identification, such as:

- A locally issued driver's license with a photograph
- A passport or alien registration card, together with:
 - A college photo identification card

- A major credit card (verify the current status)
- An employer identification card
- An out-of-area driver's license
- A current utility bill from the customer's place of residence (e.g., gas, electricity, telephone)

In addition, the following identity verification measures should be taken:

- Consider the customer's residence or place of business. If it is not in the area served by the bank or branch, ask why the customer is opening an account at that location.
- Follow up with calls to the customer's residence or place of employment, thanking the customer for opening the account. Disconnected phone service or no record of employment warrant further investigation.
- Consider the source of funds used to open the account. Large cash deposits should be questioned.
- For large accounts, ask the customer for a prior bank reference and write a letter to the bank asking about the customer.
- Check with service bureaus for indications that the customer has been involved in questionable activities such as kiting incidents and non-sufficient-funds (NSF) situations.
- If applicable, establish the customer's identity through an existing relationship with the institution, such as some type of loan or other account relationship.
- Consult third-party credit reporting agencies and customer identification services.

Business Accounts

Business principals should provide evidence of legal status (e.g., sole proprietorship, partnership, or incorporation or association) when opening a business account. The following verification measures should also be taken:

- Check the name of a commercial enterprise with a reporting agency and check prior bank references.
- Compare information provided by principals with information filed with the jurisdiction's registrar of companies (e.g., secretaries of state in most of the United States)
- Follow up with calls to the customer's business thanking the customer for opening the account. Disconnected phone service warrants further investigation.
- When circumstances allow, perform a visual check of the business to verify its actual existence and that the business has the capability of providing the services described.
- Consider the source of funds used to open the account. Large cash deposits should be questioned.

Since tellers are often the frontline defense in preventing check fraud, it is important that they receive training that will allow them to identify fraudulent checks used to open new accounts.

Tellers should:

- Be aware of magnetic and fractional routing numbers.
- Look for variations in font sizes in the payee, amount, and date sections.
- Recognize the increased likelihood of counterfeit items from foreign entities.
- Look for checks with numbers lower than two hundred.
- Be aware of the date that the account was opened.
- Have easy access to the signature card.
- Be aware of what is acceptable identification.
- Recognize forged/altered identification.
- Recognize forged negotiable instruments.
- Be familiar with patterns of behavior related to potential culprits:
 - Overly polite
 - Nervous
 - Aggressive and hurried

Detection

Some of the more common red flags of potential new account schemes are:

- Customer residence outside the bank's trade area
- Dress and/or actions inconsistent or inappropriate for the customer's stated age, occupation, or income level
- New account requesting immediate cash withdrawal upon deposit
- Request for large quantity of temporary checks
- Services included with the account that do not match the customer's purpose
- Missing or inaccurate customer application information
- Invalid phone numbers or addresses in customer account information
- Use of a mail drop address (a service where a non-affiliated party collects and distributes mail for individuals or entities)
- Large check or ATM deposits followed by rapid withdrawal or transfer of funds (a pass-through account)
- Business accounts without standard business transactions, such as payroll or transactions that would be expected in that business
- Transactions without a clear purpose in jurisdictions known for high levels of corruption
- Opening deposit that is a nominal cash amount

- Rare customer ID type
- Applicants over the age of 25 with no credit history
- Customers who cannot remember basic application information (i.e., phone number, address)

Money Transfer (Wire) Fraud Schemes

Wire transfers of funds are nothing new—they began in the 1940s. However, with today's growing emphasis on a cashless society, the number of wire transfers increases each year.

Typically, fraudsters who commit this type of crime are knowledgeable about wire transfer activity, have at least one contact within the target company, and are aggressive in carrying out the theft.

Instantaneous Transfer

Wire transfer services electronically move funds worldwide from a financial institution to a beneficiary account at any banking point as per a customer's instructions. (A banking point is any institution or business capable of receiving electronic transactions, such as banks, savings and loans, credit unions, brokerage firms, and insurance companies.) On any day, \$2 trillion to \$3 trillion moves among financial institutions. The transactions are primarily for completing interbank purchases and sales of federal funds; purchasing, selling, and financing securities transactions; disbursing loan proceeds or repaying loans; and conducting real estate business.

Although these technologies enhance operations and increase the financial institutions' efficiency, they also provide a tremendous opportunity for criminals who learn to manipulate the electronic environment for their personal gain. Wire transfer fraud is a particularly dangerous risk to a business's solvency—one major wire transfer fraud can destroy any firm.

Common Schemes

The following are some of the more common schemes involving wire transfers.

Dishonest Bank Employees

People who have access to correct account identification information can transfer money improperly—insiders wire funds to themselves and/or related parties.

Misrepresentation of Identity

People pose as customers, having used pretext calls to obtain correct account information from the bank. People posing as wire room employees in another bank or a branch office order transfers to dummy accounts in another bank.

System Password Security Compromised

People who have legitimate access to sensitive account and daily code information for a limited time (e.g., computer consultants) initiate improper transfers through unauthorized access.

Forged Authorizations

Bank officers' and customers' authorization, whether oral or written, is improperly obtained or forged. People forge orders to transfer money to their own accounts when the recipient account is actually in someone else's name.

Unauthorized Entry and Interception

Unauthorized personnel gain access to the wire room and its equipment, or the actual transmission is intercepted and altered.

Preventing and Detecting Wire Transfer Fraud

Fraud examiners and auditors need to advise management on ways to prevent and detect wire transfer fraud and to regularly evaluate controls related to prevention and detection.

Business Audits and Other Controls

Every firm must have written policies and procedures for wire transactions. In addition, fraud examiners or auditors should conduct unannounced audits of those transactions. The following are other examples of wire transfer controls:

- Make sure the person authorizing the wire transfer isn't the individual who orders it.
- Require those ordering transfers to have secure passwords or other authentication methods.
- Maintain and keep a current list of those ordering wire transfers, as well as a log of all transfers.
- Require the person authorizing the wire transfer to verify the order before initiating the transfer, especially when wiring instructions for existing customers or vendors are changed.
- Require employees who handle wire transfers to go on vacation periodically.

- Require that reconciliations of accounts affected by wire transfers be performed by individuals not involved with the wire transfer process.
- Keep all confidential information about the firms' accounts and wire transfers in safe rooms secured with locks. Give computer key cards to these rooms to authorized personnel only. Shred discarded documents.

Businesses frequently perform vendor audits, but often neglect to audit their bank's wire transfer controls. To conduct such audits, a fraud examiner should:

- Pick a sample of transactions and review the log of the calls made back to the banking points to verify their authenticity. (Listening to the recording of the actual authorization to ensure compliance with call-back rules might be an option.)
- Review documentation of past wire transfer activity from bank statements or bank online transaction history for a daily debit and credit match of each transaction.
- Obtain written confirmations of transactions from the wire transfer provider to determine the timeliness of their receipt by your firm.
- Promptly reconcile problems caused by the usual custom of ending all wire transfers for a day in the mid-afternoon. (Some customers believe they should receive credit and interest on funds received at the end of a day. However, wire transfers made after the afternoon closing time aren't credited until the next business day.)

Bank Audits

Financial institutions should ensure the following safeguards when transferring funds:

- Provide customers with unique codes that are required to authorize or order wire transfers.
- Maintain and update lists of employees authorized to perform wire transfer transactions.
- Compile audit trails of incoming and outgoing wire transactions, as well as the employee responsible for each portion of the transaction.
- Review all wire transfer transactions at the end of each day to ensure that the original transfer instructions were executed correctly.
- Make sure the businesses to which the funds are transferred are contacted to ensure authenticity of fund transfer requests. If the businesses are contacted by phone, the phone numbers used should be the original numbers given by the customers when the accounts were opened and not the phone numbers provided by the callers who requested the transfers.
- Don't execute wire transfers solely from faxed instructions. Again, verify authenticity by phoning the original numbers given by the customers when the accounts were opened and not the numbers provided by the callers who requested the transfers.

- Require that all accounts affected by wire transfers be reconciled by bank employees not involved with the wire process.
- Ensure that the in-house wire operations manual is available only to authorized personnel and secured when not in use—especially after hours. Cleaning crew employees could help themselves to client pass codes and other confidential information.
- Record all incoming and outgoing calls for wire transfer instructions.
- Carefully screen wire transfer personnel applicants.
- Reassign to other departments wire transfer employees who have given notice that they are resigning but still have some time left with the company.
- Require all employees involved in the transfer of funds to take at least five consecutive days of vacation each year; assign their duties only to other transfer department staff members during their absence.
- Make sure bank employees never disclose sensitive information over the telephone until the caller's identity and authorization have been verified against the customer information file.
- Separate duties among wire employees who transmit or receive requests for funds. These employees shouldn't also verify the transactions' accuracy.
- Train employees on proper internal controls, fraud awareness (including current fraud schemes and trends), and the importance of protecting information. Share alerts issued by government agencies and professional groups.

Automated Teller Machine Fraud

An automated teller machine (ATM) is a dispensing facility from which a debit or credit card holder can withdraw cash. Some types of prepaid cards can also be used at ATMs. The facility can also perform other services, such as depositing funds and verifying account balances, but the most common use is to dispense funds. Some fraud schemes involve the unauthorized use of ATM facilities. Examples include:

- Theft of card and/or unauthorized access to personal identification numbers (PINs) and account codes for ATM transactions by unauthorized persons
- Employee manipulation
- Counterfeit ATM cards
- Counterfeit ATMs
- Magnetic strip skimming devices
- Skimming devices that target chip-based cards
- ATM deposit fraud

Skimming

ATMs can be equipped with devices that scan and store credit card numbers. These devices include false keyboards that perpetrators place over the ATM's existing keyboard to record PINs and devices hidden inside the card reader to scan the card's magnetic strip. Credit card skimming is more likely to occur if the ATM is in a secluded spot, allowing the perpetrator the opportunity to tamper with it. Generally, perpetrators prefer nonbank ATMs, as these tend to be in less secure locations and subject to less surveillance.

Skimming and shimming—to be introduced in the subsequent section—are discussed in more detail in the “Payment Fraud” chapter in the Financial Transactions and Fraud Schemes section of the *Fraud Examiners Manual*.

Shimming

The move to chip-based cards has prompted criminals to develop new techniques to steal credit card information. *Shimming* is a variation of skimming that specifically targets chip-based cards. A shimmer is a small device that is placed inside the card reader of an ATM, where it records the data contained on chip-based cards. While shimmers cannot be used to clone chip-based cards, they do allow criminals access to the collected data to create magnetic-strip card clones for use at retailers or banks that are not properly enforcing updated card security standards. Additionally, shimmers can be used by fraudsters to obtain card information to be used for card-not-present (CNP) fraud.

Detection

When investigating ATM schemes, look for a lack of separation of duties between the card issuing function and the PIN issuance.

Account Takeover

In an account takeover, the perpetrator gains unauthorized access to a customer's account, usually through online banking. The perpetrator often gains access through phishing techniques, in which they attempt to get victims to visit fraudulent websites or download malware that gathers personal information from the user's device. A perpetrator can also gain access to accounts using credentials obtained from a data breach. Once a fraudster gains account access, they pose as the customer and are able to perform various actions

regarding the account, such as creating payments to be issued from the account without the true account holder's knowledge. Depending on when the victim reports the takeover, this type of crime can go undetected for several months.

Detection

These schemes are best detected through automated monitoring to identify red flags, with manual examination of transactions that appear suspicious. Automated monitoring systems use a variety of factors to determine whether a transaction appears abnormal for that particular customer, including:

- Daily or overall purchase patterns that substantially exceed the customer's normal range
- Purchase volume substantially exceeds customer's anticipated income or credit limit
- Geographic location of transactions (online and mobile banking applications can typically collect such data)
- Identification of electronic devices (e.g., smartphones, tablets, PCs) that the customer registers with the institution
- Abnormal IP addresses that the user logs in from
- Whether the transacting parties make sense for the particular customer
- Abnormal transaction timing (e.g., large volume of purchases late at night for the customer when there previously were none during this time)

Many financial institutions now use behavioral analytics software that can proactively identify account takeovers. These programs are designed to establish a baseline that describes the manner in which a particular user typically accesses and interacts with a web application. After enough data has been collected to establish a user's profile, any activity that significantly deviates from the expected behavior is flagged for further review, and in some cases, halts the transaction in real time.

Fraud examiners should assess the organization's risk and determine what types of schemes are most likely to occur. The best automated monitoring system will be tailored for the financial institution and its various types of customers.

Advance-Fee Fraud

An *advance-fee fraud* is a scheme in which the fraudster persuades the target to advance sums of money by falsely promising the delivery of a product or a service. Banks find deals that seem too good to be true to gain access to large amounts of money (deposits) at below-market

interest rates. The catch is that the bank must pay an upfront finder's fee to a person claiming to have access to the money. In some cases, desperate institutions are offered access to illegal money, and they typically do not report the loss of the advance fee when the deal falls through. More information on advance-fee schemes can be found in the "Consumer Fraud" chapter.

EXAMPLE

The bank is contacted by an agent (such as a broker, advisor, consultant, promoter, lawyer, or bank customer) offering to provide money at a below-market interest rate for a long period of time (e.g., ten–twenty years). The agent asks for a large fee to close the deal. The agent takes the fee and disappears. The deposits might or might not exist, and if they do, they seldom equate to the agent's representations.

Red Flags

There are a few key indicators of advance-fee fraud, including:

- The agent requests documents on bank stationery or signatures of officers.
- The bank is asked to give nondisclosure agreements to protect agents or other parties.
- There are several complex layers of agents, brokers, and other intermediaries.

Brokered Loans

A variation of the advance-fee scheme is the brokered loan. *Loan brokering* applies to either packages of individual residential (consumer) loans or single commercial loans. A variation of a brokered loan is *loan participation*, where multiple parties purchase and have interests in a loan or a package of loans. The fraud schemes associated with brokered loans or loan participation generally involve selling phony loans (packages) or selling participations in loans that have not been properly underwritten. Normally, a large fee is charged for these brokered loans.

With residential loan packages, the broker sells the package, takes the money, and disappears. Brokered loans are not usually sold with any recourse to the broker. Therefore, the purchaser must look to the borrower and the underlying collateral for debt satisfaction. With loan participations, the lead bank generally performs the underwriting. However, this does not relieve the participating bank from its obligation to perform its own due diligence. If the participating bank does not independently examine the documentation and perform its own due diligence, then fraud schemes on the part of the selling institution are possible.

Letter-of-Credit Fraud

Most letter-of-credit fraud arises from foreign trade and contracting. Letter-of-credit fraud can be perpetrated by beneficiaries using forged or fraudulent documents presented to the issuing bank with a demand for payment. The documents, however, must conform to the terms of the letter-of-credit agreement.

EXAMPLE

An American exporter might offer to sell goods to an overseas importer. When terms are arranged, a letter of credit is obtained in the exporter's favor and confirmed by a bank near the exporter's location. (The actual export never occurs, and the request for payment is fake.)

Inside/Outside Frauds

Inside/outside frauds are on the rise; in this type of fraud, the employee (an insider) might be co-opted through a bribe or a threat of violence against them or a family member. Sometimes the insider is a bank teller who agrees to cash certain items as long as the items look reasonable and are below a cashing limit. Other times, the insider is a proof operator or sorter operator who inserts documents directly into the computer system to effect fraudulent deposits. The insider might also be selling copies of documents to individuals who use computer techniques to make fraudulent items.

Account Information Frauds

Information is sold to organized rings or insiders who use the information themselves. As financial institutions make more services available to customers and strive to make them more usable, information about customer account relationships resides in many forms, such as 24-hour customer operators, online systems, printed documents that are innocently put in the trash only to be retrieved, or credit card information on high-line cards.

Trading Activities

Trading activities can be compromised to defraud banks. Usually perpetrated with the assistance of an internal employee or by an employee acting alone, trading can include foreign exchange, securities trading, loan sales, and securitization. Often, when this type of problem is suspected, the investigator must turn to traders themselves as the only source to gather information.

For more information on fraud related to securities trading, see the “Securities Fraud” chapter in the Law section of the *Fraud Examiners Manual*.

Prevention

Like other organizations, financial institutions should have standard internal control measures to assist in the detection and deterrence of fraud. In addition to normal procedures, such as separation of duties and budget and actual comparisons, the following are some specific control measures that might enhance the detection and deterrence of financial institution fraud.

Loan Origination, Underwriting, Closing, Disbursement, and Servicing Separation

By separating all of the functions relating to loans, a lending institution reduces the opportunity for an individual (an insider) to perpetrate loan fraud. Additionally, the separation provides for at least one, if not several, levels of independent review to reduce an institution’s external loan fraud exposure.

Committee Approval of All Large or Unusual Transactions

If a loan committee or a board of directors committee is responsible for approving loans and other large or unusual transactions, then insiders will have a more difficult time perpetrating large fraud, and the transactions submitted by external fraudsters will be subject to another layer of independent review.

Transfer Journal Entries and Orders Review

Regularly review all transfer journal entries and orders. As with an expense review, if a routine-but-unscheduled review occurs from time to time, then the fraudster loses their vehicle for concealment.

Independent Review of Loans

An independent review of loans provides a nonpartisan approach to all loan transactions. Either the internal or external auditors (or other consultants) can perform this independent review that allows for a second opinion on loan transactions. The reviews should be consistent and performed on a regular basis to help establish loan loss reserves. Typically, this loan review is established for loans over a certain dollar amount, such as \$25,000 or \$100,000.

Management Review of Write-Offs

Excessive write-offs are a form of concealment for phantom loans, conflicts of interest, and embezzlement. Therefore, if all write-offs are subject to management review *before they are written off*, then management reduces the potential environment for fraud.

Routine Examination of Officers' Accounts

Routine examination of officers' accounts might prevent fraud schemes such as wire transfer fraud, embezzlement, withdrawals from dormant accounts, conflicts of interest, and so on. This review can be performed when the officer is on mandatory vacation.

Proper Lending Policies

Employees should be trained in the institution's proper (and regulated) lending policies. Any deviations from the policies will be red flags and will help to prevent loan fraud from both internal and external perpetrators.

Document Requirements for Standard Transactions

Deviations from normal or proscribed documentation should be an automatic red flag. Who better to recognize a potential fraud than the employees routinely handling the documentation? Therefore, employees should be well-educated in proper documentation for the transactions they are handling.

Information Verification

Fraud potential can be eliminated—or at the very least detected—before companies suffer damages if the employee knows how to verify information. For example, if the loan officer advises a potential borrower that the information submitted on financial statements will be verified, the borrower will be less likely to submit false or fraudulent financial statements. Additionally, if a teller advises a depositor that the deposit will be verified before cash is paid out, then the incidence of split deposits can be reduced.

Employee Training

Fellow employees are generally the first people to recognize other employees' unusual transactions or behavior changes. These might be early indicators that a fraud has started or will soon begin. Employees and managers should be properly trained to recognize these symptoms. For example, bank tellers should be adequately schooled in split deposit schemes, new account officers in new account schemes, and so on.

Standardized Procedures

An institution can provide a low-fraud environment by standardizing procedures in sensitive areas, such as the following:

- Loan application processing
- Information required for loan approval
- Credit report requests
- Appraisals accepted from a pre-approved list of vendors
- Inspection reports on construction draw loans
- Conflict of interest disclosure statements
- Routine confirmation calls for
 - Wire transfers
 - Construction vendors
- Confirmation of registered securities with registrar or transfer agent
- Periodic physical inventory of securities

Suspicious Transaction Reports

Under the Financial Action Task Force's (FATF) Recommendation 20, countries should require financial institutions to promptly report to the country's financial intelligence unit if they have "reasonable grounds to suspect that funds" from a transaction "are the proceeds of a criminal activity, or are related to terrorist financing." Many countries have implemented laws in compliance with Recommendation 20, such as the Bank Secrecy Act (BSA) in the United States or Australia's Anti-Money Laundering and Counter-Terrorism Financing Act 2006. The reports are typically called *suspicious transaction reports* (STRs), *suspicious activity reports* (SARs), or something similar. The financial intelligence unit should review the reports and work with law enforcement to investigate likely instances of financial crime. For more information about STRs, see the "Money Laundering" chapter in the Law section of the *Fraud Examiners Manual*.

For information regarding reporting requirements of suspicious activity reports in the United States, see the content on "Suspicious Activity Reports" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

The Basel Committee on Banking Supervision²

The Basel Committee on Banking Supervision (BCBS), established by the central-bank Governors of the Group of Ten (G10) countries at the end of 1974, provides a forum for regular cooperation on banking supervisory matters. Its objective is to enhance understanding of key supervisory issues and improve the quality of banking supervision worldwide.

The committee is composed of 45 members from 28 jurisdictions. Countries are represented by their central bank and also by the authority with formal responsibility for the prudential supervision of banking business where this is not the central bank.

The committee does not possess any formal supranational supervisory authority, and its conclusions do not, and were never intended to, have legal force. Rather, it formulates broad supervisory standards and guidelines and recommends statements of best practice in the expectation that individual authorities will take steps to implement them through detailed arrangements—statutory or otherwise—which are best suited to their own national systems. In this way, the committee encourages convergence toward common approaches and common standards without attempting detailed harmonization of member countries' supervisory techniques.

The committee reports to the G10 and to the heads of supervisory authorities of those countries where the central bank does not have formal responsibility. It seeks their endorsement for its major initiatives. One important objective of the committee's work has been to close gaps in international supervisory coverage in pursuit of two basic principles: that no foreign banking establishment should escape supervision; and that supervision should be adequate.

In 1988, the committee introduced a capital measurement system commonly referred to as the Basel Capital Accord. This system provided for the implementation of a credit risk measurement framework with a minimum capital standard of 8% by the end of 1992. Since 1988, this framework has been progressively introduced not only in member countries, but also in virtually all other countries with internationally active banks. In June 1999, the committee issued a proposal for a revised Capital Adequacy Framework. The proposed capital framework consists of three pillars: (1) minimum capital requirements, which seek to

² The material in this section is compiled from materials and resources issued by the Bank for International Settlements. For more information on this subject, please refer to their website at www.bis.org.

refine the standardized rules set forth in the 1988 Accord; (2) supervisory review of an institution's internal assessment process and capital adequacy; and (3) effective use of disclosure to strengthen market discipline as a complement to supervisory efforts. Following extensive interaction with banks, industry groups, and supervisory authorities that are not members of the committee, the revised framework was issued in June 2004. This text serves as a basis for national rule-making and for banks to complete their preparations for the new framework's implementation.

Over the past several years, the committee has moved more aggressively to promote sound supervisory standards worldwide. In close collaboration with many non-G10 supervisory authorities, the committee developed a set of principles, which provides a comprehensive blueprint for an effective supervisory system.

The committee's secretariat is provided by the Bank for International Settlements (BIS) in Basel. The fifteen-person secretariat is mainly staffed by professional supervisors on temporary secondment from member institutions. In addition to undertaking the secretarial work for the committee and its many expert sub-committees, it stands ready to give advice to supervisory authorities in all countries.

The Basel Core Principles for Effective Banking Supervision

The Core Principles for Effective Banking Supervision (Core Principles) have been used by countries as a benchmark for assessing the quality of their supervisory systems and for identifying future work to be done to achieve a baseline level of sound supervisory practices. Experience has shown that self-assessments of countries' compliance with the Core Principles have proven helpful for the authorities, in particular in identifying regulatory and supervisory shortcomings and setting priorities for addressing them. To facilitate implementation and assessment, the committee developed the Core Principles Methodology.

The Core Principles are a framework of minimum standards for sound supervisory practices and are considered universally applicable. The committee drew up the Core Principles and the Methodology as its contribution to strengthening the global financial system. Weaknesses in the banking system of a country, whether developing or developed, can threaten financial stability both within that country and internationally. The committee believes that implementation of the Core Principles by all countries would be a significant step toward improving financial stability domestically and internationally and provide a good basis for further development of effective supervisory systems.

The Core Principles define 29 principles that are needed for a supervisory system to be effective. Those principles are broadly categorized into two groups:

- Supervisory powers, responsibilities, and functions (principles 1 to 13)
- Prudential regulation and requirements (principles 14 to 29)

The Core Principles are neutral with regard to different approaches to supervision, so long as the overriding goals are achieved. The principles are not designed to cover all the needs and circumstances of every banking system. Instead, specific country circumstances should be more appropriately considered in the context of the assessments and in the dialogue between assessors and country authorities.

National authorities should apply the principles in the supervision of all banking organizations within their jurisdictions. Individual countries, in particular those with advanced markets and institutions, may expand upon the principles in order to achieve best supervisory practice.

A high degree of compliance with the principles should foster overall financial system stability; however, this will not guarantee it, nor will it prevent the failure of individual banks. Banking supervision cannot, and should not, provide an assurance that banks will not fail. In a market economy, failures are part of risk-taking.

The committee stands ready to encourage work at the national level to implement the principles in conjunction with other supervisory bodies and interested parties. The committee invites the international financial institutions and donor agencies to use the principles in assisting individual countries to strengthen their supervisory arrangements. The committee will continue to collaborate closely with the International Monetary Fund (IMF) and the World Bank in their monitoring of the implementation of the committee's prudential standards. The committee is also committed to further enhancing its interaction with supervisors from non-G10 countries.

The Core Principles can be found here: www.bis.org/publ/bcbs230.htm.

The Basel II Framework

The International Convergence of Capital Measurement and Capital Standards: A Revised Framework (Basel II Framework) offered a new set of standards for establishing minimum capital requirements for banking organizations. It was prepared by the BCBS, a group of central banks and bank supervisory authorities in the G10 countries, which developed the first standard in 1988.

Capital Requirements

Nearly all jurisdictions with active banking markets require banking organizations to maintain at least a minimum level of capital. Capital serves as a foundation for a bank's future growth and as a cushion against its unexpected losses. Adequately capitalized banks that are well managed are better able to withstand losses and to provide credit to consumers and businesses alike throughout the business cycle, including during downturns. Adequate levels of capital thereby help to promote public confidence in the banking system.

The technical challenge for both banks and supervisors has been to determine how much capital is necessary to serve as a sufficient buffer against unexpected losses. If capital levels are too low, banks may be unable to absorb high levels of losses. Excessively low levels of capital increase the risk of bank failures which, in turn, may put depositors' funds at risk. If capital levels are too high, banks may not be able to make the most efficient use of their resources, which may constrain their ability to make credit available.

The 1988 Basel Capital Accord set out the first internationally accepted definition of, and a minimum measure for, bank capital. The BCBS designed the 1988 Accord as a simple standard so that it could be applied to many banks in many jurisdictions. It requires banks to divide their exposures up into broad "classes" reflecting similar types of borrowers. Exposures to the same kind of borrower—such as all exposures to corporate borrowers—are subject to the same capital requirement, regardless of potential differences in the creditworthiness and risk that each individual borrower might pose.

While the 1988 Accord was applied initially only to internationally active banks in the G10 countries, it quickly became acknowledged as a benchmark measure of a bank's solvency and is believed to have been adopted in some form by more than 100 countries. The committee supplemented the 1988 Accord's original focus on credit risk with requirements for exposures to market risk in 1996.

Advances in risk management practices, technology, and banking markets have made the 1988 Accord's simple approach to measuring capital less meaningful for many banking organizations. For example, the 1988 Accord sets capital requirements based on broad classes of exposures and does not distinguish between the relative degrees of creditworthiness among individual borrowers.

Likewise, improvements in internal processes, the adoption of more advanced risk measurement techniques, and the increasing use of sophisticated risk management practices such as securitization have changed leading organizations' monitoring and management of exposures and activities. Supervisors and sophisticated banking organizations have found that the static rules set out in the 1988 Accord have not kept pace with advances in sound risk management practices. This suggests that the existing capital regulations may not reflect banks' actual business practices.

The Basel II Framework's Effect on Capital Requirements

The Basel II Framework builds on the 1988 Accord's basic structure for setting capital requirements and improves the capital framework's sensitivity to the risks that banks actually face. The overarching goal for the Basel II Framework is to promote the adequate capitalization of banks and to encourage improvements in risk management, thereby strengthening the stability of the financial system. This goal is to be accomplished through "three pillars" that reinforce each other and that create incentives for banks to enhance the quality of their control processes. The first pillar represents a significant strengthening of the minimum requirements set out in the 1988 Accord, while the second and third pillars represent innovative additions to capital supervision.

Pillar 1 of the Basel II capital framework revises the 1988 Accord's guidelines by aligning the minimum capital requirements more closely to each bank's actual risk of economic loss.

First, Basel II improves the capital framework's sensitivity to the risk of credit losses generally by requiring higher levels of capital for those borrowers thought to present higher levels of credit risk, and vice versa. Three options are available to allow banks and supervisors to choose an approach that seems most appropriate for the sophistication of a bank's activities and internal controls.

Under the "standardized approach" to credit risk, banks that engage in less complex forms of lending and credit underwriting and that have simpler control structures may use external measures of credit risk to assess the credit quality of their borrowers for regulatory capital purposes.

Banks that engage in more sophisticated risk-taking and that have developed advanced risk measurement systems may, with the approval of their supervisors, select from one of two internal ratings-based (IRB) approaches to credit risk. Under an IRB approach, banks

rely partly on their own measures of a borrowers' credit risk to determine their capital requirements, subject to strict data, validation, and operational requirements.

Second, the Basel II Framework establishes an explicit capital charge for a bank's exposures to the risk of losses caused by failures in systems, processes, or staff or that are caused by external events, such as natural disasters. Similar to the range of options provided for assessing exposures to credit risk, banks will choose one of three approaches for measuring their exposures to operational risk that they and their supervisors agree reflects the quality and sophistication of their internal controls over this particular risk area.

By aligning capital charges more closely to a bank's own measures of its exposures to credit and operational risk, the Basel II Framework encourages banks to refine those measures. It also provides explicit incentives in the form of lower capital requirements for banks to adopt more comprehensive and accurate measures of risk as well as more effective processes for controlling their exposures to risk.

Pillar 2 of the Basel II capital framework recognizes the necessity of exercising effective supervisory review of banks' internal assessments of their overall risks to ensure that bank management is exercising sound judgment and has set aside adequate capital for these risks.

Supervisors will evaluate the activities and risk profiles of individual banks to determine whether those organizations should hold higher levels of capital than the minimum requirements in Pillar 1 would specify and to see whether there is any need for remedial actions.

The committee expects that, when supervisors engage banks in a dialogue about their internal processes for measuring and managing their risks, they will help to create implicit incentives for organizations to develop sound control structures and to improve those processes.

Pillar 3 of the Basel II capital framework leverages the ability of market discipline to motivate prudent management by enhancing the degree of transparency in banks' public reporting. It sets out the public disclosures that banks must make that lend greater insight into the adequacy of their capitalization.

The committee believes that, when marketplace participants have a sufficient understanding of a bank's activities and the controls it has in place to manage its exposures, they are better able to distinguish between banking organizations so that they can reward those that manage their risks prudently and penalize those that do not.

The Basel III Framework

On December 16, 2010, the committee issued two publications containing the final text of an update to Basel II. These were followed, on January 13, 2011, by an Annex containing the reform to the redefinition of regulatory capital. These publications, collectively known as Basel III, are a comprehensive set of reform measures to strengthen the regulation, supervision, and risk management of the banking sector. The implementation deadline has been delayed several times as a result of amendments and is currently scheduled for 2023.

Increased Capital Requirements

Under Basel III, the minimum requirement for common equity—the highest form of loss absorbing capital—was raised, starting from the previous 2% level prior to Basel III, and eventually increasing to 4.5% by 2019. The Tier 1 capital requirement, which includes common equity and other qualifying financial instruments based on stricter criteria, increased from 4 to 6% over the same period. Additionally, Basel III implemented adjustments regarding how the percentage is measured, making it more strict.

The capital conservation buffer above the regulatory minimum requirement is calibrated at 2.5% and is met with common equity, after the application of deductions. The purpose of the conservation buffer is to ensure that banks maintain a buffer of capital that can be used to absorb losses during periods of financial and economic stress. The conservation buffer was set to be gradually phased in, starting in 2016 and ending in 2019. While banks are allowed to draw on the buffer during such periods of stress, the closer their regulatory capital ratios approach the minimum requirement, the greater the constraints on earnings distributions. This framework reinforces the objective of sound supervision and bank governance and addresses the collective action problem that has prevented some banks from curtailing distributions such as discretionary bonuses and high dividends, even in the face of deteriorating capital positions.

A countercyclical buffer within a range of 0–2.5% of common equity or other fully loss absorbing capital will be implemented according to national circumstances. The purpose of the countercyclical buffer is to achieve the broader macroprudential goal of protecting the

banking sector from periods of excess aggregate credit growth. For any given country, this buffer will only be in effect when there is excess credit growth that is resulting in a system wide build-up of risk. The countercyclical buffer, when in effect, would be introduced as an extension of the conservation buffer range.

These capital requirements are supplemented by a non-risk-based leverage ratio that will serve as a backstop to the risk-based measures described previously.

In addition to meeting the Basel III requirements, global systemically important financial institutions (SIFIs) must have higher loss absorbency capacity to reflect the greater risks that they pose to the financial system. The BCBS has developed a methodology that includes both quantitative indicators and qualitative elements to identify global systemically important banks (SIBs). The additional loss absorbency requirements are to be met with a progressive Common Equity Tier 1 (CET1) capital requirement ranging from 1–2.5%, depending on a bank's systemic importance. For banks facing the highest SIB surcharge, an additional loss absorbency of 1% could be applied as a disincentive to increase materially their global systemic importance in the future. A consultative document was published in cooperation with the Financial Stability Board (FSB), which is coordinating the overall set of measures to reduce the moral hazard posed by global SIFIs.

Global Liquidity Standards

The Basel III global liquidity standards include a common set of monitoring metrics to assist supervisors in identifying and analyzing liquidity risk trends at both the bank and system-wide levels. Included in the standards are the liquidity coverage ratio and the net stable funding ratio (NSFR).

LIQUIDITY COVERAGE RATIO

The liquidity coverage ratio (LCR) requires banks to have sufficient high-quality liquid assets to withstand a thirty-day stressed funding scenario that is specified by supervisors. In January 2013, the BCBS issued a final revised standard on the LCR that included the following provisions.

- An increase in the range of eligible assets that can be held as part of the required liquidity buffer (subject to the discretion of each national supervisor)
- Changes in cash outflow and inflow rates

- A revised timetable, keeping the original January 1, 2015, date for full implementation, but with a transitional period where the minimum level of liquidity coverage will gradually rise from 60% of the minimum standard to the full 100%
- A clarification that it is expected that supervisors will permit the use of the liquidity buffer in times of stress (i.e., banks will be allowed to use the buffer, and thus fall below the minimum ratio, in a liquidity stress scenario)

NET STABLE FUNDING RATIO

The NSFR is a longer-term structural ratio designed to address liquidity mismatches. It covers the entire statement of financial position and provides incentives for banks to use stable sources of funding.

Sound Practices for the Management and Supervision of Operational Risk

In February 2003, the BCBS issued a guideline entitled “Sound Practices for the Management and Supervision of Operational Risk.” This paper outlined a set of principles that provide a framework for the effective management and supervision of operational risk, for use by banks and supervisory authorities when evaluating operational risk management policies and practices. The BCBS recognized that the exact approach for operational risk management chosen by an individual bank will depend on a range of factors, including its size and sophistication and the nature and complexity of its activities. However, despite these differences, clear strategies and oversight by the board of directors and senior management, a strong operational risk culture and internal control culture (including, among other things, clear lines of responsibility and separation of duties), effective internal reporting, and contingency planning are all crucial elements of an effective operational risk management framework for banks of any size and scope. However, the principles outlined in the guideline establish sound practices relevant to all banks.

Background

Deregulation and globalization of financial services, together with the growing sophistication of financial technology, are making the activities of banks and thus their risk profiles (i.e., the level of risk across a firm’s activities and/or risk categories) more complex.

Developing banking practices suggest that risks other than credit, interest rate, and market risk can be substantial. Examples of these new and growing risks faced by banks include:

- If not properly controlled, the greater use of more highly automated technology has the potential to transform risks from manual processing errors to system failure risks, as greater reliance is placed on globally integrated systems;
- Growth of e-commerce brings with it potential risks (e.g., internal and external fraud and system security issues) that are not yet fully understood;
- Large-scale acquisitions, mergers, de-mergers, and consolidations test the viability of new or newly integrated systems;
- The emergence of banks acting as large-volume service providers creates the need for continual maintenance of high-grade internal controls and back-up systems;
- Banks may engage in risk mitigation techniques (e.g., collateral, credit derivatives, netting arrangements, and asset securitizations) to optimize their exposure to market risk and credit risk, but which, in turn, may produce other forms of risk (e.g., legal risk); and
- Growing use of outsourcing arrangements and the participation in clearing and settlement systems can mitigate some risks but can also present significant other risks to banks.

This diverse set of risks can be grouped under the heading of “operational risk,” which the committee has defined as “the risk of loss resulting from inadequate or failed internal processes, people and systems, or from external events.” The definition includes legal risk but excludes strategic and reputational risk.

Operational risk event types that the BCBS—in cooperation with the industry—identified as having the potential to result in substantial losses include:

- Internal fraud (e.g., intentional misreporting of positions, employee theft, and insider trading on an employee’s own account)
- External fraud (e.g., robbery, forgery, check kiting, and damage from computer hacking)
- Employment practices and workplace safety (e.g., workers’ compensation claims, violation of employee health and safety rules, organized labor activities, discrimination claims, and general liability)
- Clients, products, and business practices (e.g., fiduciary breaches, misuse of confidential customer information, improper trading activities on the bank’s account, money laundering, and sale of unauthorized products)
- Damage to physical assets (e.g., terrorism, vandalism, earthquakes, fires, and floods)
- Business disruption and system failures (e.g., hardware and software failures, telecommunication problems, and utility outages)

- Execution, delivery, and process management (e.g., data entry errors, collateral management failures, incomplete legal documentation, unapproved access given to client accounts, non-client counterparty misperformance, and vendor disputes)

Industry Trends and Practices

The BCBS also recognized that management of specific operational risks is not a new practice; it has always been important for banks to try to prevent fraud, maintain the integrity of internal controls, reduce errors in transaction processing, and so on. However, what is relatively new is the view of operational risk management as a comprehensive practice comparable to the management of credit and market risk in principle, if not always in form. The current trends in the financial industry, combined with a growing number of high-profile operational loss events worldwide, have led banks and supervisors to increasingly view operational risk management as an inclusive discipline, as has already been the case in many other industries.

In the past, banks relied almost exclusively upon internal control mechanisms within business lines, supplemented by the audit function, to manage operational risk. While these remain important, recently there has been an emergence of specific structures and processes aimed at managing operational risk. In this regard, an increasing number of organizations have concluded that an operational risk management program provides for bank safety and soundness, and are, therefore, making progress in addressing operational risk as a distinct class of risk similar to their treatment of credit and market risk. The BCBS believes that an active exchange of ideas between the supervisors and industry is key to ongoing development of appropriate guidance for managing exposures related to operational risk.

Sound Practices

In developing these sound practices, the BCBS has drawn upon its existing work on the management of other significant banking risks, such as credit risk, interest rate risk, and liquidity risk, and the BCBS believes that similar rigor should be applied to the management of operational risk. Nevertheless, it is clear that operational risk differs from other banking risks in that it is typically not directly taken in return for an expected reward, but exists in the natural course of corporate activity, and that this affects the risk management process. At the same time, failure to properly manage operational risk can result in a misstatement of an institution's risk profile and expose the institution to significant losses. Reflecting the different nature of operational risk, for the purposes of this paper, "management" of operational risk is taken to mean the "identification, assessment, monitoring, and

control/mitigation” of risk. This definition contrasts with the one used by the BCBS in previous risk management papers of the “identification, measurement, monitoring, and control” of risk. In common with its work on other banking risks, the BCBS has structured this sound practice paper around a number of principles. These principles were grouped in four broad categories:

- Developing an appropriate risk management environment
- Risk management: identification, assessment, monitoring, and mitigation/control
- Role of supervisor
- Role of disclosure

DEVELOPING AN APPROPRIATE RISK MANAGEMENT ENVIRONMENT

Principle 1: The board of directors should be aware of the major aspects of the bank’s operational risks as a distinct risk category that should be managed, and it should approve and periodically review the bank’s operational risk management framework. The framework should provide a firm-wide definition of operational risk and lay down the principles of how operational risk is to be identified, assessed, monitored, and controlled/mitigated.

Principle 2: The board of directors should ensure that the bank’s operational risk management framework is subject to effective and comprehensive internal audit by operationally independent, appropriately trained, and competent staff. The internal audit function should not be directly responsible for operational risk management.

Principle 3: Senior management should have responsibility for implementing the operational risk management framework approved by the board of directors. The framework should be consistently implemented throughout the whole banking organization, and all levels of staff should understand their responsibilities with respect to operational risk management. Senior management should also have responsibility for developing policies, processes, and procedures for managing operational risk in all of the bank’s material products, activities, processes, and systems.

RISK MANAGEMENT: IDENTIFICATION, ASSESSMENT, MONITORING, AND MITIGATION/CONTROL

Principle 4: Banks should identify and assess the operational risk inherent in all material products, activities, processes, and systems. Banks should also ensure that before new products, activities, processes, and systems are introduced or undertaken, the operational risk inherent in them is subject to adequate assessment procedures.

Principle 5: Banks should implement a process to regularly monitor operational risk profiles and material exposures to losses. There should be regular reporting of pertinent information to senior management and the board of directors that supports the proactive management of operational risk.

Principle 6: Banks should have policies, processes, and procedures to control and/or mitigate material operational risks. Banks should periodically review their risk limitation and control strategies and should adjust their operational risk profile accordingly using appropriate strategies, in light of their overall risk appetite and profile.

Principle 7: Banks should have in place contingency and business continuity plans to ensure their ability to operate on an ongoing basis and limit losses in the event of severe business disruption.

ROLE OF SUPERVISORS

Principle 8: Banking supervisors should require that all banks, regardless of size, have an effective framework in place to identify, assess, monitor, and control/mitigate material operational risks as part of an overall approach to risk management.

Principle 9: Supervisors should conduct, directly or indirectly, regular independent evaluation of a bank's policies, procedures, and practices related to operational risks. Supervisors should ensure that there are appropriate mechanisms in place which allow them to remain apprised of developments at banks.

ROLE OF DISCLOSURE

Principle 10: Banks should make sufficient public disclosure to allow market participants to assess their approach to operational risk management.

PAYMENT FRAUD

An influx of new payment technologies balanced against the need to retain traditional methods has resulted in a period of great change in the payment industry. Countless payment methods, ranging from cash to cryptocurrency, allow items and services to be bought online or in-person. As such, a burgeoning variety of fraudulent schemes aimed at exploiting this transitional era have appeared in recent years. Fraud examiners must ensure that their knowledge of traditional payment fraud, such as check and credit or debit card fraud, is supplemented with awareness of newer schemes.

Check Fraud

Despite the declining use of checks, check fraud remains a factor in the payment fraud landscape. Check fraud endures primarily because payment by check continues to account for a significant proportion of all business-to-business payments made in the United States. According to the Association for Financial Professionals' (AFP) 2020 *Payments Fraud and Control Survey*, 74% of companies that reported actual or attempted payment fraud encountered check fraud, a slight increase from the 70% reported in 2019. The continued high level of check fraud is thought to be a result of the massive increase in business email compromise (BEC) schemes that commonly target checks. Payment by check was still the most frequently used payment method in this study and, consequently, the most vulnerable to fraud.

The overall decline in check use is mostly attributed to the efficiency and ease of more modern forms of payment, namely online payment services, mobile payments, credit cards, debit cards, and wire transfers. For example, in most European countries, it is customary for businesses to publish their International Bank Account Number (IBAN) on invoices so that the customer can pay via bank transfer. Additionally, some European businesses still use *giros*, which is a method of transferring money by instructing a bank to directly transfer funds from one bank account to another without the use of checks. Giros are considered an effective way for companies to receive payments from foreign customers. Despite the declining use of checks, financial institutions and merchants that still use and accept this form of payment must be aware of the red flags of fraudulent checks.

Many merchants overburden police and prosecutors with reports of check fraud rather than implementing effective training and controls to help prevent such schemes from the outset;

therefore, law enforcement and prosecutors do not have the time or manpower to pursue all such cases and are often uneager to do so. Furthermore, check fraud perpetrators frequently migrate from one location to another, making their apprehension and prosecution difficult.

The best protection for financial institutions and merchants, then, is to educate employees to recognize forged and fraudulent checks and the schemes behind them. Merchants and financial institutions should have a strict check acceptance policy with which all employees are familiar. When accepting checks, employees should always ask for identification and make sure it is valid. Many check passers mollify store personnel by showing them a small laminated rectangular document with a picture. After looking at several hundred of these, many employees tend not to scrutinize them, and check passers rely on this. It is therefore important for employees to closely examine each piece of identification. Employees can also be trained to recognize the signs of forged or fraudulent licenses and other forms of identification used to facilitate check fraud.

Counterfeiting Checks

An effective check counterfeiting operation can turn a small financial investment into a fortune within a short time frame. This can be done without high levels of computer expertise or expensive software. Often, all that is required is a quality computer, a color inkjet printer, check format and magnetic ink character recognition (MICR) font software, magnetic ink cartridges, and paper stock.

Check counterfeiters commonly recruit other individuals to cash fraudulent checks. This allows the suspects to distance themselves from the transaction and avoid being identified by law enforcement. In many cases, the people presenting the checks have no identifying information about the actual counterfeiters.

Signs of Counterfeit and Forged Checks

Counterfeiters go to great lengths to make checks appear genuine. However, there are visible indicators that a check is counterfeit. For example, if the printing on the check does not seem uniform in texture and color or slants up or down, the check is likely counterfeit. Also, in the United States, the financial institution's nine-digit routing transit number must match the first nine numbers at the bottom left portion of the check. These numbers occasionally do not coincide on altered checks, often due to the fraudster's attempt to slow down the check-clearing process. The check number is typically found both in the check's upper-right corner and in the encoded account and serial number at the bottom.

Knowing that many merchants regard checks with low check numbers as suspect, fraudsters often attempt to add a digit. Again, they might have difficulty matching the ink used to produce the check. An effective method of detecting fake checks is to fan a group of checks. Counterfeit checks will sometimes stand out as having a slightly different color.

Check Fraud Vulnerabilities

A particular institution might be targeted for check frauds because of its location, inadequate internal controls, or marketing strategies that present opportunities to savvy check fraud artists. Some mutual fund companies, for example, allow customers to open accounts by mail, a form of communication with many security vulnerabilities. A significant number of check fraud complaints from a particular geographic area might indicate the presence of an active, organized group, which warrants law enforcement attention.

Investigators assigned to a particular region or institution should maintain regular contact with businesses and regulators. Specific inquiries by investigators aim to identify weaknesses, develop controls, and prevent future losses. Analyzing the complaints filed by other victims of check fraud—including retail operations, check-cashing establishments, and food stores—might reveal common elements of schemes that might not otherwise seem related.

Check Theft

Three types of check theft are: using stolen canceled checks and statements to obtain new checks, check washing, and stealing blank check stock.

- *Stolen canceled checks and statements*—Although a stolen canceled check cannot be negotiated, it does have fraud implications. Using a stolen canceled check or check statement, a fraudster can order checks from a mail-order check printer and have them sent to a mail drop address. Checks can then be written on the new stock and cashed using false identification.
- *Check washing*—Check washing is a type of check fraud that involves using acid-based chemicals found in common household products to erase particular pieces of information, such as payee name or amount, being careful not to alter the check issuer's signature. The check is allowed to dry, after which a new payee and payment amount are inscribed. Fraudsters who perpetrate check washing schemes usually write the checks for relatively modest amounts to decrease scrutiny and reduce the chance of exceeding the check issuer's account balance. Because checks written using colored inks and ball-point pens tend to be most susceptible to the chemicals used in these schemes, experts recommend using black ink and gel pens.

- *Stolen check stock*—Professional thieves using sophisticated methods steal blank check stock already encoded with customer account information, which makes passing the check even easier. Corporate checks are the most likely target in these schemes since they are easily cashed and deposited.

Check Fraud Schemes

Paperhangers

Paperhangers are the experts of phony check passing. They frequently select a particular establishment or store and observe its security methods. Any store that scrutinizes check writers' identification is not a good target for paperhangers. However, they often observe the employees and pass the check to one who seems to be the least experienced or most apathetic. The paperhanger then asks the employee for cash back from the transaction and makes the check out for an amount greater than the purchase price. In some cases, the checks are counterfeit; in other cases, the checks are being written on a closed account. A variation of this scam is making a fraudulent deposit at a bank and asking for cash back.

Stop Payment Orders

Stop payment orders involve individuals who use a check to purchase an expensive item from a retail establishment and then notify their bank to stop payment on the check. Savvy check fraudsters might even contact the merchant, saying the item was defective and that the establishment can expect to hear from the customer's legal representative. Meanwhile, the check passer sells the item for a profit.

In another scenario, after purchasing the item and notifying the bank to stop payment, the fraudster goes back to the store to return the item and receive a full refund. The merchant refunds the amount in cash but never receives payment from the fraudster's bank.

Check Kiting

Check kiting is one of the original white-collar crimes. It continues to survive even with a financial institution's ability to detect it. *Check kiting* is the practice of recording the deposit of an interbank transfer before recording the disbursement, thus briefly double-counting the amount of cash. In a kiting scheme, multiple bank accounts are opened, and money is "deposited" from account to account; however, the money does not exist.

Float refers to the amount of time that it takes between when a check is submitted and when funds are removed from its associated account. It is during this time that funds are in two

places at once: the check recipient's possession and the check writer's account. Therefore, during the float period, the check writer is given credit for the funds before the check clears the financial institution upon which it is drawn, leaving a brief period of time that makes check kiting possible.

Businesses are most susceptible to check kiting if they have employees who are authorized to write checks or make deposits into more than one bank account. Unless detected, this process of writing a check on an account with insufficient funds to cover another check can continue indefinitely.

In recent years, check kiting has become more difficult because technology now decreases the float period. In many cases, electronic debiting of an account occurs simultaneously with the transaction.

Demand Drafts

A *demand draft* is a check created by a seller that has a buyer's checking account number but no signature. Demand drafts can also be used to commit check fraud. Demand draft fraud involves the misuse of account information to obtain funds from a person's bank account without that person's signature on a negotiable instrument. Other terms for demand drafts are *preauthorized drafts* and *telephone drafts*. While there are many legitimate business uses for demand drafts, such as quick-turnaround telephone transactions initiated by airlines and car rental companies, demand drafts have been used by deceptive telemarketers who obtain bank account information and withdraw funds from consumers' bank accounts without them realizing that such withdrawals are occurring.

Third-Party Bill Paying Services

The checks produced by third-party bill paying service providers do not include the payers' signature. Instead, the signature line reflects something such as "signature on file." Unauthorized checks produced by third-party payment services are not usually detected until customers review their monthly bank statements. By the time a customer identifies an unauthorized check, it is often too late to recover the funds because the 24-hour window (actually until midnight of the next banking day) for the timely return of checks has passed. These checks usually pass through the check sorting operation without suspicion because they include accurate account information and sometimes accurate serial numbers. Too often, business and individual account holders are unaware that their account information provided to a third-party bill-paying service can be used for fraudulent purposes.

Traveler's Checks

The use of traveler's checks is declining significantly and will likely eventually be replaced by electronic options. In fact, an increasing number of vendors in locations throughout Europe—and in other parts of the world—no longer accept traveler's checks as a valid form of payment. However, for some travelers, traveler's checks continue to provide a convenient payment method while abroad.

As traveler's check denominations of \$100 are most common, some check fraud rings specialize in the production and distribution of this type of check. Commonly, check passers of this type make a small purchase using a fake \$100 traveler's check and receive the remaining amount back in cash. Naturally, this scheme works well in areas that have a lot of tourist business. These fraud rings often commit this scam several times in one area in rapid succession.

Traveler's checks have several distinguishing features, such as watermarks and holograms, as well as microprinting and ultraviolet ink. There are two basic methods of counterfeiting traveler's checks: color copying and offset printing. Color-copied checks lack the raised ink texture common on most traveler's checks. Instead of a textured feel, a phony check appears slick and flat. Offset lithographic reproductions of actual checks are of higher quality than color-copied checks. However, neither has the texture, watermark, microprinting, or hologram that legitimate checks have.

Payroll Check Fraud

Employees of payroll check processing companies print duplicate payroll checks that are sold to third parties or cashed by members of the processing company. To avoid the security used by financial institutions, the fraudsters cash the checks at grocery stores and check-cashing operations with loose controls. The checks are usually written for amounts of \$300 or less to avoid suspicion. Of course, payroll processing companies have access to personal information on the legitimate recipients of the payroll checks and sometimes use it for other fraudulent purposes.

Dumpster Diving

Often, check fraud can be as simple as retrieving financial documents or information from a trash receptacle.

EXAMPLE

Thirty people were charged in a \$10 million fraud scheme that involved counterfeiting checks, bank statements, and credit card receipts pulled out of the trash. The defendants, who defrauded people in 17 states, used checks, bank statements, credit card receipts, and other documents from garbage bins to create counterfeit checks, false driver's licenses, and false credit reports, officials said. Counterfeit blank checks, printed on high-quality color printers, allegedly were used to defraud banks of \$2 million.

Obviously, this type of fraud is preventable through shredding and proper disposal of sensitive and confidential materials by banks, merchants, and individuals.

Scanning

Checks can be reproduced on a fraudster's computer by using a scanner and a legitimate check. Anyone with access to a company's check stock can "borrow" a check rather than actually stealing it. Checks can then be manufactured by scanning a corporate logo from a business card onto a simple business-sized check.

System Password Security Compromised

In this type of scheme, people who have legitimate access to sensitive account and daily code information for a limited time (e.g., computer consultants) effect improper transfers through unauthorized access.

Check Fraud Rings

While organized crime syndicates are most commonly associated with drug trafficking and violent crimes, they are also significant purveyors of check and credit or debit card fraud.

In 2012, more than forty members of an organized crime ring operating out of Houston, Texas, were arrested for participating in a massive check fraud scheme. Members stole rent checks and money orders from more than one hundred apartment building lockboxes. After washing and counterfeiting the checks, members of the ring recruited countless other individuals, including homeless people, to cash the fraudulent checks at various establishments.

Check fraud rings thrive because the items needed to commit check fraud are easily obtainable and the cost is minimal. Often, the only necessary equipment for a check fraud

ring is a scanner, printer, and personal computer. Moreover, check fraud is considered a relatively low-risk crime; the chances of being arrested and prosecuted are low, and the penalties are relatively mild in most jurisdictions.

Many rings specialize in payroll or other institutional checks, written for relatively small amounts. But some groups infiltrate financial institutions, collecting corporate payroll checks, money orders, and masters of original bank checks, and then cashing the duplicates for several thousand dollars.

Some crime rings recruit accomplices in financial institutions with access to customers' personal information, who then pass the information on to counterfeiters. The counterfeiters then produce falsified identification (e.g., driver's licenses or credit cards), which they use to open accounts, establish lines of credit, and secure loans. Other crime rings obtain the information needed to commit large-scale check fraud from illicit sources on the *dark web*, a notorious segment of the internet that is not accessible by conventional web-browsing software. Sensitive personal information that can enable these schemes is often illegally obtained in data breaches targeting financial, retail, and other businesses, and then it is sold to fraudsters on illicit dark web marketplaces, frequently referred to as *darknets*.

An organized group might include a counterfeiter or printer, a distributor, one or more providers of false identification, and several co-conspirators who open false bank accounts or visit check-cashing establishments to negotiate fraudulent checks.

Crime rings that practice check fraud tend to be ethnically homogenous and are usually not rigidly structured. It is common for only the leaders of these rings to know the extent of their subordinates' participation. The leaders are usually intelligent and educated, and they often have a criminal or business background. Gangs have been known to share members and cooperate with one another to conduct fraudulent activities.

Check Fraud Detection

Techniques

The cashier or teller is the frontline defense in preventing check fraud. It is important that these individuals receive the training necessary to identify fraudulent checks. They should:

- Be aware of magnetic routing numbers.
- Use extra care in examining a check drawn from a nonlocal bank and require positive identification.

- Examine the date on the check for accuracy of day, month, and year. Avoid accepting a check if it is not dated, if it is postdated, or if it is more than thirty days old.
- Be aware of any visible differences in the font used to print the account holder's name, address, and any additional information (e.g., phone number) on the front of the check.
- Be sure that the magnetic ink used for routing codes appears non-reflective and dull.
- Look for MICR coding that does not match the bank district and the routing symbol in the upper right-hand corner of the check.
- Be aware of the date that the account was opened and the check number.
- Be aware of stains or discolorations on the check possibly caused by erasures or alterations.
- Have easy access to the signature card.
- Look for perforated edges on the checks.
- Be aware that a color copy might reflect odd colors at times due to a failure of the toner to mix correctly.
- Notice the absence of any design in the background of the check paper.
- Notice the absence of a bank logo and the printing of the bank name in the regular lettering.
- Notice the absence of the bank's address on the check.
- Be cautious of information that is typed or stamped.
- Avoid accepting a check that is not legibly written. It should be written and signed in ink and must not have any erasures or written-over amounts.
- Be aware of what is or is not acceptable identification (e.g., foreign documentation, non-photo identification).
- Recognize forged or altered information.
- Recognize forged negotiable instruments.
- Telephone the business or account officer for approval on suspicious requests.
- Be familiar with patterns of behavior related to potential culprits:
 - They are overly polite, nervous, or aggressive and hurried.
 - They tend to delay endorsement or identification during peak hours.

Check Fraud Prevention and Investigation

Since the U.S. Federal Reserve Board (FRB) implemented Regulation CC in 1987, which mandated the accelerated availability of customers' funds, check fraud at banks has increased. Most bank customers' funds are available for withdrawal a day after deposit, leaving the bank little time to verify the transaction's validity. Regulation CC allows banks two days to make funds available; however, most banks provide next-day withdrawal to stay competitive.

Special security printing techniques have been developed to make counterfeiting blank checks more difficult. One of the features is the use of a pattern of colors that is difficult to separate even with special cameras, filters, and film. Another technique is scrambled indicia printing, which is a seemingly random pattern of tiny colored dots printed on the paper. Using a colored filter to view the check makes a word or pattern develop.

An additional technique, which is also used by credit card issuers, is to print a *micro line* on the check, which appears as a solid line when viewed normally. Using a magnifying glass shows that the line is actually very small words or letters that are very difficult to recreate with ordinary printing processes. Other security measures include using a three-dimensional hologram that is easily identifiable by the naked eye but is impossible to reproduce via ordinary copying or printing. Some checks have a security seal on the back that is visible when held up to a light. Reproductions, even good ones, will not have a seal.

Check Fraud Investigations

During a check fraud investigation, look for the following:

- Frequent deposits and checks:
 - In the same amounts
 - In round numbers
 - With checks written on the same (other) bank
- Frequent automated teller machine (ATM) account balance inquiries
- Many large deposits made on Thursday or Friday to take advantage of the weekend
- Large periodic balances in individual accounts with no apparent business
- Low average balance compared to a high level of deposits
- Many checks made payable to other banks
- Bank willingness to pay against uncollected funds
- Deposits not made daily or intact
- Receipts that do not indicate mode of payment
- One or more personal checks in the cash drawer by the fund custodian
- Deposit timing lags
- Irregular check endorsements
- Amount of deposit does not agree with daily activity report
- Inappropriate access to signature plate
- Check numbers, payee name, date, and amount do not agree with entries in the check register
- Voided checks are not retained

- Checks issued to individuals for large, even dollar amounts
- Supporting documentation for checks is not available or has been prematurely destroyed
- Cash withdrawn when depositing checks

There are several tips for businesses to use when cashing business and payroll checks:

- Examine all checks.
- Insist that the check be signed in front of the clerk.
- Compare the signature written on the check with the signature on the driver's license or government-issued identification.
- Be particularly careful with large-dollar checks presented by noncustomers.
- Examine all checks for signs of counterfeiting, such as a glossy, wax-like appearance and any lack of detail and sharpness.
- Look for signs of alterations or erasures, especially in the signature or numerical and written amounts.
- Compare the bank identification and routing numbers for a match.
- Verify that the texture of the check appears smooth; a rough document might signal erasures.
- Be cautious of information that is typed or stamped.
- Know that checks, except government issue, typically have at least one perforated edge.
- Know that the magnetic ink used for routing codes should appear nonreflective and dull.
- Look for faded colored paper, which can indicate that the check has been chemically bleached.
- Know that a color copy might reflect odd colors at times due to a failure of the toner to mix correctly.
- Know that black lettering might have a slightly greenish cast when examined under a magnifying glass.
- Know that a light colored or delicate background might fade out when copied.
- Look for the absence of any design in the background of the check paper.
- Look for the absence of a bank logo and the printing of the bank name in regular lettering.
- Look for the absence of the bank's address on the check.
- Examine checks for an overall appearance of poor-quality printing and paper.
- Know that a payroll check is usually for an odd amount and will appear neat, clean, and usually unfolded.

Tellers should telephone the business or account officer for approval on suspicious requests.

Check Fraud Prevention Tools

CHECK WASHING PRECAUTIONS

As mentioned previously, *check washing* involves the use of acid-based chemicals to erase the name of the payee, the amount payable, or both. Individuals with business accounts are at a much greater risk when it comes to check washing. If the business does not have strict controls in place to protect its checks, it is likely that if any money is stolen from its accounts, the bank will not return the money. Therefore, business checks should be locked securely when not in use and individuals with business accounts should make sure not to leave blank computer-printed checks in the printer. Failure to take such precautions could result in businesses being equally liable for the money that could potentially be stolen.

In addition, there are specific pens designed to prevent check washing called *check writing pens* that are available at many office supply stores. These pens have special ink that prevents criminals from using solvents to remove or alter the payee's name or check amount. When someone tries to wash a check written with these pens, either it will not work, thereby leaving the check intact, or it smears the ink, making it apparent that the check has been washed.

FORENSIC DOCUMENT EXAMINATION

Through handwriting, an individual can be positively identified, as is the case with DNA or fingerprinting. When investigating check fraud, a forensic document examiner focuses on the signature and the handwriting itself.

SIGNATURE

When investigating a forged signature, a fraud examiner should compare the suspicious signature to a sample of the actual one, noting any discrepancies between the two. While one's signature might change over time, it would be close to impossible for a forger to duplicate a signature with 100% accuracy; minute identifying characteristics mark people's writing and are not reproducible.

HANDWRITING

Like fingerprints, handwriting is unique to an individual. Consequently, if the narrative portion of the check is handwritten, it offers a document examiner a greater opportunity to identify a forgery.

ELECTROSTATIC DETECTION APPARATUS

An electrostatic detection apparatus allows fraud examiners to detect indented writing from the top page of a pad of paper up to five pages below the original. This tool uses photocopier toner to develop the areas of indentation after a document has been covered with an electrically charged plastic film. In the best of cases, when the document is processed with the electrostatic device and the toner image is developed, the writing impressions are clearly defined and highly contrasted. If the developed writing is to be used in an investigation or to demonstrate results for the courts, the fraud examiner must turn to electronic image processing technology for further enhancement.

Credit and Debit Card Fraud

Credit and debit card fraud is the misuse of credit or debit card information to make purchases without the cardholder's authorization. Credit and debit card fraud is successful because the chances of being caught are small and prosecution is not ensured. Retailers have identified credit and debit card thieves and contacted law enforcement, but they often receive little or no response regarding the crime.

Credit and Debit Card Schemes

There are many different types of credit and debit card schemes, including the sale of cards to thieves, the unauthorized use of cards by family members or acquaintances, the use of card numbers in online transactions (i.e., card-not-present [CNP] fraud), and the fraudulent obtainment of a card.

Unauthorized Use of a Lost or Stolen Credit or Debit Card

Fraudulent activity normally occurs within hours of the loss or theft of a card, before most victims have called to report the loss. Victims are commonly unaware that their credit or debit cards are being used fraudulently until they review their monthly statement. It is important that victims report the loss or theft of their card within sixty days of receiving the statement with the fraudulent charges to avoid being held responsible for more than \$50 worth of charges made during that time frame. If the card number is compromised but the physical card is not stolen, then, generally, the consumer is not liable for any charges if the unauthorized charges were reported in a timely manner. If the card issuer is not notified of the theft and the card is used, then the customer might be held liable for any charges.

Organized Crime Rings

While some individuals steal cards for relatively small gains, organized crime rings perpetrate much of today's credit and debit card fraud. These rings often consist of numerous professional criminals, each performing a specific role in a large criminal operation.

Many organized credit and debit card fraud rings employ software engineers who develop malware to obtain stolen card information directly from victims. Credit and debit card fraud rings also use hackers to breach the payment systems of major retailers, hotels, restaurants, or other businesses to acquire card information. These software engineers and hackers might work directly for a crime ring, or they might offer their services in a freelance capacity through sites on the dark web.

Crime rings also commonly use rogue employees at retail locations such as restaurants to skim customers' credit and debit card numbers. After enough card numbers are obtained, purchases are made through the internet in CNP fraud or by low-level criminals who use counterfeit cards and false IDs to withdraw money from automated teller machines (ATMs) or purchase items that are easily converted to cash on the black market. The proceeds are then split among the scheme participants according to a previously determined arrangement.

Advance Payments

Consumer regulations require credit card issuers to credit customers' accounts immediately upon receipt of payment. This means deducting the payment amount from the balance of the card account before the check or other payment instrument actually clears the bank. Experienced fraud rings can easily exploit such a vulnerability.

Using a forged or counterfeit check, an advance or overpayment is made on a stolen credit or debit card. Since the issuer must credit the payment upon receipt, there is no time to verify the check's authenticity. Consequently, cash advances and purchases can be made immediately. This scheme can be extremely lucrative to the perpetrators.

Stolen Card Numbers

The internet is the primary venue for trafficking stolen credit and debit card information. Thieves find credit and debit cards or lists of cardholders and their corresponding account numbers, and then make them available to a larger group, which uses the information to obtain goods and services in the authorized cardholder's name. Credit or debit card and personal information is commonly obtained through burglaries, skimming, and data breaches.

The information is then sold to brokers, who are commonly based in Russia or Eastern European countries, or sold through websites located on the dark web, where countless underground websites specialize in the sale and trade of illicitly acquired information.

Many sites wantonly trade in this information, with entire sections devoted to payment card fraud, account frauds, personal information, and generic services. These sites are often sophisticated, offering customer reviews, multiple payment options, and guarantees. The international and dispersed nature of the fraud makes it arduous to deter or prosecute.

Counterfeit Cards

Another type of bankcard fraud involves the illegal counterfeiting of credit or debit cards. Known as *blank plastic cards*, this scheme uses credit-card-sized plastic with embossed account numbers and names. This scheme works in conjunction with a corrupt and collusive merchant or a merchant's employee. Other counterfeit cards are wholly manufactured using high-speed printing facilities and are used in association with organized crime groups.

Many counterfeiting operations are centered in Taiwan, China, and Hong Kong since these countries manufacture the holograms and magnetic strips that appear on many cards. Forged holograms are smuggled into and distributed throughout other countries around the world by crime ring members.

Advancements in technology make the actual counterfeiting process easier and allow for more accurate duplication. Duplicating legitimate cards is still an intricate operation, however. Magnetic strips, numbers, holograms, and logos must all appear authentic.

Desktop computers, embossers, tipping foil, and laminators are common tools in the reproduction process. However, the hologram is the most difficult aspect of a credit or debit card to accurately reproduce. True holograms use a lenticular refraction process; counterfeits are generally only reflected materials, usually a foil with an image stamped on it. These decals are attached to the card's surface rather than fixed into the plastic, as is the case with legitimate cards. Some fraudulent holograms do not change colors—as legitimate ones do—when viewed from various angles. However, with the increasing use of chips inside the cards and the addition of a personal identification number (PIN), counterfeiting cards has decreased significantly in countries using this technology.

Telephone and Mail-Order Fraud

Fraudsters might call unsuspecting victims and offer a free vacation or other prize, with the only requirement being that the winner must have a credit card. Once the thieves have the card number, they can order merchandise or have money wired to themselves.

Many perpetrators call individuals at random and pretend to be a credit card representative. Victims are told that their card number might have been obtained and used illegally by criminals. Alternatively, a supposed travel agency representative might call, claiming the victim has won a discount travel package. In each case, the victim is asked to provide a card number for verification or inclusion in the discount deal. The fraudsters then use the victims' card numbers to CNP purchases. They might select an unoccupied address to which their merchandise can be delivered, asking that the delivery service put the package by the back door.

False Applications

Perpetrators might apply for a new card using information purchased from the dark web or stolen from a wallet, purse, or the garbage. Additionally, they might steal a preapproved credit card application from the victims' mail or trash, or they might use credit card applications that are prominently featured in store displays.

True Name Fraud

New credit card accounts can be opened by individuals possessing a victim's true name identification, such as a driver's license or government-issued identification number. True name identification is commonly obtained via the dark web as the result of a large-scale data breach, or from lesser crimes such as pickpocketing.

Non-Receipt Fraud

Non-receipt fraud is a form of credit or debit card fraud in which the perpetrator intercepts credit or debit cards that are in transit between the credit issuer and the authorized account holder. Losses attributable to mail theft have declined significantly as a result of card activation programs, in which cardholders must call their financial institution and confirm their identity before the card is activated.

Key-Enter Counterfeiting

Credit and debit card security codes are designed to provide protection against credit and debit card fraud. These codes are typically three or four digits long and are independent

of the account number and PIN. They are primarily used to secure cards used in CNP transactions or transactions occurring over the internet, by mail, or over the phone.

When banks began using card security codes, fraudsters came up with a clever ruse in response. For instance, the Card Verification Value (CVV) system, which is used by Visa, features a three-digit number embedded in the magnetic strip of a credit or debit card, identifying it as a legitimately issued credit instrument. Card counterfeiters figured out a way to get around that system. By leaving the magnetic strip uncoded or making it unreadable, fraudsters force merchants handling the transaction to enter the card number manually. This means the transaction never falls under the scope of the CVV system.

Bank and card officials quickly found a patch for this scheme. The Card Verification Value 2 (CVV2) and Card Validation Code 2 (CVC2) systems use a three-digit security code that is printed in reverse italics at the end of the signature panel on the backs of cards. It is designed to validate that a genuine card is being used during a transaction. When a point-of-sale (POS) terminal reads a card's magnetic stripe, Visa's CVV, MasterCard's Card Validation Code (CVC), or Discover's Card Identification (CID) number can be verified during the authorization. Merchants using CVV2/CVC2 can expect a reduction in charge backs and fraud in CNP transactions.

Creditmaster

This software program allows the user to generate valid credit or debit card numbers by using valid numbers from existing credit or debit cards. Newly generated numbers are tested by attempting small purchases through online merchants. Once card numbers are deemed valid, they can be used for larger online purchases or loaded onto counterfeit cards. Although this type of software was more commonly used in the early days of the internet and is now much less effective, it is still available for download.

Skimming or Shimming

This scheme requires a device, often referred to as a *skimmer*, *wedge*, or *shimmer*, that scans and stores a large amount of credit and debit card numbers; skimmers scan magnetic strips, while shimmers read microchips in smart cards. Card skimming or shimming is more frequent in businesses where an employee is able to remove the card from the customer's view to process the transaction before returning it to the customer.

Credit cards known for having high credit limits tend to be favored targets. This scam might occur in a retail situation in which a credit or debit card is processed behind a concealable counter or in a restaurant scenario wherein a server walks away with a customer's card to process the transaction. For example, a restaurant patron gives a credit or debit card to a server who swipes the card through a wedge while conducting the legitimate transaction. Once the server has collected enough card numbers, that individual can sell them to a counterfeiter or produce fake cards using the stolen information. It might be months before the customer notices any unauthorized transactions, making the point of loss very difficult to determine and unlikely that the guilty server will be caught.

Skimming or shimming can also be performed via the attachment of covert devices to ATMs, automated fuel dispensers, vending machines, POS terminals, or self-service checkout kiosks. These devices are sometimes paired with a tiny hidden camera meant to record the input of a user's PIN. Consumers must be wary of any card readers that seem awkwardly installed or appear to have been tampered with.

Pretext Calling

Some fraudulent actors call unsuspecting customers and pose as bank or credit card agents. The actor requests account information or other identifying information from the victim and uses it to apply for additional credit cards or to purchase goods or services.

Institutional Identity Theft and Spoof Sites

Fraudulent actors might create false internet sites, pretending to sell goods to buyers who must enter their credit or debit card information and other personal information to make purchases. The "seller" then uses the information to make fraudulent purchases in the buyer's name. More recently, fraudulent actors have begun creating fake affiliate websites of actual sellers or other creditors, such as banks. The perpetrator then sends emails to existing customers of the actual seller or creditor that will direct them to the fake website. These emails inform unsuspecting customers that there is a problem with their account and ask them to log on to the website that the wrongdoer has copied to re-enter their personal and credit or debit card information. The fraudulent actor then uses the information to make purchases.

Information on how to commit credit and debit card fraud is readily available online. Postings on the internet give step-by-step instructions on how to obtain carbon paper receipts and call credit-reporting agencies using merchant numbers. The latter is done to verify that the card is valid and to obtain the amount of credit available. The fraudster usually watches a store

employee dial the agency's number, noting the numbers as they are dialed, and then listens to the employee give the merchant number. This number can often be found next to registers and can be copied down if in plain sight, giving the fraudster an excellent avenue to test stolen cards.

Merchant Scams

Collusion occurs between merchants' salespeople and credit or debit card fraudsters to process valid card numbers on blank plastic cards. They might also make several imprints on sales tickets and fill them in at a later time.

Magnetic Stripe Compromise

Magnetic stripe compromise is a more sophisticated method of obtaining account information for fraudulent purposes. It requires the transfer, or encoding, of legitimate account information, along with a security code, from the legitimate magnetic stripe to a counterfeited card with a magnetic stripe. The full, unaltered, legitimate magnetic stripe must be obtained to accomplish fraud via this method.

Magnetic Stripe Diagram

Track 1

Track 2

As shown in the Magnetic Stripe Diagram, two tracks appear on the card's magnetic stripe. Track two is the most widely read. It is forty characters in length; is strictly numeric; and contains the account number, expiration date, a security code, and discretionary bank data. Track one is 79 characters in length, is alphanumeric, and contains this information plus the cardholder's name.

Company Credit Cards

Company credit cards are provided to employees for convenience in conducting company business. Generally, no personal expenses may be charged on the company credit card except as specifically authorized by company procedures. The employee must promptly pay the company for any personal charges made on the card. Company credit cards should not be used to avoid preparing documentation for direct payment to vendors. Where allowed by local law, charges on company credit cards for which a properly approved expense report has not been received at the time of an employee's termination of employment may be deducted from the employee's last paycheck. The company will pursue repayment by the employee of any amounts it has to pay on the employee's behalf.

Prepaid Card Fraud

In recent years, prepaid cards have gained popularity. Prepaid gift and debit cards are commonly used by those who do not have a bank account or who prefer relatively anonymous payment methods. Unfortunately, these consumers are often targeted with prepaid card fraud schemes that can manifest in many ways. Prepaid cards can be purchased at countless retailers and are difficult to track after they have been purchased and activated. These features make prepaid cards attractive as facilitators that can enable a variety of fraud schemes.

Among the schemes that prepaid cards are used to facilitate are credit and debit card theft schemes. Thieves use stolen credit and debit cards to purchase prepaid debit or gift cards, thus quickly converting the illicit credit or debit card funds into a legitimate cash equivalent. These schemes have prompted many retailers to insist on cash or debit cards with PINs as the only payment methods allowed for the purchase of prepaid gift and debit cards.

Fraudsters employ various schemes to convince victims to purchase prepaid cards, load them with funds, and provide them with the card information to pay for an item or advance fee. Once fraudsters have the card information, they withdraw the funds or transfer them to another prepaid card, making the trail difficult to follow.

One example of a popular prepaid card scheme involves posts on social media advertising easy ways to make money. As prepaid card users are often financially insecure, they are more likely than others to click on links in such posts and follow the fraudster's instructions. The fraudster instructs the victim to purchase a prepaid debit card (e.g., Vanilla, Green Dot) scratch off the PIN, and send the card information. The victim is promised that more money will be added to the debit card in exchange for a small fee, typically \$25 or \$50. The fraudster then absconds with the value of the prepaid card and the fee.

Some jurisdictions have implemented regulations related to prepaid cards that offer consumers protections that are similar to credit cards, limiting liability for unauthorized transactions if a prepaid card is lost or stolen and the purchaser reports it to the issuer promptly. Consumers might need to register their prepaid cards to qualify for any liability limitations.

The Law Concerning Credit Card Fraud

Credit card fraud is generally governed at a national level through consumer protection or identity theft statutes and regulations that promote criminal charges related to credit card fraud and limit the liability of cardholders for unauthorized use. These statutes and regulations might establish processes that cardholders must follow to avoid liability, such as reporting a lost or stolen card within a certain time period or capping the monetary amount that a consumer can be held liable for (e.g., \$50 in the United States) if they follow reporting guidelines.

Most jurisdictions focus credit card fraud legislation on the protection of consumers rather than merchants, banks, or card issuers; however, these protections can extend to businesses or organizations with credit card accounts.

Guidance for Cardholders

It is in both the issuing bank's and the cardholder's interest to minimize credit and debit card fraud. Although liability for credit card fraud is limited in many countries (e.g., liability for lost or stolen credit cards is limited to \$50 in the United States), liability for debit cards is generally not as limited. Cardholders might have to spend significant time and money (including possible legal expenses) to refute fraudulent credit and debit card accounts or transactions. With debit card fraud, cardholders might have to wait until the dispute process is fully resolved to have funds restored to their accounts. In addition, while cardholders might be aware of identity theft's pervasiveness, they might not be familiar with its consequences or know ways to prevent

or minimize its effects. Since issuing banks might not bear the losses related to identity theft that involves credit or debit cards, banks should inform cardholders of ways to protect physical cards and combat the risk of identity theft.

Banks should send cardholders occasional reminders of steps that can be taken to safeguard their credit and debit card identities, including the following:

- Always carry as few cards as necessary.
- Do not provide card information to unauthorized people.
- Do not leave cards unattended with merchants.
- Routinely review card or account statements and immediately report any unrecognizable charges.
- Immediately report the loss or theft of any card to the card issuer.
- Obtain credit reports annually in order to detect any suspicious activity in which credit cards or other extensions of credit have been granted or applied for without the customer's consent.
- Never reveal account numbers or other card account information to individuals attempting to gain information on the telephone after they represent themselves as agents of a bank.
- If aware of suspicious activity, immediately inform the relevant credit reporting agencies and have a *fraud alert* placed on the account, which will prevent any potential new creditor from granting new credit without first contacting the customer personally.
- Always keep card receipts in a safe place, and destroy them after receiving the billing statement that reflects the charges.
- If an unapplied-for credit card is received, call the issuer and determine why it sent the card. Someone might have applied in the customer's name and missed the opportunity to steal the card from the mailbox when it arrived.
- Void incorrect receipts and destroy carbon copies of card slips.
- Keep a record of account numbers, expiration dates, phone numbers, and addresses of each card issuer and contact them in the event of the loss or theft of a card.
- Do not lend a card to another person.
- Do not write an account number where others might have access or be able to see it.

Prevention and Detection of Credit and Debit Card Fraud

The essential part of any detection program is the education of the tellers and merchants who are responsible for handling the transactions. It is widely suspected that the vast majority of store clerks and cashiers do not check credit and debit card signatures or request identification from a customer who presents a card as payment.

While any of the following can occur in a perfectly legitimate transaction, these characteristics are frequently present during fraudulent transactions. Tellers and merchants should be advised to be alert for customers who:

- Purchase an unusually large number of expensive items.
- Make random purchases, selecting items with little regard to size, quality, or value.
- Do not ask questions on major purchases.
- Sign the sales draft slowly or awkwardly.
- Charge expensive items on a newly valid card.
- Cannot provide photo identification when asked.
- Rush the merchant or teller.
- Purchase a large item, such as a television, and insist on taking it at the time, even when delivery is included in the price.
- Make purchases and leave the store but then return to make more purchases.
- Become argumentative with the teller or merchant while waiting for the transaction to be completed.
- Make large purchases just as the store is closing.

Tellers and merchants should be aware of the common signs of forged cards:

- Holograms crudely stamped or badly faked with tiny bits of aluminum foil
- Misspelled words on the card
- Altered signature panel
- Discolored
- Glued
- Painted
- Covered with white tape
- Cards that appear to have been flattened and restamped

At the consumer level, the credit or debit card user should remember the following:

- Know where one's card is at all times.
- Never leave a card unattended.

- Do not leave a store or automated teller machine (ATM) without all receipts.
- Do not leave a card in plain sight where others can get the number.
- Do not leave receipts in a public trash can, hotel, or shopping bag.
- Review monthly statements for accuracy and unfamiliar charges.
- Review statements via electronic means rather than waiting for paper statements. If possible, cancel paper statements altogether.
- Destroy expired cards.
- Never reveal a card number over the phone to anyone who has offered a prize.
- Report missing cards immediately.
- Do not allow a salesperson to record the card number on a check.
- Keep cards out of the view of others to limit exposure of the account number and Card Verification Value (CVV).
- Always check the card when it is returned after a purchase to make sure it is the correct card.

Prevention

Prevention is the key to reducing credit and debit card losses. The following programs can be implemented to prevent credit and debit card fraud.

Education Programs

Tellers and merchants should be trained on credit and debit cards' security features. Although the majority of counterfeit cards contain some of the security features, they are usually not complete and offer indicators that the card is not legitimate. Credit and debit card issuers should take measures to inform their customers about credit and debit card fraud, what the financial institution is doing about fraud, and how the consumer can help.

Liaison with Law Enforcement

Companies should develop a strong liaison with law enforcement. When a company receives intelligence of active frauds, law enforcement should be notified immediately.

Credit Card Company Security Initiatives

All the major credit and debit card companies have initiated security measures to help combat online theft. For instance, the Visa Secure program protects merchants from fraud-related chargebacks on all Visa personal debit and credit card transactions, even when processing transactions from nonparticipating issuers. Visa Secure also protects consumers by requiring a form of identity verification when making purchases with participating online merchants,

helping ensure that no one else can use their Visa card online. The Visa card works the same as usual when purchasing from online merchants that are not yet participating in the Visa Secure program. Additionally, Visa works alongside financial institutions and merchants to continually monitor consumers' accounts to detect suspicious or unusual activity. By taking these steps, Visa is able to work proactively to reduce fraudulent transactions.

MasterCard SecureCode allows cardholders to register and set up their own private SecureCode number. Users of SecureCode are automatically prompted by their financial institution at checkout to provide their SecureCode each time they make a purchase with a participating online merchant. The SecureCode is quickly confirmed by the financial institution, and then the purchase is completed. The SecureCode is never shared with the merchant; it is similar to entering a personal identification number (PIN) at an ATM. MasterCard has also initiated the PayPass system in which cardholders can make purchases with a simple tap, rather than swiping or dipping their card or using a PayPass-enabled device. This adds a level of security since the card or PayPass device never leaves the cardholder's hand.

Here are some of the red flags that might indicate fraudulent credit and debit card activity:

- Shipping address is different from the billing address, or the shipping address has suddenly changed
- Unusually large purchase compared to normal purchase patterns for the account in question
- Change in name on the account
- Change in date of birth or government-issued identification number

Physical Security Features

In response to the counterfeiting problems, credit and debit card companies are mastering the possibilities of making card fraud more difficult. Some of their programs are discussed here.

VISA CARD FEATURES

- Visa cards are available in traditional and quick-read formats. The traditional card format includes the embossed account number in a straight line, while the quick-read format features the laser-printed account number in four rows of four numbers.
- The Visa logo has micro-printing around the border. The fine print is barely legible without magnification.
- The flying dove hologram is displayed on the back of the card, on either side of the signature panel or above the Visa logo.

- Visa's account numbers begin with a 4 and contain 16 digits. All digits must be clean, even, and the same size and shape.
- A four-digit number is printed below the account number on embossed cards. This four-digit number must match exactly with the first four digits of the account number. Both must begin with 4.
- An ultraviolet-sensitive dove is visible on the front of the card when it is placed under an ultraviolet light.
- If someone has tried to erase the signature panel, the word *VOID* is displayed.
- Card Verification Value 2 (CVV2) is a three-digit code that appears on the back of the card in the signature panel. Typically, the signature panel has a series of numbers, but only the last three digits make up the CVV2 code. CVV2 is used primarily in card-not-present (CNP) transactions to verify that the customer is in possession of a valid Visa card at the time of the sale. Merchants will request the CVV2 from the cardholder at checkout, and the information is sent electronically to the card-issuing bank to verify its validity. Within seconds, the CVV2 results are returned with authorization. If the code is returned as invalid, merchants have the right to stop the transaction. For added protection, merchants are prohibited from keeping or storing the CVV2 number after the transaction has been completed.
- Valid dates should be checked for evidence of tampering, and expired cards should not be accepted.

More information about Visa's security features is available at <https://usa.visa.com/support/consumer/security.html>.

MASTERCARD CARD FEATURES

- All cards include the MasterCard Global Hologram, the Debit MasterCard Hologram, the MasterCard HoloMag, or the MasterCard Premium Brand Mark. Merchants should be aware that the MasterCard card design and the MasterCard Brand Mark might be oriented vertically.
- The hologram (whether on global or debit cards) is located on the front or back of the card.
- Embossed account numbers begin with a 5 and contain 16 digits.
- The first four digits of the account number must be the same as those printed directly below (preprinted bank identification number).
- The signature panel on the back of the card includes the word *MasterCard* printed in multicolors at a 45-degree angle. The last four digits of the account number are printed in reverse italics in the upper-right corner of the signature panel.

- Magnetic tape must be present and appear smooth and straight with no signs of tampering. HoloMag tape might be used in place of the traditional magnetic tape.
- The HoloMag tape or MasterCard hologram is on the back or front of the card.
- The Card Validation Code 2 (CVC2) number is printed in reverse italics in an adjacent box to the right of the signature panel.

More information about MasterCard's security features is available at www.mastercard.us/en-us/business/overview/safety-and-security.html.

AMERICAN EXPRESS FEATURES

- Ultraviolet inks are used such that when a genuine card is examined with a black light, the letters *AMEX*, as well as phosphorescence in the portrait of the Centurion, are visible.
- The portrait of the Centurion is printed with a high degree of clarity and detail like the portraits on U.S. currency.
- Erasure or tampering with the signature panel will cause the waved print background to appear white or smudged.
- The account number is 15 digits and begins with 37 or 34. The embossing should be clear and uniform in size and spacing.
- A duplicate account number is printed on the back of the card to ensure that the card number on the front has not been altered.
- The preprinted (non-embossed) Card Identification (CID) number, which is a four-digit number printed on the front of the card that is used to ensure that the individual using the card is actually the card owner, always appears *above* the account number, on either the right or the left edge of the card.
- The card number or card member name is printed in the same typeface as the American Express typeface.
- All American Express cards, including Network, Optima, and Corporate, bear the same security features outlined here.

More information about American Express's security features is available at www.americanexpress.com/content/dam/amex/hk/en/staticassets/merchant/pdf/support-and-services/useful-information-and-downloads/GuidetoCheckingCardFaces.pdf.

Technological Deterrents

Banks can take advantage of technological developments to deter credit and debit card fraud. These developments can make both the counterfeiting of cards and the fraudulent use of

valid cards more difficult. Some of these developments require very little technology. For instance, most credit and debit cards now include verification codes on the back to help merchants match cards used in purchase transactions with authorized cardholders. Card networks also maintain address and zip code verification services so that merchants, especially those involved in internet or telephone transactions, can determine whether the supposed cardholder lives at the address given by the person placing the order.

Photographs

Photographs of the legitimate cardholder help deter counterfeiting to a degree, although they have become increasingly easy for counterfeiters to purchase or find online. Photographs can be altered, but technological advancements permit digital encoding of the cardholder's image on the card's magnetic strip. Use of this technology requires specialized processing terminals that add to the cost of fraud detection.

Holograms

Holograms have been used by issuers as security devices since the early 1980s. Not long after their implementation, however, it was found that a very accurate counterfeiting industry was emerging. Even if one assesses the average credit limit of fraudulent cards conservatively, it only takes a few cards in circulation to add up to considerable losses for the issuer.

Signature Panel

Signature panels usually contain images of the issuer's logo. Missing logos or damaged signature panels are red flags of forged credit and debit cards. Signatures on the panel and the sales receipt should always be compared for consistency. While most merchants might have a policy that employees should compare these signatures, it is often ignored. Furthermore, many consumers write *see ID* or simply refuse to sign their signature panel at all under the misguided assumption that it leaves them less vulnerable to fraud.

Activation of Cards

In an effort to curb credit and debit card fraud perpetrated using the mail, companies that issue new cards by mail do not activate them until the customer contacts the card issuer. Upon contact, the card issuer might ask callers for personal information such as their mother's maiden name and birth date, or other information that a fraudster probably would not have. Once the issuer verifies the information, the card is activated for use.

Advanced Authorization

Several credit and debit card companies have begun employing technology for analyzing card transactions both individually and collectively across its network in order to detect emerging fraud patterns. When a card is swiped, advanced authorization provides an instantaneous rating of the transaction's potential for fraud to the card-issuing financial institution, including whether the card number was among those lost or stolen in a data-security incident. These systems are designed to spot situations where multiple accounts are associated with fraudulent testing or some other type of coordinated attack involving multiple accounts.

Credit and Debit Card Behavioral Analysis

Card issuers monitor credit and debit card usage and analyze spending behavior to identify potentially compromised cards. For example, if a Canadian customer whose card usage is typically limited to locations in Canada suddenly begins making purchases in Belgium, the card issuer is likely to suspend the card or deny the flagged transactions pending an investigation into whether the customer is the same person making the purchases. Likewise, an account suspension might result if a card's frequency of use suddenly increases or if the card is otherwise used in some way that is inconsistent with the customer's previously established behavioral profile.

Card Scrutiny at Point of Sale

In some cases, merchants do not get a chance to scrutinize customers' credit or debit cards. Consumers use the credit or debit card machines at the sales counter and the card never leaves their possession. While this makes things more convenient for the consumer, it often means that the merchant does not receive payment from the card issuer if a transaction is returned. If one of the key authorization components is missing (e.g., signature, expiration date, authorization number, card imprint), the amount of the sale is a loss for the merchant.

Card-Not-Present Transactions

A *card-not-present (CNP) transaction* is a credit or debit card purchase made without the cardholder physically presenting the card to the merchant (e.g., via the internet, over the phone, through the mail). With these transactions, vendors never have the opportunity to see the customer's credit or debit card. The only fail-safe, self-protective measure available to merchants is to postpone delivery until the transaction has cleared the customer's account. However, in order to stay competitive, most merchants offer next-day delivery service or other expedited shipping that occurs before the transaction clears. There are, however, some options available to merchants:

- Check the billing address against the delivery address. Beware of orders with different billing and shipping addresses unless the item is intended as a gift.
- Compare shipping addresses against a log of addresses previously associated with fraudulent orders.
- Compare IP addresses for internet orders with those used with previous orders by the same customer.
- Require all information printed on the back of the card to be provided. In particular, the CVV—the three-digit number above the signature panel on the back of the card—should be requested.
- Many payment processing services offer built-in anti-fraud features similar to those used by credit and debit card companies, such as automated analysis of transactions for fraud detection.

Potential signs of CNP fraud:

- Larger-than-normal orders—Because stolen cards or account numbers have a limited life span, perpetrators maximize the size of their purchase.
- Orders that include several of the same item—Having multiples of the same item increases a criminal's profits.
- Multiple cards used from a single IP address.
- Rush or overnight shipping—Fraudsters want these fraudulently obtained items as soon as possible to ensure they are received before the company identifies the fraudulent activity and cancels the order.
- Shipping to an international address—A significant number of fraudulent transactions are shipped to fraudulent cardholders outside the country where the order was placed.
- Transactions with similar account numbers—These transactions are particularly useful if the account numbers used have been generated using software available on the internet.
- Shipping to a single address, but transactions placed on multiple cards—This could involve an account number generated using special software or the use of several stolen cards.
- Multiple transactions on one card over a very short period of time—This could be an attempt to “run a card” until the account is closed.
- Large orders on newly created accounts without a history of purchases.

European Union's Revised Directive on Payment Services

In 2015, the European Parliament adopted the revised Directive on Payment Services, known as PSD 2, to increase consumer protection and promote the use and development of online and mobile payment services. All European Union (EU) governments were required by the

Directive to incorporate the regulation into local law by January 2018. The Directive aims to reduce CNP and other e-commerce fraud by requiring payment service providers and members of the European Banking Authority (EBA) to enhance their information security controls and ensure stricter customer authentication for accessing accounts or initiating payments. It also extends the scope of regulated transactions to include any currency and imposes new requirements to make complaint resolution procedures more effective. All organizations subject to PSD 2, which could include any global companies that process payments locally in the European Economic Area (EEA), were required to comply by September 2019, although the deadline was extended to December 2020.

Financial Institution Measures

Banks and other financial institutions have great resources at their disposal to prevent fraudulent transactions. Many of them need merely to enforce their existing policies.

- New account screening—Educate personnel to thoroughly check applicants' information, comparing ID information, addresses, and credit reports for accuracy.
- Personal identification number (PIN) activation—Bank customers are often required to provide PINs in order to activate their cards over the phone. Callers who are not able to provide the PIN might have manufactured or stolen the card in question.
- Phone number validation—If the caller's number does not match any of the telephone numbers listed in the customer's account information, bank personnel should ask some identifying questions.
- Card Verification Value 2/Card Validation Code 2 (CVV2/CVC2)—Implement these systems as soon as possible. They are among the best defenses financial institutions have against credit and debit card fraud.

Smart Cards

A *smart card* is a plastic card, the size of a credit or debit card, embedded with a microchip. These cards can identify the user through encrypted information on the chip and must be inserted into a card reader connected to the credit provider's network. The technology is also known as *chip-and-pin* because the user typically must be present with the card and enter a PIN rather than provide a signature, which is typical of a magnetic stripe credit or debit card. In some countries, including the United States, a less secure chip-and-signature system is being used instead of chip-and-pin. This system uses a microprocessor-embedded smart card, but it maintains the magnetic stripe card's signature verification rather than a PIN.

The worldwide standard for smart card technology is known as *EMV*, which is an acronym for its developers: Europay, MasterCard, and Visa. The EMV standard has already been adopted by more than eighty countries and has been proven to reduce fraud related to counterfeit cards (magnetic stripe cards, in contrast, have proven easier to duplicate). However, without a PIN requirement, EMV credit cards that are lost or stolen offer little more protection than the traditional magnetic stripe cards.

A key advantage of smart cards is that, unlike regular magnetic stripe credit and debit cards, they cannot be easily replicated. Similarly, smart cards cannot be easily counterfeited, which greatly reduces the potential for fraud with in-person transactions. And generally, smart cards are more secure than magnetic stripe cards. Smart cards include a wide variety of hardware and software features capable of detecting and reacting to tampering attempts and countering possible attacks. If someone tries to tamper with a chip on a smart card, the card detects the intrusion and shuts itself down, rendering the card useless.

Despite the advantages that smart cards have over magnetic stripe cards, and although smart cards are designed to withstand different kinds of potential attacks on security, they are not immune from attacks.

There are four main classes of attacks on smart cards: physical, side-channel, software, and environmental. *Physical attacks* are invasive attacks that seek to reverse engineer the target card and determine the card's secret key(s). *Side-channel attacks* exploit information learned by observing smart cards' power consumption and electromagnetic emissions. *Software attacks* exploit implementation vulnerabilities in smart cards through their own communication interface. *Environmental attacks* seek to induce faults in smart cards by altering the physical environment around them (e.g., temperature, UV radiation, light).

Depending on the type of the embedded microchip, smart cards can be either memory cards or microprocessor cards.

- *Integrated circuit (IC) memory cards*: IC memory cards have a memory chip with storage space for data; they have no processing capabilities. Although IC cards can hold thousands of times more memory than magnetic stripe cards, their functions are limited to basic applications such as phone cards.

- *Microprocessor cards:* Microprocessor cards, or chip cards, have storage space for data and microprocessors with the ability to process data. In addition, these cards offer other functions such as encryption, advance security mechanisms, local data processing, complex calculation, and other interactive processes.

While the adoption of smart cards has significantly reduced fraud for card-present (CP) transactions, much of the fraud has been displaced to CNP transactions on the internet. Significant increases in CNP fraud have occurred globally in the years following the transition to smart cards. Large-scale data breaches and the continued increase in online spending have also contributed to the rising volume of CNP fraud.

Evolving Credit and Debit Card Security Features

Many traditional credit and debit card security features have evolved or changed completely. As countries migrate to smart cards at different rates, several variations will exist until a single standard is adopted. Because some merchants, automated fuel dispensers, and self-service kiosks are not yet equipped to accept smart cards, many credit and debit card users carry hybrid cards that include both a microchip and a magnetic stripe; these cards might or might not require a PIN to complete a transaction.

Embossed credit and debit cards are slowly being supplanted by smooth cards in order to prevent physical card imprints. Additionally, local bank branches are able to produce unembossed debit cards within minutes, which reduces the need to send cards to customers through the mail. Furthermore, embossing equipment is now easily obtained by identity thieves, which reduces the effectiveness of embossing for security purposes. Some credit and debit card issuers now print the customer's name and card number on the back of the card rather than on the front.

CardFree Cash

Some ATMs offer customers a service called *CardFree Cash*, which allows them to withdraw cash from an ATM without the use of a debit or ATM card. To use this service, customers call their financial institution and receive a specially generated access code. Once this code is activated, customers can then set a PIN that allows them to withdraw funds from their bank account at any participating ATM. This service eliminates the need for a debit or ATM card and allows people to access cash in emergency situations when a physical card is not available.

One of the primary benefits of CardFree Cash is that it helps prevent fraud associated with the use of physical cards, such as ATM skimming schemes. Additionally, eliminating the need to carry a debit card helps lower the risk of fraud perpetrated with lost or stolen cards. However, this service also creates account takeover vulnerabilities; a fraudster who is able to change the contact information on a customer's financial account could access the account at an ATM without a card. See the "Account Takeover Fraud" section later in this chapter for additional information on how such schemes work.

Electronic Bill Payment and Person-to-Person Payments

As previously mentioned with regard to check fraud, the use of checks is quickly declining in popularity. This is largely because of the increase in popularity of *electronic bill presentment and payment* (EBPP). More people are foregoing the traditional and inefficient method of mailing checks or using cash to pay their bills. Instead, automatic or one-time payments can be made on banks' or credit card companies' websites.

Individuals can pay each other for goods or services through this same electronic system, which is known as *person-to-person* (P2P). The most popular P2P system is PayPal, but many credit cards and banks offer the service to their existing customers as well. P2P payments can now be made through a variety of services using a computer, smartphone application, or email address.

Online payment services have relatively low processing and customer service costs for billers, and customers can reduce time and costs in making payments by using these services. With some EBPP systems, customers might be able to manage their funds more efficiently. Electronic bill payment has received faster acceptance than bill presentment, although acceptance appears to be dependent on the cost of these services. As the EBPP method of payment continues to increase, it is important to be diligent in detecting and preventing potential fraud.

Giro

A *giro* is a payment transfer from one bank account to another, initiated by the payer. Giro transfers are practiced primarily in European countries and are often used to receive payments from foreign banks. The use of checks and paper giros has declined in favor of electronic payments, which are faster, cheaper, and have a reduced risk of fraud.

Electronic Funds Transfer

In most jurisdictions, laws governing electronic funds transfers (EFTs) are enacted at a national level. For example, in the United States, the Electronic Funds Transfer Act (EFTA) is a federal law intended to protect the rights of consumers with regard to EFTs that are initiated from consumer accounts, unlike the state laws that govern checks or wholesale wire transfers.

An *EFT* is any transfer of funds, other than one originated by a check or similar paper instrument, that is initiated through an electronic terminal, telephonic instrument, or computer or magnetic tape that orders or purports to authorize a financial institution to debit or credit an account. Although jurisdiction-specific regulations and terminology might differ, each of the following could generally be considered an EFT:

- A customer's withdrawal of funds from the customer's own account by use of an automated teller machine (ATM)
- A customer's transfer of funds from the customer's checking account to the customer's savings account at the same financial institution initiated by the customer through a personal computer
- A customer's transfer of funds from the customer's checking account to the customer's savings account at the same financial institution initiated by the customer through the bank's automated telephone service
- A customer's use of a debit card to purchase goods from a merchant who swipes the card through a point-of-sale (POS) device to authorize the deduction of the amount of the sale from the customer's checking account
- A customer's transfer of funds from the customer's bank account to a third party initiated by the customer through a personal computer
- An employer's instruction, initiated by computer or through a magnetic tape, to a financial institution to deposit funds representing an employee's pay into the employee's account
- A noncustomer's instruction, initiated by computer or through a magnetic tape, to a financial institution to withdraw funds from a customer's checking account and transfer the funds to a noncustomer's bank account

Access Devices

Access devices are instruments that allow access to account funds. Statutes related to access devices differ among jurisdictions, but the term generally refers to debit cards, credit cards, personal identification numbers (PINs), telephone transfer and bill payment codes, and other means that a consumer might use to initiate an EFT from the consumer's account. A consumer's account is considered an asset account, such as a demand deposit or savings

account, established for personal, family, or household purposes. The term *access device* does not include a check or draft that is used to capture magnetic ink character recognition (MICR) encoding that initiates a one-time automated clearing house (ACH) debit. For example, if a customer authorizes a single ACH debit from the customer's account by giving a check to the merchant so it can capture the routing, account, and serial numbers to initiate the debit, the check is not an access device. However, if the customer pays by check, or provides information from a check that is physically retained by the consumer (i.e., the routing number, customer's account number, and serial number), the transaction does constitute an EFT.

When an access device is necessary to instruct a financial institution to perform a transfer, the financial institution is able to claim that it was authorized to debit or credit a consumer's account only if the transfer was initiated through use of an "accepted" access device. An access device qualifies for this status only if the device was issued to a person who requested and received it; signed and used it; or authorized another to use it for the purpose of transferring money between accounts or obtaining money, property, labor, or services.

For additional information regarding regulations on access devices in the United States, see the content on "Access Devices" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

Wire Transfer Fraud

Wire transfers are used to quickly move funds between financial institutions. Wire transfers requested before 2 p.m. are typically completed the same day. Fees for wire transfers are often much higher than those for ACH or other types of transfers. The speed of wire transfers makes them an attractive target for fraudsters. According to the Association for Financial Professionals' (AFP) 2020 *Payments Fraud and Control Survey*, wire transfers were second only to traditional check fraud as the most common payment method subjected to fraud. Wire fraud has been driven in recent years by the rise of business email compromise (BEC) schemes.

Business Email Compromise

BEC schemes typically rely on manipulating company executives or other high-ranking employees into executing high-value wire transfers.

BEC perpetrators often begin by conducting extensive background research on senior executives—often including the chief financial officer—through phishing or other furtive methods. They then pose as the company’s chief executive officer (CEO) or as the head of an important supplier either through email or over the phone and demand an immediate wire transfer in a manner consistent with previously made requests from the individual they are impersonating. Employees often succumb to the pressure and send the transfer without confirming the legitimacy of the requests, leading to the loss of millions by businesses around the world every year.

An evolved version of the BEC scheme involves the attacker getting between a business and its customers during the course of an ostensibly legitimate business transaction. In this version of the scheme, attackers obtain a company’s email list and send numerous emails containing malware or phishing language. Once employees click on a bad link, open a malware-laden attachment, or enter their password into a fake log-in request, the attacker gains access to the company’s email system. The attacker then monitors messages for opportunities to hijack transactions between the business and its clients.

For example, if a buyer sends an email to the company asking for a quote on a large order, the attacker might redirect all future emails from the buyer, as well as the company’s responses. The attacker is then able to spoof the buyer’s email and send a forged purchase order to the company. When the company responds with an invoice containing wire payment details, the attacker alters the payment information and forwards it to the buyer. The buyer then unwittingly wires the payment to the attacker’s account.

Electronic Bill Presentment and Payment

EBPP involves the presentment of bills from one or more sellers of goods or providers of services to a consumer through electronic means and the payment of that bill by the consumer, also through electronic means.

At present, EBPP systems vary in organization and complexity. They might involve a transaction between a single merchant and a customer, the consolidation of multiple bills from different billers, or the consolidation of multiple payments from different customers. Initially, EBPP systems were offered by proprietary providers. However, many banks have entered the field, often by contracting out implementation of the system to proprietary providers. Banks might have an advantage in marketing these systems because consumers

who are likely to use them often have existing relationships with their banks. Bank customers, therefore, might be more willing to trust those institutions to handle their accounts than to entrust funds to a new entity with which they have no previous or tangible relationship.

Biller Direct Systems

Existing EBPP systems usually fall within one of two categories: biller direct systems or consolidation/aggregations systems. In a biller direct system, merchants deal with each customer individually—the customer enters into an agreement with the biller to receive and pay bills electronically. To do so, the customer accesses the biller’s website, creates a username and password, and provides the biller with personal information (i.e., email address, bank account number, and bank routing number), allowing the biller to collect payment from the customer’s bank account. After establishing an electronic payment account, customers can log on to the biller’s website using their username and password, pull up a copy of their bill, review it, and instruct the biller to obtain payment from their bank account. In some systems, the biller sends an email to customers notifying them that their bill is available to view online.

After a customer views the information posted by the biller, the customer can approve the information and authorize payment. The biller then initiates payment by contacting a payment provider that has agreed to collect payments on the biller’s behalf. The payment provider contacts the financial institution that holds the customer’s account and requests that the institution debit the customer’s account and remit the proceeds to the payment provider. The payment provider then credits the proceeds, minus any fees, to the biller. These payments may be transferred through an ACH transfer or through a paper transfer such as a cashier’s check when the recipient is not able to receive payments in an electronic form.

Person-to-Person Payment Systems

P2P payment systems are an increasingly popular method for making payments between individuals or between an individual and a business. P2P payments are commonly used to make online payments but are not as common for in-person payments, such as paying for clothes at a department store or buying groceries at a supermarket. These services are also used to move money internationally and between various currencies at exchange rates that rival traditional methods of currency exchange. TransferWise and PayPal are examples of popular P2P payment systems. Mobile payment applications or digital wallets, such as Venmo or Apple Pay, might also have P2P payment features.

A Model of P2P: PayPal

PayPal, with more than 305 million active accounts, is dominant in the market and can therefore serve as a model of the P2P system for illustrative purposes. Potential users of the system must log in to the provider's website and submit registration information, including their name, mailing and email addresses, and phone number. An email is sent from PayPal to the user's provided email address with the user's password. Before initiating any transfers, the user must send that password from the email account provided to PayPal at the time of registration. This permits the provider to verify information about the user and reduces the probability that the user is engaged in fraudulent activity or has established an account in the name of a fictitious person.

To make a payment, the user enters a username and password, along with the email address and payment information for the recipient. The user can authorize the provider to withdraw funds from any of three sources. First, the user may maintain an account directly with the provider. Second, the user can authorize the provider to withdraw funds from the user's account at another financial institution. If the user registers a bank account as a source of payment, the provider verifies the user's control of the account by making two small deposits into the account in an undisclosed amount and requiring the user to confirm the amount of the deposits. Third, the user can authorize the provider to charge the user's credit or debit card with the amount of the payment.

Types of Fraud

There are several ways in which fraud can be perpetrated through EBPP and P2P systems since passwords that allow access into customer bank accounts must be made available to third parties. Also, bills that contain significant information about customers pass through multiple parties. Potential sources of fraud include the following:

- A biller might send a bill for services not rendered or for goods never sent.
- A person who has obtained information about another person's bank account might instruct a biller to obtain payment from the other person's account.
- A hacker might obtain passwords and usernames from an aggregator and use that information to direct transfers from a consumer's bank account.
- An employee at the site providing EBPP services who knows consumers' usernames and passwords for screen-scraping purposes might use that information to direct transfers from consumers' bank accounts.
- A bank employee might use customer information to direct transfers from a customer's account.

Unfortunately, the financial institution that offers electronic funds transfers to its customers will have difficulty determining the source of any leak of customer information necessary to initiate a transfer. Therefore, to maintain good relations with its customers and to avoid further liability, a bank might accept responsibility for them. Thus, the best strategy for the bank is to take measures that reduce the probability that fraud will occur.

Detection and Deterrence of Electronic Funds Transfer Fraud

Considering the limited capacity of banks to shift losses from unauthorized EFTs to their customers, banks should make efforts to minimize the incidence of fraud. The justification for limiting consumer liability might be that banks are in a superior position to learn of and counteract fraudulent schemes that are used to effect unauthorized transactions. Banks can take certain initiatives to secure access devices and computers from interference; they can also follow know-your-customer (KYC) rules to prevent the issuance of access devices to individuals who are likely to use them fraudulently. Banks can prevent transfers to accounts associated with prior fraud complaints as well.

The following sections provide specific safeguards that banks can perform to reduce the risk that they or their customers become victimized by unauthorized EFTs.

For additional information regarding detection and deterrence of EFT fraud in the United States, see the content on “Detection and Deterrence of Electronic Funds Transfer Fraud” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Issuance and Use of Access Devices

EFT fraud often involves individuals who use information to obtain access to the accounts of others. As a result, bank personnel can prevent fraud by exercising care in the initial decision to allow an individual to access the bank’s computerized services. Banks offering EBPP or P2P systems to customers should:

- Confirm phone and mailing addresses on the application to ensure that they are consistent with information about the applicant that is available from other sources and, with respect to existing customers, consistent with current records about these customers. This might involve obtaining credit reports about the applicant or obtaining copies of utility bills that show the applicant’s address.
- Make sure that the area or city code in the applicant’s telephone number matches the geographical area for the applicant’s address.

- Send a welcome letter to the address on the application with the bank's return address so that the letter is returned if the applicant does not live there.
- Verify by telephone or additional mailings any change of address requests in the same way that new account applications are verified.
- If a customer reports the loss or theft of an access device, cancel the existing card, PIN, or other form of access and issue a new one.
- If a customer reports that a person previously authorized to use an access device no longer has that authority, cancel all cards, PINs, or other access devices and issue new ones to the customer.
- Always mail PINs separately from other information, such as usernames, with which they are associated.
- Separate the responsibility of bank employees who have custody of information relating to access devices from those who have responsibility for issuance, verification, or reissuance of PINs.
- Ensure that any communication concerning usernames or passwords is sent in a secure, encrypted format.
- Require customers who register for EBPP or P2P systems to provide information indicating that they are authorized to use the bank account or credit card from which payments will be made.
- Employ multifactor authentication to verify transfers via EBPP or P2P systems.

Operation of Payment Systems

Banks that participate in EBPP or P2P systems can take steps to detect fraudulent transactions, either by providing information to customers or by analyzing transactions that have characteristics associated with fraud. These measures include the following:

- Send customers email alerts when a new bill arrives or a payment is sent. The email should advise the customer to contact the bank immediately if the bill was not expected or the payment was not authorized.
- Refuse or scrutinize any transactions from a payer or recipient who has been the subject of a notice from a credit or debit card issuer indicating that the person was involved in an unauthorized card transaction or unauthorized transfer to or from a bank account.
- Ensure that the name on the bank account associated with the P2P account matches the name on the P2P account itself.
- Track and verify payments of similar amounts to the same recipient.

- Be aware of activities that are typically associated with fraud and scrutinize transactions with customers who engage in such activities since P2P systems are frequently used to make payments for online activities. These activities include pyramid schemes, online auctions, and sale of items that have a delayed delivery date.

Protection of Internet Addresses

Banks or their customers can become victims of fraud, especially identity theft, if they do not carefully monitor the use of their name on the internet. Fraudulent actors might create false domain names to attract the bank's customers and get them to provide information that will then be used for illicit purposes. This activity, known as *cybercloning* or *brandjacking*, involves the creation of a spoof site, complete with a domain name similar to the domain name of a legitimate bank that displays the real bank's logo. An email might be sent asking customers and potential customers to log on to the false domain name. Those who respond might be asked for information such as account numbers and credit or debit card numbers. Alternatively, individuals might register domain names close to the domain name of actual banks and use those sites to market goods or services with which the bank would not want to be associated. For instance, Citigroup had a battle with an individual who registered the name citicard.com and directed users who logged in to this site to an online gambling site.

Prevention of EFT Fraud in Other Companies

The Information Systems Audit and Control Association (ISACA) recommends several steps for preventing EFT fraud in companies. The following is a brief overview:

- Define the EFT process and control points.
- Define EFT policies and procedures.
- Ensure physical security surrounding all EFT components.
- Implement effective EFT application security.
- Implement effective network operating system security.
- Implement effective security surrounding EFT data.
- Implement effective system logging that establishes a baseline that can be used to measure unusual activity.
- Conduct reconciliations to allow for the determination of whether data have been modified during any stage of the EFT process.

Online and Mobile Account Fraud

Most consumers maintain several online accounts that they access through the internet and through applications on mobile devices. These accounts hold credit or debit card information, bank account information, digital or virtual currencies, and quasi-currency such as rewards points. While storing payment options in these accounts increases convenience, it also makes these accounts highly valuable targets for fraudsters.

Account Takeover Fraud

Account takeover fraud occurs when a fraudster surreptitiously takes control of a payment account. Targeted accounts can include credit cards, banking, brokerage, or any type of online retail account (e.g., Amazon).

To take over an account, thieves obtain email addresses or other log-in information and use various means to obtain passwords, such as phishing emails or password-cracking botnet attacks. Because consumers often use the same username and password for multiple accounts, hackers commonly create code that can run credentials obtained from a data breach at one company to see if they are valid at another.

Once the thief overtakes an account, communication methods and contact information are altered to keep the account holder unaware of the fraudulent activity. The thief is then free—depending on the type of account—to place orders using stored payment information, transfer funds, or request duplicate credit or debit cards.

Account takeover fraud has increased significantly in recent years, partly in response to EMV (Europay, MasterCard, and Visa) card technology becoming more prevalent and thus making traditional credit and debit card fraud more difficult. Consumers should opt for multifactor authentication when available, request notification of account access or changes when offered, and regularly check any online accounts that hold payment information.

Additional information on account takeover fraud can be found in the “Financial Institution Fraud” and “Identity Theft” chapters of this section of the *Fraud Examiners Manual*.

Mobile Payments

The ubiquitous presence of mobile devices has fostered a demand for mobile payments. These payments are typically made through contactless technology, such as digital wallets or applications—also known as *in-app payments*. For example, Uber (an online transportation

network) provides customers with a mobile application that recognizes their location and sends a driver to transport them from one point to another. To use the application, customers must first submit their payment information (e.g., credit or debit card), which is automatically accessed when the service is used. In this situation, the Uber customer's log-in credentials are equivalent to payment for the service, which makes them a target for cybercriminals. Numerous applications and software or hardware features, such as digital wallets, now enable mobile users to make person-to-person (P2P) payments. Most mobile payments require users to authenticate themselves, and the technology available in many mobile devices allows for biometric authentication, such as a partial fingerprint or three-dimensional facial scan, which is difficult for fraudsters to bypass.

Mobile payments that do not require or offer biometric authentication can be more vulnerable to cyberattacks due to the common practice of using the same log-in credentials for multiple applications. If one application is hacked, criminals might attempt to access various platforms with the same credentials.

Contactless technologies, such as Apple Pay, enable payment methods that merely require customers to place their mobile device in the vicinity of a POS terminal or other payment station. When Apple Pay users want to make a purchase, they must first authenticate themselves, often through a fingerprint or facial scan on newer devices, and then they must wave their device over a sensor that deducts the cost of the purchase from their previously established payment account. Apple Pay users can also complete P2P transactions with, or transfer funds to, other Apple Pay users without using near field communication (NFC).

NFC allows two devices to exchange information when placed within close proximity of one another. NFC can also function in one direction, such as when a mass transit user taps a metro card on a card terminal to gain access to a train station. The terminal reads the card, deducts payment, and writes the transaction to the card's NFC chip.

NFC payments are relatively secure because they do not actually transmit credit or debit card information; instead, a new *token* is generated with each transaction, which leaves potential fraudsters without payment information to steal. However, these payment methods remain vulnerable due to the initial account set-up process. Accounts can potentially be hacked or otherwise accessed through weaknesses in a device's operating system. Additionally, mobile payment accounts can be opened with stolen credit or debit card information, thus alleviating the need for fraudsters to go through the trouble of producing physical counterfeit cards.

Alternative Currencies

Alternative methods of transferring value have flourished in recent years, challenging the dominance of traditional payment methods such as cash and credit or debit cards. Value can now be stored in countless ways, including cryptocurrencies, loyalty or rewards points, and currencies designed for use within the virtual economy of a specific online environment.

Cryptocurrencies

Cryptocurrencies (e.g., Bitcoin, Ethereum, Litecoin) are different from fiat currencies in that they are not issued as legal tender by national governments, with the exception of a handful of countries, including Tunisia, the Marshall Islands, Senegal, and Venezuela. Although Venezuela introduced a national cryptocurrency, the petro, it was intended to avoid international monetary sanctions, has not performed well, and is not accepted in any international transactions. Other nations have announced plans to explore the possibility of a national cryptocurrency, but thus far, none have been established at an operational level.

Rather than the faith and trust of a national government, almost all cryptocurrencies are based on cryptographic proofs of work. These proofs are completed by networks of computers using specialized software to solve complex mathematical equations over long periods of time. This process is known as *mining*.

For a cryptocurrency transaction to occur, a majority of *nodes*, which are computers that make up a cryptocurrency's network, must validate the transaction. Upon validation of the transaction, it is recorded on the cryptocurrency's ledger, encrypted, and stored on all the network's nodes. This makes cryptocurrency transactions practically irreversible. To reverse a transaction, a majority of nodes would need to agree to change the encrypted ledger that records all transactions of a particular cryptocurrency. Thus, any fraudulent cryptocurrency transactions or transactions involving the proceeds of fraud are extremely difficult to reverse.

Cryptocurrencies have been relatively anonymous and have not been subject to significant monitoring or regulation by governments or financial institutions thus far, although many countries are developing controls and regulations that could affect their classification as assets, how they are traded and purchased, or how they can be spent. For these reasons, they are attractive vehicles for various fraud schemes, including money laundering (see the "Money Laundering" chapter in the Law section of the *Fraud Examiners Manual* for additional information on alternative payment methods).

However, many countries have implemented laws that require *cryptocurrency exchanges*, which are businesses that allow customers to exchange fiat currency for cryptocurrency or one cryptocurrency for another, to comply with know-your-customer (KYC) requirements, similar to financial institutions, or at least maintain records of customers' identities. These requirements have made investigating cryptocurrency transactions easier for fraud examiners, as they can potentially compel cryptocurrency exchanges to provide information about their customers through subpoenas or court orders. If a fraud examiner can identify a cryptocurrency wallet associated with illicit transactions, then they can potentially discover the identity of the wallet's owner.

As cryptocurrencies have become more widely adopted and used, they have been involved with a wide variety of fraud schemes, but perhaps none more so than money laundering. Converting illicit fiat currency proceeds into cryptocurrencies and then transferring cryptocurrencies through complicated series of transactions across numerous wallets makes tracing the illicit funds' path tedious and difficult for fraud examiners or law enforcement.

Cryptocurrencies can also be a vehicle for pump and dump schemes whereby an investor, or group of investors, artificially drives up the price of a coin before divesting. This often results in the collapse of the investment's value for those investors not involved in the scheme. These schemes are much more likely with lesser known coins than with well-known coins such as Bitcoin or Ethereum. Additionally, due to the variety of, and interest in, cryptocurrencies, a coin might be created with the sole intention of committing a pump and dump scheme.

Cryptocurrencies are also commonly used as payment in transactions conducted on the dark web. Countless frauds are enabled by the perceived anonymous nature of these payments, including the sale of stolen identities, payment information, and intellectual property. However, authorities have been able to track some illicit transactions involving popular cryptocurrencies, including Bitcoin, and make arrests in connection to the related fraud schemes.

Virtual Economies

The rise of virtual economies has followed the explosion of interest in massively multiplayer online (MMO) gaming platforms. These platforms include titles such as EVE Online, Second Life, and World of Warcraft, all of which have large and multi-faceted in-game economies. These games often include millions of participants who interact in free-roaming virtual environments and use in-game currency to exchange virtual goods and services (e.g., Linden dollars in Second Life).

Wealth in a virtual economy is typically generated by spending significant time and effort participating in the game to slowly earn in-game currency, or it can be generated by simply paying for in-game currency using outside payment methods, such as credit or debit cards, PayPal, or bitcoin. However, despite being isolated, virtual economies are at risk for fraud.

For example, *gold farming* is a scheme wherein an MMO game is played—either personally or with the use of automated bots—with the sole purpose of rapidly earning in-game currency, typically by manipulating or cheating the game’s earning system. After enough currency has been amassed, the currency or the account that holds the currency is sold on the black market.

Other schemes can be used to launder money through virtual economies by setting up numerous player accounts and transferring in-game currency from one account to another to disguise its origin. These schemes are enabled by exchanges that exist on the dark web to convert gaming currencies into virtual currencies such as bitcoin. Virtual economies that allow players to sell in-game assets or currency to other players for fiat currency have been exploited as a means to make illicit payments related to bribery or corruption schemes as well.

As virtual economies grow in value and participation, so, too, will their exposure to various forms of fraud.

Loyalty Fraud

Consumers earn points for airlines, hotels, credit cards, and countless other programs that reward them for maintaining brand loyalty over a long period of time. Loyalty programs are used to maintain a base of customers or to incentivize consumers to try a new product or service.

Consumers often view reward points and loyalty programs as being equivalent to cash. For example, someone with 100,000 airline miles might think of those miles in terms of the money saved on the purchase of two international round-trip airline tickets, potentially several thousand dollars.

Unfortunately, thieves have also begun to think of loyalty points in terms of cash and, as such, these programs are increasingly subject to fraud. Loyalty accounts are also attractive fraud targets because they are often less secure than accounts with financial institutions, commonly lacking fraud prevention mechanisms such as multifactor authentication or account activity monitoring.

And while consumers regularly check accounts held with financial institutions, rewards accounts tend to be monitored much less frequently. This often results in fraud being reported long after the incident has occurred.

Loyalty fraud typically results from fraudsters gaining access to a rewards account by obtaining log-in credentials through phishing or hacking. Fraudulent transactions can be difficult to recognize because many consumers use their points to purchase gifts for others, with many airlines even allowing the conversion of travel points for tickets in another person's name.

Increasingly, points programs from one company are joined with programs from other companies to enhance the options and utility available for consumers. Whereas airline points at one time might have only been valid toward the purchase of an airline ticket with the issuing airline, rewards programs are increasingly offered as part of an alliance of expanded loyalty networks that allow consumers to exchange their points for numerous unrelated products and services, such as hotel stays, retail purchases, or gift cards.

The ability to convert loyalty points to sellable items such as gift cards allows fraudsters to leverage compromised loyalty accounts for cash. Furthermore, many loyalty programs allow the transfer of points from one account to another within the expanded program network, thus allowing fraudsters to transfer points from numerous compromised accounts into whichever program is most conducive to their scheme.

INSURANCE FRAUD

The insurance business, by its very nature, is susceptible to fraud. Insurance is a risk distribution system that requires the accumulation of liquid assets in the form of reserve funds, which are in turn available to pay loss claims. Insurance companies generate a large steady flow of cash through insurance premiums. Steady cash flow is an important economic resource that is very attractive and easily diverted. Large accumulations of liquid assets make insurance companies attractive for *takeover* and *loot* schemes. Insurance companies are under great pressure to maximize the return on investing the reserve funds, thus making them vulnerable to high-yielding investment schemes.

Types of Insurance Policies

Property insurance indemnifies against pecuniary loss to the insured's property (and, in some policies, to the property of others) for specific losses, such as those from fire, theft, or auto collision. *Casualty insurance* indemnifies against legal liability to others for injury or damage to people, property, or other defined legal interests because of specified risks or conduct. There are several types of casualty insurance, such as health, disability, life, fidelity, and bonds. *Health insurance* indemnifies against medical care costs under specified circumstances.

Disability insurance indemnifies against income loss under defined circumstances. *Life insurance* indemnifies for the death of the insured. *Fidelity insurance* indemnifies against economic loss to the insured caused by employee dishonesty. *Indemnity bonds* indemnify against loss to third-party beneficiaries when the insured fails to fulfill a specific undertaking for the third party's benefit.

Insurance policies can be marketed in combinations. Homeowners insurance and auto insurance policies usually include features of both property and casualty insurance. Some health insurance plans, for example, also might include disability benefit provisions. There are a multitude of insurance fraud schemes. Likewise, there are fraud schemes that are prevalent only in specific insurance areas. The largest amount of insurance fraud is in health care. Like all other industries, insurance is susceptible to both internal and external fraud schemes.

External health care fraud is perpetrated by outsiders against the company. The two main types of external fraud schemes are those committed by providers (such as doctors,

institutions, and home health agencies) and claim fraud by the insured. Health care frauds—a specific variation of insurance fraud—will be discussed in the “Health Care Fraud” chapter in this section of the *Fraud Examiners Manual*.

Agent/Broker Fraud

Cash, Loan, and Dividend Payments

A company employee requests cash, a loan, or a dividend payment without the knowledge of an insured or contract holder and either deposits the money into their bank account or a fictitious account. To minimize their chances of being detected committing a fraudulent act, the employee might change the company policyholder’s address of record to either their own address or a fictitious address. Once the payment is issued, the address is then changed back to the previous address.

Settlement Payments

Company employees can misdirect settlement payments, such as matured endowment or paid up, to the branch office, their homes, or fictitious addresses. The employee can easily create a payment defalcation by changing the address of record prior to the settlement payment issue date, thus misdirecting the payment in question. Also, an orphan contract holder might be transferred to their agency periodically, affording the opportunity to improperly request the issuance of a settlement payment.

An *orphan contract holder* is a policyholder or contract holder who has not been assigned to a servicing agent or the whereabouts of whom are unknown. The servicing agent attempts to locate this family group and can possibly influence them to purchase additional insurance.

A clerical support employee might receive notification that the orphan contract holder does not reside at the given address. This will give the support staffer an opportunity to change the address to either their own home or a fictitious address and possibly create a fraud.

Premium Theft

An agent collects the premium but does not remit the payment to the insurance company. Thus, the insured unknowingly has no coverage available upon a qualifying event.

Fictitious Payees

An agent or a clerk can change the beneficiary on record to a fictitious person and subsequently submit the necessary papers to authorize the issuance of a payment.

Fictitious Death Claims

An agent or employee obtains a fictitious death certificate and requests that a death claim payment be issued. The agent then steals the payment.

The sales representative can also write a fictitious application and, after the contestable period (e.g., two years), submit a phony death claim form and obtain the proceeds. The agent, by investing a small amount, could receive a much larger sum in misappropriated claims.

A company is particularly vulnerable to this scheme if the perpetrator has knowledge of the underwriting procedures, such as the limits under which insurance can be written without a medical exam and what should be submitted on a death claim.

Underwriting Irregularities**Equity Funding**

Equity funding is the process of using existing premium/policy values to finance new businesses. As long as the insured is aware of what is being done by the agent and fully understands the long-range method of payment on the new contract, there is no apparent underwriting irregularity.

Equity funding techniques, also known as *piggybacking*, usually do not produce quality business. Furthermore, the company increases the amount of life insurance on the books but receives little or no new funds while incurring increased sales and administrative expenses associated with the issue of that new business.

Equity funding irregularities might involve improper financial benefits to field personnel as well as annual incentive compensation bonuses paid to management, if applicable. The fraud examiner should determine what financial benefit will occur from an improper equity transaction.

Misrepresentation

Misrepresentation might occur if a sales representative knowingly makes a false statement with the intent to deceive the prospective insureds in order to obtain an unlawful gain.

False Information

A company employee might submit the following false information to obtain unlawful financial gain:

- Improper medical information to obtain a better insurable rate for the prospective policyholder (e.g., standard to preferred rate)
- Improper date of birth to obtain a cheaper premium on the new policy
- Improper home address to obtain a cheaper premium for home or automobile insurance
- Improper driving history prior to purchasing automobile insurance to reduce the annual premium or obtain insurance where the individual would normally have to apply through the risk pool

Fictitious Policies

To keep their position, a salesperson submits fictitious policies to improve their writing record. Also, prior to an individual leaving the company, they write fictitious policies called tombstone policies to improve their commission pool so that their compensation will be greater. The term *tombstone policy* came into being because agents would literally copy names from tombstones to write new, fictitious policies.

Surety and Performance Bond Schemes

Surety and performance bonds guarantee that certain events will or will not occur. An agent issues worthless bonds to the insured for high-risk coverage, hoping that a claim is never made. If a claim is made, the agent might pay it using agency funds, delay the payment, or leave town.

Sliding

Sliding is the term used for including additional coverage in an insurance policy without the insured's knowledge. The extra charges are hidden in the total premium. Since the insured is unaware of the coverage, few claims are ever filed. For example, motor club memberships, accidental death, and travel accident coverage can usually be added to the policy without the insured's knowledge.

Twisting

Twisting is the replacement, usually by high-pressure sales techniques, of existing policies for new ones. The primary reason, of course, is for the agent to profit since first-year sales commissions are much higher than commissions for existing policies.

Churning

Churning occurs when agents falsely tell customers that they can buy additional insurance for no cost by using built-up value in their current policies. In reality, the cost of the new policies frequently exceeds the value of the old ones.

Vehicle Insurance Schemes**Ditching**

Ditching, also known as *owner give-ups*, involves disposing of a vehicle to collect on an insurance policy or settle an outstanding loan. The vehicle is normally expensive and purchased with a small down payment. The owner falsely reports the vehicle as stolen while orchestrating its destruction or disappearance in some way, such as by having it stripped for parts, burned, or submerged in a large body of water. In some cases, the owner just abandons the vehicle, hoping that it actually will be stolen. Sometimes the scheme involves a homeowner's insurance claim for the property that was supposedly in the vehicle when it was "stolen."

Past Posting

Past posting is a scheme in which a person is involved in an automobile accident but does not have insurance. After the accident, the person gets insurance, waits a short time, and then reports the vehicle as having been in an accident, thus collecting for the damage previously incurred.

Vehicle Repair

This scheme involves the billing of new parts on a vehicle when used parts were actually replaced. Sometimes this involves collusion between the adjuster and the body repair shop.

Vehicle Smuggling

This is a scheme that involves the purchase of a new vehicle with maximum financing. A counterfeit certificate of the vehicle's title is made showing that it is free and clear. The

vehicle is insured to the maximum, with minimum deductible theft coverage. It is then shipped to a foreign port and reported stolen. The car is sold at its new location and insurance is also collected for the “theft.”

Phantom Vehicles

The certificate of title is a document that shows the legal ownership of a vehicle. Even though it is not absolute proof that a vehicle exists, it is the basis for the issuance of insurance policies. Collecting on a phantom vehicle has been shown to be easy to do. Note that the term *phantom vehicle* might also refer to vehicles involved in uninsured motorist claims wherein the vehicle and driver that purportedly caused the damage in question cannot be identified.

30-Day Special

In this scheme, the vehicle’s owner reports the vehicle stolen and hides it just long enough for the insurance company to settle the claim—usually thirty days. Once the claim is paid, the vehicle is abandoned by the owner. These schemes are typically perpetrated by owners of vehicles that are in need of extensive repairs that would not be covered by their automobile insurance policies.

Paper Accident

This scheme involves the fabrication of an automobile accident that only exists on paper. When the repair costs are small (e.g., less than \$1,000), many insurance companies do not bother to send an investigator to examine the vehicle. Because this is a low-risk endeavor and the authorities are not involved, this scheme is very popular within organized crime rings.

Hit and Run

The *hit and run* is a variation of the paper accident. The owner of a previously damaged vehicle calls the police and claims to be the victim of a hit and run accident. The resulting police report is used to file an insurance claim. This scheme might also be perpetrated after a single-car accident with no witnesses.

Staged Accidents

Staged accidents are schemes in which an accident is predetermined to occur on a vehicle. The schemes are organized by crime rings and the culprits move from one area to another. They often use the same vehicle over and over, which sometimes causes their scheme to be uncovered.

Two Vehicle Accident

Perpetrators cause an accident and then lead the innocent driver to believe it's their fault.

Three or More Vehicle Accident

Perpetrators set up an accident in which all the drivers are involved.

Side Swipe

The *side swipe* is a scheme that relies on opportunity. In a busy intersection with multiple turn lanes, the perpetrator makes the same turn over and over again, waiting for another driver to cross into their lane. When a driver finally does, the perpetrator purposely drives into the other car. Witnesses and police involvement are helpful to the perpetrator in this case.

Drive Down

The scheme involves a perpetrator waving on a driver attempting to merge in front of them, and then intentionally colliding with the merging vehicle. After the accident, the perpetrator denies having waved on the merging driver.

Other Staged Accidents

Two drivers purposely collide where they will not be observed. Additional damage might be added to the vehicles after impact. The cars are driven to a road or highway and arranged so that the accident appears to have occurred there. The police are then notified.

SWOOP AND SQUAT

A victim of this scheme is passed by two cars while driving. The car in the lead cuts in front of the second, forcing it to stop abruptly. The victim rear-ends the second car while the other driver speeds away. Victims often accept responsibility for the accident, thinking it was their fault for not paying attention. The rear-ended vehicle usually contains the maximum amount of passengers, all of whom claim injuries.

Inflated Damages

The business environment and the competition for work in the automobile repair industry have motivated a scheme where some establishments inflate the estimated cost to cover the deductible. The insured is advised by the repair shop that the shop will accept whatever the company authorizes.

Vehicle Identification Number Switch

Vehicle identification number (VIN) switch fraud schemes are the work of professionals in which a wrecked vehicle is reported as repaired and subsequently sold. The vehicle is not repaired, but the VIN plate is switched with a stolen vehicle of the same make and model.

Rental Car Fraud

A person does not need to own a vehicle to commit automobile fraud. There are several schemes that can be perpetrated using rental cars. The most prevalent involve property damage, bodily injury, and export fraud.

Property Schemes

Property schemes usually involve the filing of insurance claims for property that never existed or for inflated loss amounts.

Inflated Inventory

Property that is lost through fire is claimed on an insurance form. However, property that does not exist also finds its way onto an inventory of the property claimed. Property claimed might have been previously sold or never owned by the claimant.

Phony or Inflated Thefts

A home or car that has been burglarized is the basis for filing a claim for recoveries of monies lost. However, as with items “destroyed” by fire, the items never existed or were previously sold.

Paper Boats

A claim is filed for a boat that sank, but actually never existed. It is not difficult to register a boat that is based on a bill of sale. After a period of time, a loss is claimed for the sinking of the boat. It is difficult to prove that the boat did not exist or was not sunk intentionally.

Life Insurance Schemes

Fraudulent Death Claims

To obtain reimbursement for life insurance, a death certificate is required. However, phony death certificates are not that difficult to obtain. The person might be very much alive and missing, or the person might be dead and the death is past posted. With small settlements, death claims are not closely scrutinized and are paid relatively easily.

Murder for Profit

A murder for profit scheme involves the killing (or arranging for the killing) of a person in order to collect the insurance. The death might be made to look like it was an accident or a random killing.

Vanishing Premium Scheme

This scheme involves insurance companies marketing deceptive vanishing premium life insurance policies. The idea of the *vanishing premium* policy is that, after a set number of years of paying the policy's premium, the policy would be paid off. At that point, the policy holder would not have to make any more payments toward the policy.

In reality, though, around the time the policy would be paid off, the insurance company explains that the policy had been revised, and that several more years of payments are necessary. The policy holder is then faced with a dilemma: either cease making payments and risk having the policy lapse due to non-payment or continue making the expensive payments for several more years.

Liability Schemes

In a liability scheme, the subject claims an injury that did not occur. The slip-and-fall scam is the most common, where a person claims to fall as the result of negligence on behalf of the insured.

Workers' Compensation Fraud

Some countries, such as the United States, have workers' compensation laws that require employers or their insurance plan to reimburse employees (or act on their behalf) for injuries that occurred on the job regardless of who is at fault and without delay of legal proceedings to determine fault. The injury may be physical, such as a broken limb, or mental, such as stress.

Common Schemes

Schemes are generally broken into four categories: premium fraud, agent fraud, claimant fraud, and organized fraud schemes.

Premium Fraud

Premium fraud involves the misrepresentation of information to the insurer by employers to lower the cost of workers' compensation premiums.

EMPLOYEE CLASSIFICATION

Workers' compensation rates vary depending on an employee's job classification. Employees that have a higher risk for injury on the job will have a higher premium rate. For example, clerical employees have a lower probability for an injury than truck drivers or construction workers, and thus their premiums should be lower. Therefore, to lower their premium rate, an employer might intentionally misclassify employees.

UNDERSTATEMENT OF PAYROLL

The premium for a specific job classification is based on the total payroll for that classification. The employer might understate the amount of the payroll for higher-risk classifications.

EXAMPLE

Two men pleaded guilty to charges of conspiracy and mail fraud in connection with a fraudulent scheme to reduce workers' compensation claims for a construction company. The men falsely reported that workers in high-risk trades were engaged in less dangerous occupations to lower premiums. They also concealed millions of dollars on the company payroll from the insurance company, thereby avoiding workers' compensation payments on those dollars.

EXAMPLE

A married couple found themselves responsible for a \$71,049 judgment after being accused of misreporting payroll in their drywall business. Two former employees tipped off investigators that they were being paid with checks bearing different company names.

Half of their payroll money was paid by an insured drywall company, and the other half came from one that was not insured. Workers' compensation claims came from the company that was paying premiums.

GEOGRAPHIC LOCATION OF THE INSURED'S OPERATION

Premium rates can differ significantly based on geographic location. An employer might have a storefront location or a PO Box in an area that has lower rates. An employer with employees in multiple countries might list all of its employees as operating in the country that has the lowest rates.

HISTORY OF PAST LOSSES

The modification or *mod* factor is a multiplier that is used to determine premium rates. The multiplier is derived by comparing the employer's claims history with other employers' claims histories in the same industry. The higher the claims loss, the higher the mod, and thus the higher the premium. A new business starts with a neutral mod for that type of business. Employers that have a high mod factor might become a "new" business that does not have a mod established and thus have lower premiums than they should.

CORPORATE GERRYMANDERING

The risk pool assigned to an employer accepts any business regardless of its claim experience. However, it does not have to accept any employer that owes premiums. Some employers create a new corporate entity to obtain coverage or avoid higher premiums due to past heavy losses.

EXAMPLE

An insurance company was awarded a \$15 million judgment against an entertainment company in a suit involving a workers' compensation fraud scheme. The entertainment company set up a shell corporation to pose as a start-up production company needing insurance. The ruse allowed the company to get workers' compensation at much lower rates than if the insurance company had known who it was actually insuring. The entertainment company then manipulated the coverage to other films in which it had an interest, again at significantly lower rates.

FORGED DOCUMENTS

Some employers forge or alter prior certificates showing coverage to collect payment for work done or as proof of coverage to authorities.

Agent Fraud**PREMIUM THEFT**

Agents issue certificates of coverage indicating the customer is insured, but they never forward the premium to the insurance company.

CONSPIRING TO REDUCE PREMIUMS

An agent might alter the application for coverage completed by the employer to be able to offer a lower premium to their client. The agent might also improperly advise the employer as to how to complete the application or advise the employer to transfer a group of employees into a lower risk classification to avoid the experience modifier.

Even though the employer might not be aware that the schemes are a violation of law, since the employer signs the application, they can be charged for their part in the scheme.

Claimant Fraud

Claimant fraud involves misrepresenting the circumstances of any injury or fabricating that an injury occurred.

INJURY FRAUD

In this type of fraud, false information about the injured worker is submitted to the workers' compensation carrier. The report describes the injury and states that the employee is either totally or partially disabled and either unable to work or only able to work part-time. In many of these schemes, the fraud is helped along by a doctor who, for a fee, will provide a false diagnosis and false medical records for phony treatments.

The employee might stage an accident and fabricate an injury or actually have an accident and then exaggerate the injury.

EXAMPLE

A former personnel supervisor for a city was charged with embezzling funds from the city's workers' compensation system. It was charged that they provided information to a doctor that enabled them to submit almost \$500,000 in fake claims for medical services that were supposedly provided to city employees. The supervisor was also alleged to have altered the computerized personnel records on their own and then authorized payment of \$300,000 in fake disability claims to their friends and relatives.

EXAMPLE

A firefighter was arrested for insurance fraud related to workers' compensation payments they had received. The individual claimed they fell off a ladder and injured their knee while working as a meat cutter in a grocery store. They collected temporary disability benefits and received medical treatment for six months, complaining of pain and telling doctors that they could barely walk. At the same time, the firefighter was training with their city fire department as a reserve firefighter. The training consisted of strenuous exercise, such as heavy lifting and an hour of physical training each day.

SECONDARY EMPLOYMENT

Employees who are collecting workers' compensation benefits might also secure a job with another employer—either part-time or full-time. The employee might fake their identity or assume someone else's identity to receive compensation.

Organized Fraud

Organized fraud schemes are composed of the united efforts of a lawyer, a capper, a doctor, and the claimant. This scheme is used not only in workers' compensation cases but also in other medical frauds, such as automobile injuries.

THE LAWYER

Lawyers are usually the organizers of the schemes and the ones who will profit the most. The majority of workers' compensation cases are accepted on a contingency fee basis. If no settlement is awarded, then the lawyers will not be paid. This is a high-volume business, and the lawyers do not want the cases to be litigated. They are relying on the insurance company's desire to settle as quickly as possible.

The lawyers will entice the claimant into securing their services by promising a large settlement from the insurance company. The claimants might or might not have to undergo the medical tests, since the only requirement of the claimants is that they be insured. The lawyer will then refer the injured party to a doctor for “treatment.”

THE CAPPER

Cappers, also known as *runners* or *steerers*, are used to recruit patients for the scheme. They might be employed by either the attorney or doctor and are paid—either on a percentage of the total or on a per-person basis—for bringing in patients. Cappers might approach patients at unemployment compensation lines, work sites, scenes of accidents, or at any other type of organized gathering. Patients are brought into the scheme with promises of enrichment.

EXAMPLE

In August of 2010, the last member of a group of 51 suspects was arrested for insurance fraud and other crimes. The insurance fraud included clinic workers and owners who hired runners to recruit automobile accident victims, as well as staged automobile accident participants when they ran out of “legitimate” accident victims. Runners received \$500 to \$700 per patient, and the estimated fraudulent claims from this scheme exceeded \$4 million.

THE DOCTOR

Doctors might be organizers or players in the scheme, but they must be a part of it for it to work properly. Doctors are used to make the scheme appear authentic, and they are well compensated for their efforts. The doctors bill for services that they might or might not render, as well as for unnecessary services. In addition, if patients have regular health insurance, doctors might double bill for the services. If an injury is the result of an automobile accident that occurred while the patient was on the job, the doctor might bill all three insurance companies: the workers’ compensation carrier, the employee’s health insurance, and the automobile carrier.

Because of coordination of benefit clauses in most insurance contracts, the insurance companies will coordinate the benefits to the extent that the maximum amount paid will be 100% of the injuries. However, the doctors will not let the patient’s health insurance company know that the injury is work-related or accident-related, and thus the claim might be overpaid, since both claims are paid at their full liability.

Most of the treatments rendered are office visits, x-rays, vascular studies, physical therapy, and spinal manipulations. In some cases, hospital employees are part of the scheme and allow the use of the facility fraudulently.

Red Flags

- Documents have obviously been altered; correction fluid or erasure is evident.
- Documents are improperly filled out with entries in the wrong place or information that does not make sense.
- Claims are filed where the carrier indicated no record of coverage.
- Poor-quality photocopies of documents are submitted instead of original documents.
- Small payrolls are reported for large contractors or employee leasing operations.
- Payroll figures reported to insurers disagree with payroll reported for other purposes.
- Claims for employee injuries are inconsistent with that employee's classification.
- Industrial or construction enterprises with a work force are reported to be in low-rate categories.
- "New" corporations participate in ongoing jobs.
- Most of the employees from an employer with a high experience suddenly become employees in a new business.
- The agency employs large numbers of support staff and only has one licensed agent.
- The agent only accepts cash or money orders for premiums.
- No policy is received after an extended time.
- No bill is received for premiums.
- An employer review of the application indicates that it is inaccurate.
- Individual employees are reclassified into a lower classification.
- The employer begins to declare a smaller payroll.
- Claimants:
 - Are disgruntled, soon-to-retire, or facing disciplinary action or layoffs.
 - Are involved in seasonal work that is about to end.
 - Take unexplained or excessive time off prior to claimed injury.
 - Take more time off than the claimed injury seems to warrant.
 - Have no witnesses to the accident.
 - Have accidents that occurred in an area where the employee normally would not be working (especially if it's a high-risk area).
 - Delay the reporting of an accident.
 - Are new on the job or have a history of short-term employment.
 - Have a history of injuries.

- Have inappropriate or a lack of medical treatment for injuries.
- Are experiencing financial difficulties.
- Change physicians when a work release has been issued.
- Frequently change medical providers.
- Make demands for quick or early settlement.
- Are never at home after a “serious” injury or can only be reached by return telephone calls.
- Are unusually familiar with workers’ compensation procedures.
- Are consistently uncooperative.
- Receive mail at a PO Box or at an address different from that on employment or driver and vehicle licensing records.
- Have soft tissue injuries that are hard to prove.
- Are incapacitated but seen in activities that require full mobility.
- Have independent medical exams that reveal conflicting medical information.
- Have a history of self or family employment; have a trade or work in a cash business.
- Have injuries that occur in an area where the employee would normally not be working.
- Have injuries that would not normally be the type the employee should have.
- Have injuries that occur on a late Friday afternoon or are reported on a Monday morning (if injuries are reported Monday morning, the injury could have resulted over the weekend).
- Are actively involved in contact sports or physically demanding hobbies.
- Have dates of disability or absences from work that do not coincide with the physician’s date of disability or dates of treatment.
- Have unprofessional diagnostic terminology.
- Have misspelled medical terminology throughout the medical report or hospital record.
- Have a pattern of accident claims by an individual or family members.
- Claimant repeatedly does not show up for their requested independent physical examinations or is not home when the regularly scheduled nurse stops by for therapy.
- The claimant’s attorney is known for handling suspicious claims.
- Attorney reports their representation began on the day of the reported incident.
- Same doctor and attorney are known to handle these types of cases.
- Claimant complains to the insurance company’s chief executive officer (CEO) in order to press for payment.
- The attorney threatens further legal action unless a quick settlement can be made.
- The attorney inquires about a settlement early into the life of the claim.
- Wholesale claim is handled by law firms and multiple class action suits.

- Dates of the accident are vague or contradictory.
- Treatment for the injury follows previous first-time visits to a provider.
- Same provider always bills for extra time or extra consideration on a claim.
- Provider is working through an attorney.
- Provider is reluctant to communicate with the insurance company.
- Provider shares the same patients with the same colleagues.
- Provider refers patients to specific other providers.
- Provider prescribes unnecessary supplies and/or care by a specific provider.
- Medical records are destroyed.
- Medical records are out of sequence and missing dates of service.
- Different handwriting appears on documentation with same dates of service.
- Records are reported as lost, burned, or stolen when requested.
- Progress notes consistently reflect that the patient has a high degree of pain, yet their condition is improving or progressing as planned.
- Diagnosis is inconsistent with the treatment rendered.
- Provider bills on a holiday or Sundays.
- The medical reports are conflicting.
- Claims are photocopied.
- Claims for other patients are identical.
- The claimant bills or harasses the insurance company for payment.
- The claimant's address is different on the claim form than it is on the enrollment file.

Investigation Tips

Premium Fraud

- Review the application for coverage for completeness and accuracy.
- If the business is claiming to be new, verify that it is indeed new and no mod factors have been established.
- Review the underwriting of the application for suspicious activity. If the company is a large company and has a small payroll, verify the number of employees, as well as their classification.
- Review claims to determine if they are consistent with the type of employment reported and the number of employees claimed.
- Conduct an on-site audit of their payroll and related records for the policy period and determine where their principal place of employment is located.
- Observe if there are too many clerical employees or other low-risk occupations that make up the calculation leading you to believe that the records are misstated.

- Analyze the financial statements, when available, to determine what payroll expenses actually are compared to what is reported.
- Review accident and injury reports for suspicious activities.
- Conduct surveillance as needed to observe and document various activities.
- Document findings and report the results of the activity as required.

Claimant Fraud

In spite of the possible indicators of fraud, medical treatment must be secured immediately, but an investigation should be opened immediately if there is a suspicion of fraud. The following should be kept in mind when beginning such an investigation:

- The manager who is responsible for the area where the injury occurred should initiate an investigation on each reportable accident.
- The accident should be discussed with the employee as soon as possible.
- A signed statement from the employee should be obtained as soon as the employee is able to do so.
- In obtaining a signed statement, the following questions should be answered, as applicable:
 - What was the employee doing just prior to the accident and after the accident?
 - Was the employee carrying out their regular duties in the manner they should normally be conducted?
 - Had the employee been properly instructed as to how to safely perform the duties? When, and by whom?
 - Did they work in accordance with these instructions?
 - Did another employee cause the injury?
 - Was the equipment or machinery properly guarded and in good condition?
 - Was the equipment suited for the purpose it was being used?
 - Was the workplace properly lighted?
 - What were the housekeeping conditions in the area?
 - Did the work being done by the injured employee differ in any way from that being performed by other employees?
 - Is there a safer way that this operation can be performed?
 - Was the injured employee in good health when they reported to work on the date of the accident?

Have an independent medical examination performed to document the illness. The person performing the exam should photograph the patient, obtain a copy of the patient's photo identification such as a driver's license, and obtain the patient's signature.

The following questions should also be asked:

- Are you disabled from working?
- Are you now working part-time, full-time, or not at all?
- What are your daily activities?
- What is your activity level with regard to your ability to walk, jog, run, drive, swim, or participate in sports activities or hobbies?

Detecting and Preventing Insurance Fraud

The insurance industry is a prime target for fraudsters who are looking to profit financially. For example, in the United States, the insurance industry consists of more than 7,000 companies that collect over \$1 trillion in premium payments annually, and according to the U.S. Federal Bureau of Investigation (FBI), the total cost of insurance fraud amounts to more than \$40 billion annually.¹ This equates to large losses for insurance companies and also leads to increased premium costs for individuals. Thus, detecting this type of fraud in a timely manner saves organizations from experiencing large financial losses and keeps individuals from covering the cost of fraud by having to pay for more expensive insurance plans.

Insurance Fraud Detection

Red Flags of Insurance Fraud

Red flags of insurance fraud might include any of the following:

- The claim is made a short time after the policy's inception or after an increase or change in the coverage under which the claim is made.
- The insured has a history of multiple insurance claims and losses.
- The insured previously asked an insurance agent hypothetical questions about coverage in the event of a loss similar to the actual claim.
- The insured is very assertive and insistent about a fast settlement and exhibits more than the usual amount of knowledge about insurance coverage and claims procedures, particularly if the claim is not well documented.
- In a burglary loss, the claim includes large, bulky property, which is unusual for a burglary.
- In a theft or fire loss claim, the claim includes a lot of recently purchased, expensive property, but the insured cannot provide receipts, owner's manuals, or other documentary proof of purchase.

¹ Federal Bureau of Investigation (FBI), "Insurance Fraud," www.fbi.gov/stats-services/publications/insurance-fraud.

- In a fire loss claim, the claim does not include personal or sentimental items, such as photographs or family heirlooms, that would usually be listed among the lost property.
- The insured cannot remember or does not know where they acquired the claimed property, especially unusual items, or cannot provide adequate documentation.
- The insured already has receipts and other documentation, witnesses, and duplicate photographs for everything, making the claim seem too perfect.
- Documentation provided by the insured is irregular or questionable, such as:
 - Numbered receipts are from the same store and dated differently or sequentially.
 - Documents show signs of alteration, such as dates, descriptions, or amounts.
 - Photocopies of documents are provided and the insured cannot produce the originals.
 - Similar handwriting or signatures—or the insured’s apparent handwriting—appear on different receipts, invoices, gift verifications, appraisals, etc.
 - The amount of tax is incorrect, either for the price of the property or for the date appearing on the receipt.
 - Receipts, invoices, or shipping documents are not marked with shipping stamps, especially stamps that would indicate payment or receipt.
 - In a theft or loss away from home, the insured waits an unusually long time before reporting the theft to the police.
 - The insured is able to give the police a complete list of lost property on the day of the burglary or shortly afterward.
 - The amount of the claim differs from the value given by the insured to the police.
 - In a business inventory or income loss claim, the insured does not keep complete books, or the insured’s books do not follow accepted accounting principles.
 - The physical evidence is inconsistent with the loss claimed by the insured.
 - In a burglary loss, there is no physical evidence of breaking and entering, or a burglary could not have occurred unnoticed under the circumstances.
 - In a fire loss:
 - * The apparent cause and origin of the fire is inconsistent with an accidental cause and origin, or there is evidence of the use of an accelerant.
 - * The remains of the property do not match the claimed property.
 - The premises do not show signs of having contained the claimed property, or the amount of property will not fit into the space where the insured says it was.
 - Physical damage to the insured’s car is inconsistent with it having been in a collision with an uninsured car.
 - The insured has discarded the claimed damaged property before the adjuster can examine it.

- Over the period of time it was allegedly acquired, the cost of the claimed property seems to exceed the insured's financial ability to purchase it.
- The insured provides supporting evidence and documentation that cannot be corroborated.
- The insured refuses or is unable to answer routine questions.
- Information on a life insurance application is very vague or ambiguous as to the details of health history: dates, places of treatment, names of physicians or hospitals, or specific diagnosis.
- Applicant fails to sign and date the life insurance application.
- Pertinent questions on the application are not answered, such as income, other insurance carried, hazardous duties, or aviation or flying activity.
- The insured has excess insurance, either shown at the time of application or developed through an underwriting report of database information.
- Earned income does not warrant the amount of insurance being applied for.
- The applicant's date of birth as shown on the application is much earlier than shown with other carriers or in previous applications or policies.
- The agent exerts a great deal of pressure on the insurance company to have the policy issued because of the large amount applied for, but they do so without the underwriter's knowledge.
- The physician's report is very vague on details of past medical history and does not coincide with the information shown on the application.
- A death claim is presented in which the death has taken place outside of the country.
- The signature on the application for insurance does not appear to be the same signature as shown on an authorization at the time of the claim.
- A claimant or claimant's attorney attempts to limit the type of information to be related by a signed authorization, which is a standard authorization used by the company.
- An attorney is immediately brought into a contestable death claim, attempting to interfere with the investigation and withhold information required by the company.
- A contestable death claim that is reported as an accidental death could possibly be a suicide (e.g., fatal accident involving only one vehicle, a hunting accident, an accidental shooting while cleaning a weapon or repairing the same).
- An autopsy report discloses a different height and weight than what is shown on the recent application (auto or house fire death). Dental records do not coincide with those dental findings as shown by an autopsy report.
- Records are missing on a patient who was confined to a hospital, or records are missing on a patient from a physician's office.

- The death claim package sent to the insurance company is too well packaged and complete in every detail with supportive documents. Documentation that was not initially requested or required by the insurance company was voluntarily sent, such as newspaper reports, burial certificates, or reports on the shipment of the body from one country to the home country.
- The routine audit of a designated insured group shows a significant increase of added employees whose names do not show up on the payroll.
- Gunshot wounds or stabbings were self-inflicted by the insured.
- There is pressure for speed of handling (e.g., claimant wants to stop by the office to pick up their check because they state that they are leaving for a trip the next day).
- A series of prescription numbers from the same drug store do not coincide chronologically with the dates of the prescriptions.
- An automobile fire occurs in a very remote rural area without any witnesses, but the driver claims that an electrical shortage in the engine compartment caused the entire car to catch fire.
- Preliminary information for a business fire loss or home fire loss indicates considerable financial difficulties and financial pressures being brought upon the owner, and the fire is suspicious in nature and/or origin.
- An employee within the claims operations of an insurance company is known to have a drinking problem, a drug problem, financial pressures, serious marital difficulties, or an extramarital affair, and irregularities start to appear.
- When dealing with burglary losses from a business or home, the investigator observes any of the following:
 - The remaining contents at the scene are of a much inferior quality than those items reported stolen.
 - There is no indication of indentation in the piling of the carpet where heavy items of furniture or equipment were to have been placed.
 - There are no hooks or nails on the walls where valuable pictures might have been hung.
- Entrances or exits are too small to take a large item through without laboriously disassembling it.
- There is a deliberate cover-up or false statements contained in a filed claim.
- A disability income protection claim is filed and it is determined that the claimant had recently purchased numerous expensive items on credit and had them all covered by credit accident and health (A&H) insurance coverage.
- Public transportation accidents in which there are more passenger claims filed than there were passengers at the time of the accident.

- A witness to an accident or incident deliberately tries to hide from investigators rather than come forth and tell the truth.
- An official document of findings is in complete conflict with the facts in the case and there is no explanation for this conflict of facts. Photographs or other documents do not substantiate the reported findings.

Computer-Generated Detection Tools

Data analysis is an effective tool used to detect insurance fraud schemes. By using data analytics, fraud examiners can generate reports that provide good leads to possible fraud. The following are examples of commonly used tools that can aid in the detection of insurance fraud schemes.

ADDRESS SIMILARITY REPORTS

Address similarity reports electronically compare multiple payments going to the same address. These reports are extremely useful because they might show a payment defalcation or funds going to another insurance company, broker, or fictitious payee.

FILE COMPARISON TOOLS

A comparison of issue files to disbursement files can determine if funds are being used to place new policies by using the equity of old policies. For example, computer-assisted audit tools and techniques (CAATTs) are used to download and compare electronic files.

ELECTRONIC CONFIRMATIONS

Electronic confirmations should be sent to verify that company records agree with policyholder records. These types of confirmations can be sent to policyholders when disbursements have been mailed for premiums that are in force (i.e., active) or lapsed or when there has been a change of address on an account.

EXCEPTION OR MANUAL OVERRIDE REPORTS

Computerized reports that list all exceptions to normal electronic processing can be produced. All human intervention can appear on a periodic management information report and can be test-checked by management. It is imperative that management review all exception reports for possible frauds on an ongoing basis.

Special Investigation Units

Many insurers have implemented special investigation units (SIUs) within their organizations to detect and investigate fraudulent claims, as well as assist in the prosecution of those claims. These teams of experts generally consist of individuals who have prior experience in law enforcement or other professional fraud-related roles with specialized knowledge on how to conduct interviews and identify suspicious behavior. SIU members might also be used to train claims adjusters on spotting red flags of potential fraudulent activity.

Public Awareness and Reporting Mechanisms

Although it has been an issue for many years, the extent and cost of insurance fraud is still shocking to many. Making the public aware of what constitutes insurance fraud and how to report it is paramount in combatting this problem. Many U.S. states have recently adopted public fraud awareness advertisement to demonstrate what constitutes insurance fraud, so people can recognize and report it. To facilitate reporting, insurance organizations should institute hotlines for their employees so they can report suspected insurance fraud anonymously.

Fraud examiners should familiarize themselves with any organizations in their jurisdiction that can provide assistance in facilitating the reporting of fraud and working with law enforcement to prevent, report, and combat insurance fraud, similar to the National Insurance Crime Bureau (NICB) in the United States. Other examples of organizations that are devoted to fighting insurance fraud include France's Agency Against Insurance Fraud (ALFA) and Canada's Insurance Crime Prevention Bureau (ICPB).

Insurance Fraud Prevention

Due to the large financial losses associated with insurance fraud, it is imperative that insurers take a proactive approach against fighting fraud. Offenders committing this type of fraud are continuously looking for insurance companies that have less effective fraud prevention barriers. Insurance companies should publicize their zero-tolerance policy against fraud and support it with their organizational processes to prevent themselves from becoming victims.

Common Methods of Insurance Fraud Prevention

The following are common methods that organizations can use to prevent insurance fraud:

- Provide continuous training to employees on what insurance fraud looks like for them to easily identify fraudulent behavior.
- Thoroughly examine an applicant's background and risk level before granting them insurance coverage.

- Be aware of internal and external risks present in insurance companies.
- Maintain separation of duties throughout the organization to mitigate internal risk among underwriters, agents, representatives, and other employees.
- Conduct fraud risk assessments and put fraud prevention controls in place; continuously monitor the controls and their effectiveness and update them as needed.
- Implement software or the use of artificial intelligence to identify questionable information inputted by clients, agents, and other employees charged with inputting data to quickly identify and review questionable entries.
- Promote the organization's zero-tolerance policy against insurance fraud by publicizing the organization's stance on escalating instances of fraud to law enforcement.

FRAUD RISK ASSESSMENTS

Insurance companies must be aware of the risks faced both within and outside of their organizations to prevent this type of fraud from occurring. Conducting a fraud risk assessment is one of the most efficient tools that insurance companies can use to assess and respond to fraud. A *fraud risk assessment* is a process aimed at proactively identifying and addressing an organization's vulnerabilities to both internal and external fraud. By doing so, insurance companies are able to identify the areas and processes most susceptible to fraud and implement controls to better prevent fraud from occurring. By openly communicating this throughout the organization, the perception of detection increases and can deter employees from using their position to commit insurance or other types of fraud.

For more information on fraud risk assessments, see the "Fraud Risk Assessment" chapter in the Fraud Prevention and Deterrence section of the *Fraud Examiners Manual*.

UNDERWRITING AND CLAIMS-HANDLING PROCESSES

To prevent fraudulent insurance claims from being paid to claimants, insurance companies need to have efficient underwriting and claims-handling processes in place. Artificial intelligence is increasingly being used by insurance companies in their claims and underwriting processes to save time and identify potentially fraudulent claims as they occur. There is software available that allows insurance companies to identify patterns in customer payouts and flag suspicious claims with more accuracy than manual review. Automated risk assessments in the underwriting process can verify data using internal and external databases to ensure that clients or insurance agents have inputted accurate information when attempting to obtain insurance coverage.

AGGRESSIVE PROSECUTIONS

Often, fraudsters believe the large financial incentive of successfully committing insurance fraud far outweighs the risk of being caught. According to the Coalition Against Insurance Fraud, prosecutions for insurance fraud in January 2020 decreased 25% from five years ago.² Offenders should be prosecuted more aggressively to combat insurance fraud. Penalties such as jail, probation, or fines imposed in criminal court might prevent some individuals from engaging in this type of fraudulent behavior.

HEALTH CARE FRAUD

Health care fraud may be defined as an intentional act to defraud a health care benefit program or to obtain through false representations money or other property owned by a health care benefit program. This type of fraud involves a deception or misrepresentation that an individual or entity makes, knowing that the misrepresentation could result in some unauthorized benefit to the individual, entity, or some other party. The most common fraud involves a false statement or a misrepresentation or deliberate omission that is critical to the determination of benefits.

Due to the highly technical nature of the health care industry and the diversity in payment systems throughout the world, health care fraud schemes can be among the most complex. Therefore, while this chapter focuses on the most prevalent categories of health care fraud and their related schemes, variations are possible due to differences in countries' health care systems.

Some additional country-specific information that might not pertain to a global audience can be found in the "Supplemental Regional Information" section of this chapter located on fraudexaminersmanual.com.

Types of Health Care Systems

To understand and investigate a health care fraud scheme, it is necessary to understand the type of health care system in which the fraud examiner is operating. For instance, some fraud schemes will be possible under some systems, but inapplicable or functionally different in others. There are many ways that health care systems can be classified, but for the purposes of this manual, the major factors will be:

- The extent to which the jurisdiction's health care system is privately operated and government operated
- The payment system(s) used
- The method for calculating compensation for health care services

Public and Private Systems

Each country has its own way of addressing health care, ranging from completely private systems to systems that are completely owned and operated by the government. Most countries, however, have mixed systems in which some services are provided by the government, while others must be paid by individuals or private insurance companies.

The differences in each system primarily affect who is defrauded and the method by which resources are stolen or misused. Government programs in nations with universal health care are the main target of health care fraud, while countries that rely on private parties to pay for health care see more schemes against insurance companies and individuals. Additionally, whether health care providers are private parties or employed by the government can make a significant difference in the types of schemes observed.

Payment Systems

The issue of payments systems involves how payment flows from the parties paying for services to the parties who provided the services. There are three common systems: direct payment, single payer, and third-party payer, and each can be present in the same country.

Direct Systems

The first system is straightforward. In a direct system, patients pay directly from their own funds for health care services. Due to the largely unpredictable nature and high costs of health care, this payment system usually is accompanied by the other systems.

Single Payer

In a single-payer system, a government health care program pays providers on behalf of the patients who receive services. In other words, the “single payer” is the government. However, there might be copayments from patients in these systems (generally small payments in addition to what the government pays) and services that are not covered by the government program. Also, in single-payer systems, the government might directly own and operate health care facilities (such as in the United Kingdom) or delegate those duties to private parties (such as in Canada).

Regardless of whether health care providers are employed by the government or privatized, there are similar ways in which they can submit fraudulent bills or cost information. However, fraud examiners should consider the relationship to identify likely fraud schemes.

For example, a government-employed physician who receives a set salary probably has less incentive to charge for fictitious services than a private physician who receives compensation based on each service provided.

Most governments that provide relatively robust health care programs use single-payer systems.

Third-Party Payer

A small number of countries use the third-party payer system, including the United States. The following list shows the parties in a third-party payer system.

- The first party is the patient or the person, such as a parent, responsible for the patient's health bill.
- The second party is the provider—the physician, clinic, hospital, nursing home, or other health care entity rendering the care.
- The third party is the insurance company or health care program that pays the physician, clinic, or other second-party provider for the care or services to the first party (patient). Generally, individuals are responsible for obtaining their own health insurance, but government programs might subsidize programs for those with low incomes, seniors, or people with special needs.

Again, a mix of these systems is possible. For instance, a country might have a single-payer system, but it might also be common for its residents to purchase additional medical coverage from a private insurer.

In countries with private health insurance, fraud accounts for 5–10% of all funds paid out, according to some estimates. Health care fraud in countries with government-provided health care is perpetrated primarily by providers.

Methods for Calculating Compensation

There are several types of reimbursements for providers: fee for service (FFS), capitation, episode of care, and salary. Each has advantages and disadvantages from an anti-fraud perspective.

Fee for Service

FFS reimbursement occurs when providers receive payment for each service rendered. The disadvantage of FFS payment is that it creates an incentive for providers to increase their

compensation by performing excess and unnecessary services. However, providers tend to like this payment system because it gives them wide discretion in selecting the services that meet the patient's needs.

Capitation

Capitation is a reimbursement method in which providers receive one lump sum for each patient that they treat, regardless of how many services the provider renders to each patient. While this method avoids some of the incentives for providers to perform unnecessary services, it might give providers a reason to focus on the quantity of patients they see rather than the quality of service. Additionally, capitation does little to stop schemes involving fictitious patients.

Episode of Care

Episode-of-care reimbursement is a health care payment method in which providers receive one lump sum for all the services they provide related to a condition or disease (as opposed to capitation, which is a lump sum per patient). This method captures some of the benefits of capitation by removing incentives to provide unnecessary services, but it is also (in theory) more fair to providers than capitation because it compensates them more when multiple health issues are treated.

Salary

When governments directly operate health care facilities, it is common to pay providers a basic salary rather than offer service-based compensation. Even so, some medical services might be provided through contractors instead of government employees. Salary employees are not compensated for each service, so there seems like less incentive for performing unnecessary services or claiming fictitious services occurred. However, there are various institutional fraud schemes that still involve similar tactics.

Copayments, Deductibles, and Self-Insurance

Other important concepts for fraud examiners to understand when reviewing a health insurance fraud case include copayments, deductibles, and self-insurance.

Government and insurance health programs often require patients to pay a *copayment*, or a small portion of the total payment, when receiving drugs or services from a health care provider. There might be a small fee for a routine doctor's office visit or copayment for a prescription, for instance. Health care providers in private health care systems can commit kickback fraud violations under certain circumstances if they do not attempt to collect the copayments.

Patients are also often required to pay a *deductible*—an amount that individuals must pay before the insurance company pays reimbursements in a set timeframe—most commonly for a calendar year. Once again, a health care provider who fails to collect deductibles might be charging patients kickbacks instead.

Another concept is the *self-insured plan*, in which an employer accepts the financial risk of the health care costs of its employees. The employer administers its own health insurance benefits. Rather than shift the risk to a health insurance entity, the organization assumes the costs of health care for its employees or members and their dependents.

Provider Fraud

Provider fraud consists of practices by health care providers (including practitioners, medical suppliers, and medical institutions) that cause unnecessary costs to health care programs or patients through reimbursement for unnecessary or excessive services or services that do not meet the recognized standards for health care.

Provider fraud is a particularly pervasive risk in the health care industry for several reasons. Providers possess the knowledge of medical techniques, procedures, and terminology needed to avoid being questioned by claim-handling personnel. Additionally, most insurance companies and government health care programs contract directly with providers for billing arrangements, leaving patients uninformed and uninvolved. In addition, patients are usually reluctant to accuse physicians of wrongdoing because they rely on the provider's continued services and because, when providers engage in fraudulent practices, they often forgive any out-of-pocket expenses that the patient incurs.

Common types of provider fraud schemes are explored below. For additional information regarding provider schemes that are more frequently associated with specific specialties and jurisdictions, see the content on “Common Fraud Schemes by Specific Providers” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Fictitious Providers

In a *fictitious provider* scheme, corrupt providers or other criminals fraudulently obtain and use another provider's identification information and steal or purchase lists of patients'

identifying information. Thereafter, the perpetrator submits bills using the fictitious provider's information to the insurance provider or government health care program for medical services, although no services are performed.

In perpetrating this type of scheme, fraudsters might set up fictitious entities using their legitimate home addresses or PO Box numbers and their own government identification numbers. Alternatively, they might use the addresses and identification numbers of their family members, business partners, or neighbors. Often, fictitious companies are opened and then quickly dissolved, with the money depleted as quickly as possible.

Fictitious Services

In a *fictitious services* scheme, legitimate health care providers charge or bill a health care program for services that were not rendered at all. Often, the providers submit bills for patients they have never seen but whose private patient information they purchased from someone involved in identity theft or someone who otherwise improperly obtained it. These scams frequently are committed by medical equipment providers and service providers (such as infusion drug therapy), but they can involve normal physician offices, ambulance services, and others. Some fictitious services schemes involve patients who are legitimate patients of a doctor or provider. These individuals are charged or their health care programs are billed for patient visits or encounters that never occurred.

Rolling Labs

A *rolling lab* is a mobile laboratory that solicits individuals to participate in health screening tests at no cost to the patient. After conducting the tests, however, the lab bills the individual's insurance provider or health care program. Also, the lab might bill additional claims for later service dates even though no more tests are conducted.

Patients might be contacted by telephone for a free physical exam, or the provider might rent office space in a doctor's office for one day and then test all of that doctor's patients. Alternatively, the lab might be set up as a temporary operation in a shopping center, health club, spa, or on vacant property; passers-by are then invited in for a "free" health screening. The testing equipment itself often arrives in a truck or van and moves from one office to another.

Subsequent to the exam, the insurance company or health care program is billed for numerous claims for a single date of testing performed by multiple providers. Additional claims are billed

for later service dates even though no more testing is performed. The lab typically moves to another location prior to the patient receiving the test results to avoid detection.

Over-Utilization

Over-utilization occurs when a physician prescribes unnecessary or excessive patient services. There are two possible explanations for this. The first is monetary gain to the provider. Second, the physician may have believed additional visits were necessary for proper treatment or to reduce potential malpractice liability.

Clinical Lab Schemes

Clinical lab schemes occur when a provider advises a patient that additional medical testing is needed to diagnose a problem when the testing is not actually required or advisable. The fee for the unnecessary work often is split with physicians. In some cases, physicians own the medical testing service.

Additional medical testing, which is later viewed as excessive, is not always fraud. Many doctors have a genuine fear of retaliation from their patients; they are afraid of malpractice lawsuits that might result from a delayed or erroneous diagnosis.

Uncredentialed Providers

Most jurisdictions require that medical providers possess specific credentials to perform and charge for certain services. For example, a physician assistant might be authorized to provide and bill for some medical procedures, but not those that only a physician is authorized to perform. Health care fraud is committed when someone without the necessary credentials performs a service but bills as though an appropriately credentialed provider actually rendered the service. This is a common form of fraud and is often difficult to detect.

Red flags of uncredentialed providers include:

- A credentialed provider submitted bills for procedures that add up to suspicious or impossible hours. For instance, a provider submitted twenty claims for a specific four-hour procedure all within one week, for a total of eighty hours, on top of other services performed that week.
- The practice group has a relatively low proportion of licensed staff per patients treated.

Disparate Price to Government Programs

Many government health care programs require that they receive the best available price that providers offer. In a disparate price scheme, providers charge some patients (e.g., those in direct-payment situations) a lower rate than they charge the government. This disparate bill rate causes the government to pay a higher rate in violation of regulations mandating that the government receive the lowest rate. In addition, some government health programs, such as Medicaid in the United States, require that wholesale pharmacies provide the program at the average wholesale price. However, providers might manipulate their data and provide false information to the government program.

Equipment and Supplies Schemes

While it is typical to think of provider fraud as schemes committed by physicians, nurses, and other direct service providers, fraud schemes by organizations and individuals providing medical equipment and supplies are also common. Medical services generally require many types of supplies and equipment, ranging from simple gauze to high-cost magnetic resonance imaging (MRI) machines. The following are several types of schemes committed by equipment manufacturers and sellers, suppliers, and similar providers.

Ambulance Transportation

Fraudulent billing for ambulance transportation can include bills for more mileage than incurred, for trips never taken, or for trips not covered by the insurance policy or health care program.

Infusion Care

Fraud schemes involving infusion care treatment include:

- Services billed at abnormally high rates in comparison to cost
- Bills for patients who are not covered by insurance or beneficiaries of the health care program
- Bills in excess of the physician's prescription
- Bills for unnecessary treatment
- Kickbacks given to the prescribing physician

Durable Medical Equipment

The term *durable medical equipment (DME)* refers to medical equipment that can withstand repeated use, such as wheelchairs and specialized patient beds. Fraud schemes perpetrated by DME suppliers frequently involve:

- Falsified prescriptions for DME
- Intentionally providing excessive DME
- DME not being delivered
- Billing for DME rental beyond when the DME is checked back in
- Billing for DME not covered by the insurance policy or health care program
- Scooter scams (i.e., billing for electric-powered wheelchairs that are either unnecessary or are of poorer quality than the model billed for)

Home Health Care Companies

Under some health care programs, patients who are confined to their home are eligible to receive home health care services. Fraud schemes involving home health care providers include:

- Forging physicians' signatures on plans of care to make it appear that patients qualify for home health visits
- Altering the approved number of home health care visits on a legitimate plan of care
- Billing for home health care visits that were never made
- Billing for costs incurred during home health care visits that are not reimbursable

Pharmaceuticals

Pharmaceutical fraud is the largest source of provider fraud in the health care industry, and can involve pharmaceutical manufacturers, pharmacies, and providers who prescribe such products. Fraud schemes stemming from pharmacy transactions include:

- Merchandising—substituting something of value for a prescription drug
- Billing for brand name drugs but dispensing generic drugs
- Billing beyond amount prescribed
- Billing for drugs not prescribed
- Billing for a high-priced generic drug but dispensing a lower-priced generic drug
- Inflating the price of drugs sold to government-backed health care programs above those sold to private parties
- Package size differential—billing third-party payers for the price of drugs purchased in small package sizes when they were purchased at less cost in larger quantities
- Black-market purchasing—purchasing drugs at significantly reduced rates and then dispensing at regular prices
- Off-label marketing—illegally inducing medical providers to order a drug for off-label purposes (i.e., a purpose not approved by the appropriate drug-regulating agency)
- Providing kickbacks or bribes to providers to induce them to prescribe pharmaceutical products

Impostor Provider

An *impostor provider* is a provider who does not exist but bills fraudulent claims. A variation on this scam involves assuming the identity of a deceased provider and practice—or putting together a group of licensed providers—and fraudulently billing under the group’s provider identification code.

To help determine whether a provider is an imposter:

- Call the telephone number on the bill to determine if the provider exists; however, keep in mind that a fictitious provider might actually have rented a location and established a telephone number.
- Contact the applicable licensing board to determine if the alleged provider was licensed to practice in the area at the time the service was allegedly provided.
- Visit the provider’s physical address to determine if it is valid; if it is, speak to the superintendent to determine the tenant for that address.
- Contact the jurisdiction’s postal service to verify what mail is being dropped at that address.

False Diagnoses

When providers know that a service is not covered by a health care program, they might use false diagnoses or procedure code manipulation. Examples of common services not covered are investigational or experimental procedures and elective cosmetic surgery (although reconstructive surgery after an injury or illness is often covered).

In addition, physicians might justify ordering expensive x-rays or other diagnostic services by falsely purporting that a need exists to make such diagnostic inquiries. The services are rendered, but because the claim for the services is based on false information and is used to deceive the insurance company or health care program, it is considered a false claim.

Double Billing

Double billing occurs when the health care beneficiary or the provider seeks to be paid twice for the same service. The fraud might be perpetrated by the beneficiary, with the complicity of the provider, or it might be conducted by the provider alone. The bill might be submitted to two (or more) different insurance providers or health care programs, or it might be submitted twice to the same insurance provider or health care program with documentation intended to show that two separate expenses have been incurred.

EXAMPLE

A doctor has his own practice and is also affiliated with a clinic. The clinic submits bills under its letterhead and tax identification number, and the doctor also submits a charge on his own stationery for the same service.

Red Flags of Provider Fraud

Warning signs that a health care provider is engaging in fraudulent practices include:

- Lack of supporting documentation for claims under review
- Details in supporting documents that do not match the claim
- Medical records that have been altered
- Medical records that were created long after the alleged patient visit
- Medical records that seem sloppy, disorganized, or otherwise unprofessional
- Missing pages of medical records that would cover the period of time under review
- Routine, nonspecialized treatment for patients living several hours away from the provider
- An unusually high volume of patients
- An unusually large number of claims for reimbursement
- Unusually high profits compared to similar businesses in the same geographic region
- Matching addresses on the claim form for the patient and the provider
- High percentage of coding outliers
- Pressure for rapid processing of bills or claims
- Threats of legal action for delay in making payments

Additionally, fraud examiners should be wary of the red flags of someone submitting claims as an impostor provider:

- Misspelled medical/dental terminology
- Unusual charges for a given service
- Similar handwriting by the claimant and the provider of service
- Typed, not printed, bill headers
- Bills with irregular columns
- Unassigned bills that are normally assigned, such as large hospital or surgical bills
- Typed or handwritten hospital bills
- Drug receipts from the same pharmacy but on different color paper
- Erasures or alterations
- Lack of any provider's signature on a claim form
- Absence of the provider's medical degree or required license

- An illegible provider signature on the bill submitted or the signature does not match the one on file
- Surgeries that don't have other related services such as hospital charges
- Physician's specialty does not agree with diagnosis
- Services billed do not agree with diagnosis
- Impossible or unlikely services
- Photocopied bills

Fraud by the Medical Staff

Employees of providers also have an opportunity to steal and cover up theft of cash. They can submit fraudulent claims for patients and divert the payments to themselves. If they are covered under insurance, they can also use their own contract to submit fraudulent claims. For many employees of medical providers, care rendered by their employer to them or their family is free, but claims may be filed and assignment not accepted.

Another scheme involves the provider's office calling in orders for unnecessary prescription drugs to pharmacies. Once the drugs are picked up, they can be sold. For example, in a case involving collusion between a medical office employee and a resident of a retirement community, the resident had developed a business selling the drugs purchased from the employee to her friends and neighbors in her community.

Inflated Billings

Health care billings can be inflated by providers as well as beneficiaries. The following are some of the most common fraud schemes encountered by investigators and claims approvers:

- Altered claims
- Added services
- Code manipulation

Altered Claims

Altering valid claims can be accomplished using a pen; photocopier; or scanner, computer, and printer. Common alterations are:

- Amounts changed
- Date of service changed
- Name of patient changed

For example, a medical bill can be altered by placing an additional number in front of the amount charged, and the date of service can be altered so that it becomes a covered expense rather than one that was incurred prior to the patient being eligible for coverage. The individual claiming services were provided can also change the name on the bill from a noncovered family member or acquaintance to one who is covered under the insurance policy or health care program.

Detection

Procedures that can help identify altered claims include:

- Analyzing charges and identifying any excessive claims for prescription or medical services above an acceptable level
- Looking for any alterations, erasures, changes of ink, or correction fluid marks on the original bill prior to paying the claim; this is important in today's environment in which original bills, checks, and other documents are destroyed as soon as they are scanned and digitally stored to minimize storage space for recordkeeping
- Training adjusters to look for obvious alterations when processing claims

Added Services

Some fraudsters add on services never rendered to dates of actual services. In these cases, the verification process is the same as the procedures listed under the alteration process.

Code Manipulation

Medical coding is an integral part of pricing and billing for services in many health care systems. It is a process of assigning alphanumeric codes to medical procedures and diagnoses for the purpose of determining costs and facilitating payments. Payment amounts are based largely on the codes that are submitted to the relevant government health care program or private insurer.

Types of Medical Codes

Countries usually adopt their own method of classifying medical procedures and diagnoses, but the increasing globalization of the health care industry has resulted in increased consistency. Fraud examiners should be able to identify the applicable medical coding systems in health care fraud examinations.

The most common types of medical coding systems are:

- *Diagnostic codes*—used to classify diseases, illnesses, and injuries (e.g., diabetes, strep throat, wrist fracture)
- *Procedure codes*—used to classify types of medical procedures (e.g., orthopedic surgery, abdominal x-ray, respiratory therapy)
- *Drug codes*—used to classify types of drugs that are administered to patients (e.g., ibuprofen, hydrocodone, amoxicillin)

INTERNATIONAL CLASSIFICATION OF DISEASES CODES

The International Classification of Diseases (ICD) is a diagnostic coding system that is used to classify diseases and related health problems. It is published by the World Health Organization (WHO). More than one hundred countries use ICD codes to report mortality data, and many countries also use ICD codes to allocate resources and determine provider reimbursement.

The ICD codes are updated periodically to reflect new diagnoses and other changes in the medical community. The latest revision is ICD-10, which has been implemented by almost all countries that use ICD coding.

ICD-10 uses a three- to seven-digit code that is structured in the following format: XXX.XXXX. The first three digits represent the category of disease; the next three digits represent the disease's etiology (cause), anatomic site (location), and manifestation (symptoms). The final digit is an extension, which allows for even more specificity in classification. For example, the ICD-10 code "S06.0X1A" signifies "concussion with loss of consciousness of thirty minutes or less, initial encounter."

PROCEDURAL CODES

ICD is a diagnostic coding system. Some countries use a procedural coding system for the purpose of reimbursement. The United States, for example, uses a procedural coding system called Current Procedural Terminology (CPT), which is maintained by the American Medical Association (AMA). Each five-digit CPT code corresponds to a specific medical service. For example, the codes "90658" and "99214" refer to "flu vaccine" and "physician examination," respectively.

Code Manipulation Schemes

Fraudulent code manipulation takes place if the physician or other primary provider knowingly enters an incorrect diagnostic, procedural, or drug code to obtain some benefit.

Because the coding system can be complicated, providers, insurers, and health care program employees often have difficulty identifying the codes that most accurately describe the services provided. The process can be difficult because some coding systems attempt to identify codes for all accepted medical procedures, including codes to describe minor procedures that are components of more comprehensive procedures. Payment policies add to the difficulty. For example, the fee for surgery often includes the cost of related services for the global service period (i.e., for a set number of days before and after the surgery). To prevent overpayment in these cases, health care programs and insurers must identify when claims for surgery include codes that represent related services and reduce the payment accordingly.

It is difficult for providers, insurers, and health care programs to maintain proficiency in proper coding practices because a substantial number of the codes are changed periodically. These complexities can inadvertently lead providers to submit improperly coded claims. They also make health care programs vulnerable to abuse from providers or billing services that attempt to maximize reimbursements by intentionally submitting claims containing inappropriate combinations of codes.

UNBUNDLING

Because health care procedures often have special reimbursement rates for a group of procedures typically performed together (e.g., blood test panels by clinical laboratories), some providers attempt to increase profits by billing separately for procedures that are actually part of a single procedure. This process is called *unbundling*.

Simple unbundling occurs when a provider charges a comprehensive code, as well as one or more component codes. For instance, in the following examples, the provider would be overpaid because the fee for the total procedure already includes the value of its component parts.

EXAMPLE

As Billed			If Correctly Billed		
PROCEDURE CODE	SERVICE	COST	PROCEDURE CODE	SERVICE	COST
58150	Total hysterectomy	\$1,300	58150	Total hysterectomy	\$1,300
58720	Removal of ovaries and tubes	\$950			
49000	Exploration of abdomen	\$671			
44955	Appendectomy	\$250			
58740	Lysis of adhesions	\$550			
	TOTAL	\$3,721		TOTAL	\$1,300
29877	Knee arthroscopy with debridement	\$1,650	29877	Knee arthroscopy with debridement	\$1,650
29870	Diagnostic knee arthroscopy	\$1,625			
	TOTAL	\$3,275		TOTAL	\$1,650
47610	Cholecystectomy with common bile duct exploration	\$1,997	47610	Cholecystectomy with common bile duct exploration	\$1,997
47600	Cholecystectomy	\$705			
	TOTAL	\$2,702		TOTAL	\$1,997

Unbundling can be detected through the use of a computer program that determines whether each code submitted is a component of one or more comprehensive codes.

MUTUALLY EXCLUSIVE PROCEDURES

A variation of unbundling, this scam involves billing for procedures that are either impossible to perform together or, by accepted standards, should not be performed together.

GLOBAL SERVICE PERIOD VIOLATIONS

Some dishonest providers will bill for a major procedure—such as a surgery—as well as related procedures when the fee for the major procedure already includes the fee for related procedures during the predefined time period (the global service period). Detecting these abuses can be difficult because the fraud examiner must determine which services are related to the surgery and which are not. This difficulty is compounded by the fact that such services might be rendered by more than one provider.

UPCODING

Upcoding occurs when a provider bills for a higher level of service than actually rendered. In a typical upcoding scheme, a durable medical equipment (DME) company provides patients with an inexpensive product (e.g., a manual wheelchair) but bills the government for a more expensive product (e.g., an electric wheelchair).

Another common upcoding scheme is to falsely claim that an established patient is a new patient. A new patient generally requires an extensive examination and consumes more of the provider's time. Therefore, under some medical coding systems, providers are reimbursed more for new patients than established patients.

Kickbacks in the Health Care Industry

Kickbacks in the health care industry can come from several sources. The medical community is facing competition that it has not faced in the past, and monetary offers to prospective patients have been difficult to refuse.

Examples of kickbacks include:

- Payment for referral of patients
- Waiver of deductibles and copayments
- Payment for additional medical coverage
- Payment for vendor contracts
- Payments to adjusters

Payment for Referral of Patients

Providers in an area of high competition will pay runners to recruit new patients. In addition, patients might receive a monetary reward if they refer another patient to a provider. The provider makes up for the kickback in the unnecessary billing of medical expenses or false claims. In addition, providers will pay kickbacks to other physicians for patient referrals.

Waiver of Deductibles and Copayments

Many insurance policies and health care programs require patients to pay a deductible and copayment, or a small portion of the total payment, for services rendered. One of the reasons for having copayments is to make patients take an active part in the financial responsibility for their care. To attract patients, however, providers might improperly pay for or waive the patient's out-of-pocket expense, hoping to make up for that cost in additional business.

Payment for Additional Medical Coverage

Physicians with patients who are facing long-term care or lifetime treatment, such as dialysis for kidney failure, might improperly obtain additional medical coverage (e.g., by purchasing additional insurance contracts) for their patients. This ensures that the provider will be paid, and the patient has no out-of-pocket expense.

Payment for Vendor Contracts

Companies doing business with medical practitioners will pay a “consulting” fee for referring business to them or using their supplies.

Payments to Adjusters

In order to get a claim settled quickly, a patient, or someone operating on their behalf, might bribe adjusters or other claims-handling personnel to approve or speed up the payment of a claim.

Fraud by Medical Institutions

Fraud schemes perpetrated by institutions and their employees include those commonly used by doctors and other providers. However, the more common schemes in which hospitals are primarily involved include:

- Filing false cost reports
- DRG creep
- Billing for experimental procedures
- Improper contractual and other relationships with physician
- Revenue recovery firms to (knowingly or unknowingly) bill extra charges

Filing False Cost Reports

To obtain reimbursement for procedures and treatments, health care institutions submit cost reports, and these cost reports are used to calculate how much the insurer or health care program will reimburse the institution for its expenses.

Because cost reports can represent extremely large payments, some institutions file false cost reports to obtain higher reimbursements or funding than permitted. The false reports might inflate the costs incurred, give the wrong percentage of their services dedicated to patients, mischaracterize the nature of those costs, or include unallowable items.

Inclusion of Unallowable Items

The following are examples of noncovered or unallowable items that might be included in cost reports:

- Expenses for tax penalties, late charges, and promotional advertising
- Costs incurred from a related-party transaction with a mark-up over the costs incurred by the related party
- Expenses that are reimbursed under other programs (e.g., billable medical supplies and therapies)
- Excessive expenses such as hotel, food, and travel expenses for recreational events
- Luxury items (e.g., lavish furnishings, corporate planes, swimming pools, or spas)

DRG Creep

Hospitals and other medical institutions use diagnostic-related groupings (DRGs) to categorize patients based on their diagnosis, treatment, length of stay, and other factors. Originated in the U.S. health care system, DRGs and similar models have become popular in many countries for the purposes of determining costs and reimbursing institutional providers. For example, a hospital heart bypass operation is worth a certain amount of reimbursement and a hernia repair is worth a different amount.

DRG creep occurs when a hospital or other medical institution deliberately and systematically manipulates diagnostic and procedural codes to increase reimbursement amounts or other forms of funding. In other words, DRG creep is an intentional pattern of upcoding by a hospital or other medical institution. For example, a hospital might repeatedly and incorrectly code angina (pain or discomfort in the chest due to some obstruction of the arteries) as a myocardial infarction (a more serious event, commonly known as a *heart attack*), and thus be reimbursed at a higher level.

Billing for Experimental Procedures

One form of medical fraud is the billing for experimental use of new medical devices that have not yet been approved by the jurisdiction's health care authority. Some hospitals deliberately mislead third-party payers by getting them to pay for the manufacturer's research. Many of the doctors involved are alleged to have stock in the manufacturing companies.

Improper Relationships with Physicians

Certain relationships between hospitals and physicians result in fraud to insurers and health care programs. Note that whether the relationship is improper often depends on whether the physician is employed by the institution. In many jurisdictions, the following transactions are generally regarded as suspect:

- Payment of any sort of incentive by the hospital each time a physician refers a patient to the hospital
- Provision of free or significantly discounted billing, nursing, or other staff services
- Free training for a physician's office staff in areas such as management techniques, coding, and laboratory techniques
- Guarantees that provide that, if the physician's income fails to reach a predetermined level, the hospital will supplement the remainder up to a certain amount
- Low-interest or interest-free loans, or loans that may be forgiven if a physician refers patients to the hospital
- Payment of the cost of a physician's travel and expenses for conferences
- Payment for a physician's continuing education courses
- Coverage on the hospital's group health insurance plan at an inappropriate or very low cost
- Payment for services, such as consultation at the hospital, that require few, if any, substantive duties by the physician, or payment for services in excess of the fair market value of services rendered

Revenue Recovery Firms

Another form of health care fraud involves so-called revenue recovery firms padding medical bills. These billing consultants review patients' bills (months or even years after treatment) looking for charges that were missed. Critics have charged that too often these firms pad medical bills by adding on fictitious charges. The more charges that are added onto the bill, the more the revenue recovery firm gets paid. In addition, their employees might be paid bonuses for excess charges and might be pressured to meet monthly quotas.

Changing Codes

One of the most common methods used by revenue recovery firms is to change every hospital's or nursing home's billing codes. An example would be changing each code for an ordinary bandage so that the provider is charged for a more expensive surgical dressing.

Adding Items

Extra charges are added onto hospital bills by assuming that hospitals used certain items, even though there was no evidence of the procedure or service. For instance, if the hospital had certain procedures for which it sometimes uses a piece of x-ray equipment, the auditor reviewing the bill would always assume that the hospital had used the equipment and would put it on the bill.

Kickbacks

Often, hospitals are unaware (sometimes intentionally) of the extent of the fraud committed by revenue recovery firms. In other cases, however, revenue firms report that they will contact a hospital or nursing home directly and tell them that if the institution will give them their bills, they will split the profit produced by the added charges.

Billing for Expensive Treatments

Numerous charges for the use of expensive treatments such as laser are added to patients' bills. Charges might be added after the patient had already been billed for the use of the laser.

Altering Records

In some instances, firms might actually alter medical records. For example, in one case, a firm added more than \$1,300 to a patient's bill for video equipment that was supposedly used during surgery. To justify the fraudulent billing, the firm checked a box on the surgical record to indicate that the equipment had been used. After the original document was obtained, it showed that the box was not checked on the original form completed by the surgical staff.

Donating Organs

One hospital, which has ceased using a particular firm, reported that the firm regularly double billed for services and treatments. In another instance, outside auditors found that the firm attempted to charge dead patients for having donated their organs.

Additional Anesthesia Time

Another common scheme is the charging of additional hours of anesthesia. Patients should be billed from when they enter the surgery room to when they leave the surgery room. The revenue firm pads the bill by increasing the time billed to include time spent in a recovery room, or before the patient went into the operating room.

Rent-a-Patient Schemes

So-called *rent-a-patient* schemes involve paying individuals to undergo unnecessary medical procedures that are then billed to the patient's insurer or health care program. These schemes occur in countries using a third-party-payer system or single-payer system that allows private providers to bill health care programs.

Rent-a-patient schemes typically begin with the leasing of a fake medical clinic. Past investigations show that these clinics tend to be nondescript, often within shopping centers, and in destitute sections of town. The lessee of the clinic is almost always involved in the criminal organization of the scheme. Once a fake clinic is in place, recruiters (also called *runners* or *cappers*) are hired to solicit low-income individuals, often those who do not speak the local language, and offer them money in exchange for submitting to "minor" surgical procedures.

EXAMPLE

A surgery center paid hundreds of dollars to patients who endured largely unnecessary operations and then falsely charged the government. One of the operations involved collapsing the patient's lung to snip a nerve that would supposedly control sweaty palms. The surgery did stop the patient's not-so-sweaty palms from perspiring; it also caused the patient to lose strength in his hands and sweat profusely from other body parts.

Once recruiters have convinced an individual to become a willing participant, they will request a copy of the individual's beneficiary information to confirm benefits prior to subjecting the patient to an unnecessary treatment.

Recruiters will drive the patients to small clinics. Along the way, the recruiter will advise each patient to describe particular false and embellished symptoms to the health professional at the clinic, such as: "I sweat too much"; "My stomach is bothering me"; "My nose hurts." Such descriptions will later be used by the scam clinic to create medical charts, justifying a particular surgical procedure. The patients then wait in line, sign an informed consent form, and promise to give the clinic all the checks thereafter received. Following administrative procedures, the patients briefly meet with a doctor and undergo the procedures that have been predetermined for them. The recruiter will then give the patients a modest amount of cash and drive them home.

After rendering services, the provider will bill the patients' insurer or health care program for the unnecessary procedures beyond the usual and customary cost (past investigations

evidence up to 5,000% above average market price). The claims will likely include fees for surgical supplies and medical equipment that were never used or distributed. Some insurers reimburse patients directly for out-of-network claims, thereby requiring the patient to pay the facility. However, because the patients targeted in rent-a-patient scams are often indigent and believe they deserve the money for enduring the unnecessary procedures, it is common for them to deposit or cash the checks. It is a cycle whereby the victims are not only used to perpetrate the fraud, but in the end become fraudsters themselves.

Health care programs have difficulty determining when rent-a-patient schemes are being committed because their claims systems can only compare codes and cannot determine the usual and customary cost for a particular procedure. To make matters worse, rapid claims turnover inevitably leads to poor oversight regarding fraud-related claims.

What to Do?

Consumer education is crucial when confronting rent-a-patient schemes. Health care programs must educate their beneficiaries on the prevalence of this type of fraud and provide these individuals with means of communication when they believe fraud is occurring. Disadvantaged populations must also be informed about the negative impacts of participating in such schemes, such as health risks and criminal liability.

Health care programs must educate from within. Investigation units should be established to include skilled fraud examiners. Fraud detection software programs should be purchased to detect irregular claims patterns. They should merge resources, insight, and intellect from around the country to circumvent and prosecute rent-a-patient schemes.

Red Flags of Rent-a-Patient Schemes

The following might indicate that a rent-a-patient scheme is occurring:

- Large influx of non-local patients to a particular clinic; including clusters of patients from a particular location
- Several non-related procedures on a patient in a short period of time (e.g., a colonoscopy and circumcision on one patient within a few days or even weeks)
- Numerous claims by a particular clinic for the following procedures: colonoscopies, endoscopies, septoplasties, circumcisions, and thoracoscopies with sympathectomy
- Parallel procedures on families (husbands, wives, and children) on the same day
- Extremely high staff salaries
- Charging beyond the average market price for procedures, medical equipment, and devices

Other Frauds in the Institutional Setting

The following are additional schemes that have a high risk of being perpetrated against medical institutions.

Write-Off of Patient Accounts

When a patient account or other type of receivable has been determined to be uncollectible, the account is written off to bad debts. It becomes a fraudulent transaction when the account has been written-off prematurely and the balance is subsequently collected, with the proceeds going to the employee. In this scheme, employees have the opportunity to collect the receivable and divert the funds to themselves because companies typically do not keep track of old written-off accounts receivable.

Often, old accounts receivable are assigned to a collection agency. These agencies typically are paid on a percentage of the collected amounts. Fraud schemes can be perpetrated by these agencies if the company does not monitor the method by which the agency receives old accounts and the collection process itself.

The assignor organization needs to assure itself that the collection agency is being assigned only old accounts and not good accounts that can reasonably be expected to be paid within the normal course of business.

Additionally, the organization needs to be sure that the collection agency cannot compromise the indebtedness so that collections are not reported. This would allow the collection agency to compromise indebtedness for its own collection and not remit amounts owed to the organization.

Credit Balances Fraud

When patients have more than one party responsible for payment for services provided, institutions have been known to collect more than the original amount billed. This might occur when the patient has coverage under multiple insurance policies, is a beneficiary of more than one health care program, is in a vehicle accident where multiple automobile insurance carriers are involved, or is in a situation where workers' compensation is applicable. In addition, the facility might also collect the deductible and copayment from the patient. If the hospital has a credit balance, the amount paid above the charges should be refunded to the applicable parties. However, this does not always occur. Generally, the refund will only be made upon request.

Theft of Pharmaceuticals and Supplies

Because of the ready market for selling pharmaceuticals and supplies, they have a propensity for being stolen. Narcotic drugs, although they are usually tightly controlled, still might be stolen and sold on the street. Supplies such as canes, sunglasses after cataract surgery, and admission kits are popular items for theft or employee abuse.

Fraud in Special Care Facilities

Medical facilities that offer special care services, such as nursing homes and psychiatric hospitals, and the patients in them are at a greater risk of fraud than most other medical institutions. Many health care fraud schemes are revealed after a patient reports strange charges or other red flags. Unfortunately, criminals take advantage of the fact that patients in special care facilities are more vulnerable to fraud.

There are several features unique to special care facilities that make them particularly vulnerable to fraud:

- Unscrupulous providers can operate their schemes in volume because the patients are all in the same facility.
- Many patients in special care facilities do not have the legal capacity or ability to be responsible for their own financial affairs and, consequently, are not as likely to report fraud involving their care.
- In some instances, special care facilities make patient records available to outside providers who are not responsible for the direct care of the patient (sometimes in violation of regulations).
- In automated claims environments, scrutiny of the claims at the processor level is inadequate because the automated systems used do not accumulate data that would promptly flag indications of improbably high charges or levels of service.
- Even when abusive practices are detected and prosecuted, repayment is rarely received from wrongdoers because they usually go out of business or deplete their resources so that they lack any resources to repay the funds.
- Patient personal funds are often controlled by the facility's administration and are an inviting target for embezzlement. Individually, patients generally maintain a relatively small balance in their personal funds accounts. Collectively, however, these funds generate a considerable source of income for an unscrupulous special care facility operator or employee.

Additionally, many special care facilities do not have the in-house capability to provide all the services and supplies their patients need. Accordingly, outside providers market their services and supplies to special care facilities to serve the needs of their patients. Some special care facilities allow outside providers or their representatives to review patient medical records; these providers can obtain all the information necessary to order and bill for services and supplies that are not necessary or even provided.

Nursing Homes

Nursing homes are a growing sector of the health care industry. As such, they have become a common target of fraud. A wide array of providers—including medical equipment suppliers, laboratories, physicians, optometrists, and psychiatrists—have been involved in fraudulent or abusive billing for services and supplies furnished to nursing facility patients. Most fraudulent activity involves billing for unnecessary or undelivered services, or misrepresenting a service to obtain reimbursement.

Psychiatric Hospital Fraud

Psychiatric hospitals are susceptible to fraud because of the very nature of mental health problems and the way they are diagnosed and treated. Unlike the acute care field, it is often difficult to determine whether a person requires hospitalization for psychiatric treatment.

Abuse in the Admissions Process

Some psychiatric treatment facilities have programs for patients who exhibit symptoms of both psychiatric illness and substance abuse problems. Fraud occurs when a patient is admitted on the basis of a diagnosis that reflects the patient's health care coverage rather than the patient's illness. Psychiatric hospitals have been accused of finding something wrong with patients when it is known that they have health care coverage. Such patients might often be admitted without examination by a physician.

Fraud in the Treatment Process

The following types of abuses can occur with regard to psychiatric treatment:

- Extending the length of treatment programs or delaying discharges because patients have additional health care benefits remaining
- The use of illegitimate, questionable, non-approved, or dangerous treatment programs and forms of therapy, such as brain wave synchronization, magnet therapy, memory retrieval/enhancement therapy, and deep sleep therapy

- Engaging in excessive treatment of psychiatric patients such as thyroid testing, drug tests, or psychiatric evaluation tests

Abusive Marketing Practices

Many medical institutions rely on marketing as a means of encouraging treatment and generating referrals. Overly aggressive marketing methods include:

- Paying bonuses to employees to persuade or pressure prospective patients to undergo a psychiatric evaluation and to admit themselves for treatment
- Encouraging patients to admit themselves by offering financial incentives, such as payment of plane fare, child care, and waivers of patient copayments or deductibles

Financial Rewards for Referrals

Many facilities are dependent on outside sources of patient referrals, such as physicians or other clinicians. This dependence has led some hospitals to develop economic relationships in order to obtain referrals:

- Rewarding clinicians who refer patients by referring patients who need outpatient treatment to those clinicians
- Allowing allied health professionals who refer patients to provide therapy for their own patients at the hospital, while nonreferring allied professionals are not allowed to use the hospital
- Paying medical directors or other physicians an incentive bonus linked to the overall profitability of the hospital
- Paying a physician who is under contract to the hospital but who provides no services

Red Flags for Psychiatric and Substance Abuse Claims

Fraud examiners should look for the following red flags of fraud from psychiatric institutions:

- Treatment takes place far from the patient's home.
- Patient is on disability.
- Provider's credentials are questionable.
- Documentation of treatment is lacking.
- Ancillary services are not treatment oriented.

Fraud by the Patient

There are various schemes that patients can perpetrate against government health care programs and private insurers, including:

- Fictitious claims
- Multiple claims
- Doctor shopping
- Misrepresentations on applications
- Altered bills
- Third-party fraud
- Ineligible claimants

Fictitious Claims

If a government health care program or private insurer allows an insured or beneficiary to submit reimbursement claims, then such parties might make fictitious claims. For example, beneficiaries or insureds might attempt to perpetrate a fraud by submitting fictitious claims for medical services that did not occur or for nonexistent dependents.

Multiple Claims

A *multiple claims scheme* involves filing multiple claims for reimbursement for the same medical service. When patients are eligible for medical coverage under multiple government programs or insurance policies, they might have the right to seek reimbursement from more than one party. However, all insurers should be advised of the multiple policies. If more than one insurance policy is in place, one insurance carrier is generally designated as the primary insurer and the other companies will be secondary or tertiary insurers. When the beneficiary is covered by both government programs and private insurance, some countries require the private insurer to pay its claims first, and the government only covers the remaining amount.

Patients commit fraud when they make a claim for a covered expense without revealing that they have already received reimbursement for that expense. For example, patients might seek reimbursement for the same medical service from both the government and a private insurer, two different private insurers, or two different government health care programs.

Doctor Shopping

Patients might “shop” (i.e., search) for multiple doctors who will provide controlled substances. One physician often does not know that the other has prescribed the drug. In addition, the patient might go to emergency rooms and complain of soft tissue injuries, sprains, and strains to obtain controlled substances.

Misrepresentations on Applications

Patients must meet eligibility requirements to qualify for benefits under government health care programs and private insurance policies. For example, a particular government program might only be available to citizens over age 65, or a private insurance policy might exclude patients with certain chronic medical conditions. When such restrictions exist, patients are required to disclose their personal and health information during the application process. Patients sometimes make misrepresentations on their insurance applications to circumvent coverage restrictions. Misrepresentations can include false information or the omission of relevant information.

Altered Bills

A dishonest claimant can inflate a prescription or medical bill by placing an additional number in front of the amount charged. The claimant can also alter the date of service so that it becomes a recoverable expense rather than one incurred prior to eligibility. The individual submitting a claim might change the name on the bill from a noncovered family member to one included in the health care plan.

Third-Party Fraud

Third-party fraud involves the unauthorized use of an insured’s identity to obtain their insurance benefits. The insured usually discovers the fraud when they receive a benefit statement containing medical services they did not receive.

Ineligible Claimants

Patients sometimes seek reimbursement for ineligible claimants. For example, if a primary beneficiary dies, any secondary beneficiary named in the policy is generally ineligible for benefits. However, the secondary beneficiary might fail to notify the insurer of the death and continue to submit claims. Divorced parties can also commit ineligible claimant fraud. For example, suppose that a primary beneficiary and a covered spouse file for divorce, but neither party notifies the health care program. The ex-spouse might continue to submit claims even though they are no longer eligible for benefits.

Red Flags

A fraud examiner should be aware of the following indicators of fraud by patients:

- Pressure by a claimant to pay a claim quickly
- Individuals who hand-deliver claims and insist on picking up their payment in-person
- Threats of legal action if a claim is not paid quickly
- Anonymous telephone or email inquiries regarding the status of a pending claim
- Identical claims for the same patient in different months or years
- Dates of service just prior to termination of coverage or just after coverage begins
- Services billed that do not appear to agree with the medical records
- Billing for services or equipment that are clearly unsuitable for the patient's needs

Detection

The following methods are helpful for detecting fraud schemes by patients:

- Conduct utilization reviews of outpatient services to ensure that requested services are necessary.
- Flag future claims of aberrant providers or insureds.
- Develop automated programs that identify excessive charges for prescriptions or medical services above an acceptable level.
- Perform built-in claims to identify and reject duplicate submissions.

Fraud by Insurance Companies

In countries where private insurance plays a role in the health care system, such as the United States, there are several fraud schemes that might be committed by such insurance companies. These schemes may include the following:

- Submission of false documents
- Failure to investigate questionable claims
- Failure to pay legitimate claims
- Charging unapproved rates
- Requesting rate increases based on fraudulent data
- Deceptive or illegal sales practices
- Failure to apply discounts
- Patient screening

Submission of False Documents

If the insurance company works in tandem with government health care programs (e.g., by acting as an intermediary for the payer), then the insurance company commits fraud when it improperly bills the government or submits false cost reports or audits.

Failure to Investigate Questionable Claims

When an insurance company acts as an intermediary administering a government health care program, the insurance company has a duty to try to detect false claims by providers and beneficiaries. Although it is impossible to detect every fraudulent claim, if a company bypasses its own claims verification procedures, it can be found guilty of fraud in some jurisdictions.

Failure to Pay Legitimate Claims

The insurance company or carrier is required to pay a claim if there are benefits available, the claim is properly submitted and contains all of the required information, and there is no fraud. An insurance company might commit fraud when claims are consistently rejected even though the required information has been submitted. Some jurisdictions have regulations regarding the amount of time an insurance company has to pay a “clean” claim—one that has all the needed information. Even if an insured party has committed fraud in the past, and for some reason or another is still an insured, the insurance company must still adjudicate a valid claim.

Charging Unapproved Rates

Some jurisdictions require insurance companies to obtain approval on their premium rates (the price that insured parties pay to be covered by the insurance). An insurance company might improperly begin charging the unapproved rate before it is allowed to do so.

Requesting Rate Increases Based on Fraudulent Data

Insurance companies or carriers needing regulatory approval for rate increases use cost data to justify their increases. The act is fraudulent if they purposefully submit false cost data to get a raised rate.

Deceptive or Illegal Sales Practices

Insurance companies might promote or condone deceptive or illegal sales practices to increase sales. The most common example is to disguise an insurance policy as a savings plan or investment.

Failure to Apply Discounts

An insurance company might be guilty of fraud if it fails to apply discounts that have been negotiated with providers. The alleged overcharging occurs when an insurance company negotiates a discount on a medical bill. If the company does not provide the discount, the consumer's copayment is made on the full price rather than the discounted price, and the consumer ends up paying a higher percentage of their bill than they should. For example, if a bill is \$1,000 and a 50% discount is negotiated, the consumer's 20% portion should equal \$100. If the company does not administer the discount, the consumer pays 20% of the full \$1,000 or \$200.

Patient Screening

Because so much emphasis is placed on preventive care, some insurance companies might reduce their risk by limiting their insured to only healthy patients, which is illegal in some jurisdictions.

Detection

Methods to detect fraud committed by an insurance company might include the following:

- Review complaints by insureds.
- Compare financial statement data to data used to request rates.
- Compare rates charged with rates approved.
- Compare discounts negotiated with providers with the amounts allowed on the claims and coinsurance charged.
- Review rejected members to determine if underwriting guidelines were abused.

Employee Claims Fraud

Employees of health care programs and insurers, especially claims examiners and customer service representatives, can present additional problems to the fraud examiner. Due to their ability to access claims and subscriber files, the frauds perpetrated by these employees against the health care program or insurance provider can be almost limitless. The employee might collude with program beneficiaries or might use a beneficiary's claim information without the beneficiary's knowledge. The following are some common employee claims fraud schemes.

- Claims fraud using the employee's contract
- Claims fraud using another beneficiary's (i.e., insured's) contract number
- Claims payment using a relative's contract

- Claims adjustment system
- Payment for canceled contracts or deceased insureds
- Improper payee schemes

Claims Fraud Using the Employee's Contract

Employees who process health care claims generally have access to claims data and claim forms. They might be able to fraudulently adjust claims or pull someone's claim, change the claimant's contract number, and have the claim processed.

Claims Fraud Using Another Beneficiary's Contract Number

In health care systems in which private insurance is used, an employee who has access to individuals' enrollment files can locate an individual with a similar name as the employee. From there, the employee can easily complete a claim form and submit the claims through the regular processing system. The employee only has to put their own address in to receive the payment.

Claims Payment Using a Relative's Contract

Employees can fabricate claims and submit them under a relative's contract or government identification number.

Claims Adjustment System

Claims that are legitimately paid incorrectly need to be adjusted. However, an adjustment examiner might adjust a claim for fraudulent purposes.

Payment for Canceled Contracts or Deceased Insureds

If adjusters have access to the enrollment files, they might search for a deceased individual. By submitting or processing a claim before the deceased's coverage is canceled, adjusters can manipulate the claims system and divert payment to themselves.

Improper Payee Schemes

A claim approver overrides a claim payment system and pays out claims to improper payees. For example, the claim approver might use the name and address of a family member or acquaintance for the payee information.

Detection

The following steps can be used to determine if a company is dealing with an employee who is defrauding the system:

- Pull high-value claim payments. Investigate all unusual patterns by verifying services.
- Review printouts for special payee codes to search for employees.
- Review printouts for a high number of adjusted claims per insured or beneficiary.
- Review printouts of recently canceled contracts for unusual claims activity just prior to cancellation.
- Review address change lists for employee names or unusual activity.

Once unusual activity has been identified, follow normal investigative procedures.

Prevention

The following are some measures that can be taken to help prevent employee claims fraud:

- Have a separate area to handle employee claims.
- Limit access to employee claims information.
- Set up automated monitoring controls within the claims system to generate exception reports for high-value claims payments and multiple adjusted claims.
- Inform employees that audits are conducted regularly.
- Require and enforce adjusters to lock or log off of their terminals when they are not in use.

Agent Fraud

In jurisdictions with private health care insurance, insurance companies generally use the services of a broker or agent external to the firm. Unfortunately, the best interests of the insurance company are not always served. Several schemes have been identified that can be classified as fraudulent.

Phony Groups

Agents will set up bogus companies to sell health insurance to individuals at group rates.

Phony or Nonexistent Policies

Rather than going to the trouble of setting up a bogus company, many agents will sell a phony policy and then disappear with the money.

Medical Underwriting Fraud

The broker will write a policy knowing that the client has pre-existing conditions that would prevent acceptance for coverage.

Eligibility Fraud

A broker might seek to add ineligible family members, partners, or associates to a group policy by representing them as employees.

In another eligibility fraud scheme, a broker sells a low-cost group policy to an organization that employs a small percentage of people with serious health problems. A better rate can be obtained by separating healthy people from sick people. The broker splits off the unhealthy people in their own group, placing the coverage with an insurer of last resort, such as a carrier that is given favorable tax status in exchange for issuing coverage to anyone.

Payment Inducements

These schemes involve brokers furnishing group coverage to individuals who would not otherwise qualify for such policies by adding them to legitimate groups or establishing a fictitious group for the purpose of obtaining waivers and/or cheaper rates. The broker profits not only from the normal sales commission but also from a “surcharge” or billing fee that is added to the published premium that is collected from the policy holder by the broker. In another scenario, a broker might charge a markup for adding employees to a legitimate group.

Switching Policies

This scheme involves agents telling their customers that they are obtaining one policy, taking the premium for that policy, and then buying a cheaper policy with less coverage instead. The agents then pocket the difference.

Electronic Claims Fraud

Electronic data interchange (EDI) is the exchange of electronic data between computers, with no human interaction. While this technology has advanced the ability to conduct business quickly and easily, it has also provided would-be fraudsters with an increased opportunity to commit white-collar crimes.

EDI's origins are in the 1960s, when many industry groups started to develop EDI standards in areas such as purchasing, transportation, and financial transactions. The next major step

forward came when EDI-focused associations developed the first standards of electronic data interchange. They have currently developed more than three hundred different standards for individual industries concerning the transmission of EDI. These standards are published by the Data Interchange Standards Association (DISA).

Although these standards have been adopted and used worldwide by a multitude of different industries, the health care industry had been notoriously slow in adopting the new technology because the health care system is so complicated that a switch in operation procedure of this magnitude would be difficult and expensive to implement. However, a substantial number of health care providers have endorsed the industry conducting business electronically.

EDI can be used internally within a business as a way of communication and data transfer, and it can also be used for the same purposes between different businesses. In the case of the health care industry, EDI enables the different companies to send claims, invoices, and other vital data that once was shipped in a paper format via the postal service. The fact that EDI allows for an immediate exchange of data makes the process of submitting and approving health care claims much more efficient for the health care industry.

The health care transactions affected by EDI include:

- Claims payment
- Enrollments
- Claims submission
- Eligibility
- Claim status
- Crossover coordination of benefits (COB)
- Health care service review
- Patient information record
- Capitated payment
- Interactive claim
- Provider information

EDI has the potential to save the health care industry vast amounts of resources because it provides a more efficient way to do business. However, fraud examiners fear that a more efficient system also paves the way for more efficient ways to defraud the health care industry.

Solid controls must be established to deal with the health care industry's conversion to EDI, or else the potential savings might be eroded by bigger fraud losses. The electronic conversion of information completely removes paper-based controls.

Auditors reviewing electronic claims often use the same techniques as when auditing any other type of health care claims, but they might examine electronically transmitted information rather than original documentation. If the electronic information is reliable, then there is no difference; however, history has proven that electronic claims provide ample opportunity for fraud.

EDI frustrates fraud examiners' ability to detect fraud in the health care industry in three ways:

- The automation of claims has erased claims professionals' ability to detect suspicious-looking claims. Because they are used to handling the paperwork of claims, EDI hampers the claims professionals from getting a good picture of the overall nature of an account, instead reducing each transaction to individual claims.
- Because of the impersonal nature of electronic transactions, EDI raises the temptation of would-be fraudsters to commit white-collar crime.
- EDI leaves no paper trail, making the process of fraud detection difficult for the fraud examiner.

The reasons the health care industry is concerned about EDI's potential to stimulate fraudulent activity include:

- There is a lack of tools to detect EDI fraud.
- The variety of health care services increases the potential for dissimilar frauds.
- The efficiency of EDI allows for more vendors and thus more claims to account for.
- The swiftness in which transactions take place allows less time to uncover fraud.

In the past, the health care industry has developed sophisticated methods of detecting fraud within the paper-based system. Now that the conversion to EDI is taking place, the health care industry must find a way to apply those methods to the electronic format. These methods will only be as sophisticated as the health care industry chooses to make them; the less concern that the industry shows for creating fraud indicators, the more opportunity it gives fraudsters to successfully evade the rules.

Fraud examiners should not fear that the conversion to EDI will eliminate any fraud-related job opportunities. In fact, that conversion will actually open up many fraud examination jobs,

as the safeguards and red flag system against fraud have not been effectively established at this time. Therefore, fraud examiners need to be aware that their jobs include not only investigating fraud, but also creating systems that can effectively deter fraud.

Many new and complicated legal issues are raised as a result of the health care industry's conversion to EDI, such as:

- How does the insurance company or health care program prove that all electronic claims are authentic?
- Who is responsible for errors in electronic health care claims?
- How does the fraud examiner prove that the contents of an electronic health care claim are false?
- How does the health care industry ensure that all electronic transmissions are received exactly as they are sent?
- What terms and conditions govern electronic claims?
- How will fraud examiners determine the actual origin of electronic submissions?

Because automated claims are easily altered, the health care industry must ensure that claims are authentic. Fraud examiners should document that claims have been received in the same condition in which they were processed to help ensure that they are admissible as evidence.

Some examples of ways to ensure claims' authenticity include:

- Data encryption
- Digital signatures
- Message authentication codes
- Prior claims' history checkups
- A variety of field checks

The Effects of Prosecution in an Electronic Environment

EDI creates another type of legal evidence, but the basic legal principles regarding that evidence should remain intact. Therefore, the burden falls on the companies of the health care industry to demonstrate that its electronic system has proven safeguards that counteract fraud. If the system is proven to be reliable, the company can then show that it has created a reliable record of transactions.

One of the greatest weaknesses within an EDI system is that in the prosecution, defendants may claim that they did not enter the claim or that the claim was mishandled by the health

care company. Thus, a health care company must maintain the integrity of its electronic records. The health care company must have several ways to uncover fraud, from automatic red flags to intricate fraud analysis programs that recognize familiar patterns that might ultimately lead to fraud.

A health care company must prove the origin of all electronic communication and the original content of the transaction. It must also reduce the possibility that the original claim's content can be intentionally or unintentionally compromised. By doing these things, the health care industry can effectively use EDI without substantially raising the possibility of fraudulent activity.

Health Care Compliance Programs

Health care compliance programs are simply a set of effective internal controls designed to ensure that health care company operations adhere to the guidelines, regulations, and laws affecting the organization. Ideally, these internal controls should complement controls that already are in place within the accounting system. This is imperative because many health care fraud schemes involve the financial operations of the company, such as billing and collections. Compliance efforts are meant to encourage a culture that fosters prevention, detection, and resolution of conduct that is outside of established company policies.

As part of their compliance programs, health care organizations should consider taking the following actions:

- Develop and distribute policies that define standards and procedures to be followed by the organization's agents and employees. Specifically, the organization should establish standards of conduct that emphasize the organization's commitment to compliance in areas such as regulations issued by any relevant government health care programs; fraud and abuse laws; federal, state, and local laws; and corporate ethical policies, mission, and goals. Periodically circulate to every employee a standards of conduct statement that requires the signatures of all directors, officers, managers, employees, and contractors certifying that they have read, understand, and agree to comply with its terms.
- Designate or hire a high-level employee who has ultimate responsibility to operate and monitor the compliance program and to report directly to the chief executive officer (CEO) or governing body. This employee would be much like the company's own internal inspector general.

- Use reasonable care to identify sanctioned providers and remove those individuals from any activity that would violate a law or regulation. This can be done by dismissing the provider or reassigning that person to an area of the company that does not have direct contact with patients covered by government insurance or to an area that is neither directly nor indirectly reimbursed by a government program.
- Require regular training programs for all employees and contractors. Each entity should have some policy for educating managers, executives, and employees about fraud. This can be conducted during employee orientation and/or through ongoing training programs and other company communication methods. Initial and annual training for all staff, especially for those in the marketing, sales, and billing departments, is essential. Training should focus on billing policies and procedures, application of federal rules and regulations, disciplinary actions for noncompliance, personal responsibility of every employee to comply, and fraud and abuse laws.
- Use various kinds of monitoring and proactive auditing systems to detect fraud and unusual trends to ensure compliance. There are many statistical aberrations that an experienced fraud examiner can monitor in a proactive manner to identify potential problem areas, such as noticeable variations in billing patterns. For instance, if suddenly there is a 200% increase in billing for physician consultations, the fraud examiner might wish to review those services to determine if simple office visits are being characterized fraudulently as more complex—and thus, more lucrative—consultations.
- Establish and publicize a reporting system in which employees can report criminal conduct without fear of retribution (hotline or ombudsman program). Each employee in the company should know where to report suspicious, unethical, or illegal behavior. Steps should include establishing a self-disclosure policy, which outlines procedures for reporting law violations to the appropriate authorities, and a records retention policy, which sets standards on how long records should be stored and in what format (e.g., electronic media, original paper document).
- Develop a system to respond to allegations, investigate those allegations, and, if needed, implement the appropriate disciplinary measures. Be consistent and also discipline individuals who fail to detect the offense due to negligence. The compliance program should outline specifically who will investigate suspected irregularities, and to whom these irregularities will be reported (i.e., management, internal investigators, law enforcement, and/or legal counsel).
- Regularly review for systemic weaknesses in company operations and/or policies and make changes as needed.

Adherence to the aforementioned guidelines might provide leniency if an organization is liable for a health care fraud violation. Essentially, what a compliance program is designed to do is provide insurance for the provider. By taking every reasonable and prudent step possible, a provider will have demonstrated to a prosecutor, judge, or jury that they have taken steps to prevent fraudulent activity from pervading their operations. Consequently, the damage to a provider's reputation, finances, and freedom can be controlled and minimized to the fullest extent possible.

Additionally, effective compliance programs do what they are designed to do—stop fraud. Organizations' bottom line is protected by a strong compliance program due to less fraud committed against the organization from both internal and external parties.

For additional information regarding how health care compliance programs work in specific jurisdictions, see the content on "Health Care Compliance Programs" in the "Supplemental Regional Information" section of this chapter on [fraudexaminersmanual.com](https://www.fraudexaminersmanual.com).

CONSUMER FRAUD

Consumer fraud embodies a wide variety of misleading practices related to advertising, marketing, or the selling or buying of goods and services. It can arise when a product or service does not operate as intended and can involve the concealment or overcharging of fees. It can also occur when a seemingly legitimate company urges a customer to agree to unfair terms in order to complete a transaction or when a victim purchases a product that appears to be safe even though the seller might know that the product is unsafe.

Consumer fraud is an international concern. Each year, millions of consumer complaints are received by consumer-fraud agencies around the world. Individuals report a vast array of frauds, including debt collection schemes, impostor schemes, automobile schemes, and prize and sweepstake schemes. Cooperation among international consumer-protection agencies is vital to combating consumer fraud globally.

Consumer Fraud Schemes

Consumer fraud schemes involve a range of fraudulent conduct, usually committed by professional scammers, against unsuspecting victims. Scammers are skilled fraudsters who develop strategies, select targets, and use an appropriate method of delivery to lure their victims. Scammers usually act alone, but they might group together for a particularly complex endeavor.

The victims can be organizations but more commonly are individuals. Victims can be old or young, male or female, or wealthy or poor, and they are usually dispersed geographically. Many victims who become the targets of consumer fraud are considered to be in the naïve segments of the population, such as older individuals. It is important to note, however, that even the savviest consumers can become targets if they are not aware of the schemes involving consumer fraud.

Some examples of consumer fraud schemes include advance-fee schemes, debt consolidation schemes, and diploma mills. The following are various types of consumer fraud schemes.

Advance-Fee Schemes

Advance-fee schemes are structured to obtain an illegal gain by falsely promising the delivery of a product or service. In some schemes, the product is marketed to a large number of customers, and then the operation is shut down prior to the delivery stage.

Common scenarios used to commit advance-fee scams include the following:

- A home improvement contractor requires pre-payment for materials.
- Notice of a supposed inheritance from an unknown relative is received.
- Various exorbitant fees are required prior to securing financial assistance or advice.

Debt Consolidation Schemes

People who find themselves in debt sometimes turn to consolidation agencies for help. These agencies do not advance loans, but rather act as an intermediary between debtor and creditor. Some agencies are legitimate, but many are not.

In a typical scenario, the debtor contacts the agency, which compiles a list of the creditors and the amount of monthly payments. The agency usually writes letters to the creditors requesting a workout plan at lower monthly payments spread over a longer period of time. The creditors will often offer such an arrangement if they feel that the debt will thereby be paid or if the workout plan will forestall bankruptcy or default by the creditor.

Unscrupulous debt consolidation schemes often involve the agency collecting the money from the debtor but not forwarding it to the creditors. In some instances, considerable time can pass before the debtor finds out that their money has been misappropriated.

Another variation of the debt consolidation scheme occurs when customers are guaranteed that they will receive a loan or a credit card regardless of their credit rating. Typically, the victims have been rejected by legitimate financial institutions because their credit ratings are poor. The victim must pay a processing fee for the application to be accepted. After the victim pays the fee, the con artist disappears.

Diploma Mills

For what is often a hefty fee, a diploma can be purchased by those who apply. The fraudster usually claims that the fee is for processing the application or for verifying the

experience necessary for the degree to be awarded. The hallmark of the diploma mill is the ease with which the degree is obtained. Because the school is not accredited, the degree is essentially worthless.

Personal Improvement Frauds

Many people spend significant time and money to improve their health and appearance. Unfortunately, it is often difficult to determine whether they are paying for a real treatment or just another scam. Fraudsters constantly come up with new wonder drugs to capitalize on health-conscious individuals. However, in some cases, the fraudsters risk the consumer's health by promoting unstudied and dangerous products (e.g., diet pills, vitamins, low-calorie or fat-free foods, exercise equipment or routines, cosmetic surgery, and cancer cures).

Dietary and Health Cure Schemes

Dietary and health cure schemes are consumer fraud schemes in which fraudsters attempt to deceive consumers by claiming certain products or foods are organic and pure and will cure or eliminate certain illnesses or diseases. Their claims, however, are not supported by any regulatory authorities.

Regulatory authorities in most countries have guidelines for labeling and advertising foods and drugs to help consumers make educated choices when purchasing foods and prescription drugs. The World Health Organization (WHO) provides information related to diseases, pharmaceuticals, and health. It has also developed programs to educate consumers on ways to stay healthy and avoid the spread of disease by getting the proper medical treatment.

The WHO aims to educate consumers about health-related topics so they can avoid unscrupulous marketers who prey on the sickest and most vulnerable consumers. The WHO targets its programs in areas where fraudsters are more prone to commit consumer fraud schemes. These areas include medical devices, herbal products, and other dietary supplements to treat or cure cancer, arthritis, hepatitis, Alzheimer's, diabetes, and many other diseases.

Cosmetic Surgery Schemes

One way that consumers attempt to improve their looks is through cosmetic surgery. Although most surgeons are qualified, others are inexperienced and poorly trained; they only want money regardless of the health risks to the patient. There are also unscrupulous surgeons who perform surgery when there are better and safer alternatives available. One

example of this is varicose vein surgery, as there are several other forms of treatment available for varicose veins. Alternative treatments should always be investigated and second opinions obtained before proceeding, even with a qualified and experienced physician.

Modeling and Acting Schemes

Fraudulent modeling and acting agencies are not set up to promote talent, but rather to get consumers to purchase a program that provides no benefits. The scam begins with a promotion through advertisements. When people respond to the ads, they pay a screen-test fee (the screen test is recorded, and a fee is required to receive a copy).

After a screen test, aspiring actors and models receive a letter saying they passed and have great potential in the industry. The fraudsters apply pressure for individuals to spend money on an agency-introduction program, which supposedly educates models and actors about headshots preferred by prospective agents.

Representatives make false promises of a high success rate and guarantee at least one agency offer. After purchasing the program, consumers receive the names and addresses of a few modeling and talent agencies, along with a few photographs. They soon learn the program is fake when they are not contacted by any modeling or talent agency. Consumers might attempt to get a refund but are not able to because the fraudster has disappeared.

Automatic Debit Program Schemes

Automatic debit programs are a convenient way to pay bills, such as recurring charges for mortgages and car loans. Fraudsters exploit these programs by obtaining consumers' bank account information through telemarketing schemes. Fraudsters then use this information to draft money from consumers' bank accounts without their consent.

These scams often begin with a call from a telemarketer regarding a free prize—for which the consumer must provide a bank account number to qualify. Some telemarketers tell the truth, namely that the information is needed to debit the consumer's bank account. Once telemarketers have the account number, they make a demand draft with the bank, which does not require the consumer's signature.

In most jurisdictions, telemarketers are legally required to obtain consumers' verifiable authorization to obtain funds from their bank accounts. Depending on the law, telemarketers might be required to (1) obtain consumers' written authorization, (2) obtain audio recordings

of the consumers' verbal authorization, and/or (3) send the consumers written confirmation prior to debiting their bank accounts. Some laws require telemarketers to disclose certain information (e.g., the date and amount of the demand draft) to consumers before debiting their bank accounts. In some jurisdictions, telemarketers must have a refund procedure that consumers can use when there is a dispute over the confirmation's accuracy.

Consumers should contact the agency that oversees telemarketing in their country of residence and determine what telemarketers are required or not required to do as it relates to automatic debit programs.

Equity-Skimming Schemes

Equity skimming involves a perpetrator draining the equity from a home through various means. One method is to help homeowners establish a home equity line of credit and encourage them to access the funds for investment purposes. Another method occurs when a perpetrator charges a homeowner inflated fees supposedly to help the homeowner profit by refinancing the home multiple times and thus skimming the equity.

Fundraising, Nonprofits, and Religious Schemes

Some groups use the words *cancer* or *AIDS* in their title to convince the consumer they are legitimate charitable organizations. Others offer a prize or award for the consumer as a reward for their contribution. In recent years, a concept known as *crowdfunding* has become a popular online method of raising money for myriad causes and has already led to reports of fraud.

Home-Based Businesses

Decades-old home-based business scams have in recent years migrated to and flourished on the internet. These scams are especially effective during a downturn in the economy and typically prey on those who are desperate for work or supplemental income. Many companies marketing home-based businesses require a person to buy materials for assembly-at-home products, while other common ploys include stuffing envelopes or processing medical bills. The consumer is promised that the company will purchase the completed products, and when it does not, the consumer is left with a bad investment and a stock of low-quality, worthless goods.

Home Improvements

A common scam involves phony repair people selling their services door-to-door. After paying the fraudster in advance for the materials needed to fix a roof, window, or other item, the consumer is left with unfinished repair work and no repair crew.

Money Manager or Financial Planner

These scams involve convincing targeted victims to invest in low-risk, high-return opportunities. Of course, consumers who invest in these opportunities see no returns at all.

Scavenger or Revenge Scheme

This involves the company that initially conned the consumer. Using a different company's name, the outfit contacts the consumer again and asks if they would like to help put the unethical company out of business and get their money back. Naturally, an up-front fee is required to finance the investigation.

Sweepstakes, Giveaways, and Prizes

Some schemes lure in victims by stating that they've won a sweepstakes or large prize. The scammer then notes that the winner must pay certain fees before claiming a prize. Signs of a sweepstakes or prize scam include prepayment of taxes, shipping and handling charges, and processing fees. Legitimate prizes and sweepstakes do not require the recipient to send money or pay for anything. Sweepstakes and prizes that require up-front fees are examples of advance-fee fraud.

Advance-Fee Sweeps

An example of an advance-fee sweep occurs when a telemarketer poses as a representative from a sweepstakes company and tells individuals they have won the grand prize and will receive it as soon as they prepay the taxes owed on it. Fraudulent telemarketers sometimes pose as government officials and request prepayment of taxes before the prize is delivered.

In another type of advance-fee sweep, a fraudulent telemarketer apologizes for an oversight, usually failing to notify individuals that they won a prize. The fraudster explains that the prize's delivery has already been arranged, but that a fee must be paid for the prize to be released.

The fraudster instructs the victim to go to the bank to get a money order for the amount of the fee and to send the money via wire transfer. Once the fraudster receives the money, the fraudster ceases contact with the victim. Only then does the victim realize that they will never receive the prize and that they have been swindled out of thousands.

Another example of this scam is when a fraudster falsely claims to be a sweepstakes representative and informs individuals that they have won money. To receive their prizes, the winners are told that they must establish accounts with the government taxing authority to deposit a taxation fee equal to 1% of the prize.

The fraudster offers to establish the account and collect the tax for the individual and then instructs them to express mail a check made payable to the fraudster personally. The fraudster uses a phony name and a temporary address. The victim is then scammed for the advance fee, which can total into the thousands.

Free Prizes

Few individuals receive free prizes or gifts from telemarketers; such prizes generally involve buying a product or paying an advance fee. Deceptive telemarketers tell individuals they won a “free gift for credit card holders.” The free prize scam is another version of the advance-fee scam. The fraudulent telemarketer asks victims to verify their credit card number for shipping purposes; however, the credit card is debited for some hidden fee.

False Text Message Prize Offers

Unsolicited text messages informing consumers that they have won a prize are common. The text includes a link to a website, and consumers can win the prize if they provide some personal information on the website and pay a small fee. Scammers sell the personal information to marketing companies and keep the fees as a bonus. The consumers lose their money, never receive a prize, and compromise their personal information.

College Scholarship Services

This fake service usually charges an up-front fee or advance payment fee for finding a scholarship suitable for the applicant.

Credit Repair Schemes

Fraudulent companies use solicitations that offer to repair a consumer’s credit. These statements are not only false but might be illegal. Valid negative credit information cannot be

removed or erased from a credit report. For example, in the United States, such information is retained for seven years (ten years for bankruptcy information). The only remedy for a bad credit history is to change credit habits.

Credit Card Debt Elimination Scheme

Many people are burdened by credit card debt and will do almost anything to find a way out. Unfortunately, there are many scammers waiting to prey on these consumers with credit card debt elimination schemes. Many consumers are lured by scammers who promise to completely eliminate their debt.

In a credit card debt elimination scam, the caller tells consumers they have to pay a hefty fee before the services begin. The fraudster says if buyers pay the fee with a credit card, they will not actually have to pay it because the credit card debt is going to be eliminated anyway.

The callers might also tell consumers not to worry about the bank suing them for not paying off their debt because banks turn over the debt to a collection agency, as they do not want the hassle and expense of suing someone. Some scammers entice consumers into thinking that credit card debt is illegal by citing legislation, but they provide no information about what those laws actually entail. Many scammers know that consumers will not look up these statutes.

Credit Analysis Offers Scheme

Credit analysis offer schemes come in the form of advertisements on television, through the mail, or on the radio, offering people the ability to obtain information about credit repair programs and to receive a “confidential analysis” of a consumer’s credit history. The analysis is marketed to correct a personal credit profile and reestablish credit. When the consumer calls, the salesperson asks for an advance fee—usually through a demand draft. The consumer is asked to provide bank account information for the advance fee.

In these schemes, the fraudulent company sometimes claims that the fee is refundable for up to three days. However, once consumers provide their banking details, their accounts are immediately debited for the fee, even if they call back the same day to decline the offer.

Missing-Heir Scheme

In the modern version of this scam, the fraudster poses as a probate investigator or other genealogist, charging fees to distribute an inheritance.

Airline Ticket Schemes

Many consumers search several online websites before booking a trip to find the cheapest deal on airline tickets. To attract customers, some sites significantly undercut competitor prices by offering deals that are too good to be true. Fraudsters create fictitious websites to capture a consumer's personal information (e.g., credit card information) to commit other frauds. Consumers think they purchased an airline ticket at a great price, but they just gave their credit card information to fraudsters.

After the purchase, consumers receive an email informing them their credit card was declined and providing instructions to wire payment or send a money order. In both scenarios, the fraudster not only has access to the consumer's personal information, but also receives payment for an airline ticket the consumer never receives.

Airline ticket schemes are similar to phishing schemes but differ in that the consumer initiates contact. In traditional phishing schemes, the fraudster targets the victim. Consumers can avoid becoming victims of airline ticket schemes by purchasing airline tickets through trusted, reputable sites, even though the price might be higher than on other less-known sites.

Scamming Families of Migrant Children

Scammers use knowledge of children who have crossed international borders to extort money from their family members. They claim to work for a government agency or to be child welfare workers. They know specific details about the children and their location. They tell family members the children are about to be released from an immigration center, but they need money to pay for processing and travel fees. Fraudsters provide victims with instructions to send payments, usually by wire transfer. Family members of migrant children should be aware that parties responsible for reuniting these children with their families will never ask them for money.

Government Imposter Schemes

Some fraudsters impersonate government officials. In one such scheme, they call individuals, claim to work for a government agency, and say they won the lottery. Before individuals can receive their prize, they just have to pay taxes and service charges. The individuals wire the money only to find out later that no government agency was involved, no prize existed, and they have been scammed out of money.

In another government imposter scheme, a consumer receives a call or an official-looking letter that seems to be from a government agency. The letter includes the consumer's name, address, and government identification number. Either the caller or the letter claims the consumer owes a debt that must be paid immediately to avoid being arrested or going to court. The scammer requests that the debt be paid through a wire transfer or a loaded, rechargeable credit card. Many times, consumers send the money regardless of whether they owe it out of fear of facing legal consequences.

Consumers should know that government agencies do not ask individuals to wire money or use rechargeable credit cards. If individuals receive a call from someone claiming to work for a government agency who asks for money, they should hang up the phone and contact the government agency directly to determine if they really owe a debt.

Romance, Sweetheart, and Friendship Schemes

In a romance, sweetheart, or friendship scheme, fraudsters offer love or friendship to a lonely person, especially a financially well-off widow or widower. They charm their way into the victim's heart and then attempt to steal their money, often by asking for a loan. These fraudsters can find their victims on the internet through dating websites, social media networks, or chat rooms, as well as in person through social groups, church groups, or any other place where lonely individuals who are seeking a connection might gather.

Travel or Vacation Scheme

A travel or vacation scheme is a variation of an advance-fee scheme that occurs when a fraudster creates a fake vacation rental listing or website. The fraudster takes photos of properties directly from the internet and uses random interior photos from other rental sites to make the properties appear to be lived in.

In reality, the advertised property does not exist or is not at the address provided. As part of the scam, the fraudster usually asks the victim to wire funds for the first and last night's stay or even requires the victim to pay in full. After receiving the funds and passing off fake information about the short-term rental to the victim, the fraudster disappears and is no longer reachable. The victim shows up at the address provided and realizes the rental property does not exist.

Bait and Switch Scheme

In a *bait and switch scheme*, the fraudster advertises unavailable properties and reserves a less-desirable rental for the victim. Upon arriving at the property, the renter realizes it is not the advertised place. Another version of this scam occurs when the fraudster double-books a location and sends whoever arrives last to a backup rental in worse condition than the advertised unit.

Price Jacking Scheme

Price jacking is similar to bait and switch, except that travelers actually get the rental they reserved, but they have to pay more for it than they agreed.

Deceptive Email Schemes

In a deceptive email scheme, a fraudster hacks into the email account of a legitimate rental owner or manager and forwards the rental inquiries to the fraudster's own email account. This allows the fraudster to pose as the owner and collect payments.

Consumers who participate in the home-sharing economy need to protect themselves. They can avoid becoming victims of short-term home rental schemes by considering the following tips:

- Beware of emails with bad grammar. Legitimate property owners or management companies generally do not maintain websites or send emails that contain bad grammar.
- Be cautious if asked to send money using money-transfer services. Most owners or managers ask for payment through a more secure means, such as a credit card or PayPal.
- Use websites such as Google Earth to verify that the property exists as advertised.
- Communicate with the owner over the phone. One of the best ways to uncover a scam is to ask questions. Direct communication allows the potential renter to ask specific questions about the property and check references from people who stayed there previously.

Hotel Schemes

Consumers typically have confidence that hotel management has fraud prevention measures in place, but, unfortunately, hotels are not immune to consumer fraud schemes. Scammers perpetrate hotel fraud using various methods, but their purpose is the same—to take advantage of travelers.

One variation of a hotel scheme involves a late-night call from the front desk. The caller claims that the front desk is having billing issues and asks the guest to verify the credit card information on file. The hotel guest trusts the caller and unknowingly provides the credit card information to a scammer. Consumers should know that hotel personnel do not phone their guests for personal information. Instead, they ask them to come to the front desk so any issues can be resolved in person.

In another scheme, a scammer slides fake pizza delivery fliers under the doors of hotel rooms. When guests call to place an order, the scammer takes their credit card information as payment. When the food fails to arrive, hotel guests realize they gave a stranger access to their credit card. Before ordering delivery service, hotel guests should verify the business or ask hotel staff for recommendations.

Scammers might establish a Wi-Fi network with a name similar to the hotel's network. Guests who log into the scammers' network might provide them with access to their personal information. Before using Wi-Fi in a hotel, guests should confirm the correct network with hotel staff.

Insurance Fraud Schemes

Insurance fraud schemes come in many forms and are damaging to society as a whole. While many insurance fraud schemes involve policy holders defrauding the insurance company, some schemes are perpetrated by legitimate insurance companies who target unsuspecting consumers. One scheme perpetrated by dishonest insurers involves collecting premiums or payments from consumers in exchange for fake policies. These unscrupulous insurance companies attract consumers by advertising the fake policies at costs well below the market price.

Another scheme perpetrated by insurance companies involves the sale of insurance policies to consumers in locations where they are not licensed. For example, an insurance agent licensed in Quebec but operating in Vancouver sells an insurance policy to someone in Vancouver, even though the agent is not licensed there. When the policy holder files an insurance claim, it gets rejected, thus revealing the scam.

Consumers should be aware of the red flags of insurance fraud schemes. Some warning signs include:

- Aggressive insurance agents who pressure consumers to purchase a policy immediately
- Insurance premiums that are significantly lower than other comparable premiums
- Failure to receive insurance identification cards or a copy of the insurance policy
- Insurers who cannot be reached via telephone or email or do not have a listed phone number

Child Adoption Schemes

Adoption fraud includes any illegal act or intentional misrepresentation by any party involved in the adoption process. Adoption fraud occurs when there is intent to deceive or misrepresent by any parties involved. Parties involved in adoption fraud can include prospective birth mothers, adopting parents, or adoption professionals.

In an adoption scheme where the birth mother is the perpetrator, she agrees to give her unborn child to multiple adopting families in exchange for money. The birth mother requires an up-front payment from each family, but she has no plans for them to adopt her child. In frauds perpetrated by the adopting parents, they might verbally agree to let the birth mother see the child, but they forego this agreement when the adoption process is complete, and they physically have the child. An adoption agency might charge adopting parents significantly higher fees than other agencies, and then it fails to provide the promised services.

Electronic Payment Fraud

Wire transfers involve the electronic transfer of funds, as instructed by the customer, from a banking or financial institution to a beneficiary account. Electronic payment fraud occurs when an individual with authorized or unauthorized access intentionally uses or manipulates a consumer's bank account for personal gain.

Elder Fraud

Older individuals are frequent targets of consumer fraud scams by fraudsters all around the world. *Elder fraud*, also known as *elder financial abuse*, includes different types of consumer fraud schemes perpetrated against older individuals. For example, elder fraud might involve individuals using deceit to scam older victims out of their money or property, coercing them to sign over a deed or title, using their property without permission, or promising to care for their health needs in exchange for money but never following through on the promise.

Elder fraud is often perpetrated by someone the victim knows, such as a family member or caregiver. Fraudsters use a wide range of tactics to scam older individuals. They might be friendly, sympathetic, and willing to help in some cases, and use fear tactics in others. The chosen tactic generally depends on the situation.

The Better Business Bureau (BBB), an organization that promotes the advancement of marketplace trust, issues a report—BBB Scam Tracker Annual Risk Report¹—on consumer fraud complaints from the United States and Canada. The 2019 report found that individuals over the age of 65 were less likely to be victims of fraud, but their losses were substantially higher than those of younger victims. According to the report, older individuals were most likely to fall for scams involving travel, vacations, and timeshares; home improvement; and romance.

Elder Fraud Schemes

The following are common types of elder fraud schemes.

Home Improvement Schemes

Fraudsters often use homeownership to take advantage of older individuals. In a *home improvement scheme*, the fraudster recommends a friend who can perform needed home repairs for an older individual at a reasonable price. This friend might require the homeowner to sign a document upon completion, confirming repairs were made. In some cases, the victims later learn they signed over the title of their house to the repairperson. In other cases, not only is the victim overcharged, but the work is also performed improperly.

Sweepstake and Prize Schemes

Another consumer fraud scheme targeting older individuals is related to sweepstakes and prizes. Fraudsters inform older individuals they won a prize but must pay a fee to receive it. The fraudsters then convince their victims that they can eventually win the grand prize if they send in another fee. This cycle continues until the victims catch onto the scheme or are no longer able to send fees because they have depleted their savings.

¹ www.bbb.org/globalassets/local-bbbs/council-113/media/bbb-institute/riskreport2019/2019-scamtracker-riskreport-final.pdf.

Travel, Vacation, and Timeshare Schemes

Fraudsters often target older individuals with fraud schemes involving travel, vacations, and timeshares. In these schemes, fraudsters post advertisements for vacation properties that are nonexistent, significantly different than promised, or not actually available for rent.

Telemarketers sometimes target older individuals directly, promising inexpensive vacation packages or timeshares that can be easily resold.

Tech-Support Schemes

The goal of a tech-support scheme is to convince victims to pay for unnecessary computer services to repair nonexistent viruses or other problems. The scheme usually begins with a fraudster calling a victim and claiming to be a computer technician working for a well-known tech company (e.g., Microsoft or Apple). Alternatively, the victim might be tricked into calling the fraudster directly via pop-up messages warning about nonexistent computer problems.

Once the victim is on the phone, the fraudster generally instructs the victim to download and run software that gives the fraudster remote access to the victim's computer. The fraudster proceeds to perform phony diagnostic tests on the victim's computer, and then falsely claims to have detected viruses or other problems and offers to fix the victim's computer for a fee. In addition to collecting a fee for unnecessary services, the fraudster might install spyware onto the victim's computer.

Romance Schemes

As previously discussed in this chapter, romance schemes are used to steal from individuals who are looking for love or friendship. These schemes often target older individuals.

Work-at-Home Schemes

Work-at-home business opportunities target older individuals who need extra income to supplement their retirement benefits. These business opportunities might include assembly crafts, chain letters, coupons, envelope stuffing, medical billings, and report writing.

Grandparent Schemes

The grandparent scheme plays on the victim's emotions. A scammer calls an older individual and asks if the individual knows who is calling. When the grandparent guesses the name of a grandchild, the scammer pretends to be that grandchild. The scammer claims to be in a financial bind and asks if the grandparent can send money via the internet or a money

transfer service. The scammer urges the grandparent to avoid telling anyone about the situation. Once scammers receive the money, they continue to contact the grandparent for more money.

Fortunately, there are ways older individuals can protect themselves against grandparent schemes. If they receive a call from someone claiming to be their grandchild, they should confirm the person's identity before sending any money. Several ways to confirm the legitimacy of the caller would be to:

- Ask questions an imposter would not know, such as the birth date of the grandchild's father or a pet's name.
- Hang up the phone and contact the grandchild directly.
- Contact friends or relatives and ask if they are aware of any issues with the grandchild.

Protecting Against Elder Fraud

Family members, friends, and other trusted individuals play an important role in guarding against elder fraud schemes. If family members or others close to the older individual suspect elder fraud, they should contact the appropriate legal authorities in their local jurisdiction and file a report.

To determine if elder fraud has occurred or is occurring, people close to the older individual should watch for warning signs that might point to a specific issue or problem.

Red Flags of Elder Fraud

The following are some common red flags for elder fraud schemes. While the presence of any one of these circumstances does not necessarily indicate that elder fraud is occurring, individuals close to the older individuals should take note of multiple occurrences of or patterns in these warning signs.

- Outstanding bills
- Disconnection notices for unpaid utilities
- Large bank account withdrawals with no explanation
- New friends who appear suddenly and without prior mention
- The discovery of signed or forged legal documents (e.g., power of attorney [POA]) that the older individual is not aware of
- Another caregiver asking probing or unexpected questions about the older individual's spending habits

- The older individual missing property or belongings
- The discovery of financial decisions or arrangements made that the older individual is unaware of (e.g., the opening of a new account in the person's name)

Telemarketing Fraud

While the telephone, newspaper, and postal service used to be the key tools of telemarketers, the internet has afforded fraudsters a fast-paced and anonymous method of carrying out their schemes. Telemarketing offenses are classified as consumer fraud, yet many businesses are affected by office supply and marketing services scams. The nature of phone rooms, the geographical distances between the perpetrators and their victims, and the resources and priorities of law enforcement agencies all make enforcement efforts difficult.

Telemarketing Terminology

A term in the scammer's vocabulary might include *nailing* the customer (i.e., closing the deal). A salesperson's most effective skill is *puffing*, the ability to sound convincing while exaggerating the value of a business opportunity or gift. To make the puffing more persuasive, marketers hire *singers* or *criers* to tell potential victims what a great deal they are getting. Calls from angry customers who realize they have been swindled are known as *beat calls*. These are handled by someone claiming to be the company's manager or vice president.

Boiler Room Staff

Work in a *boiler room* is shared by *fronters*, *closers*, and *verifiers*.

FRONTERS

The fronter calls victims and makes the initial pitch. This low-level worker is usually breaking into the business and reads from a script to the prospective customer. Fronters seldom see the merchandise or know the full extent of the operation, which potentially limits what they can tell investigators and protects them in the event of prosecution.

CLOSERS

The closer is a veteran. Fronters pass an interested caller to their closer, identified as the firm's "manager," who convinces the person to buy.

VERIFIERS

Next, the caller is passed to a verifier, who reads some vague words about the deal and records the person's agreement. These recordings intentionally leave out key details, recording only the customer's consent.

Staff Exploitation

The customers of fraudulent telemarketing operations are not the only victims. Fronters are often poorly educated and easily taken advantage of by the career criminals who run the operations. Salespeople might face hidden costs in a work agreement, similar to the ones involved in the items they push on unsuspecting customers. For example, boiler room operators hold back parts of their phone lists and sell them to crew members as "hot leads."

Telescam veterans know how to operate a gift sting that bilks both the customer and the salesperson. Operators overstate the retail value of the gifts, so the customers get less than they paid for; then, by giving agents an inflated wholesale cost, the operators can pay these workers less commission, which is figured on the "profit margin" between wholesale and retail.

The salespeople in boiler rooms are sometimes as desperate as their victims. Most are unemployed, with little education or marketable skills. Telemarketing promises easy work and big pay without any experience. Many people who start out as fronters, however, are serving an apprenticeship in their criminal careers. They are enticed by cars, mobile phones, and other perks.

Naturally, there are no payroll taxes deducted from paychecks, so employees can owe big tax bills at the end of the year. Fronters' commission payments are often shorted or withheld. Paychecks frequently fail to clear the bank. Owners promise big profit shares for a month or two, and then shut down the business. They tell the workers that their assets have been frozen by creditors or regulators. Workers lose their jobs and usually their last weeks' commissions.

Telemarketing Suppliers

The telemarketing industry relies on a number of sources to supply its phone scripts, mailing lists, merchandise, phone banks, and autodialers. Mailing lists and phone lists are sold for a few cents per name. Lists of people who have been victimized before or who have bad credit records are more valuable to the scammer and therefore more expensive. By supplying

telemarketers with the tools of their trade, these companies make telescamming possible. Many of the suppliers are aware of telemarketers' criminal intentions and choose to ignore them.

Turnkeys

Turnkeys comprise an industry of their own by providing the collateral a telemarketing scam needs: turnkeys launder credit card receipts and checks, sell autodialers and phone lists, and provide the merchandise portrayed as valuable prizes.

Independent Service Organizations

Telemarketers often have difficulty securing credit card services from reputable institutions. Many banks will not open credit-processing accounts for businesses that do a substantial amount of their business in phone sales because these accounts typically incur a high rate of chargebacks. Consumers have sixty days to protest fraudulent charges to their credit cards, and if successful, the issuer must incur the financial loss to reimburse the consumer for the fraudulent charges.

Telemarketing operations have learned the difficulties they face when dealing directly with banks. To circumvent this obstacle, phone sales companies hire "independent service organizations," which approach banks on the telemarketer's behalf. The service company agrees with the bank to cover any chargebacks from the operation. The telemarketer is required to post a large bond to cover potential losses, so the service organization is also protected from loss. However, even with a high-value bond, the reserve funds can be quickly depleted when customers start to realize they have been swindled, leaving the service company and/or the bank with enormous losses.

Factoring Companies

Telemarketing operations also commonly engage factoring companies. These groups buy credit card receipts from telemarketing operations at a discount, and then use their merchant bank accounts to convert the receipts into cash. Some factors charge as much as 30% of the receipts' gross value to launder the slips. Factoring is illegal in some jurisdictions, though perpetrators find loopholes or ways to disguise their alliances.

INTERNATIONAL FACTORING COMPANIES

Factoring through Asian and European merchants is becoming increasingly common. Factoring companies in these countries tend to charge a lower price for their services than

some other countries—between 9 to 10% of the gross. Regardless of their locale, factors have the opportunity to make a great profit. They also, however, face the risk that banks will put a hold on their accounts or sue them for excessive chargebacks. In response to the losses suffered at the hands of dishonest telemarketers, banks and credit card companies have started reviewing their accounts to locate those businesses with inordinate numbers of chargebacks. The financial institution closes these accounts and might file suit if the account holder can be located.

Check-Cashing Establishments

Another convenient tool at the telemarketer's disposal is the check-cashing store. If a boiler room operation wishes to avoid the risks of setting up a bank account that might be traced or seized, customers' personal checks are taken to a company that cashes them for a small fee. These establishments rarely require any identification to cash the checks. Customers might complain and try to stop payment on their checks, but they are ordinarily too late.

Common Telemarketing Scams

Senior Scams

Perpetrators of telemarketing scams enjoy targeting older people. Older individuals are often more vulnerable to pitches promising them extra money and luxury goods because many live on fixed incomes. These pitches can seem like an easy way for older individuals to improve their financial status.

Targeting the Unemployed

The unemployed are another favorite target for sweepstakes pitches and job search services. People with bad credit pay telemarketers to “repair” their credit record or get a major credit card. Instead, they get a list of banks that offer credit cards, commonly published in newspapers, or an application for a card that requires a security deposit for activation, usually several hundred or a thousand dollars. These people are also targeted by advance-fee loan scams, which promise loans in exchange for a fee.

Affinity Fraud

Affinity fraud targets groups of people who have some social connection. Neighborhoods chiefly populated by racial minorities, especially immigrant groups, are often the site of affinity frauds, and older individuals and language minorities are frequent targets as well. In addition, religious and professional ties are often exploited. Marketing technology has made it possible for a company to buy targeted lists, not just by location, but according to buying

habits, leisure activities, and club memberships. The most expensive lists carry the names of people who have already fallen for a telemarketing scam. This is called *reloading*.

Consolation

When irate customers call telemarketers back to complain, their calls are routed to professionals who placate the caller with more promises and obfuscations. Some boiler rooms have a prearranged communication route for leading complaints through four or five different “departments.” This tactic causes many callers to eventually end the call without having spoken to anyone. In some instances, telemarketers confronted with furious callers threatening legal action do award something of value to the customer, though the item is usually worth far less than the person has paid.

If obfuscation and consolation prizes fail to appease the caller, the con turns to threats and intimidation. This is a favorite method for dealing with older individuals. Threats are used not just to keep customers from filing complaints, but to cajole more money out of them. Some telemarketers have actually threatened callers’ personal safety if they refused to pay.

The odds of catching a boiler room operation in progress are usually poor. Operations can select a town, set up a room, get their money, and leave again in a matter of weeks or months. When authorities raid a boiler room, the operation has typically already moved on.

If the company owners registered with the appropriate regulators, they probably did so under an alias. By the time police arrive, the perpetrators have moved on and the chances of finding them are minimal.

Toll-Free Numbers

Toll-free numbers offered by phone service companies are used by some operations. The scam is a toll-free line, advertised in mailers, fliers, and newspaper ads, to lure victims into making the call themselves. The toll-free number usually carries a recording that directs customers to a different line that charges the caller a per-minute fee to hear recorded messages. A favorite device of sellers is to insist that the offer being made is good for less than 48 hours. To secure the opportunity, the customer hands over a cashier’s check to an overnight-delivery service. Even if the victim does have second thoughts, they will be unable to stop payment on a cashier’s check.

Automatic Debits

The personal bank account is a convenient tool for defrauding telemarketing customers by setting up an automatic debit to the buyer's account. Telemarketing operations use this method to obtain payment before victims can change their minds about their purchases. To make things worse, telemarketers can simply use the information to drain the victim's account. This information is usually obtained by telling the victim that the account numbers are needed to verify eligibility for a giveaway or business opportunity. Banks are not responsible for any losses that customers suffer in this way, so there are no chargebacks and little recourse for the swindled customer besides filing a complaint. Even if an investigation of the complaint brings the scammer to court, the chances that the victim will receive restitution are poor.

Business Opportunities (Biz Ops)

Many telemarketing frauds are aimed at people starting their own businesses. Regulators put losses in fraudulent business opportunities at over \$100 million a year, and most observers think the number is far higher.

Work-at-Home Schemes

Besides franchise offers and other miscellaneous business scams, the most prevalent frauds involve work-at-home schemes. Victims of these phony offerings do not see themselves as part of the telemarketer's prey. They believe they are making a legitimate business investment.

Telemarketers use business-related terms such as *exclusive territory*, *annual gross revenues*, and *emerging markets* in these calls. This helps convince the targeted victim that the business operations are legitimate.

Some business-pitch operations are complete fabrications. They offer envelope stuffing or book-review enterprises that do not really exist. Scammers mail out postcards, buy inexpensive ads in magazines and newspapers, or send out spam emails. Some might not even take any phone calls. The ads convince the victims to send money to a mailbox or via an online payment method. Many private companies will rent mail-drops to anyone for a monthly fee.

Fly and Buy

Some scams involve ventures such as vending machines, internet terminals, and merchandise display racks. They often gain credibility by setting up a front operation and inviting investors

for tours. This part of the ruse is known as the “fly and buy.” For example, the promoter usually schedules a meeting with the potential victim. The promoter will then offer to let them in on a deal for something such as video pool and video bowling games. Thrilled with the demonstration and the promoter’s promises of quick profits, the victim will pay thousands of dollars for the machines. Unfortunately, they often break down within a few months. Complaints generally go unanswered, or by the time the machines break, the promoter has moved on to other victims.

Entrepreneurial Enterprises

Telemarketers do not only deal in machinery-oriented scams like those described previously. The raising of exotic animals like ostriches and emus for luxury items and for slaughter has been a popular scam for a while, including weekend retreats to a model farm for would-be ranchers.

Whatever the nature of the opportunity, there are signs that indicate that it is not legitimate. Among the most common are:

- Classified ads urging the prospect to call a toll-free number
- Wild, unsubstantiated claims about potential earnings
- Promises about exclusive territories, assurances about good locations, or the assistance of a professional locator
- References specified by the company
- The lack of a complete disclosure document containing information about the promoter’s experience, lawsuit history, audited financial statements, and substantiation for earnings assertions

Employment Services

Employment service scams prey on the unemployed by promising good jobs, many of which are overseas, with the added enticement of tax-free wages. Victims pay between \$250 and \$1,000 for the service. Some get lists of government jobs, which are usually available for free, or listings from classified ads. Most get nothing.

Credit Services

The simplest credit scam promises that the company will secure a loan for the applicant, regardless of credit history and references, if the person pays an up-front fee, usually between \$35 and \$75. Checking account debits are a favorite payment method, as are 900 numbers, which charge by the minute to hear information widely available that provides no help in

getting a loan for the listener. Usually, there are few or no loans made. Occasionally, loan information and applications might be mailed out to the victim, but usually the operators are not heard from again after the fee has been paid.

Credit Repair Scams

Similar to loan scams are those that promise to repair credit. Fraudsters who pitch credit repair services like to say that they can “wipe away,” “doctor,” or “cosmeticize” negative items on credit, insinuating they have ways of changing or disguising a person’s credit history. Despite the fact that there is really no way to erase bad credit, many people fall for this scam, paying large sums of money to expunge their records.

Prime-Rate Credit Cards

In this scam, telemarketing companies assure customers they can get major cards for a small fee even if their credit report is poor. Victims receive an application for a credit card, which they could obtain on their own. Telemarketers also push secured cards, which require a cash deposit to the issuer’s bank to activate the card.

Gold Cards

A relatively new credit card sting on the internet touts “gold card” status for customers, regardless of credit history. The advertisement claims applicants will be processed for a major credit card. In actuality, applicants are merely assisted in filing an application for a major credit card, a worthless service since applications are quite simple to complete and submit. For a large up-front fee, participants receive a “catalog card,” which is only redeemable if the holder buys the company’s over-priced, low-quality merchandise listed in the catalog as discounted for cardholders. Even then, an actual purchase might require paying additional fees or cash deposits before the customer is allowed to charge the remainder. Since the issuers do not report payment activity to any of the credit reporting bureaus, using the card does not improve the customer’s credit rating.

Lotteries/Lottery Clubs

Consumers receive a false claim that they have won, or can get help to win, a lottery, often in a different country. Most lottery scams are perpetrated by con artists in other countries, sometimes using local addresses to disguise their real locations. Sometimes the lottery actually exists, but invitations to play don’t come from governments that operate legitimate lotteries or anyone connected to them. The consumer has no way of ensuring that they will receive the tickets that they pay for or, in the unlikely event that they do win, will ever be able to collect

their money. In many countries, it is illegal to play lotteries across borders. Differences in legal systems, difficulties of conducting investigations in other countries, and expenses and other complications involved in pursuing cross-border fraud make the chances of a consumer getting their money back very slim.

Buyer's Clubs

This scheme involves membership in discount buying clubs that consumers never agreed to join or were signed up for through free-trial offers. Consumers should beware of advertisements for products at incredibly cheap prices or for free if the consumer pays for shipping, as these offers might be designed to lure the consumer into a buyer's club membership. Another way to avoid being a victim of a buyer's club scheme is to understand how a "trial-offer" works. In many cases, the consumer will automatically be charged for a membership when the free trial expires unless they contact the club to cancel. The consumer should ask for the details of all membership offers in writing before agreeing to join. If unauthorized charges or debits are noticed on monthly statements, the consumer should contact their credit card issuer or bank and ask for their account to be credited for these unauthorized charges.

Travel/Vacation Schemes

These schemes involve offers of free or discount travel that never materializes. Consumers need to be skeptical of offers involving free trips. Airlines and other well-known companies sometimes operate contests for travel prizes; however, there are also companies that offer free trips to try to lure people into buying their products or services. Consumers also need to know what is included with the trip; a free or incredibly cheap trip might have hidden costs. For instance, the cruise might be free, but the consumer has to pay to fly to the departure point and stay in a hotel at their own expense. Or they might have to endure a long, high-pressure sales pitch for a timeshare or travel club membership as part of the trip. Often, the best travel deals are only available for off-peak times, not during holidays or other popular travel dates.

To avoid being victims of travel/vacation schemes, consumers should confirm all travel arrangements. If transportation and hotel are included in the travel package, ask how to contact those companies and confirm with them directly that the reservations have been made. Consumers should do their own travel research; it's easy to get information from a local travel agent or the internet. When making travel arrangements, it is advisable to pay with

a credit card. Fraudulent travel operators can take a consumer's money and run, and even legitimate companies can go out of business. Paying with a credit card allows the consumer to dispute the charges if the promises that are made are not kept.

Real Estate

Real estate scams are easily recognized. There is almost always an element of time pressure, with the victims being convinced they are participating in a “once-in-a-lifetime, now-or-never” deal. Perpetrators mislead victims into thinking they will miss the opportunity to make a fortune if they do not act fast.

Companies tout the riches available in real estate through seminars and books that claim to offer secret ways to cash in. The customer pays for the secret info and gets worthless tips in return.

TIMESHARES

Another scam sells timeshares in condominiums for travelers. Telemarketers pass themselves off as brokers to condominium owners and purport to specialize in selling timeshares.

OPTIONS

Some real estate ads try to coax investors into buying “options” on property. Supposedly, the option locks in a present-day price on behalf of the purchaser, who can exercise the option later if they wish to buy the land or to sell it at a profit. Sometimes the investor has bought nothing but a piece of paper—the “agent” has no authority to make deals on the property. Occasionally, the option is only valid for a few months, or is too vaguely worded to be enforceable. Usually, there is an actual plot of land, but in most instances, it is undevelopable due to location or zoning restrictions, and is therefore worthless.

DEVELOPED PROPERTY

Various developed property schemes have been identified around the globe. These scams often involve a large deposit toward a property in a paradisiacal location such as Belize or Costa Rica that might or—more likely—might not be refunded dependent upon contractual technicalities. Those who do buy property through these schemes often find that their property is not as advertised or is heavily restricted from further development. In one example, the General Development Corporation of Florida ran a legendary land fraud scam in which potential investors were shown lots and houses guaranteed to make them rich. In

this rendering of the “fly and buy” scheme, victims were shepherded and had their contracts restricted until they signed a deal. The scam continued for approximately six years and cost victims millions.

Art/Rare Items

Land deals prey on the public’s reverence for real estate. The con who deals in art objects preys on a similar impulse—the reverence for the rare. Paintings worth little more than their canvas and oil are tagged as “masterpieces” sure to grow in value. The victims who fall for these scams tend to be art novices who seem to unquestioningly believe the “dealer’s” appraisal of the piece.

Victims buy lithographic prints, mass-produced by the thousands, thinking they are purchasing limited editions. Any anxieties the victims might develop are calmed by a promised thirty-day, no-obligation trial and with “certificates of authenticity.” Among the most popular artists to counterfeit are Salvador Dalí, Pablo Picasso, Marc Chagall, and Joan Miró.

Cruise ships are among the most common venues for this type of scheme. Captive cruise participants are often subjected to art auctions that promise a seemingly classy event and free champagne. Auction prices are commonly driven artificially high due to false bids by the scheme’s co-conspirators.

Collectibles and Memorabilia

Collectibles and household decorative items such as vases, bric-a-brac, and figurines are also commonly hawked by telemarketers. Again, these supposedly valuable objects are nothing more than cheap, shoddy merchandise. War memorabilia is especially popular, particularly items related to the World War II. Documents and keepsakes from any bygone era are on the fraudulent telemarketer’s best-seller list. Stamps are sold as rare when they are in fact worthless.

Coins are another prime money-maker for telemarketers. “Certificates of authenticity” and “appraisals” are included with the merchandise to reassure customers, but these documents are usually produced by the sales company or doctored from a legitimate original.

Precious Stones

Gems are generally regarded as items that will not lose their value. Telescammers exploit this mindset by offering “high-quality” gems for wholesale prices. Customers are told they are being offered a special deal due to fluctuations in the market or because their names are on an industry list.

Victims are told that the risk is minimal. By acquiring the stones wholesale, the individual minimizes the investment exposure. The company even offers its own “brokerage” services, which can liquidate the stones at a moment’s notice should the investor need the cash back quickly. The stones not only have a grading certificate and appraisal documents, but they are also sealed in a plastic wrapper to guarantee that their condition remains flawless. The real purpose of the seal—which victims are told must not be broken if the gems are ever to be offered for sale—is to keep buyers from making a genuine inspection of the article.

Once a victim makes a buy, a company spokesperson calls a second time, saying that if the person buys more stones, their “gemstone portfolio” will be more attractive to prospective buyers and at auctions advertised in company literature. If the victim buys additional items, a company broker will inevitably call with “good news.” The brokerage will have found a buyer for the victim’s holdings, but before the transaction can go through, the customer must pay some “minor fees.” These might be passed off as finders’ fees, brokers’ commissions, examination fees, international duties, or taxes. There may be a provision requiring the victim to buy more stones before making the sale.

A variation on the scheme targets those who have already bought gems from telemarketers and whose names are taken from insider lists. The caller claims to be a broker representing an overseas buyer who is ready to purchase the listener’s portfolio. But, invariably, the buyer must have a few more stones in the portfolio—which the caller offers to supply—in order to make the sale, and there are fees and commissions to be paid.

Precious Metals

The precious metals market has traditionally been one of wide variances. Prices fluctuate constantly, and even experts have trouble deciding what the next trend will be. Telemarketing operations play on this instability with offerings of gold, silver, and platinum. Once again, victims are told prices will never be this good again and that if they hesitate, they will miss a singular opportunity to make a fortune.

Premium Rate Telephone Numbers

Beginning in the early 1990s, telephone numbers in the United States starting with 976 and 900 prefixes were widely employed for various uses, such as psychic hotlines, phone sex lines, and other dubious enterprises. While these services have fallen out of use in the United States after being replaced by online- and mobile-phone-related billing mechanisms, they are still used extensively in many countries. By using premium rate telephone numbers, customers can participate in interactive television programming or listen to prerecorded messages from their favorite celebrities. Some callers insist they did not know they were being charged for the service. By using a toll-free number that then links the caller to the per-minute charges, promoters are able to secretly begin charging customers for calls. Toll-free numbers are often used as a front in telemarketing operations to lead consumers to think that a call is free, when in fact they are masking hidden charges. A particularly vicious combination uses a toll-free number to make a presentation about communication services. Once the caller dials in, the interactive voice response service automatically puts a monthly charge, sometimes labeled “voice mail,” on the caller’s phone bill.

International Calls

Callers believe they are dialing an international number for free information, usually about travel contests, discount fares, or overseas jobs. But the phone numbers, in Guyana and the Caribbean, charge an exorbitant per-minute fee for a recorded message that runs for 15 minutes. The promoters get a kickback from the phone company; in one case, 37 cents per minute went to the scammers.

Another international rate scheme finds the victim receiving a call that rings only once. When the victim returns the missed call, they unwittingly dial an international number that results in extraordinarily high charges. As most calling plans now include long distance, the phone numbers appear to be toll-free but are typically located in island nations, such as the 473 area code in Grenada, which are typically dialed in the same manner as a domestic call. These scams were at one time confined to only a few easily avoidable area codes in the Caribbean, such as 809 in the Dominican Republic. However, they have enjoyed more success recently due to the rapid proliferation of new area codes in the region, which has made the immediate recognition of international phone numbers more difficult.

Selling Free Information

Companies involved in this kind of scheme take out ads in newspapers and magazines, or buy spots on talk radio, promising they can locate government jobs, get deals on liquidated

equipment, or find student loans. All this information is available cheaply or free to the public, through government offices, on the internet, and from other sources. One need only know where to look.

Scholarship Services

Maybe the most widely broadcast offering in the information racket is the college scholarship locator service. Whatever information these scam scholarship services do provide is available for little or no cost from legitimate institutions. The perpetrators imply that they have insider connections, or that they actually administer the dispersal of monies, when in reality they merely provide lists of scholarships offered by foundations and universities.

Student Aid Inc. (SAI), a New York City firm, provides an example. SAI guaranteed students and their parents that they would receive valuable scholarships or grants for a small fee. “In reality,” government prosecutors showed, “the defendants almost never obtained scholarship money for consumers.” SAI used a common clause in its contracts to keep from paying refunds “requiring students [to] produce letters of rejection from every scholarship on their search list even though the list included scholarships whose deadlines had passed or for which the students did not qualify.”

In most cases, information scams sell freely available material. There is also a version that does offer the information for free but adds a charge anyway. The International Call scam promises free information on travel contests and discount fares. The information itself does not cost anything, but the call to get it is billed at a high per-minute rate for a 15-minute call.

Charity Fronts

An increasing number of groups calling themselves nonprofit, charitable concerns are not what they appear. Very little or no money goes to the advertised cause. Police and firemen’s associations have in some cases lent their names to telemarketing fund drives that only give about 35% of their collections to the group. Some boiler room operators claim to call for these groups—or for drives against a disease or underprivileged children—when they are in no way affiliated with the charity.

A twist to this scam is the impersonation of disabled workers by boiler room operators. Fraudsters call victims, claiming to be disabled, and attempt to sell light bulbs and other household products. The merchandise is priced at three times its actual value. The money is, of course, pocketed by the operators.

Door-to-Door Promotions

A favored device of phony charities is to send school-age children door to door, saying they are raising money for antidrug programs or for a group that takes underprivileged kids on trips. Some of the children repeat what they are told in exchange for a few dollars. Others believe they will receive rewards and free trips when in fact they, too, are being scammed.

Giveaway Schemes

The most common giveaway scheme is known as the *1-in-5*. In this scheme, a consumer receives a letter or postcard in the mail informing that individual that they have already won a prize. The prizes usually include luxurious vacations, new cars, or cash. Unfortunately, the odds of winning any of the prizes are extremely low. Victims might receive items of minimal or no value or coupons redeemable only for the company's substandard merchandise.

Winners who call back are often asked to stipulate how they intend to spend their winnings for the company's records, or for publicity materials. Then they will be asked to pay a processing fee or to prepay the taxes on their winnings.

Magazine Subscriptions

A productive front for prize hawkers is the magazine subscription service. Prepaid subscription offers extract money from customers through credit cards and bank debits, and then never deliver the publication. In other instances, the processing fees far exceed the actual value of the subscriptions.

Office and Household Supplies

A prevalent office supply scam involves copy machine toner. An invoice for toner is sent to a company. The cons have usually called beforehand, gotten the name of the employee in charge of supplies, and addressed the invoice to that person. Although the office never ordered or received any toner, the con men are relying on poor communication to cover their ruse. The invoice will most likely be sent to the accounting department and paid. If the proper controls are in place at every level of business operations, this scheme should be detected. Too many businesses, however, are vulnerable to this kind of scam.

The caller might get the company's representative to accept a trial or promotional shipping of the product. They might claim to be a supplier for the company or a new salesperson from a regular supplier. The product arrives and an invoice follows a couple of weeks later. If the

company tries to send the product back, it is returned. To avoid further complications, the company will normally pay the bill just to put an end to the situation.

Any sort of office supply, from paper, to shelving, to cleaning products, can be part of a scam. Medical supplies shipped to doctors' offices and clinics are pushed in a similar fashion. Individual households can be the target of these ploys, as well. Water purifiers are often used in tandem with giveaway offers; the victim buys a filtering device, at an inflated cost, in order to qualify for the giveaway. Pyramid-style operations often use household products and health-related merchandise, such as vitamins or skin cream, as part of their machinations.

Phishing

Phishing is a popular scheme that involves tricking businesses or individuals into providing passwords, account numbers, or other sensitive data by claiming to be from an actual company the victim does business with. A solicitation for information appears to come from a legitimate business and can occur over the phone (such as a call from the victim's "bank" saying that their account has been compromised and requesting personal identification numbers [PINs], account numbers, or passwords) or via email (which is the most common technique). An individual receives an email that appears to come from eBay, PayPal, or a financial institution. The email states that the customer must immediately log into their account to update their information. The link directs the individual to a fake site that captures their identifying information, such as government identification number and PIN, mother's maiden name, and financial account numbers.

It is crucial for people to recognize the hallmarks and warning signs of phishing so that they don't fall victim to it:

- Phishing occurs mostly by email. The sender of the email pretends to be a legitimate bank, government agency, or retailer and asks the recipient to confirm their personal information for any of these or other made-up reasons: the person's account will be closed if they don't give the information, an order has been placed in their name, or their information has been lost because of a computer glitch. Do not ever respond to these emails. Legitimate banks, government agencies, and retailers would not email you for your password or other identifying information.
- Do not click on any link in an email that asks for your personal information. The links included in the emails sent by phishers will take you to a phony website that looks just like the website of the real company or agency. If you followed the instructions, you would enter your personal information, which would go straight into the hands of identity thieves.

- Phishers might say that they are from the fraud departments of popular companies and ask you to verify your information because they suspect you might be a victim of identity theft. Other tactics include the phisher claiming to be from a lottery or sweepstakes commission that requests people's banking information to deposit their "winnings" in their accounts. Again, never disclose any personal information via email.
- Phishing can also happen by phone. Verify the caller's identity and contact their company for legitimacy. Instead of fraudsters sending spam, they might call you and pretend to be from a company or government agency, making the same kinds of false claims and asking for your personal information. If someone contacts you and says that you have been a victim of fraud, verify the person's identity before you provide any personal information. Legitimate credit card issuers and other companies might contact you if there is an unusual pattern indicating that someone else might be using one of your accounts. However, they only ask if you made particular transactions; they don't request your account number or other personal information. Law enforcement agencies might also contact you if you've been the victim of fraud. To be cautious, ask for the person's name, the name of the agency or company, the telephone number, and the address. Then get the main number and call to find out if the person is legitimate.
- Phishers also target people who list themselves on job search sites. They pretend to be potential employers and ask for your government identification number and other personal information. Before giving anyone your personal information, make sure to verify the person's identity.
- Be suspicious if contacted unexpectedly and asked for your personal information. It is difficult to determine a company's legitimacy by reading an email, going to a website, or talking to someone on the phone. If you are contacted unexpectedly and asked to give out your personal information, a red flag should go up that something is "phishy." Legitimate companies and agencies do not operate this way.
- Act immediately if you've been ensnared by a phisher. If you provided account numbers, PINs, or passwords to a phisher, notify the companies with whom you have the accounts right away.

SMiShing

SMiShing is a hybrid of phishing and short message service (SMS), commonly known as text messaging. It uses the same approach as phishing but delivers an alarming message via SMS (the protocol used to transmit text messages via mobile devices) instead of email. Criminal activity such as *SMiShing* can be seen as the prelude to online frauds targeting mobile device

users. As these devices continue to evolve, cybercriminals will take advantage of functionalities to obtain information, as well as delivering mobile malware to mobile devices.

Vishing

Vishing, also known as *voice phishing*, is a form of phishing attack where emails, for one reason or another, direct recipients to dial a 1-800 number, where an automated recording requests that callers enter personal information using a phone's keypad.

Pharming

Pharming is a cyberattack in which a user is fooled into entering sensitive data (such as a password or credit card number) into a malicious website that impersonates a legitimate website. It is different from phishing in that the attacker does not have to rely on having the user click on a link in the email to direct them to the fake website. Pharming actually exploits a vulnerability in the domain name system (DNS) server software that allows a hacker to acquire the domain name for a site and redirect the website traffic from a legitimate site to a false one. So even though the user types in the correct website address, the pharming program sends the user to an illegitimate site that appears authentic. Unknowingly, the user is then providing passwords and information directly to the hacker.

Recovery Rooms

Recovery room operations target those who have already lost money to a telemarketing scam. Posing as a consumer advocacy group or a law firm, telemarketers offer victims a chance to recover any funds they might have lost and bring the perpetrators to justice. Once the victim agrees, legal, investigative, and other fees will begin to emerge.

Inventions Schemes

Invention promotion companies offer to assist inventors in developing, marketing, or patenting their inventions. Many of these companies offer worthless services for exorbitant fees. Consumers should thoroughly research any invention promotion company they intend to conduct business with.

Ponzi and Pyramid Schemes

What Is a Ponzi Scheme?

A *Ponzi scheme* is generally defined as an illegal business practice in which new investors' money is used to make payments to earlier investors. The investment opportunity is typically presented with the promise of uncommonly high returns. Everyone involved in promoting the scheme pretends to represent a legitimate organization, but little or no commercial activity takes place. The Ponzi scheme usually unravels either when the operators keep all of the proceeds for themselves or when the number of new investors declines and dividends cannot be paid to investors. These schemes usually run for a short period of time (e.g., one or two years), although some Ponzi schemes have flourished for a decade or more.

In accounting terms, money paid to Ponzi investors is described as *income*, but it is actually *distribution of capital*. Instead of receiving investment profits, investors receive cash reserves.

Case Study: Bernie Madoff

One of the most famous examples of a Ponzi scheme occurred in the United States. On December 11, 2008, U.S. Federal Bureau of Investigation (FBI) agents arrested Bernard “Bernie” Madoff, a then seventy-year-old businessman and former chairman of the NASDAQ stock market, and charged him on a single count of securities fraud. According to the charging document, the arrest came after Madoff told two senior employees—later identified as his sons—that his investment advisory business was “basically, a giant Ponzi scheme,” estimating that investors lost approximately \$50 billion in his fraud. Federal prosecutors, however, put the amount at \$64.8 billion.

Background

Before his arrest, Madoff enjoyed a sterling reputation, recognized as a financial mastermind. In 1960, Madoff founded his investment company, Bernard L. Madoff Investment Securities LLC. The business eventually became one of the five broker/dealers that helped create the NASDAQ stock exchange, which Madoff later chaired, and established itself as one of the top market-maker businesses on Wall Street (the sixth largest in 2008).

Madoff was also a widely respected philanthropist, devoting his time and wealth to numerous charitable causes. He not only established his own multi-million-dollar private foundation

that donated money to educational, cultural, and health charities but also served on the boards of several nonprofit institutions.

Madoff's Investment Scheme

Even though it is not clear when Madoff's investment fraud began (federal investigators believe the fraud might have begun in the 1970s, while Madoff himself stated that it began in the 1990s), it is clear that Madoff's unusually consistent returns, showing annualized returns from 8 to 12%, were not the result of his investment strategy.

Before his confession, Madoff claimed that he generated the steady returns by employing a "split-strike conversion" investment strategy, which is a fairly common approach that involves a combination of stocks and options. Under this strategy, an investor attempts to generate predictable returns and reduce volatility by holding a portfolio of stocks closely correlated to an index while concurrently selling options on a stock index and buying put options on the same index.

In reality, however, Madoff did not invest any of his clients' money. According to Irving Picard, the trustee overseeing the liquidation of Madoff's assets, there was "no evidence to indicate securities were purchased for customer accounts." Instead, Madoff simply deposited his clients' money into his business account, which he then used to pay clients who requested withdrawals. In other words, Madoff was running a Ponzi scheme.

Unfortunately for Madoff, his scheme began to unravel in December 2008, when the financial crisis caused an increasing demand of cash withdrawals from his clients. The increase in redemptions caused his scheme to collapse when there were not enough funds from new investments to pay them off.

How Madoff Made It Happen

Unlike most Ponzi schemes, which collapse in a few years as withdrawals exceed deposits, Madoff's con lasted longer, spread farther, and caused more losses than any similar scheme in history. Understandably, the Madoff case raises the question, "How did Madoff fool so many people for so long?" Of course, there is no single answer to explain the success of Madoff's scheme, but there are several factors that contributed to its unusual prosperity, including his ability to attract new investors, maintain stability, and avoid detection.

Attracted New Investors

Madoff's ability to attract new investors is one reason for his scheme's success. For years, Madoff's scheme did not collapse because he successfully raised enough money from new

investors to keep paying returns. Several factors contributed to Madoff's ability to entice new investors. Most significantly, reports of solid, long-term, and low-risk returns, regardless of the market environment, lured new investors through a false sense of security. Unlike most Ponzi schemes, Madoff did not promise extraordinary returns. Instead, he promised stability and long-term profits. In other words, Madoff attracted new investors by avoiding the appearance of risk.

Similarly, his reputation and professional stature provided comfort to his investors. As a major figure in NASDAQ, a pioneering market maker, and a government advisor on market issues, Madoff's résumé was exceptional. Madoff also enjoyed a longstanding reputation as a modest and humble individual—a man who put his family first and donated much of his time and money to several charitable causes.

Moreover, Madoff lured new investors by promoting secrecy and exploiting the complexities inherent to the industry. Madoff emphasized secrecy by keeping his investors and investment strategies from the general public, which created a sense of exclusivity and an enigmatic enticement in his investment accounts. Additionally, Madoff understood that the complex and cryptic nature of the securities industry caused investors to feel that it is a discipline for people who are much smarter, and he exploited this by marketing his split-strike conversion investment method as “too complicated for outsiders to understand.” These characteristics allowed Madoff to shift investors' fears from the risk of losing money to the risk that they might miss out on making money, creating an environment ripe for fraudulent practices.

Maintained Stability

In addition to attracting new investors, some experts suggest that Madoff successfully avoided large, unexpected withdrawals that would lead to the collapse of his scheme by targeting wealthy individuals and charities. Since the wealthy feel any economic downturn last and least, such investors provided Madoff with the money he needed to keep his scheme going.

Avoided Detection

Despite multiple U.S. Securities and Exchange Commission (SEC) investigations and allegations of fraud beginning as early as 1999, Madoff's investment scheme continued without detection. There are several reasons for this. In particular, he constructed his investment business to avoid most regulatory oversight and other checks and balances. Unlike typical hedge funds that use a network of third-party service providers to perform certain functions, Madoff's firm performed these operations internally and with no third-party oversight. A hedge fund's network of third-party service providers typically includes an investment manager to manage the assets, a broker (or brokers) to manage the trades, a

fund administrator, and a custodian/prime broker. These third parties provide essential checks and balances necessary to protect individuals and institutions. Madoff's firm, on the other hand, performed these functions internally. Madoff not only traded his managed accounts in-house by operating as a broker/dealer, he also maintained custody of his clients' assets, indicating that there was no independent custodian to verify the existence of assets.

In addition to operating his business on the outskirts of regulation, Madoff avoided detection by discouraging the use of prudent investor tools like due diligence, audit statements, and understanding of investment strategy. Notably, evidence shows that Madoff kicked some investors out of his funds for asking too many questions. Likewise, Madoff reportedly shunned questions from investment media about his strategy, and, as noted previously, Madoff conducted his investment business with great secrecy and even refused to provide clients with online access to their accounts.

Conclusion

In 2009, Madoff pleaded guilty to eleven felonies, including one count of securities fraud, one count of wire fraud, one count of mail fraud, and three counts of money laundering. He was sentenced to 150 years in prison. He has also been ordered to forfeit \$170 billion dollars (the amount prosecutors say flowed through his business). Given the size, scope, and complexities involved in the fraud, the full extent of the damage caused by his scheme might never be known.

Red Flags of Ponzi Schemes

By their very nature, Ponzi schemes are prone to leaving a host of fraud indicators. The following are red flags of Ponzi schemes:

- *Sounds too good to be true:* If an investment sounds too good to be true, it probably is.
- *Promises of low risk or high rewards:* Promoters of Ponzi schemes typically promise implausibly high or quick returns with little risk. As all legitimate investments include some degree of risk, any guarantee that an investment will perform in a certain way is a clear signal that it might be part of a Ponzi scheme.
- *History of consistent returns:* Any firm that generates remarkably consistent returns regardless of market conditions should raise suspicions.
- *High-pressure sales tactics:* Reputable investment firms and agents do not push potential investors to act immediately, and legitimate investment opportunities are rarely that time sensitive.
- *Pressure to reinvest:* Often, fraudsters keep Ponzi schemes alive by convincing investors to reinvest their profits rather than take a payout.

- *Complex trading strategies*: Legitimate agents should be able to provide clear explanations about their investment strategies. For obvious reasons, Ponzi-scheme boosters purposefully employ complicated strategies that confound unsophisticated investors.
- *Lack of transparency or access*: Secrecy surrounding the operations of a financial company should be an immediate warning sign. Ponzi operators are often unlicensed, and their supposed investments are typically unregistered. Additionally, a lack of access to regular statements or an online account should trigger alarm.
- *Lack of a separation of duties*: Investors should be wary of any financial manager who manages, administers, and retains custody of the fund in question.

Some other red flags to watch out for include investments that are not properly registered, agents with criminal records, unexplained gaps in a promoter's work history, prior customer complaints, regulatory problems, questionable credentials, lack of background information on the company website, and generic contact information such as a Yahoo! email address.

What Is an Illegal Pyramid?

In an illegal pyramid scheme, an operation generates revenue by continually recruiting new members. Although the operation might offer merchandise or services for sale, the only significant revenues come from recruitment.

Not all organizations with a pyramid structure are engaging in illegal activity. Some legitimate merchandising companies use a pyramid structure to rank their employee-owners and to determine those people's compensation. A pyramid structure becomes an illegal pyramid scheme when the recruitment of new members takes precedence over the product or service that the company is ostensibly promoting. The more members that are recruited, the higher the investor is purported to rise in the ranks of the enterprise, and the more money the investor is supposed to make.

Pyramid schemes are designed to pay off their earliest investors but not later investors. Probability studies have shown that 93–95% of the participants in a pyramid scheme (all but those who join at the earliest stage) will lose most of their money. Half can expect to lose all the money they invest.

To determine the legality of a pyramid, courts often apply the *70% Rule*. This rule requires that at least 70% of a distributor's profits come from retail sales. Of course, this figure can be

difficult to verify. Distributors routinely sign falsified compliance statements out of fear that authorities will shut down the whole business, causing everyone to lose.

The legality question also depends on what the operators emphasize. An operation is likely to be classified as an illegal pyramid scheme if the company emphasizes the recruitment of new members over product sales and promises that riches can only be obtained through recruitment.

Categories of Pyramid Schemes

Pyramid schemes are classified according to the front business used in their promotion. The categories of pyramid schemes include *pure cash* schemes (e.g., endless chain schemes and fill-and-split games) and *product fronts* (e.g., financial instruments, multilevel marketing [MLM], and speculations).

Pure Cash Schemes

There are two general types of pure cash schemes: endless chains and fill-and-split games.

ENDLESS CHAINS

The most outrageous pyramid scams don't bother to conceal their true objective. They don't use services or products to establish their legitimacy. Instead, they use the *chain letter* approach. The recipient of the letter sends a sum of money (the amount varies but isn't usually very large) to the person who mailed them the letter and then passes the letter on to three or four others.

Some internet chains have become known as "administered" pyramid schemes—every exchange in the chain is monitored by a central administrator, who makes sure everybody's playing (and paying) along. The administrator takes a cut of each transaction.

FILL-AND-SPLIT GAMES

The best way to launch a pure cash pyramid is to augment it with gaming elements—include some kind of hook to keep players' attention and distract them from the absurdity of the scheme. These are sometimes called *fill-and-split games*. A popular version of this approach is known as "Airplane." Each player buys a seat on a fictitious airplane, paying from \$200 to \$2,000 a seat, depending on the scale of the game. Initial players help recruit new "passengers" and move up through the ranks of "crew," "copilot," and "pilot." When a flight is fully booked—with about six passengers, four crew members, a copilot, and a pilot—the

plane takes off, the pilots and crew are paid for the flight, and everybody moves up the ranks. Just like a real airline, a plane's investors are constantly looking to fill their seats.

Another variation of the fill-and-split game tries to capitalize on the phenomenal profits yielded over the last several decades in stock markets. Called "Financial Networking," "Market Climb," or another financial-sounding name, these pure-cash pyramids use a business metaphor in their pitch. A typical operation spreads 15 people over four levels. Eight investors buy into the network as "vice-presidents." Above them are four "presidents," just below two "cochairman" positions. At the top, is the "chairman." Every time the eight slots at the bottom are filled (average price \$1,500 to \$2,000), the pyramid splits. The chairman gets out of the game with a "golden parachute" and everyone moves up the corporate ladder, anxiously scanning for new recruits.

These games are usually predicated on what has become known as affinity fraud. New players are recruited by their affinity with existing participants. People comb religious groups or community associations for fresh leads. Affinities may be racial or cultural. Churches, synagogues, and other religious organizations offer fertile hunting grounds and great cover from promoters—an endorsement from a clergyperson is as good as gold, and law enforcement authorities are often reluctant to meddle in religious affairs. Affinity frauds might also prey on social groups or professional organizations.

Product Fronts

The category of product fronts is subdivided into financial instruments, MLMs, and speculations.

FINANCIAL INSTRUMENTS

Financial instruments—such as stocks, borrower's certificates, currency exchanges, loan scams, and investment pools—are perfect tools for the Ponzi artist. Charles Ponzi's victims in 1920 thought they were investing in postal reply coupons that, Ponzi assured everyone, yielded whopping profits by playing off the exchange rates of international currency. In our own time, as currencies around the world fluctuate from one extreme to the next, the currency exchange still makes an ideal Ponzi front.

A stock market that gains 25–30% a year (and individual stocks quadrupling, sometimes in a matter of months) encourages the impression that all anyone has to do is invest their money and wait. Unscrupulous promoters like to tout new items like internet stocks and

biotechnology startups, but any product will do. Even in this highly technological age, commodities futures are still numbered among the most common bait for Ponzi schemes.

Financial instruments are especially effective fronts because most people don't understand how legitimate financial operations take place. When investment analysts are enthused by derivatives of futures contracts, and hedge funds are betting that the market will rise at the same time they are betting it will fall, how are average investors supposed to understand their options?

MULTILEVEL MARKETING

When most people hear about a pyramid scheme, they think MLM. These organizations hawk nutrition supplements, household goods, cosmetics, television antennas, insurance, long-distance phone service, and everything from antiques to zinc. Also among the offerings might be copies of *How to Make a Million Dollars in an MLM*. One of the industry's primary money-makers is a string of "training materials" designed to prime the sales force for ever higher feats of ruthless merchandising.

Math remains the great enemy, as well as the primary tool, of MLMs. Promoters draw *matrices* (never pyramids) on a chalkboard and compute what twenty people mailing money to a distributor's house every month would amount to in a year's time. These schemers ignore other aspects of the equation. First, the market for any product outside those owned by large national brands is extremely small. Cashing in on a submarket requires an excess of savvy, finance, and luck, which most MLM-ers lack. Then there is pyramidal mathematics—after a couple of levels, you run out of people willing to hear your speech (which was already less than 5% of any area's population). In fact, between 90 and 95% of MLM operations fail in their first two years (compared to an estimated 50% failure rate for small businesses in general).

As a general rule, any organization that recruits distributors into a pyramid-style compensation plan, offers big payoffs for recruiting, and spends more time extolling its distributor levels than its product lines is probably illegal.

SPECULATIONS

The term *speculation* describes any investment proposition not covered as financial instruments or MLMs. This includes franchise offerings and business opportunities in general, work-at-home promotions, and investments in areas like real estate or mineral rights. These are traditional investments, except when they're Ponzi schemes.

Franchise scams use such opportunities as internet terminals or vending machines. By their nature, such businesses are spread out geographically and don't involve much direct contact with the promoter and the franchise holder.

Work-at-home promotions are also favorite tools of the franchise scammer. Computer technology is a popular front, since countless people really are setting up businesses from their homes. A few early dividend checks, per the Ponzi playbook, are often enough to overcome a client's hesitation and provoke a more sizeable investment. Then the promoters can take their profits and move to another location.

Big-money speculations often base their high-flown claims in the ground beneath our feet. Land and the minerals drawn from it, like gold, coal, and oil, has long been regarded as the ultimate commodity. The ground is the fundament of every human endeavor, so perhaps the land swindle is also the fundament of fraud. Someone, somewhere, it seems, has always been selling flooded lots to homesteaders, salting gold mines with chunks of pyrite, or assuring a rich merchant the new aqueduct will cut across the thousand acres of desert they just bought for a song.

Obviously, a commercial environment that thrives on speculation is highly susceptible to Ponzi fraud. Remember, the Ponzi element in a Ponzi scheme is only a technique—giving back a few dollars to sweeten the pot. Anything that can coax people to part with their money, from emu farms to underwater land developments, can be run as a Ponzi. All the name *Ponzi* really means is that a few marks get paid. This lends a competitive element to an otherwise mundane fraud. Instead of everyone losing, some lucky players do make money.

Speculation frauds don't always start out as cons, but when their schemes are revealed, many speculators find it too unrealistic to stay around—they figure they can phony their way through the crisis and pick up again later. Again, it's math that usually dooms these players. They simply can't make money fast enough to feed the deficits. They need a payoff so big that nothing short of a miracle—or more fraud—will suffice.

Speculators can quickly get caught in a chain reaction, where each fraud demands more fraud. By the time these organizations are shut down, they're spending half of their resources or more just covering up their criminal acts.

Spotting Pyramid Schemes

Most people have been exposed to pyramid schemes through television, magazines, and newspapers and therefore have some knowledge of how they work. So, if everyone is so well informed about the pyramid, how does it survive?

It could be that familiarity has lulled the public into a false sense of security. Pyramiders have several strong weapons at their disposal:

- They do pay off. Unlike a simple con game in which the fraudster throws the ruse, grabs the cash, and exits, pyramiding builds up the take by paying initial investors. This makes for excellent testimonials. Early players circulate the word and bring in new targets. Initial payoffs also keep early players coming back. Payoffs make the enterprise look legitimate and fuel the expansion process.
- They operate mainly through preexisting affiliations. Community groups, religious organizations, and social clubs all make enticing targets for pyramiders. Any pyramid requires a healthy pool of participants, so a large group already gathered together is ideal. Besides that, pyramiders know how to manipulate the trust that people place in these groups.
- They use ingenuity and false logic in their pitches. The product fronts available for pyramiding are myriad, from bath soap to electronics. Fronts in financial instruments and real estate are especially effective because most people don't understand how those businesses work anyway. Pure cash games find clever metaphors—like a conceptual airplane or business executives' hierarchy—to make themselves attractive.

Pyramiders of every stripe use a seductive, though false, logic in their pitch: "Everybody has friends and associates; you only have to sign up three or four people below you." Of course, the laws of mathematics spell doom to this logic. There simply aren't enough players to keep even a small pyramid running. Three people, each finding three people, will quickly play out their available friends and associates—if not mathematically, then socially. There's also a reasonable limit on how quickly money can grow.

The pyramid investment structure is built to overcome people's most common misgivings about investment. Promoters are very specific in their prospectus. The offer sounds good and (within its own logic) makes sense. The opportunity is usually pitched by someone familiar to the victim or at least by someone with an affinity the victim trusts. Most important, the pyramid does return people's money, with the incredible profits attached as promised.

Speed is another potent weapon in the pyramid arsenal. Cons say, “Get in now, or regret it forever.” They don’t have time—because of market demand or commitments elsewhere—for the person to check out the deal. That’s because a moderate amount of due diligence research will expose the deal as a scheme.

Illegal Pyramids Versus Ponzi Schemes

In both illegal pyramid schemes and Ponzi schemes, new investors’ money is used to make payoffs. The key element in a Ponzi scheme is that initial investors are paid with subsequent investors’ money, with little or no legitimate commerce actually occurring. This same basic principle applies to an illegal pyramid as well; the original members of the pyramid get rich on subsequent investors’ money. Therefore, *a pyramid is a Ponzi scheme*. But is a Ponzi scheme a pyramid?

The distinguishing factor of the illegal pyramid is the continual need for new investors. Each new member recruits two members, who each recruit two, and so forth. Similarly, Ponzi schemes also require a steady influx of new investor funds to pay dividends. This ever-growing increase in funds might look like a pyramid when graphed. So, in the sense that it requires exponential growth to avoid collapse, *a Ponzi scheme is a pyramid scheme*.

The difference between a Ponzi scheme and an illegal pyramid lies in how the operation is promoted. Illegal pyramids are promoted as pyramids, whereas Ponzi schemes are promoted as investment opportunities. In an illegal pyramid, the pyramidal structure helps draw new players, each believing that they will rise through the ranks of the pyramid. A Ponzi scheme, on the other hand, masquerades as some type of investment. Thus, when an enterprise promotes an investment opportunity that invests little or none of the participants’ money and uses new investments to make dividend payments, the enterprise is running a Ponzi scheme.

In summary:

If operators make the bulk of participants’ earnings dependent on recruiting and emphasize levels and stages in their promotions, we call this an illegal pyramid.

If operators claim they’re offering an investment opportunity, but conduct little or no commercial activity, we call this a Ponzi scheme.

CYBERFRAUD

Computer systems continue to improve rapidly. They are more powerful, smaller, cheaper, and more user-friendly every year. As they have advanced, computers have proliferated in our society, our businesses, and our personal lives. Modern businesses and governments depend on computer systems to support their operations, from personnel to financial management and everything in between.

Computers have become integral to business and government processes, and without them, most of today's businesses and government operations would cease to function. Imagine trying to manually process tax returns, maintain accounting records, conduct audits, compile budgets, build automobiles, build weapons systems, or check law enforcement files without the aid of computers.

The proliferation of cheap, powerful, user-friendly computers has enabled more and more people to use them and, more importantly, rely on them as part of their normal way of life. As businesses, government agencies, and individuals depend on computers as necessary tools, so, too, do criminals. Computer crimes and cyberfrauds are increasing and will no doubt continue to increase as more computers are networked internationally, thus giving global access to computer criminals.

Unlike traditional fraud cases, cyberfraud cases can be difficult for the fraud examiner because they:

- Lack a traditional paper audit trail.
- Require an understanding of the technology either used to commit the crime or affected by it.
- Typically require the use of one or more specialists to assist the fraud examiner, even when the fraud examiner is computer savvy.

In the commission of cyberfraud, computers can be the target of the scheme, the tool used to execute the scheme, or—as is often the case—both.

What Is Cyberfraud?

While there are a number of possible definitions for cyberfraud, it can be summed up in the following broad definition:

Computer-aided activity involving a deliberate misrepresentation of fact or alteration of data to obtain or receive something of value that causes a financial loss to some person or organization.

The distinguishing characteristic of cyberfraud is that the perpetrator accesses or uses a computer with the intent to execute a fraudulent scheme. However, the definition above provides a broad scope for actions that constitute cyberfraud and serves to encompass new schemes resulting from developments in technology. This is important because in some situations, employees have used company computers or other devices to further criminal acts that do not fall within the standard legal definition of fraud. For example, employees could use their company's computers to run an illegal gambling operation or to compose and send (via email) death threats. Although such incidents might not cause direct financial harm to the company, they could raise potential liability questions and should be addressed by the company's computer-use policy and security program.

Recognizing Computer Intrusion

Most of the schemes and concepts discussed in this chapter involve unauthorized access to a computer or computer system. Recognizing that a computer or network has been accessed by an unauthorized user or entity is one of the most important elements of cybersecurity. Many cyberattacks become more devastating to the victim the longer they remain undetected, in terms of damage caused, financial losses suffered, data breached, recovery efforts required, or liabilities created.

Indicators of Intrusion

Signs that attackers accessed or are currently attempting to access a system might be referred to as *indicators of compromise (IOCs)* or *indicators of attack (IOAs)* depending on the context. Regardless of the technical labels a cybersecurity professional might use to describe an indication of intrusion, it is important for fraud examiners and other computer system users to recognize signs that intruders have accessed or affected the system, which can include the following:

- Unusual inbound or outbound network traffic
- Anomalies in user access to network files
- Unusual network or computer performance

Unusual Inbound or Outbound Network Traffic

Every day, organizations' networks experience inbound and outbound traffic as part of the normal course of business. Among the typical types of traffic are emails sent to and from employees, as well as data transmitted to or from the internet. Abnormal traffic, either higher or lower than usual, could be an indication that an attacker has gained access to an organization's network and is manipulating traffic by sending malicious software to the network or exfiltrating data from it, among other things. Common signs of unusual network traffic might include:

- Geographical irregularities related to network access and traffic
- Mismatched port-application traffic
- Unusual domain name system (DNS) requests
- Web traffic with unhuman behavior
- Contacts receiving strange messages from email accounts
- Redirected web searches

Anomalies in User Access to Network Files

On an organization's network, users primarily consist of employees but could also include additional internal or external users, such as vendors or contractors. Most organizations employ a system that restricts access to sensitive files or information on their network to only those who require that access as part of their organizational role, and user patterns typically reflect access that aligns with the normal course of business. Any abnormalities or outliers to the usual access patterns could indicate that the network has been compromised by an insider or external actor and might include:

- Increases in database read volume
- Bundles of data being in the incorrect place
- Higher volumes of unsuccessful or suspicious system log-in attempts
- Large number of requests for the same file
- Suspicious registry or system file changes
- Passwords not working

Unusual Network or Computer Performance

Many different types of computer and network intrusion or compromise can result in performance issues for the computers or networks that are presumed to be affected, whether the issues relate to malware infection, external unauthorized access, or insider actions. Some unusual performance issues that could indicate that a computer or network is compromised might include:

- Slowed access to files
- Unexpected patching of systems
- Changes to mobile device profiles
- Abnormal HTML response sizes being received
- Disconnection to the internet
- Fake antivirus messages appearing
- Unusual hard drive activity that results in loud noises (e.g., a cooling fan whirring continuously)
- Unwanted browser toolbars and pop-up ads appearing
- Unwanted or unknown software being installed

Many organizations use an intrusion detection system (IDS) and/or an intrusion prevention system (IPS) in their cybersecurity controls or systems, which are discussed later in this chapter.

Insider Threats

While much of this chapter explores ways that attackers gain unauthorized access to computer systems, it is important to note that threats to an organization's information systems can also come from inside a company. Although many cyberattacks are committed by outside parties, company insiders sometimes exploit the powers or information access granted to them by their positions. Individuals such as operators, media librarians, and hardware technicians often have privileges that provide them with access to many of their organization's key functions and assets.

At many organizations, management also has a tendency to tolerate less stringent supervisory controls over information system personnel. This tendency is based on the premise that such work is not only highly technical and specialized, but also difficult to understand and control. For example, systems software support is often entrusted to a single programmer who generates the version of the operating system in use, establishes password or other control lists, and determines the logging and accounting features to be used. In addition, companies often permit, and sometimes encourage, such personnel to perform these duties during non-prime shift periods, when demands on computer time are light. As a result, many of the most critical software development and maintenance functions are performed in an unsupervised environment. Thus, information system personnel often enjoy a degree of freedom quite different from that which would be considered normal in a more traditional employment area.

Insiders are typically aware of the weaknesses in their company's internal control systems and sometimes purposely exploit them just to see if they can do so successfully. The most prevalent method of insiders committing cyberfraud is probably alteration or falsification of input transactions (and/or documents), including:

- Alteration of input
- Alteration of output
- Data file manipulation
- Communications systems
- Operating systems
- Computer operations

The characteristics of the traditional insider cyberfraudster are very similar to those of the hacker or other computer criminal: intelligent, hardworking, seldom takes time off, bored with the routine of the job, and has a very large ego. Many computer technicians have demonstrated a greater loyalty to the technology than to the organization for which they work. This technology loyalty can create an attitude that any behavior is acceptable if it is in the name of technology.

The following are indicators of insider cyberfraud:

- Access privileges are beyond those required to perform assigned job functions.
- Exception reports are not reviewed and resolved.
- Access logs are not reviewed.
- Production programs are run at unusual hours.
- Lack of separation of duties exists in the data center.

Computer Hacking

Hacking refers to the use of technology to gain unauthorized access to sensitive information on a computer system.

The desire to gain unauthorized access to computer systems can be prompted by several motives, from simple curiosity to computer sabotage or espionage. Intentional and unjustified access by a person not authorized by the owners or operators of a system might often constitute criminal behavior. Unauthorized access creates the opportunity to cause additional unintended damage to data, system crashes, or impediments to legitimate system users. Often, however, hacking is motivated by profit.

There are several types of hackers. *Black-hat hackers* are malicious hackers who infiltrate computer systems for criminal purposes. Conversely, *white-hat hackers*, *red-team hackers*, or *security researchers* are well-intentioned hackers who are hired to identify weaknesses in an organization's network before they are exploited by malicious hackers. Hacktivists are politically motivated hackers; they commit cybercrimes, including data breaches, to gain publicity, earn public support, gather new members, embarrass their targets, and so on.

Hackers use various ways to gain unauthorized access to computer systems. Often, unauthorized access is accomplished from a remote location using one of several means. The perpetrator might be able to take advantage of lax security measures to gain access or might find loopholes in existing security measures or system procedures.

Frequently, attackers gain unauthorized access by impersonating legitimate system users; this is especially common in systems where users employ common passwords or maintenance passwords found in the system itself.

But, the most direct way of gaining access to a computer is to use someone else's password or generate (without authorization) a new password. Passwords are supposed to keep computers safe, but most passwords are created by users, who tend to choose weak passwords, use passwords that follow certain patterns, and use the same password for multiple accounts. Consequently, most passwords are not secure.

People usually pick something familiar and easy to remember as their password. For example, an aerobics instructor might use *fitness* or a sports fan might use *tennis*. If the attacker knows or can learn something about their target, cracking the password becomes even easier. That sports fan, for example, might have a picture of a tennis player hanging on their wall, directly in their line of sight.

Moreover, some attackers use rogue software applications to penetrate a system, while others trick unsuspecting users into downloading harmful programs or divulging their access credentials. These programs and applications operate in the background of the infected computer and can disable security settings and capture information that is sent back to them.

Methods Used to Gain Unauthorized Access

Common methods for gaining unauthorized access are discussed in the subsequent sections.

Social Engineering

Social engineering is a method for gaining unauthorized access to a computer system in which the attacker deceives victims into disclosing personal information, such as their password, or convinces them to commit acts that facilitate the attacker's intended scheme.

Often, social engineering schemes attack companies. When executing these attacks, the attacker tricks one of the target company's employees into revealing information. The social engineer might assume a number of different guises to accomplish this deception. They might pose as a new or temporary worker and ask IT employees for a password so that the hacker can begin work. Alternatively, they might pose as someone in a position of authority and intimidate employees into revealing confidential information.

Deception, however, is not always required. In large corporations, attackers can take advantage of certain anonymity among employees. By donning office attire, they can blend into the crowd and peruse the premises, providing them with an opportunity to obtain a password written down at an employee's desk.

To prepare for social engineering schemes, the attacker might search a company's dumpster for relevant documents, such as internal telephone directories and correspondence.

Additional information on social engineering can be found in the "Theft of Data and Intellectual Property" and "Identity Theft" chapters of this section of the *Fraud Examiners Manual*.

PHISHING

Phishing is a type of social engineering scheme that involves impersonating a trusted individual or entity. Generally, phishers manipulate victims into providing sensitive information by falsely claiming to be from an actual business, bank, internet service provider (ISP), or other entity with which the target does business.

In this type of scam, phishers typically use emails to direct internet users to imitation websites that look legitimate, such as log-in portals for online banks, retailers, or government agencies. Phishers control these imitation websites and use them to steal sensitive information, such as bank account details and passwords. Other phishing schemes involve corrupted files that will install malware or allow the attackers access to a computer system once the victim downloads and opens the files.

To aid in preventing phishing emails, computers should be armed with spam filters, antivirus and antispyware software, and a firewall, which should be kept up to date to ensure proper performance. A spam filter can help reduce the number of phishing emails received.

Antivirus software, which scans incoming messages for troublesome files, and antispyware software, which looks for programs that have been installed on a computer and tracks a user's online activities without their knowledge, can protect users against pharming and other phishing techniques that fraudsters use.

Additionally, to prevent identity theft through phishing emails, computer users should delete unsolicited emails from banks, credit unions, investment firms, and government agencies with which they do not have an established relationship. If the recipient does have an existing relationship with the supposed originator of the email, the user should call the organization to confirm whether the email is legitimate before taking any further action. Organizations should educate their employees and computer system users on phishing scams and basic prevention methods, such as exercising caution when downloading or opening files attached to unsolicited or external emails.

SPEAR PHISHING

Spear phishing is a targeted phishing attack generally focused on a corporate entity or a specific employee within the entity. The ruse is typically meant to fool the corporate employee into believing that the phishing email originated not from a bank or financial institution, but from the employee's own IT or human resources (HR) department. The goal is to obtain the employee's username and password to access the corporate network.

BUSINESS EMAIL COMPROMISE

In recent years, a new form of spear phishing attack known as *business email compromise* (BEC) has emerged that directly targets employees who have the ability to make large payments or who have access to sensitive proprietary information. BEC schemes typically involve fraudulent emails that appear to be from the company's own chief executive officer (CEO) or from the head of a foreign supplier that the company has done business with for years. The emails often instruct the employee to perform a time-sensitive wire transfer to ensure that the supply chain is not disturbed, but the scheme has evolved to feature other methods or requests, which will be subsequently described in this section. Increasingly, these emails are paired with an insistent phone call from someone posing as the email sender or as the sender's attorney.

In September 2019, the U.S. Federal Bureau of Investigation (FBI) released a public service announcement concerning a sharp increase in the number of BEC schemes, stating a total of more than \$26 billion in losses reported worldwide from June 2016 to July 2019, including an increase in identified losses of 100% between May 2018 and July 2019.¹ Although these schemes can take numerous forms, the FBI has identified common scenarios for BEC schemes:

- *Business working with a foreign supplier*: Fraudsters posing as a company's foreign supplier send an email to the company and request that funds be transferred to an alternate account controlled by the fraudsters.
- *Business executive requesting a wire transfer*: Fraudsters use the compromised email account of a high-level executive to pose as the executive and ask an employee to transfer funds to the fraudsters' account.
- *Direct deposit changes*: Rather than asking for a wire transfer or specific payment, some fraudsters executing BEC schemes pose as company executives or other high-ranking employees and request that account information associated with the direct deposit of their payroll checks be changed, thereby redirecting the funds into a new account.
- *Real estate payments*: Fraudsters posing as realtors, title company employees, or lawyers request a change in wire transfer payment instructions related to a sale of property, redirecting funds into a new account.
- *Data theft*: Fraudsters use the compromised email account of a high-level executive to request employees' tax information or other personally identifiable information from the person responsible for maintaining such information (e.g., HR personnel). The stolen data might then be used to commit a variety of fraud schemes.
- *Gift cards*: Fraudsters pose as an executive and request that an assistant or subordinate purchase gift cards from retailers under the pretense that they will be gifts for family or employees and the executive is too busy to do the shopping themselves. These schemes are more likely to occur near holidays and typically involve the fraudsters requesting gift card numbers and personal identification numbers (PINs).

BEC schemes are often successful because employees want to satisfy their superiors or business associates and are intimidated into action without verification. Employees who receive email requests for wire transfers or calls urging an immediate payment are urged to contact the supposed requester at a known phone number to confirm the request.

¹ FBI, "Business Email Compromise: The \$26 Billion Scam," www.ic3.gov/media/2019/190910.aspx.

VISHING

Vishing, or *voice phishing*, is the act of leveraging Voice over Internet Protocol (VoIP) in using the telephone system to falsely claim to be a legitimate enterprise in an attempt to scam users (both consumers and businesses) into disclosing personal information or executing an act that furthers a scheme. Government and financial institutions, as well as online auctions and their payment services, can be targets of voice phishing.

A vishing scheme is generally transmitted as an incoming recorded telephone message that uses a spoofed (fraudulent) caller ID matching the identity of a misrepresented organization. The message uses an urgent pretext to direct unsuspecting users to another telephone number. The victim is invited to input their personal information using their telephone keypad. The criminals capture the key tones and convert them back to a numerical format.

There are several types of information at risk from vishing, including payment card information (numbers, expiration dates, and the last three digits printed on the signature panel), PIN, government identification number, date of birth, bank account numbers, and passport number.

Security experts have seen another variation of vishing where the criminals leave a voice mail message or make telephone calls directing people to the fake phone number. With VoIP and other internet-based telephone technology, criminals can make calls inexpensively and can mask their identity, location, and even make it look like they are calling from a legitimate company on caller displays.

Some potential uses of the personal information gathered through vishing schemes includes control of the victim's financial accounts; opening new bank accounts; transferring bank balances; applying for loans, credit cards, and other goods/services; making luxury purchases; hiding criminal activities; receiving government benefits; and obtaining a passport.

SMISHING

SMiShing is a hybrid of phishing and short message service (SMS), also known as text messaging. These schemes use text messages or other short message systems to conduct phishing activities. That is, in SMiShing schemes, the attacker uses text messages or other short message systems to dupe an individual or business into providing sensitive data by falsely claiming to be from an actual business, bank, ISP, or other entity with which the target does business.

Criminal activity such as SMiShing can be seen as the prelude to online frauds targeting mobile device users. As these devices continue to evolve, cybercriminals will take advantage of functionalities to obtain information, as well as to deliver mobile malware to mobile devices.

PHARMING

Pharming is a type of attack in which users are fooled into entering sensitive data (such as a password or credit card number) into a malicious website that imitates a legitimate website. It is different from phishing in that in pharming schemes, the attacker does not have to rely on having users click on a link in an email or other message to direct them to the imitation website. Pharming actually exploits a vulnerability in the domain name system (DNS) server software that allows a hacker to acquire the domain name for a site and redirect the website traffic from a legitimate site to a false one. So even though victims type in the correct website address, the pharming program sends them to an imitation website. Unknowingly, victims are then providing passwords and information directly to the hacker.

CATFISHING

Catfishing involves the creation of a fictitious online persona for the purpose of luring victims into emotional relationships under false pretenses. The fraudster will typically fabricate multiple fake social media accounts and profiles for dating websites featuring photographs of someone else. The catfisher's ultimate goal might be to ask for money, obtain sensitive information, or embarrass the target.

REVERSE SOCIAL ENGINEERING

In most social engineering scams, attackers approach the computer users, pretending that they need help; however, in *reverse social engineering* schemes, attackers get the users to make the contact. In these schemes, attackers disguise themselves as technical assistants or someone from whom the user needs help (a need often created beforehand by the attacker through sabotage). It is the reverse of social engineering—the user asks the attacker for help.

Password Cracking

Password cracking is an automated process by which an attacker attempts to guess a system user's most likely passwords. A password cracker typically exploits users who create personal, easy-to-figure-out passwords such as their name, their children's or spouse's name, their nickname, the name of a pet, and so forth. Fraudsters sometimes obtain this type of information with fake surveys, fake prizes, or some other type of social engineering. They also might try to crack passwords by entering commonly used passwords such as *123ABC* or *password1* into the system.

Altering the Way a System Generates Passwords

Not all passwords are supplied by users. Some passwords are generated by a computer system's randomizer function. For example, many ISPs give first-time users a randomly generated password (and sometimes a random username as well) that gets the person online. Then the users change the log-on information to fit their own preferences.

By learning how a certain system's randomizer works, someone can attack a system by generating valid passwords or altering how the system generates passwords. For example, with some tinkering, the randomizer can be set to give every new user the same, seemingly random, password: *EVBCL8*. But that will not work for long. It is better to have the machine make a password built off some information about the user, which is publicly available. Using a relatively simple set of algorithms, an attacker can convert a username, such as *halbfish* into an obscure looking string like *rueavzbr*. (Letters are read as numbers by computers speaking American Standard Code for Information Interchange [ASCII], so the algorithms use sine values to convert the ASCII values into a new set of numbers.)

Browsing

Browsing is one of the simplest ways to attack a system. It involves searching through large quantities of available data to find sensitive information. Browsing, for example, can involve searching physical memory for the system password table, or scanning files in disk storage for confidential information. The best way to defend against browsing attacks is to establish a strong access control system.

Keystroke Logging

Keystroke logging is the process of monitoring and tracking the keys pressed on a keyboard. Keyloggers can be based on software or hardware, and they can record every action a person performs on a computer (e.g., every cut, copy, move, and delete command). Both hardware and software keyloggers save the logged keystrokes to a file that the attacker can retrieve later.

Software keyloggers are generally delivered like Trojan horses and act in a similar way. Once installed, the software records the keystrokes, letter by letter, that a user makes on a computer keyboard. These programs are designed to record and identify usernames and passwords for the victim's computer and other secured internet sites, such as banking and online auction accounts.

Hardware keyloggers are small devices that attach to the signal path between the target's keyboard and computer. They can be attached between the computer and the keyboard cable, to other parts of the computer's hardware, or inside the keyboard. Most users would not distinguish the device from any of the other wires and plugs attached to a machine. Like software loggers, hardware loggers record keystrokes and either transmit the data or store it for later retrieval. Although hardware loggers require the attacker to have physical access to the target machine, this is often easily accomplished in a corporate environment.

Backdoors

Backdoors let attackers bypass a system's security through the use of undocumented operating system and network functions.

Remote Access Trojans

A *remote access Trojan (RAT)* is a type of malicious software that provides the attacker with complete control of the target's system. These programs can be delivered in different ways, including program patches or electronic birthday greetings. Additionally, victims might unknowingly and easily transmit them to other victims. Once the RAT is in operation, the fraudster can usually access everything on the victim's machine, stealing any data deemed valuable or turning the victim's computer into a server for at-will access or for use in a botnet.

Packet Sniffing

Packet sniffers are computer programs that monitor traffic on areas of a network and search for packets of data as they pass through the network. When a message is transmitted across the internet, for example, it flows through many computer nodes as it makes its way to its final destination. Sniffing programs can be embedded in nodes so that they read all the packets of information that pass through those nodes, looking for passwords to help the hacker gain access to a restricted system.

When users log on to an ISP, they sometimes have to type in a username and a password. Most sniffing programs collect the first portion (128 bytes or more) of each network connection being monitored. (This is where the username and password are most likely to be found.) Items like usernames and passwords are then sniffed out of the collected information.

Trapdoors

A *trapdoor* is a secret entry point into a program that allows someone who is aware of the trapdoor to gain access without going through the usual security access procedures.

HTTP Exploits

The World Wide Web is a graphical interface to internet resources. It uses a hypertext transfer protocol (HTTP) to transfer hypertext documents across an array of computer systems.

HTTP exploits involve using internet server applications to perform malicious activities. These attacks are common because firewalls typically block most internet traffic to keep it away from corporate servers, but firewalls almost always allow HTTP traffic, which is used for unhindered browsing. Thus, HTTP exploits provide attackers with a direct line to the target's server. If attackers can coerce the server into performing malicious activities, they will be able to access resources that would otherwise be unavailable.

Due to the inherent vulnerability of the HTTP standard, a migration to a far more secure standard known as hypertext transfer protocol secure (HTTPS) has occurred in recent years. HTTPS uses either the Secure Sockets Layer (SSL) or Transport Layer Security (TLS) protocol to allow encrypted communication between a website and its associated web server, thus preventing many of the attacks associated with HTTP. The stark security difference between the two standards has led Google and other search engines to prioritize HTTPS sites over HTTP sites in search results.

Spoofing

Spoofing refers to the process whereby a person or program masquerades as another to obtain unauthorized access to a targeted system. There are several types of spoofing attacks, including:

- *IP spoofing*: In this technique, the attacker mimics another system's IP address to access the target machine without authentication. By doing this, the intruder can send commands to the server under the disguised IP source addresses, making it difficult or impossible to trace the actual source of the messages.
- *Address resolution protocol (ARP) spoofing*: In this technique, the attacker sends fake ARP, which basically translates IP addresses into Ethernet or media access control (MAC) addresses, to associate their MAC address with the IP address of another node. As a result, any traffic meant for that IP address would be misdirected to the attacker.
- *DNS spoofing*: The DNS tracks domain names and translates them into their numerical equivalent so that computers can understand the address and locate the relevant computer. DNS spoofing involves making a DNS entry point to an IP address other than the one to which it is supposed to point.
- *Email spoofing*: Email spoofing involves misrepresenting parts of the email header, such as the sender address, to make it look like the email came from a different source.

Shoulder Surfing

In this method, the attacker obtains sensitive information by observing a targeted person from a nearby location (e.g., sitting next to the target in a crowded coffee shop). For example, the attacker might surreptitiously listen to a telephone conversation, watch the target enter credit card numbers or fill out bank deposit slips, and so forth.

Rummaging Through Offices

Because employees often leave important information in and around their desks when they leave their office to take a break, lunch, or vacation, many attackers obtain information by rummaging through employees' workstations.

Using an Accomplice

Sometimes an attacker is able to compromise someone within an organization and obtain enough information to gain unauthorized access into a system. Furthermore, criminals have been known to offer money to company employees in exchange for network usernames and passwords.

Discarded Media Drives

Fraudsters commonly obtain important information on improperly discarded media drives, copiers, printers, and other multifunction machines. The data stored on a computer system, hard drive, or external storage device are an ideal source for thieves wanting to commit cyberfraud. And because it is possible to recover deleted data, many attackers search for sensitive information on second-hand drives they purchased online or obtained from some other source.

For this reason, when discarding or selling a used media drive, users must ensure that the drives are scrubbed clean to make certain that the drives contain no residual data.

Like computers, some copiers, printers, and other multifunction machines have internal hard drives that store sensitive data, and therefore, the hard drives on these machines also must be scrubbed before sale or disposal.

Piggybacking

Piggybacking is a method used to gain access to restricted areas, including computer systems, in which the attacker exploits another person's access capability. Unlike most other methods of attack, piggybacking can be done to gain physical or electronic access.

Physical access via piggybacking involves gaining access to an area that is secured by locked doors, and it occurs when an attacker exploits a false association with another person who has legitimate access to the area. Examples of piggybacking to gain physical access into a restricted area would include:

- Following behind an individual who has been cleared for access into the restricted area
- Tricking an authorized individual into believing the piggybacker is authorized and convincing the individual to agree to allow the piggybacker to tag along into the restricted area
- Surreptitiously following behind an individual who has been cleared for access into a restricted area, giving the appearance of being legitimately escorted
- Pretending to be a member of a large crowd of people authorized to enter a restricted area

Electronic piggybacking occurs when an attacker gains access to an electronic system by exploiting the access capability of another person with legitimate access. One type of electronic piggybacking occurs when the attacker takes advantage of a legitimate computer user's active session when the user did not properly terminate the session, the user's logoff is unsuccessful, or the user attends to other business while still logged on.

Scavenging and Dumpster Diving

Fraudsters employ a variety of techniques to obtain the information that can be used to gain unauthorized access to systems, but such information can be obtained simply by scavenging or dumpster diving for items with sensitive information (e.g., credit card receipts; bank statements; or other sensitive records that bear an individual's name, address, or telephone number). *Scavenging* involves obtaining information left around a computer system, such as on desks or workstations. *Dumpster diving* refers to the practice of looking through someone else's trash. Dumpsters and other trash receptacles often contain sensitive information.

Data Manipulation and Destruction

Data manipulation refers to the use or manipulation of a computer to perpetrate a crime, and *data destruction* involves the unauthorized modification, suppression, or erasure of computer data or computer functions, with the intent to alter or hinder the normal functions of the targeted system.

Data manipulation and destruction involves either direct or covert unauthorized access to a computer system by the introduction of malicious software such as viruses, worms, or logic bombs.

This section describes some of the methods used to destroy and manipulate data, including:

- Malware
- Salami technique
- Fraud by input manipulation
- Data leakage
- Wire tapping
- Buffer overflow exploits
- Privilege escalation exploits

Malware

Malware is an umbrella term for any kind of malicious software, including viruses, worms, Trojan horses, spyware, and ransomware. Often, the term is used interchangeably with *virus*, which is technically inaccurate, since a virus is a *type* of malware.

Malware uses popular communication tools to spread, using worms sent through email and instant messages, Trojan horses dropped from websites, and virus-infected files downloaded from peer-to-peer connections. Malware also exploits existing vulnerabilities on systems, often making its entry imperceptible. Malware is discussed in more detail below.

Salami Technique

The *salami technique* is a type of fraud where the perpetrator steals a substantial amount of money by “slicing” off “thin” amounts of cash repeatedly over time. To execute these schemes, the perpetrator (usually a computer programmer) executes an unauthorized program that repeatedly steals small, nearly unnoticeable amounts of assets from a large number of sources without obviously reducing the whole and then transfers them into another account. By skimming funds in extremely small quantities, this technique seeks to bypass internal controls and escape detection. For example, in most banking systems, the amount of interest to be credited to an account is typically rounded off. A fraudster might set up the system so that instead of rounding off the number, that fraction of it is credited to a special account that they own.

Fraud by Input Manipulation

Fraud by input manipulation, often referred to as *data diddling*, occurs when false or misleading information is entered into a system to achieve a specific fraudulent purpose. Input manipulation does not require sophisticated computer knowledge and can be committed by

anyone with access to normal data processing functions at the input stage. Examples include forging or counterfeiting documents used for data entry and exchanging valid disks and tapes with modified replacements.

Data Leakage

Data leakage refers to the unauthorized transmission of data from within an organization to an outside destination. Often, confidential information, intellectual property, customer data, and health records are leaked. Data can be leaked in a number of ways, including via email, laptop theft, hacker break-ins, lost or stolen backup tapes, removable media, and so on.

Wire Tapping

Wire tapping into a computer's communication links is another technique used to gain unauthorized access. This method enables perpetrators to read the information being transmitted between computers, or between computers and terminals.

Buffer Overflow Exploits

Buffer overflows can be used to exploit computer systems. To launch a buffer overflow attack, the attacker sends inordinate amounts of data to a running program that is waiting to receive input. The program copies the data into a *buffer*—memory used to store data temporarily during input and output operations. Buffers have a fixed size. Thus, if an attacker sends an amount of data that exceeds the size of a data buffer, the buffer overflows, but the extra data has to be put somewhere. The result is that the extra data is placed in an adjoining area of memory that is overwritten by the data sent by the attacker. Thus, attackers can exploit this effect to hack into a computer system and assume control.

Privilege Escalation Exploits

Privilege escalation refers to the act of exploiting a bug, design flaw, configuration oversight, or other vulnerability in an operating system or software application to gain access that is beyond the user's authorized access level.

The Internet of Things

The *internet of things (IoT)* is the environment of everyday objects that use embedded sensors to collect and transmit data through the internet. IoT technology can be used to solve problems, optimize existing technology, and allow more seamless and personalized user experiences. Examples of useful IoT applications include wearable fitness devices, home-automation products, and smart parking systems.

Unfortunately, the development of IoT technology tends to focus on innovative design rather than privacy or security. IoT devices commonly connect to networks using inadequate security and can be impractical to update when vulnerabilities are detected.

This is a concern because as the number of potentially vulnerable smart products increases so, too, do the opportunities for fraudsters seeking alternate ways into otherwise secure networks. Furthermore, IoT devices often record huge volumes of sensitive data and personal information that must be protected from misuse and cybercriminals.

Malware

To review, *malware* is an umbrella term for any kind of malicious software, including viruses, worms, Trojan horses, and spyware. Malware can infect computer systems from many sources. Some of the more common carriers of malware include:

- Unknown or unchecked application software
- Infected websites
- Banner ads
- Software or media that employees bring to work
- Files downloaded from the internet
- Infected software from vendors and suppliers
- Uncontrolled and shared program applications
- Files uploaded from storage devices, such as USB flash drives
- Demonstration software
- Freeware and shareware files
- Email attachments

Types of Malware

Some of the most common types of malware include:

- Viruses
- Worms
- Trojan horses
- Spyware
- Adware
- Ransomware
- Trapdoors

- Logic bombs
- Keyloggers
- Coin miners

Viruses

The industry-accepted definition of a *virus* is:

“... a program that can ‘infect’ other programs by modifying them to include a version of itself.”

By using strings of code, virus programmers can infect a computer with a virus through various means (e.g., downloads, email, portable media, or websites) and then watch their work spread. Viruses can be designed to modify infected systems in various ways. Modifications caused by viruses include making a copy of the virus program, which can then go on to infect other programs.

Like its biological counterpart, a computer virus can replicate itself and cause damage to its host. Moreover, a computer virus can spread from one computer to another. Thus, unsuspecting users who swap disks or send programs to one another over a network can spread the infection from computer to computer. In a network environment, the ability to access applications and system services on other computers provides a perfect culture for the spread of a virus.

A virus can do anything that other programs do; the only difference is that it attaches itself to another program and secretly executes itself every time the host program is run. Once a virus begins executing, it can perform any number of functions, including erasing files and programs.

During its lifetime, a typical virus goes through the following four stages:

1. *Dormant phase*: In this phase, the virus is idle. The virus will eventually be activated by some event, such as a date, the presence of another program or file, or the capacity of the disk exceeding some limit. Not all viruses have a dormant phase.
2. *Propagation phase*: During this phase, the virus places an identical copy of itself into other programs or certain system areas on the disk. Each infected program will now contain a clone of the virus, which will itself enter a propagation phase.

3. *Triggering phase:* In this phase, the virus is activated to perform its intended function. The triggering phase can be caused by a variety of system events, including a count of the number of times that this copy of the virus has made copies of itself.
4. *Execution phase:* During this phase, the virus performs its function. The function might be harmless, such as a message on the screen, or damaging, such as the destruction of programs and data files.

Many virus scares are hoaxes, but even so, these phony warnings cause harm of their own. They slow down transmission of information and have been known to cause overloads of organizational email networks. Most of these fraudulent warnings from hoax viruses urge recipients to “forward this to everyone you know.” Before forwarding a questionable warning, it is wise to consult a few authorities who track viruses. The following sites can be accessed to confirm or debunk virus notifications:

- www.mcafee.com/enterprise/en-us/threat-center.html
- www.broadcom.com/support/security-center

There are many different types of computer viruses; however, not all of them are discussed here. But the way viruses work affects how they spread, and with this in mind, it is of value to provide a brief discussion of some major types of viruses in circulation. The following are some of the most common types of computer viruses:

- Boot-sector viruses
- Overwrite viruses
- Parasitic viruses
- Multi-partite viruses
- Directory viruses
- Stealth viruses
- Resident viruses
- Direct-action (nonresident) viruses
- Network viruses
- File infectors
- File allocation table (FAT) viruses
- Companion viruses
- Polymorphic viruses
- Macro viruses

BOOT-SECTOR VIRUSES

The *boot sector* is a sector of a hard disk, or similar storage device, that contains instructions carried out every time a computer is turned on. It is the first logical sector of a hard disk. Boot-sector viruses infect the boot sector and, because the instructions contained on a boot sector are processed before any other programs are run, the infected computer loads these viruses before other programs.

Once a boot-sector virus infects a system, every disk in the system becomes infected, allowing the virus to spread to other systems.

These viruses, however, were more popular when floppy disks were common.

OVERWRITE VIRUSES

Overwrite viruses are characterized by the fact that they delete the information contained in the files they infect, rendering files useless. Infected files do not change size, unless the virus occupies more space than the original file, because the virus replaces the content of a file rather than hiding within it. The only way to clean a file infected by an overwrite virus is to delete it completely.

PARASITIC VIRUSES

Parasitic viruses (sometimes called *binary file infectors*) attach themselves to program files (i.e., executables). When a user launches a program that has a parasitic virus, the virus is also launched. The parasitic virus is given the same rights as the program to which the virus is attached because the operating system considers it to be part of the program. These rights allow the virus to replicate, install itself into memory, or release its payload.

MULTI-PARTITE VIRUSES

Multi-partite viruses use a combination of methods to infect files; if they cannot infect a system using one method, they try another.

DIRECTORY VIRUSES

An operating system finds files by looking up the path (composed of the disk drive and directory) in which each file is stored, and *directory viruses* corrupt a directory entry so that it points to itself instead of the file it is replacing. That is, these viruses change the paths that

indicate the location of a file. If a user executes a program (file with the extension .exe or .com) that has been infected by a directory virus, the user unwittingly runs the virus program instead of the original files that the virus replaced.

STEALTH VIRUSES

Stealth viruses use a number of different techniques to conceal themselves from users and virus scanners. They constantly change their patterns to blend into the system. Stealth viruses also encrypt their virus code to evade anti-viral software, and they remove their code from any infected files before a requesting program accesses the file.

RESIDENT VIRUSES

A virus can be either a resident virus or a direct action (nonresident) virus. A *resident virus* installs itself in the infected computer's memory. Upon execution, this type of virus searches for other files or programs to infect.

DIRECT-ACTION (NONRESIDENT) VIRUSES

In contrast to resident viruses, *direct-action viruses* load themselves onto the target system's memory, infect other files, and then unload themselves.

NETWORK VIRUSES

Network viruses use network protocol, commands, messaging programs, and data links to spread. These viruses are generally developed to attack the file servers.

FILE INFECTORS

File infectors are viruses that attach themselves to programs or executable files (files with an .exe or .com extension). When an infected file or program is run, whether directly or indirectly, the virus is activated, producing the damaging effects it is programmed to execute.

FILE ALLOCATION TABLE VIRUSES

These viruses attack the file allocation table (FAT), a type of file system used to organize data and locate files. A FAT virus can be especially dangerous because it prevents access to certain parts of the disk where important files might be stored. These viruses can cause damages resulting in information losses from individual files or entire directories.

COMPANION VIRUSES

Companion viruses can be considered file-infecter viruses. They are known as companion viruses because once they get into the system, they accompany other files that already exist on the infected system; that is, once these viruses attach themselves to a legitimate program, they create a program with a different filename extension; when the system's user tries to execute the legitimate program, they execute the companion virus instead.

POLYMORPHIC VIRUSES

A *polymorphic virus* is a virus that mutates itself and changes its structure to avoid detection. Some polymorphic viruses use different encryption schemes and require different decryption routines. Thus, the same virus might look completely different on different systems or even within different files. Other polymorphic viruses vary instruction sequences and use false commands in the attempt to thwart antivirus software.

MACRO VIRUSES

Macro viruses exploit macros in application programs. A *macro* is a stored series of commands that automate repetitive tasks. For example, a macro can tell Microsoft Word to spell-check a document automatically every 15 minutes. Many common applications (e.g., word processing, spreadsheet, and slide presentation applications) use macros.

Worms

Considered a subclass of a virus, a *computer worm* is a malicious self-replicating computer program that penetrates operating systems to spread malicious code to other computers. Worms have many of the same effects on a system as computer viruses. A worm is self-contained but, unlike a virus, does not need to be part of another program to propagate itself—a worm can spread by itself. Worms are often designed to exploit the file-transmission capabilities of computers (e.g., email) and are almost always spread through email, networks, and online chat.

In addition to replication, worms are designed to perform a variety of functions, such as deleting files on a host system or sending documents via email. Worms may be multi-headed and carry other executables as a payload. But even in the absence of such a payload, a worm can wreak havoc just with the network traffic generated by its reproduction. For example, Mydoom, also known as W32.MyDoom@mm, Novarg, Mimail.R and Shimgapi, was a computer worm that became the fastest-spreading email worm, causing the internet to slow down at the peak of its spread in January 2004.

Worms can also carry backdoors as payloads, and once a system is infected with such worms, the compromised systems are used for various functions such as spamming or to collect information located on the host.

Like viruses, worms can infect the boot sector. Similarly, network worms use network connections to spread from system to system. Once active within a system, a network worm can behave as a computer virus or *bacteria* (i.e., programs that do not explicitly damage any files or other data), implant Trojan horse programs, or perform any number of disruptive or destructive actions. Network worms are designed to penetrate systems—the worm attempts to plant replicas of itself on other computers in a network. And although these programs can exist without damaging files, they reproduce at rapid speeds, saturating networks and causing them to collapse.

Trojan Horses

A *Trojan horse* is a program or command procedure that gives the appearance of being useful but actually contains hidden malicious code that causes damage. When the hidden code in a Trojan horse is activated, it performs some unwanted or harmful function. Often, viruses and worms attach themselves to other legitimate programs, becoming Trojan horses and spreading to other systems.

Trojan horses might be used for a variety of reasons. Trojans horses have the capacity to delete files, destroy information on hard drives, and allow unauthorized access to a system or network. Often, Trojan horses are used to steal password files or other personal information. Trojan horses differ from viruses in that they normally do not reproduce.

Trojan horses are one of the most common techniques used to commit computer-based frauds and sabotage.

Spyware

Spyware is a type of software that collects and reports information about a computer user without the user's knowledge or consent. The presence of spyware is typically hidden from the user and can be difficult to detect.

Spyware performs many different functions, including the delivery of unrequested advertising (pop-up ads in particular), harvesting private information, re-routing page requests to illegally claim commercial site referral fees, and installing stealth phone dialers.

Spyware usually installs itself in one of two ways:

- The spyware component comes bundled with an otherwise apparently useful program.
- The spyware takes advantage of security flaws in the internet browser.

In some cases, spyware has been found pre-installed on electronic devices, requiring removal after purchase. The most common use of spyware for fraud is the theft of personal information (including financial information, such as credit card numbers).

Adware

Adware is any software application in which advertising banners are displayed while a program is running. The authors of these software applications include additional code that delivers the ads, which can be viewed through pop-up windows or through a bar that appears on a computer screen. These internet nuisances, which perform actions such as repeatedly sending advertising pop-ups, are justified on the basis that they help recover programming development costs and help lower the user's costs. Unfortunately, adware can also be programmed to deliver so-called *drive-by* downloads that take advantage of known system vulnerabilities to install malware without the user's knowledge. These malicious pop-ups might mimic a computer error message or dupe the user into accepting the installation via a pre-selected checkbox or radio button. Advertisement-blocking browser extensions are available for most of the popular web browsers and can alleviate many of the problems associated with adware.

Ransomware

Ransomware, as its name implies, is a form of malicious software (malware) that locks a user's operating system and restricts access to data files until a ransom is paid. To intimidate internet users into compliance, ransomware often employs a convincing professional interface, commonly emblazoned with police insignia or an official government logo. Messages sometimes consist of threatening accusations that the user has been caught viewing illegal videos, downloading pirated media, or otherwise accessing forbidden internet content, with the only remedy being to pay a fine. Other forms are far more direct and make no effort to conceal their obvious attempts at extortion.

The threat of ransomware has increased sharply over the past several years, rapidly becoming one of the most significant cybersecurity threats. However, Symantec's *2019 Internet Security Threat Report* showed that while overall ransomware infections decreased

from 2017 to 2018, enterprise infections increased by 12%, and infections on mobile devices increased by 33%, highlighting the dynamic nature of the threat.²

While some ransomware simply prevents access to files, other forms actually encrypt users' files. This is of particular concern to businesses due to the potentially disastrous threat of encrypted network drives. These schemes typically promise that, after payment is received, the user will be provided with a key to release the system and unencrypt files; however, even after money is transferred, many victims find that the malware remains installed on their machine and a key is never provided.

Less sophisticated forms of ransomware have also appeared that claim to have encrypted victims' files when the malware has simply deleted the files, thus tricking victims into paying to regain access to files that no longer exist. Some forms of this imitation ransomware go a step farther by deleting the restore points and registry keys needed to reboot a system in safe mode or overwriting deleted files to make them nearly impossible to recover.

In addition to immediate damage, ransomware attacks can cause losses in the form of business continuity and reputation, while opening the door for follow-up attacks, especially phishing or SMiShing. These follow-up attacks are typically delivered through messages that offer solutions or protection related to the malware, capitalizing on the fear or hysteria resulting from the outbreak.

Ransomware is highly profitable, funneling large amounts of money directly into the underground economy and thus incentivizing criminals to develop increasingly effective incarnations of the attack. Experts now warn about ransomware moving into new venues, such as the internet of things (IoT).

Trapdoors

Again, a *trapdoor* is a secret entry point into a program that allows someone who is aware of the trapdoor to gain access without going through the usual security access procedures. The trapdoor is code that recognizes some special sequence of input, or that is triggered by being run from a certain user ID or by an unlikely sequence of events.

² Symantec, 2019 Internet Security Threat Report, vol. 24, 2019, <https://docs.broadcom.com/doc/istr-24-2019-en>.

Trapdoors have been used legitimately for many years by programmers to debug and test programs. The entry points allow programmers to bypass a program's setup and access procedures while they are developing the software. Trapdoors also ensure that there is a way to activate the program if something goes wrong with the authentication procedure that is built into the application.

Trapdoors become threats when they are used by malicious programmers to gain unauthorized access. It is difficult to implement operating-system controls for trapdoors. Security measures must focus on the program development and software update activities.

Logic Bombs

A *logic bomb* is code embedded in a legitimate program that is set to activate (or explode) and set off a malicious function when certain conditions are met. Examples of conditions that can be used as triggers for a logic bomb are the presence or absence of certain files, a particular day of the week or date, or a particular user running the application. Once triggered, a bomb can alter or delete data or entire files, cause a machine to halt, or cause some other form of damage. For example, an employee could create a logic bomb to damage their employer's computer network in an effort to drive down the company's stock once the logic bomb activated. Similarly, a former employee could, before their network access is revoked, plant a logic bomb to wipe out the organization's servers.

Keyloggers

Keyloggers monitor and log (or track) the keys pressed on a system's keyboard, and they can be either software or hardware based. Accordingly, some keyloggers are malware, but others are not. Keylogger malware is designed to capture a user's keystrokes, providing a method to collect passwords or other authentication information. Some keyloggers capture every keystroke while others only capture certain keystrokes, as when an individual visits an online banking site. Keylogger malware can be delivered through a variety of methods, including Trojan horses and browser exploits.

Coin Miners

Coin miners, or *cryptojacking malware*, are programs that, upon infecting a computer, use that computer's processing power to mine for cryptocurrencies without the owner's knowledge or consent. Some criminals who once used other malware and cyberfraud methods for generating illicit income have shifted their focus to cryptojacking due to an increase in the value of numerous cryptocurrencies. Coin miners are relatively simple programs, so there is a

low barrier of entry for cyberfraudsters. Cryptojacking can slow down infected devices due to the processing power required for cryptocurrency mining and potentially cause serious or permanent damage. Victims, including companies or corporate networks, can also incur exorbitant costs for power usage or cloud storage related to coin miners. IoT devices could be of particular risk due to their frequent lack of security or monitoring.

Crimeware

Crimeware is not a type of malware but rather a classification of malware denoted by its intent to facilitate criminal behavior. Crimeware can be described as malware designed to simplify or automate online criminal activities, such as programs to fraudulently obtain financial gain from the affected user or other third parties.

Crimeware might result in any of the following:

- Theft of private information
- Identity theft
- Financial losses through the theft of online passwords
- Financial losses through accessing online services
- Invasion of privacy
- Loss of productivity because of system slowdowns, system errors, and so on
- Unwanted advertising (e.g., spam or pop-ups)

Botnets

A *botnet*—short for *robot network*—is a group of internet-connected servers, computers, or mobile devices that interact to accomplish a distributed task. Typically, botnet systems are composed of computers infected with malware that allows them to be taken over and controlled remotely by a third party. With remote access, the third party can control and harness the power of multiple compromised systems into a powerful network.

The compromised computers are known as *zombies* or *drones*, and the malicious software programs running on them are *bots*. A *botmaster* takes over the botnet and operates the computers remotely without their owners' knowledge. Because their operators often rent their networks to others who wish to bring down websites, botnets can be very profitable.

Compromised systems are infected using a variety of techniques, including worms, remote exploits that affect the operating system or the browser, and malware-dropping Trojan horses.

Botnets can be used for various nefarious reasons, such as spamming, hosting phishing sites, installing malware, harvesting information from infected computers, installing adware, and so on.

Botnets are also used to launch distributed denial-of-service (DDoS) attacks against companies and organizations. DDoS attacks use botnets to overwhelm target servers with data in an effort to make the targeted website inaccessible and thus deny service to its intended users. DDoS attackers are often very difficult to identify due to the distributed nature of botnets.

DDoS attacks have now evolved into much more powerful and insidious varieties, such as domain name system (DNS) amplification attacks and application layer attacks, both of which are far more powerful than traditional DDoS attacks.

Malware Symptoms

The following are some symptoms that might indicate a malware infection:

- The system suddenly, and for no apparent reason, slows down its response time to commands.
- The computer stops responding or locks up frequently.
- The computer crashes then restarts every few minutes.
- The computer restarts on its own.
- The computer does not run as usual.
- The computer experiences a sudden and sometimes dramatic decrease of free space.
- The size of some files increases.
- The operating system or other programs and applications begin behaving in unpredictable ways.
- Files cannot be accessed or are suddenly erased with no warning.
- There has been a change in the length of executable files, a change in their content, or a change in their file date or time stamps.
- Disks or disk drives become inaccessible.
- An attachment that was recently opened has a double extension, such as a .jpg, .vbs, .gif, or .exe extension.
- The system does not boot up.
- There are unusual graphics and messages.
- The user cannot access a hard disk drive.
- There are unexplained and repeated maintenance repairs.
- There are unexplained changes to memory.

- System or data files disappear or become fragmented.
- Items cannot be printed correctly.
- Unusual error messages appear.
- Menus and dialog boxes are distorted.
- New icons, which are not associated with any new programs, appear on the desktop.
- Programs experience unexplained changes in size.
- Antivirus program is disabled for no reason.
- Antivirus program cannot be restarted.
- Antivirus program displays messages stating that a virus has been encountered.
- The web browser's home page is changed automatically.
- When performing an internet search, the web browser visits a strange website.
- The user is unable to stop the excessive pop-up windows that appear without cause.
- The user receives a lot of bounced back email.
- There is evidence that emails are being sent without the user's knowledge.
- Unusual and unexpected toolbars appear in the system's web browser.

Measures to Prevent Infection

Prevention is the best approach to combating malware. Although prevention efforts can reduce the number of successful attacks, absolute protection is generally impossible to achieve. But even so, the following measures can help avoid infection from a malicious program:

- Use anti-malware software to scan all incoming email messages and files.
- Regularly update virus definitions in anti-malware programs.
- Use precaution when opening emails from acquaintances.
- Do not open email attachments unless they are from trusted sources.
- Only download files from reputable sources.
- Regularly update the operating system.
- Regularly update the computer with the latest security patches available for the operating system, software, browser, and email programs.
- Ensure that there is a clean boot disk to facilitate testing with antivirus software.
- Use a firewall and keep it turned on.
- Consider testing all computer software on an isolated system before loading it.
- In a network environment, do not place untested programs on the server.
- Secure the computer against unauthorized access from external threats such as hackers.
- Keep backup copies of production data files and computer software in a secure location.
- Scan pre-formatted storage devices before using them.

- Consider preventing the system from booting with a removable storage device (such as a USB flash drive); this might prevent accidental infection.
- Establish corporate policies and an employee-education program to inform employees of how malware is introduced and what to do if malware is suspected.
- Encourage employees to protect their home systems as well. Many malware infections result from employees bringing infected storage devices or files from home.

Also, in case of data loss due to infection, steps should be taken to ensure that any lost data can be recovered. For example, companies should back up all programs and files, and they should keep the backup copies in a secure location. In extreme cases, it might be necessary to reload uncontaminated copies of files and data. Backups should be created frequently enough to avoid having to re-enter large amounts of data. Backups should be retained for a sufficient time to have a clean set of files and programs in case a malicious program has been in place but not activated for a period of time.

Investigating Malware Infections

Malware infections can be investigated by taking the following action:

- Isolate the infected system and its media.
- Run antivirus software and document the findings.
- Interview the system custodian and all users, and determine:
 - Symptoms
 - Damage
 - Prior clean-up conducted
 - Access controls in place and working
 - System malfunction
 - Personal media used
 - Unauthorized media used
 - Virus identification
- Follow the audit trail of the infection.
- Determine the source of the virus—person, system, or media.
- Make users aware of protection policies and procedures.
- Ensure countermeasures are in place and working.
- Track the costs of virus problems.

Email

Email, while an essential component of an organization's communication infrastructure, presents a degree of vulnerability that needs to be addressed in a fraud prevention program. Consider the following applications for which email can be used:

- Company employees can use email to disclose sensitive company materials to unauthorized recipients, increasing the opportunity for corporate espionage.
- Company employees can transmit viruses via email to sabotage and crash organizations' networks.
- The original senders of emails can disguise or obscure their identity.
- Companies that employ a company-wide email system can be held responsible for any unethical or illegal activities employees perform on the email system.
- Companies must be concerned with the repercussions of the actions of any disgruntled or rash employees. The speed with which a disgruntled employee can fire off an email creates the opportunity for ill-advised communications.
- Once an email message has left a company's system, it might travel through any number of "foreign" email systems before reaching its destination. An email transmission can quite easily be intercepted or compromised if not encrypted.
- Without a security-enhanced email system, the receiver of an email message has little assurance that the email is authentic. Email addresses can be easily spoofed or cloned by a knowledgeable user.

Moreover, email can be delivered almost instantaneously anywhere. In fact, one of the emerging security problems concerning email is the huge volume of space required to archive old messages. In some organizations, people are regularly asked to cull through their old email messages and delete those no longer needed. Likewise, some organizations will delete any old email messages left on the mail server machines after a certain amount of time (e.g., one or two months).

Email Security Concerns

Because email has created vulnerabilities for most organizations, it is appropriate to discuss some email security concerns from both a user-based and an organizational perspective. Organizations often fail to set boundaries for employees regarding email and might later face legal ramifications as a result.

Email Ownership

Who owns email messages on an organization's system? This is a common question, but it is not necessarily the right question. If an employee writes an email message, it is a work of authorship and, as such, the rules of copyright apply. In general, if the employee wrote the message as part of their duties for their employer (i.e., in the scope of their employment), the employer owns the copyright. If the email was not part of the employee's duties (something personal or related to another activity, whether permitted by the employer or not), then the user has copyright, but the employer, as owner of the system on which it was created or passed through, might have some rights to the copy on the system. If an employee is forwarding a message written by someone else, the issue gets even more complicated. For instance, does the original author have the right or the intention to authorize any forwarding?

Organizational Liability

As with any communications media, legal issues involving the internet are emerging at a rapid rate, but they are of limited consensus so far. Nevertheless, it can be said that employers do have some liability for how employees use a company's email system. The issues are similar to an employee's use of the company telephone, the company postage meter, the company vehicle, and so on.

The best general advice is to exercise some caution when dealing with an email system. Within the company, email can become a vehicle for sexual harassment, creating a hostile work environment, or committing illegal acts (e.g., setting up gambling pools). Outside the company, employees can use email to operate their own businesses or to send out fabricated messages in the name of other employees or their employer. Some employers monitor their email systems, but doing so presents legal issues, such as invasion of privacy. Email has also been used to gather evidence against employers or employees. Of course, the dangers and pitfalls presented by email are not necessarily greater than those caused by any other form of communication, whether inside or outside the organization.

As with any potential liability issue, employers must set guidelines for the proper internal and external use of email, just as they would for the proper use of the company telephone, stationery and postage, vehicles, and so on. For instance, the organization should have a written policy informing employees that email must not be used to send inappropriate and unprofessional messages. That is, the policy should prohibit the use of email for:

- Harassing other users of the system
- Consuming unreasonable amounts of available resources

- Intentionally sending viruses or harmful files to other users
- Evading software licensing or copying mechanisms
- Crashing/disrupting system services
- Impersonating another user anywhere on the internet
- Bypassing system security mechanisms
- Translating encrypted material without authorization
- Eavesdropping on other email interactions
- Using the system for any personal gain, either monetarily or politically, unless permitted by the organization

Some commentators recommend that employers monitor employees' email, but the decision to monitor employees' email should not be taken lightly. For instance, the fact that the company does try to monitor email might be used against the company if something slips through its monitoring system. Additionally, some jurisdictions restrict employers' ability to monitor employees' email.

Due to the rapid growth and fluid nature of the internet and email, there is a great deal of uncertainty in the law. Organizations might want to seek legal counsel in establishing proper use guidelines and before taking disciplinary action against employees because of alleged abuses.

Internet Fraud

The internet is used by billions of people worldwide and is a major means of conducting business globally.

The internet is also a tool for recreation, finding jobs and homes, making travel arrangements, and researching business and investment opportunities. But because of its appeal to consumers—those who want to fix their credit, shop, manage their finances, and find a good investment—it can also serve as a means of facilitating fraud.

Despite the dangers of internet fraud, official policing of the internet remains minimal. The Internet Crime Complaint Center (IC3), the Federal Bureau of Investigation (FBI) in the United States, and similar entities provide consumer warnings of current internet fraud schemes. Yet these anti-fraud efforts, while worthwhile, are no match for the phony investment, credit, and get-rich-quick schemes that pop up every day online.

In addition, the laws that currently apply to the internet are difficult to enforce because the internet crosses virtually every international border. The lack of international laws and the difficulty enforcing those laws gives internet fraudsters a better than average chance of avoiding capture and prosecution.

According to the *2019 Internet Crime Report*, the IC3 received more than 465,000 complaints related to fraudulent and non-fraudulent issues on the internet during 2019.³ The total dollar loss from all referred cases of fraud was more than \$3.5 billion. Frauds related to phishing prompted the highest number of complaints, followed by nonpayment for goods delivered or nondelivery of paid goods and extortion scams.

Commonly reported crimes included:

- Nonpayment/nondelivery
- Personal data breach
- Overpayment
- Advanced fee
- Harassment/threats of violence
- Credit card fraud
- Government impersonation email scams
- Business email compromise (BEC)
- Intimidation and extortion scams
- Real estate fraud
- Confidence/romance scams
- Denial of service
- Credit card fraud
- Ransomware
- Employment and business opportunities
- Identity theft
- Investment schemes
- Lottery/sweepstakes
- Phishing/vishing/SMiShing/pharming
- Auction fraud

³ FBI, *2019 Internet Crime Report*, https://pdf.ic3.gov/2019_IC3Report.pdf.

- Misrepresentation
- Corporate data breach
- Tech support scams

As evidenced in the report, the internet presents fraudsters with myriad opportunities to multiply the devices at their disposal. Some fraudsters have even used reputations of charitable organizations to exploit the most benevolent of human impulses. Perhaps the best way to guard against internet-facilitated scams is to stay informed and be very skeptical of anything that seems too good to be true. Internet users can protect themselves from most schemes by easily searching the internet for information on any offers, threats, or other communications that seem like a potential scam. Keeping informed of the latest scams on the internet might enable internet users to recognize and report these scams instead of losing money to one of them.

The majority of scams and schemes that have found new and lucrative homes on the internet are similar to the conventional frauds that have plagued consumers for ages.

Electronic Commerce and Information Security

Electronic commerce, or e-commerce, is the process of two or more parties making business transactions via computer and some type of network (e.g., a direct connection or the internet). This includes business-to-business (B2B) transactions, online retail, and the digitalization of the financial industry.

Information Security Goals

All branches of an information system, including the e-commerce branch, strive to provide security to its users and asset holders. Below is a list of common information security goals that should be achieved to ensure the security of information systems for users and account holders:

- Confidentiality of data
- Integrity of data
- Availability of data
- Authentication
- Non-repudiation

Confidentiality

The information involved in an information system transaction must only be accessible to authorized parties. This also requires that transactions, which have been captured in some way, retain their confidentiality even under attack.

Integrity

Integrity requires that transactions be incapable of modification by unauthorized parties. This is done to ensure that there is no doubt as to the validity of the transactions.

Availability

Information resources must be available. Businesses that offer products or services are very concerned with their accessibility because each moment their resources are not available results in lost opportunities.

Authentication

Authentication refers to the validation of a customer's identity. E-commerce entities must make sure that they can determine with whom they (or their computers) are communicating.

Transaction authentication protects two parties that exchange messages from any third party, but it does not protect the two parties from each other. The digital signature is the most popular solution to protecting the two parties from each other. A *digital signature* is an authentication technique that also includes measures to counter repudiation by either party. The digital signature is analogous to the handwritten signature but, to be legally binding, a digital signature must have the following properties:

- It must be able to verify the sender.
- It must be able to verify the date and time of the signature.
- It must be able to authenticate the transaction at the time of the signature.
- It must be verifiable by third parties.

Thus, the digital signature functions to authenticate e-commerce transactions. And based on the above properties, the necessary requirements for a valid digital signature can be determined. These requirements include:

- The signature must be a bit pattern that depends on the transaction being signed.
- To prevent both forgery and denial, the signature must use information unique to the sender.
- It must be relatively easy to produce the digital signature.

- It must be relatively easy to recognize and verify the digital signature.
- It must be computationally infeasible to forge a digital signature, either by constructing a new transaction for an existing digital signature or by constructing a fraudulent digital signature for a given transaction.
- It must be practical to store a copy of the digital signature.

To be effective, digital signatures use sophisticated cryptographic technology to make them resistant to forgery. Thus, a digital signature not only authenticates the user's identity before processing the transaction, it also provides cryptographic after-the-fact evidence of the transaction.

Non-Repudiation

Non-repudiation refers to a method to guarantee that the parties involved in an e-commerce transaction cannot repudiate (deny) participation in that transaction. That is, concerning information security, non-repudiation is a method to guarantee that the sender of a message cannot later deny having sent the message and that the recipient of the message cannot deny having received the message.

Again, in e-commerce transactions, non-repudiation is obtained through the use of digital signatures, confirmation services, and timestamps.

Consumer Confidence

Consumer confidence in e-commerce is also important. For consumers to retain their confidence in online transactions, the perception that the internet is safe must be fostered. Unfortunately, some cases cause consumers to lose confidence in e-commerce. In the following example, a hacker crafted a sophisticated scam that hurt millions of consumers.

EXAMPLE

Albert Gonzales had already been caught hacking into the Indian government's website and trafficking a million credit/debit card numbers before he was caught stealing many more credit/debit card numbers from TJX Companies, the company that operates retail stores such as TJ Maxx and Marshall's.

Starting in 2005, Albert found non-secure wireless networks on TJX Companies' systems and worked with others to identify vulnerable servers to attack, infiltrate, and later use to

jump into other more secure servers. From there, he and his conspirators were able to install malware used to steal data and sniffing software onto the networks of TJX and all the stores operating under the company, even outside of the United States.

TJX discovered the breach in December of 2006; it notified the authorities and was under the belief that it had only been losing data for six to seven months. After further investigation, however, TJX found that it had been losing sensitive data since 2005. In fact, TJX Companies discovered that two years' worth of sensitive data and 45.6 million credit card and debit card numbers were compromised. But by the time TJX discovered the extent of the security breach, Albert had already moved on to bigger and better operations.

In 2008, Albert was arrested on charges related to hacking into other companies' networks, and in 2010, he was sentenced to twenty years in prison.

Applying Encryption to E-Commerce Security

Generally speaking, the solutions offered by conventional and public key encryption technologies are usually adequate to ensure that e-commerce transactions are as secure as the value of the transactions requires.

Cybersecurity

Cybersecurity is the protection of computer systems and networks against unauthorized use, disclosure, modification, or destruction. Because certain controls inhibit productivity, security typically involves a compromise in which security officers, system users, and system operations and administrative personnel work together to achieve a balance between security and productivity. The most important step is obtaining management support and engagement for effective security. Without such support, any security plan will falter.

To ensure an effective security defense, computer security controls should be implemented. Computer security controls involve guards or countermeasures that avoid, undermine, or minimize security risks relating to computer systems, and they are essential to effective computer security. These controls ensure the availability of accurate data in time to meet an organization's needs at a cost that is commensurate with the risks involved. Key elements to an effective computer security control system generally fall into three categories, although overlap between the categories exists. These categories include:

- Physical security and controls
- Technical security and controls
- Administrative security and controls

Physical security involves the use of locks, security guards, badges, alarms, and similar measures to control access to computers, related equipment (including utilities), and the processing facility itself. In addition, measures are required for protecting computers, related equipment, and their contents from espionage; theft and destruction; or damage by accident, fire, or natural disaster (e.g., floods and earthquakes).

Technical security involves the use of safeguards incorporated into computer hardware or systems, operations or applications software, communications hardware and software, and related devices. Examples of technical security controls, sometimes referred to as *logical controls*, include password systems, firewalls, encryption, access control software, antivirus software, and intrusion detection systems (IDSs).

Administrative security (or *personnel security*) consists of management constraints, operational procedures, accountability procedures, and supplemental administrative controls established to provide an acceptable level of protection for computing resources. In addition, administrative controls include procedures established to ensure that all personnel who have access to computing resources have the required authorizations and appropriate security clearances. Examples include security policies and procedures, security awareness and training, adequate supervision of employees, and security reviews and audits.

Physical Security and Controls

A computer security system must not only provide protection against technical and administrative threats, but it must also protect against physical threats. Physical security threats strike directly at the availability of information. In the area of corporate espionage, physical threats to security include things such as vandalism, sabotage, and theft of proprietary information. Any physical security system, however, should be built to encompass all potential physical threats, not just those involving espionage or fraud. Thus, this section will also discuss other potential physical threats, such as fire, natural disaster, and threats to supporting utilities.

Physical security and controls involve the protection of information system resources against human-made and natural hazards, whether accidental or intentional. The idea of physical

security is to protect against unwarranted intrusions to the data center; prevent damage to the data center that might occur through sabotage, vandalism, or natural disaster; and put the organization in a position where, should damage occur, adequate backup is available. Furthermore, a comprehensive physical security system should provide for the early detection of intruders or forms of damage, such as fire, so that losses and downtime can be minimized.

Types of Physical Threats

A physical security system should be designed to protect against all foreseeable physical threats to information assets, including:

- *Crime*: Information operations can be threatened by such criminal activities as vandalism, sabotage, theft, or terrorist acts.
- *Physical damage*: This is damage to the information system assets as a result of such hazards as fire, smoke, and explosion.
- *Natural hazards*: Assets can be damaged by earthquake, lightning, windstorm, hurricane, tornado, flood, or volcanic eruption.
- *Environmental hazards*: Information operations can be damaged as the result of flammable, toxic, or corrosive chemicals within or outside the data center.
- *Threats to supporting utilities*: These can include loss of electrical power or communications lines inside or outside the computer facility or loss of climate control in the computer room.

Although criminal activity is the focus of the material, a complete security system should blend elements of prevention and detection for all potential threats, including physical damage, natural hazards, environmental hazards, and threats to supporting utilities.

Physical Controls

An effective computer security system contains physical controls to, among other things, keep unauthorized personnel from entering physical facilities (i.e., locations housing computing resources, supporting utilities, computer hard copy, and input data media), to help protect against natural disasters, and to warn personnel that physical security measures are being violated.

EXAMPLES OF PHYSICAL CONTROLS

Examples of physical controls include:

- Selecting sites that minimize the physical risks to computer-based assets (e.g., sabotage, arson, earthquakes, tornadoes, floods, or hurricanes)
- Putting security fences around the perimeter of a computing facility

- Having properly trained security guards stationed at the entrances of facilities to intercept intruders and ensure that only authorized persons are allowed to enter
- Installing double door systems at entrances of restricted areas (e.g., computing facilities) to force people to identify themselves to security personnel before they can access the secured area
- Having sources of backup power to ensure that computer services are in a constant state of readiness and to mitigate damage to equipment if normal power is lost because of sabotage, vandalism, natural disaster, or some other unforeseen occurrence
- Maintaining backup files and documentation to guard against losses due to theft, arson, sabotage, or non-malicious disasters
- Storing backup copies of the most current records at a reliable offsite location
- Installing detective physical controls to warn personnel that physical security measures are being violated (e.g., motion detectors, smoke and fire detectors, closed-circuit television monitors, and sensors and alarms)

PHYSICAL ACCESS CONTROLS

For computer security purposes, physical access controls are a notable type of physical control. *Access control* is a process by which users are identified and granted certain privileges to information, systems, or resources, and with access control systems, management can control access to information, systems, a physical facility's areas, or resources. *Physical access controls* refer to the process by which users are allowed access to physical objects (e.g., buildings). These controls can be used to verify a person's identity and privileges before granting the person physical access (to a building or site).

There are various types of physical access control devices that can be used to control access to physical objects. Some common types include:

- Locks and keys
- Electronic access cards
- Biometric systems

LOCKS AND KEYS

Locks and keys are the most common method used to control access to physical objects. Locks and keys are inexpensive and easy to install, and therefore, they are commonly used for controlling access to restricted areas. But because keys are easily lost or duplicated, many organizations use cipher locks (i.e., combination locks containing buttons that open

the lock when a particular code is punched in). With cipher locks, care must be taken to conceal the combination, and combinations should be changed on a regular basis, especially after employee terminations.

ELECTRONIC ACCESS CARDS

Many organizations use electronic access cards that verify to an electronic card reader that the cardholder has the right to access particular areas. Electronic access cards and card readers offer several advantages. Management of an organization with an electronic access card system can deny access rights without having to change locks or re-code cipher locks, it can limit access to physical areas to certain times, and this type of system can provide audit trails for incident investigations.

Electronic access cards and card readers, however, have disadvantages. These systems are prone to piggybacking, cardholders can share their cards with unauthorized persons, cards can be stolen and used by unauthorized persons, and they are more expensive than traditional locks.

There are various types of electronic access cards, including:

- Magnetic stripe cards
- Embedded wire cards
- Proximity cards
- Magnetic dot cards
- Smart cards

BIOMETRIC SYSTEMS

Biometric technology systems control access by measuring some physiological or behavioral characteristics to label and describe individuals. Common physiological characteristics measured include fingerprints, palm prints, and iris patterns. These systems use such physiological properties to verify user access. Behavioral biometrics are related to the behavior of a person, and they include typing rhythm, gait, and voice, among others.

Because biometric identifiers are unique to individuals, they cannot be lost, stolen, or shared; therefore, biometric identifiers provide a higher level of security than most other types of controls for physical access. Biometric controls can also be implemented for logical access purposes.

The most accurate biometric identification systems generally require large amounts of computing power, so those systems are typically expensive. Due to the high cost involved in implementing sophisticated biometrics access controls, they are usually recommended only for high-security, low-traffic entrance control.

Technical Security and Controls

Computer networks and communications are inherently insecure and vulnerable to attack and disruption. Consequently, management must use technical controls to protect systems against threats like unauthorized use, disclosure, modification, destruction, or denial of service.

Again, *technical security* involves the use of safeguards incorporated into computer hardware or systems, operations or applications software, communications hardware and software, and related devices.

The objective for securing computer systems and communication networks is to provide connectivity with acceptable response times, user-friendly access, and a secure mode at an acceptable cost to the organization.

Common technical controls used to secure computer systems and communication networks include:

- Logical access controls
- Network security
- Operating system security
- Encryption
- Application security

Logical Access Controls

Logical access refers to the process by which users are allowed to use computer systems and networks, and *logical access control* refers to a process by which users are identified and granted certain privileges to information, systems, or resources. These controls are designed to protect the confidentiality, integrity, and availability of informational resources.

In fact, one of the most effective methods for preventing system attacks by hackers, corporate spies, or other unwanted intruders is to implement a logical access control system to verify a person's identity and privileges before granting the person logical access to information or other online resources.

Generally, logical access can be established in three steps:

- Identification
- Authentication
- Authorization

IDENTIFICATION

When users start to interact with an information system, they are required to provide an identifier (e.g., a username, employee number, or account number), and the system must recognize the user who is attempting to access a resource. Each user's identifier should be unique, unlikely to change, and need not be kept secret. Thus, employees should not have the same type of usernames because it makes it easier for an attacker to spoof or log in using an employee's information.

In addition to being used during processing for authorization controls, the identifier can be used for variance detection and for other purposes, such as accounting and billing.

AUTHENTICATION

Once users are identified, they must be authenticated. There are three primary considerations associated with user authentication:

- A user must be prevented from fooling the computer system into thinking they are someone else. (False positive verification must be avoided.)
- The computer system must accept an accurate user identity. (False negative verification must be avoided.)
- Verification procedures must be easy for users to comply with.

There are three primary methods of authentication:

- Something the user knows (e.g., a secret password)
- Something the user has (e.g., a magnetic stripe card or smart card)
- Something the user is (e.g., biometrics information)

Ideally, the authentication process requires the user to comply with at least two of the three methods above—a strategy known as multifactor authentication—to gain access to the system. In reality, however, most organizations with medium security requirements still depend solely on re-usable passwords.

The following are options for authenticating users in information systems:

- Passwords
- Card-based systems
- Biometric systems
- Multifactor authentication

PASSWORDS

Passwords are the most common method to authenticate users for logical access. Password authentication uses a secret string of characters to control access to a particular resource.

Passwords should only be known to the user and the access control system.

Weak passwords are often exploited to breach system security; therefore, effective password administration is extremely important for maintaining security. Organizations should enforce policies requiring the use of strong passwords. Passwords should be kept in accordance with sound security practices, and the following measures are essential in maintaining effective password security:

- Passwords should be of sufficient length (usually a minimum of eight characters).
Generally, the longer the password, the more difficult it is to crack.
- Passwords should be a mix of letters, numbers, and characters.
- Passwords should be different from the user's identifier (e.g., username).
- To maintain individual accountability, management should prohibit group passwords and the sharing of passwords.
- Passwords should be changed periodically.
- Passwords of all terminated employees should be revoked immediately.
- Employees who have changed job functions or been transferred should have their old passwords canceled and new ones issued, if appropriate.
- Systems should lock out users who do not enter the correct passwords within a designated number of attempts.

Passwords are not impervious to human error or misuse. The downside of using passwords to prevent unauthorized access is that they can be bypassed, guessed, lost, written down, or given away.

Employees should be warned about possible calls from fraudsters attempting to deceive them into giving out their passwords by impersonating individuals who would need access to that

type of information. Let employees know that calls such as this are always fraudulent, and that no one should be asking them to reveal their passwords.

CARD-BASED SYSTEMS

Again, a unique personal possession such as a coded card can be used to identify individuals accessing a system. There are various types of technology that can be used to verify the identity of persons attempting to gain access to a system, including smart cards. Smart cards—cards embedded with a built-in chip for onboard data storage or computation—are similar to automated teller machine (ATM) cards; like ATM cards, they are susceptible to loss and forgery.

BIOMETRIC SYSTEMS

To review, biometric systems measure physiological properties to identify and authenticate users. Common physiological characteristics measured include fingerprints, palm prints, and iris patterns, with facial and vocal recognition being used more frequently as well.

Behavioral biometrics software authenticates users by monitoring their statistical characteristics, such as typing speed and keystroke touch.

MULTIFACTOR AUTHENTICATION

Organizations should consider implementing a multifactor authentication security system. Multifactor authentication requires the presentation of two or more authentication factors to verify the legitimacy of a transaction, and it is a preferred method for preventing attackers from cracking passwords. To review, methods of authentication include:

- Something the user knows (e.g., a password, personal identification number [PIN], or pattern)
- Something the user has (e.g., USB tokens, smartcards, magnetic stripe cards, virtual tokens, or soft tokens)
- Something the user is (e.g., biometrics, such as fingerprint or retina pattern)

To be effective, multifactor authentication needs to be user-friendly or it defeats its own purpose. If users find it burdensome, they might resort to shortcuts that end up compromising their security, like writing their password on notes that are taped to their computer.

AUTHORIZATION

Authorization determines the privileges a user has on a system once they have been authenticated; that is, once a user has been verified and authenticated, the system should check each request to determine whether it is legitimate for that user. Some users might be authorized to perform only certain functions and to have access only to certain data.

Moreover, each employee should only be allowed access to the information that they need to perform their duties. For example, an entity's logical access control system might grant a high-level manager access to files that contain sensitive financial or strategic marketing information, while it does not grant such access to low-level employees.

By limiting access to sensitive information, an organization minimizes the risk of information theft. If only a few employees have access to a secret distribution plan, for instance, then the majority of employees are precluded from revealing the information unless they are able to circumvent the authorization scheme. It also makes it more difficult and risky for an unauthorized person to access the information. Moreover, by limiting access to sensitive information, management reduces the number of potential leaks and creates fewer potential recruits for corporate spies.

Network Security

Network security is the protection of the network perimeter, as well as the segmentation of the internal corporate network. Oftentimes, management devotes resources to protecting its network from outsiders but fails to properly segment its internal network based on risks. Much like logical access control, network resources and segments should only be made available to those who require them. An example of this would be segmenting the Research and Development network from the rest of the organization due to the sensitive nature of the information that is handled in such an environment.

Network security defenses include:

- Firewalls
- Intrusion detection systems
- Intrusion prevention systems
- Network access controls

FIREWALLS

Firewalls are network hardware and software that block unauthorized or unverified access to computer systems and network assets. These tools survey incoming and outgoing transmissions and decide what type of traffic to permit onto an organization's internal network based on factors such as origination or destination address, content of the message, protocol being used to transmit the message, and other filtering methods.

Firewalls act as the first line of defense against network-based threats by enforcing an access control policy for traffic flowing between networks. A company's firewall policy determines which information can flow in and out of each protected network segment by examining packet information such as origination or destination address, content of the message, protocol being used to transmit the message, and other filtering methods. The most effective policy is one that is designed to restrict all traffic except that which is expressly permitted.

Firewalls can be an effective deterrent to network intrusions, but they should not be used as a stand-alone defense system. Nevertheless, when used in conjunction with other technologies (e.g., intrusion detection software, security auditing programs, and other access control mechanisms), firewalls can be an important part of an effective computer defense system.

INTRUSION DETECTION SYSTEMS

An *intrusion detection system (IDS)* is a device or software application that monitors an organization's inbound and outbound network activity and identifies any suspicious patterns of activity that might indicate a network or system attack or security policy violations. An IDS alerts administrators when someone or something is trying to compromise the information system through malicious activities or security policy violations. These systems are designed to supplement firewalls and other forms of network security by detecting malicious activity coming across the monitored entity's network or system activities. They act much like a motion sensor would; detecting individuals who have bypassed perimeter security.

An IDS can be instructed to look for particular violations of the company security policies—such as an excessive number of unsuccessful log-ins by the same user—and report them, as they occur, to the network administrator. The software can prevent this type of attack from occurring in the future by terminating the user's log-in account so that future attempts to use the account, even if accompanied by the correct password, will be unsuccessful.

IDSs can react in a number of ways, including reconfiguration of the organization's firewall to block messages from the intruder. Most systems will log the attack to a centralized management for future review by systems administrators. A system might also set off an alarm or send an email to the administrator to provide notification of the attack.

INTRUSION PREVENTION SYSTEMS

In contrast to IDSs, which are reactive, *intrusion prevention systems (IPSs)* are proactive. They are designed to stop intrusions from occurring, blocking the offending traffic before it does any damage instead of simply raising an alert as, or after, the malicious payload has been delivered.

NETWORK ACCESS CONTROL

Network access control technology is designed to limit access to a network based on a user's credentials and their system's security posture. The user's credentials indicate to which network segments a user has access. For example, a user in a company's accounts payable department would have access to the entire corporate network with the exception of Research and Development and some servers, while a guest could be limited to internet access only.

The security posture of the system is determined by the patch level of the system and the presence of certain security software on the user's system. A user with an up-to-date operating system and virus signature files would be granted access to the network, while a user who is behind on their virus signatures would be placed in a quarantine network until their signatures are updated.

This type of access control ensures that the network is properly segmented, that only authorized users have access, and that their systems present no major vulnerabilities to the network and its applications.

Operating System Security

The operating system is at the core of every computer system. It is responsible for the direct control and management of hardware and basic system operations, as well as running application software.

Often, attackers exploit operating system weaknesses to gain access to the system, as well as the applications and data residing on the system. To protect operating systems, system

administrators should implement a variety of measures, such as hardening the operating system, installing the vendor- or community-provided patches as soon as they become available, employing warning screens, and so on.

SYSTEM HARDENING

Hardening is the process of eliminating basic vulnerabilities on an operating system. Out-of-the-box operating systems are generally not secure because they contain a multitude of tools and features that are ripe for exploitation. Hardening helps safeguard a system from intrusion.

To harden an operating system, administrators remove the nonessential tools and utilities. Next, administrators ensure that all of the system's security features have been activated and properly configured. There are many tools and guides to help an administrator harden an operating system, and many of these are available on the internet for free.

PATCH MANAGEMENT

Every week, new vulnerabilities are discovered in operating systems and applications, and attackers exploit these vulnerabilities to gain access to systems. To protect against such exposures, system administrators should install patches as soon as they become available. Proper patch management can prevent worms and older exploits from being exploited.

WARNING SCREENS

Companies should install warning screens that appear before a user logs in to their employer's system. Many corporate computer systems display a welcome screen upon start-up. These screens should be replaced with a warning screen that informs the user that they are about to access a proprietary network. Additionally, the screen should warn that unauthorized access is prohibited and will be prosecuted under the law. This screen, however, should not identify either the organization or the network.

More specifically, the screen should warn users of the following matters:

- What is considered to be proper use of the system
- That the system is being monitored to detect improper use and any other illicit activity
- That the user should have no expectation of privacy while using this system

Organizations should consult with their legal counsel to ensure that the banner is sufficient for legal issues that might arise.

Encryption

Encryption is one of the most effective methods of protecting networks and communications against attacks through technical security controls. *Encryption* is the deliberate scrambling of a message so that it is unreadable except to those who hold the key for unscrambling the message. Any confidential information or credit card numbers should be encrypted in their entirety. There are, however, drawbacks to encryption, such as maintaining encryption keys and the inherent delays incurred by the extra steps required for processing. The decision to use encryption should be made with consideration of such issues.

Application Security

Application security encompasses controls implemented at the application level to prevent data from being accessed, stolen, modified, or deleted by unauthorized users. Attackers can exploit vulnerabilities in the design, development, or deployment of applications that allow them to obtain sensitive information pertaining to the organization itself, its employees, or its customers; therefore, it is important for companies to regularly test applications for weaknesses and implement solutions for any issues discovered in their code.

Administrative Security and Controls

Administrative security involves the use of tools and procedures to provide an acceptable level of protection for computing resources. To ensure safeguards against system and network infiltration on an organizational level, common administrative controls include:

- Security policies and awareness training
- Separation of duties
- Data classification
- Computer security risk assessments
- Security audits and tests
- Incident response plans

Security Policies and Awareness Training

Security policies provide the foundation for security in an organization. Policies provide a framework that ensures that informational assets are secured within a governing policy and are composed of a clear and concise set of guiding statements supported by management.

Well-written and effectively communicated information security policies provide employees with guidance on the proper use of information assets, which allows management to mitigate the risks associated with the inappropriate use of computer systems, software, email, and the internet.

Effective information security policies also help protect the organization against cyberfraud. Security policies should take into account all facets of computer abuse and address key areas of concern, such as computer fraud.

Therefore, company management should state, in writing, what policies and standards must be followed by employees, vendors, and business partners with regard to network and communications security. These policies should outline what must be done, who must do it, and the consequences of not complying. Also, management should ask every employee to sign an agreement to follow the company's confidentiality and security standards.

Moreover, as a condition of employment, all company personnel should be given security awareness training so that they know their role in furthering company security. Likewise, management should update employees as new risks and vulnerabilities are discovered. Organizations should ensure that the training includes employees at satellite offices, temporary help, seasonal workers, and potentially even vendors that have access to organizational data or systems.

Furthermore, leaders should offer their employees training on common issues and directives addressing how to identify red flags and how to deal with the high-risk issues the employees are likely to encounter, and training should be based on the organization's operations and needs. Accordingly, organizations should consider providing advanced instructions for personnel assigned to higher-risk areas or responsibilities.

Training must be user friendly; communications should be written in the local language and easily understood. This makes it more likely that employees will buy into the program, understand it, and appreciate it. For example, management should not give employees a large handbook that contains confusing terminology and is difficult to understand. Also, managers should train employees to recognize security threats, and impose disciplinary measures for security policy violations.

There are many different training formats available. Some popular formats include:

- Live seminars
- Online training
- Role-playing simulations
- Handbooks
- Compliance news updates
- Quizzes

Separation of Duties

Separation of duties is a key element in a well-designed internal control system, and it is fundamental to data security. Separation of duties is achieved by diffusing the tasks and associated privileges for a specific security process among multiple individuals, and to establish separation of duties with information security, organizations should be set up so that no person acting alone can compromise security controls. Accordingly, separation of duties limits the amount of power held by any person.

Below is a list of IT technologies that create concerns related to separation of duties:

- Application administrator access
- Security administrator and user setup
- Programmer access to production
- Strength of authentication
- Shared passwords
- Access to edit/change audit tables

There are various options for achieving separation of duties in information security, and the options vary depending on department responsibilities. For example, some of the best practices for ensuring separation of duties within the information systems department and between IT and business unit personnel include:

- Programmers should not have unsupervised access to production programs or have access to production data sets (data files).
- IT personnel's access to production data should be limited.
- Application system users should only be granted access to those functions and data required for their job duties.
- Program developers should be separated from program testers.
- System users should not have direct access to program source code.
- Computer operators should not perform computer programming.

- Development staff should not have access to production data.
- Development staff should not access system-level technology or database management systems.
- End users should not have access to production data outside the scope of their normal job duties.
- End users or system operators should not have direct access to program source code.
- Programmers should not be server administrators or database administrators.
- IT departments should be separated from information user departments.
- Functions involving the creation, installation, and administration of software programs should be assigned to different individuals.
- Managers at all levels should review existing and planned processes and systems to ensure proper separation of duties.
- Employees' access to documents should be limited to those that correspond with their related job tasks.

Data Classification

Organizations should also classify their data. *Data classification* refers to the categorization of data for its most effective and efficient use. Data classification allows organizations to assign economic value to data and enables them to establish a structured approach for data management. Accordingly, to determine which controls are most appropriate for protecting an organization's information, management must properly classify data. Data can be classified according to any criteria, often by its importance or frequency of use.

Working closely with each department, proprietary documents should be classified according to the level of security that best meets the company's needs. For instance, documents might be labeled *Private* for personnel matters and move up to *Restricted* for pricing or marketing information. Trade secrets or highly sensitive information should be labeled *Authorized Access Only*. Notes and drafts of documents should also be safeguarded or destroyed when the final document is completed.

Government and military data classification standards abound, but there are no set standards for classifying commercial or nongovernment data. The following table contains a typical list of classifications that a private organization might use, from highest to lowest.

Commercial Data Classification	
CLASSIFICATION	DESCRIPTION
Sensitive	Data that must be protected with the highest security; the disclosure of this data will cause the most harm to the organization
Confidential	Data that is less restrictive within the organization than sensitive data; however, its disclosure might damage the organization
Private data	Information that is private and should be guarded from disclosure (e.g., human resources data)
Proprietary	Information not generally available to parties outside the organization
Public	Information that would cause little or no harm to the organization if exposed

Even without set standards, an organization's data classification should have several characteristics. The system should be dependent on the overall sensitivity of the information and the level of confidentiality desired. Some organizations use a simple system with two distinct classes: confidential and public. Others use more complex rating levels, including sensitive, confidential, private, proprietary, and public. Establishing these categories depends on the level of protection required by the data an organization possesses.

An organization should answer the following questions to help determine which classification will best help protect its data:

- How is the information used?
- What is the value of the information?
- How old is the data?
- What damages would the organization sustain if the information were disclosed?
- What damages would the organization sustain if the data were modified or deleted?
- What laws and regulations govern the protection of the information?
- What would be the impact on national security if the information were disclosed?

Once data has been classified, management can conduct a risk assessment to determine the most cost-effective means of protecting it.

Computer Security Risk Assessments

As organizations grow, their information technology and data change in type and quantity. Thus, organizations should evaluate their security controls.

Risk assessment plays a critical role in protecting their digital assets. *Risk assessment* is the process whereby management identifies its risks, assesses the probability that those risks will materialize, calculates the damage that would result if the risks materialized, and determines the costs of applying the necessary safeguards to mitigate the identified risks.

In general, risk assessment has four main objectives:

- Identify the risks that make an organization vulnerable.
- Identify where fraud is most likely to occur.
- Quantify the economic impact that would result if the risks materialized.
- Provide an economic balance between the economic impact if the risks materialized and the costs needed to safeguard those risks.

More specifically, the risk assessment process can be summarized in the following six steps:

1. *Identify assets:* The first step is to identify physical and digital assets that the organization needs to protect and determine where that data is located.
2. *Value the assets:* Next, determine the value of each asset, taking into consideration costs related to acquisition, maintenance, profits generated, and replacement.
3. *Identify risks and threats:* Once management has identified and valued its assets that need to be protected, it should identify any threats to each asset and calculate the probability of each of those risks materializing for a single event and on an annual basis.
4. *Calculate the loss per risk:* Next, management should calculate the damage that would result if those risks materialized. Once this is done, it should combine the loss potential with the yearly rate of occurrence for each risk; this will yield the potential yearly loss.
5. *Recommend countermeasures or other remedial activities:* After calculating the loss per risk, management should review the current security measures and identify any steps that must be taken to counter the risks and calculate the cost of implementing those measures for a single event and on an annual basis.
6. *Reduce, transfer, or accept the risk:* Finally, management should manage the risk by reducing the risk. This can be accomplished by adding controls, improving processes, modifying the environment, and designing a contingency plan to apply if the risks occur; transferring the risk by acquiring an insurance policy; or accepting the risk.

The risk assessment process is time-consuming, and many organizations employ outside security consultants to reduce its effect on day-to-day operations.

Security Audits and Tests

In addition to establishing mechanisms to prevent unauthorized access, management must actively monitor and test its security systems to identify and address deficiencies and to maintain a secure system over time.

This material discusses:

- Log management and analysis
- Data security
- Security auditing
- Penetration testing

LOG MANAGEMENT AND ANALYSIS

Almost all systems maintain a log file that records system-related events, such as access attempts. *Logging*, also known as *journaling*, is the process of making a record of system-related events or logs for analysis. A *log* is a record of the events occurring within an organization's systems and networks. Logs are composed of entries, and each entry contains information related to a specific event that occurred within the system or network.

Recording logs as they occur within a system provides a basis for identifying and tracing events involved in the processing of data, in the use of computer resources, or in the operation of computer and network devices and systems.

Moreover, logs can be useful in various circumstances. They can provide valuable information when performing auditing and forensic analysis, and they can be used to support internal investigations, establish baselines, and identify operational trends and long-term problems.

It is difficult to detect security violations unless there is a record of events for analysis, and recovery from system failures can be aided by logging appropriate events. Likewise, management can generate reports from their log files (e.g., sign-on and sign-off activity and unsuccessful access attempts), and the person in charge of the company information security program should examine the logs in the journal records (e.g., event logs, audit file, records journal, or any other similar entity) on a regular basis for any entries that appear abnormal or out of the ordinary.

Moreover, users are less likely to engage in malicious activities and to make errors in their day-to-day interaction with an application if they know that their activities could be recorded.

Applications should take advantage of automated journaling systems to track user activity. One or more automated journals might be employed; the application designers should structure the journals to permit flexibility while minimizing overhead.

Logging, however, is not without challenges. Log entries are vulnerable to accidental or deliberate events that can endanger the logging process or the log contents, such as:

- The log contents can be partially or totally lost in a system crash caused accidentally (e.g., by a power failure to a volatile storage device) or deliberately (e.g., by someone trying to avoid detection).
- The logging process can be disabled or the log entry destroyed by a system penetrator.

Moreover, many organizations find it difficult to balance limited resources with a constant supply of log data. The level of detail monitored, the amount and type of data saved, the length of time data must be saved, and the complexity of processing the data affect the logging process and influence the cost and hardware requirements. A log management system can help tame the volumes of data.

The National Institute of Standards and Technology (NIST), which offers a measure of assurance that the tools used by U.S. law enforcement officials in the investigations of computer-related crimes produce valid results, defines *log management* in *Special Publication 800-92: Guide to Computer Security Log Management* as: “the process for generating, transmitting, storing, analyzing, and disposing of computer security log data.”

Log management is essential to ensure that logs are stored in adequate detail for an appropriate period. The NIST provides several recommendations to establish efficient and effective log management in *Special Publication 800-92: Guide to Computer Security Log Management*. According to NIST, management should:

- Prioritize log management appropriately throughout the organization.
- Create and maintain a log management infrastructure.
- Provide proper support for all staff with log management responsibilities.
- Establish standard log management operational processes.

- Establish the architecture for the log management system by determining what events will be recorded in logs, from which systems, where to record event data, and how long logs will be retained.
- Consolidate event records to a central collector.

DATA SECURITY

Organizations must have effective data security. Effective data security ensures the availability of accurate data in time to meet an organization's needs at a cost that is commensurate with the risks involved.

An organization's data security function should have sufficient resources and staff to administer passwords, maintain the security software, review system activity reports, and follow up on *all* potential security violations.

SECURITY AUDITING

An entity should hire experienced and qualified consultants or internal or external auditors to conduct periodic reviews of its system's security. A *security audit* involves testing the operating system and applications of a system or systems within a network or networks, focusing on the elimination of any security or access loopholes. To perform their work, security auditors conduct personal interviews, perform vulnerability scans, examine operating system settings, and analyze network shares and historical data.

Typically, security audits involve five phases:

1. Initiate and plan the audit:
 - Meet with management to identify possible areas of concern
 - Become familiar with the IT organization chart and job responsibilities of data center employees
 - Research the operating systems and software applications
 - Examine the organization's security policy and procedures
 - Assess the organization's IT budget and systems planning documentation
 - Examine the organization's data recovery plan
 - Establish audit objectives
2. Perform fieldwork:
 - Interview users
 - Inspect equipment
 - Examine and document the organization's policies and procedures

- Assess the physical security controls
 - Verify backup procedures
 - Perform tests
3. Conduct analysis:
 - Confirmation
 - Verification
 - Reconciliation
 - Exit conference
 4. Issue a report:
 - Findings
 - Recommendations
 - Schedule client corrective action report
 - Plan for follow-up engagement
 - Archive the report
 5. Follow-up:
 - Confirm corrective action
 - Address challenges
 - Repeat phases (as necessary)

PENETRATION TESTING

Some organizations that have the resources test their computer and network security by subjecting themselves to *penetration testing*—when a group of trusted individuals test an entity’s network security by attempting to breach it.

Most penetration tests are conducted by a trusted team of outsiders, sometimes referred to as a *tiger team* or *red team*. In a penetration test, the tiger or red team attempts to exploit security vulnerabilities to determine whether unauthorized access or other malicious activity is possible; they identify vulnerabilities that exist in a system or network with security measures in place.

Not all penetration tests consist solely of technical or electronic access attempts. Due to the risks posed by social engineering attacks that might involve in-person elements, such as phone calls or social engineers disguising themselves as employees, vendors, or even delivery personnel to access sensitive areas and information, penetration tests should feature elements of social engineering schemes as well.

Penetration testing is done so that management can assess the organization's security programs during real-world attacks that can be controlled. The period to conduct a penetration test varies, depending on the situation.

Incident Response Plans

Every organization should be ready to respond to a wide range of cybersecurity incidents, including cyberattacks and data breaches. An *incident response plan* describes the actions the organization will take when a data breach occurs. To ensure a comprehensive security strategy, management should plan and implement an incident response plan that defines how to respond to network intrusions. The incident response plan is an emergency plan. If a suspicious event is identified, management can take any number of possible actions, including:

- Suspend or terminate the offending process while the issue is investigated and send a message to notify the users.
- Automatically invoke special monitoring (e.g., complete logging of all activities and interactive traffic of the offending process).
- Provide real-time information on a designated console that displays the full interactive traffic of an offending terminal.

The recommended methodology for responding to cybersecurity incidents can be summarized in the following steps:

1. Preparation
2. Detection and analysis
3. Containment and eradication
4. Breach notification
5. Recovery and follow-up

PREPARATION

It is critical that organizations have an incident response plan for dealing with intrusions before they occur, and it should be created and implemented during the preparation step. If staff is trained to handle security incidents quickly and efficiently, it can minimize downtime as well as the amount of resources that are dedicated to responding to the intrusion.

Additionally, the response plan should be tested to see how well it functions in the event of an actual intrusion. Some organizations conduct dry runs to measure the effectiveness of their response systems, and in some cases, this process is combined with penetration testing.

It is important for a response plan to prioritize actions in the event that a security breach occurs. The *Site Security Handbook*, a guide to developing computer security policies and procedures, offers the following suggestion for prioritizing the goals of an incident response strategy:

- Protect human life and people's safety.
- Protect classified and sensitive data.
- Protect other data, including scientific, proprietary, and managerial information.
- Prevent damage to systems, such as loss or alteration of system files.
- Minimize disruption of computing resources.⁴

Management must delineate whom to contact if a security incident occurs, and it must define the roles and responsibilities for investigating events. These responsibilities might depend on the type of event. For example, if a database becomes riddled with errors, responsibilities could be assigned to the people who generate the data, unless the data was corrupted by errors in the programs, operations, data entry, or other functions that exceed such users' responsibilities.

To make such delineations, management must determine who will be in charge of coordinating the incident response. The coordinator will determine how the response action proceeds and what roles other affected parties should have. The coordinator is also the contact person for outside entities, such as law enforcement, if the incident is reported. The coordinator is the hub of the internal investigation and is in charge of gathering evidence. Thus, the coordinator should have a working knowledge of investigatory procedures. In addition, this person must have enough technical expertise to understand how the compromise occurred and to direct the efforts of systems administrators in responding to the attack.

Moreover, the coordinator should immediately notify the organization's legal counsel in the event of an attack. Lawyers can help determine potential liability, as well as the company's interests in publicizing or downplaying the incident. Furthermore, the legal department should advise on if and when to call law enforcement authorities.

If an organization has a computer security incident response team, the team should be notified as early as possible. If the breach occurred due to some breakdown in computer hardware or software, the hardware or software vendor should be contacted.

⁴ Ed Fraser, ed. RFC 2196, *Site Security Handbook*, Internet Engineering Task Force, September 1997.

It might also be necessary to inform employees, vendors, and customers about problems that could occur as a result of the incident and about any information they should divulge to outsiders about the attack.

DETECTION AND ANALYSIS

Once preparation plans have been established, management must concentrate on identifying incidents of breach as quickly as possible. In general, this is accomplished through the previously discussed IDSs and security auditing.

CONTAINMENT AND ERADICATION

When an attack does occur, management must fall back on its preparation and planning to mitigate the attack effectively and efficiently. The idea is to restore control of the affected systems and limit the damage. Other considerations, such as identifying the intruder, are important, but maintaining control of the system is a primary concern.

Moreover, as soon as an intrusion is detected, the appropriate personnel must be notified in accordance with the incident response plan. Information about the attack should be distributed on a need-to-know basis. Systems administrators and incident response teams need very precise technical details about the intrusion to effectively counteract it. Other employees, customers, vendors, and so on probably do not require such detailed information. Managers need to distribute enough information to effectively combat the problem without giving so much that it creates panic or additional vulnerabilities.

Also, before deciding how to repair damage or uncover the intruder's identity, the response team should begin by gathering as much information about the intrusion as possible. As soon as an attack is detected, the team must assess the resulting damage. Several crucial pieces of information must be uncovered when assessing the attack, including:

- Which systems were compromised?
- What kind of damage did the intrusion cause?
- Is the intrusion still causing problems?

Any time a breach occurs, the entire computer system should be considered suspect, and organizations should check all system software and files for irregularities. The audit file function of a security-auditing program and logs generated by firewalls and routers are helpful in detecting anomalies.

The intrusion response coordinator must also make two copies of all systems believed to be compromised: one copy that can be used in attempts to rebuild any damage caused by the intruder, and another copy that can be used as evidence in any future litigation resulting from the break-in. The copy to be used as evidence should not be altered or compromised in any way.

As the organization responds to the intrusion, it is imperative to maintain an accurate log of all details relating to the event. This not only will help investigators follow the course of events and track down the problem, but it can also provide legal evidence should the attack lead to a criminal prosecution or civil litigation.

Once the response team has identified exactly which network systems have been compromised, these systems should be contained. Containing compromised systems can be as simple as shutting down the affected systems, disconnecting the affected systems from the rest of the company system, or a combination of both. Obviously, shutting down portions of the company's computer network will cause substantial delays for company employees, reducing the company's workplace efficiency dramatically. But this action can also alert company customers and, if the company is large enough, media outlets that the company is experiencing computer problems. It is generally preferable to shut down a system and prevent additional damage, but in some cases, management might find it more prudent to keep an infected system up and running, risking some additional damage in hopes of identifying the intruder or preventing bad press. The level of acceptable risk should be included in the advance planning stages so that this decision can be made quickly and decisively when the time comes.

If the team does shut down the affected portions of the system, all access to the affected areas should be denied. The company should change the passwords to these areas and attempt to fix any holes in the system that the intruder exposed. Through audit trails and the logs recorded by the affected systems, the response team should be able to uncover the intruder's means of entry because any unusual patterns are detectable.

Further, the team should find and eliminate vulnerabilities exploited by the intruder. If malicious software was introduced, it should be copied (for evidentiary purposes) and then deleted. At this point, any patches or reconstruction programs should be applied to the system to correct holes. After the causes of the breach have been eliminated and any malicious code has been removed, the system can be returned to normal.

BREACH NOTIFICATION

In addition to taking proper actions to handle a breach, management must determine whether it is obligated to notify its customers of a security breach. Many jurisdictions have security breach notification laws that require businesses to notify their customers of a breach involving personal information. For example, as of May 25, 2018, the European Union's (EU) General Data Protection Regulation (GDPR) requires certain organizations that collect or process personal data to report data breaches to a supervisory authority within 72 hours after becoming aware of the breach and, in certain circumstances, the affected data subjects.

Although most jurisdictions' breach-notification laws contain similar provisions, they vary. Thus, management operating in multiple jurisdictions faces the difficulty of ensuring compliance with different notification laws. Therefore, before establishing new policies and practices, management should consult with legal counsel to identify what laws apply.

RECOVERY AND FOLLOW-UP

After management handles an incident, the affected systems should be returned to an operational level and monitored to ensure it is functioning adequately.

After the computer network is up and running again, management should review the experience to determine how well the response plan worked and what improvements should be made in the future.

Keeping a journal of the response activities provides management with tools to reflect on what worked and did not work during the restoration. The follow-up period is a good time to conduct a new risk analysis, revise security plans, and begin an investigation into the attacker. By spending some post-response time analyzing weaknesses in the security system, as well as the efficiency of the company's response to the security breach, management can better protect its computer network from future catastrophes.

Insurance for Cyber Risks

In recent years, insurers have begun offering coverage via specifically designed policies to address new forms of exposure in the information age. Today, an entity might be exposed to theft, damage or disclosure of data, denial of service attacks, theft of intellectual property, unauthorized access, loss of revenue, infringement of copyright and trademark, and the consequent damage to business reputation.

Often, cyber insurance is necessary because traditional comprehensive general liability policies and traditional errors and omissions policies generally do not cover internet-related losses. Many businesses believe that their traditional business coverage will cover internet-related incidents or that their web host or internet service provider (ISP) will cover damages caused by any cyberattacks, but they are probably wrong. Unless the entity's insurance policy or internet service-level agreement specifically includes language addressing such risks, any damages will probably not be covered.

Coverage provided by cyber insurance policies can include various types of coverage, including first-party coverage or third-party coverage. First-party coverage includes coverage against losses such as data destruction, extortion, theft, and hacking. Third-party coverage provides coverage when a company is sued. It covers the company if it is being sued for problems caused by technology product errors and omissions; the pilfering, public release, or misuse of sensitive or confidential information; the unwitting spread of disruptive viruses; hacker tampering to the information and advertising carried on websites; email-facilitated sexual harassment; and privacy infringement.

CONTRACT AND PROCUREMENT FRAUD

The procurement system is the collection of processes, procedures, and entities involved in purchasing goods and services by public or private entities. And because the primary objective of an effective procurement policy is to achieve the best value of money, it is important that procurement processes avoid incidences of fraud.

This section will address fraud in the procurement process, focusing on the following topics:

- Basics of contract law
- Methods of acquiring goods or services
- Phases in the contracting process
- Types of procurement fraud schemes
- Methods of preventing and detecting contract and procurement fraud

Basics of Contract Law

Entities purchase goods and services through contracts; therefore, it is helpful to understand the elements of a contract. Legal systems, however, deal with some of the basics of contract law differently. In fact, there are differences in the way that common law and civil legal systems deal with contract law. Despite such differences, this discussion provides a general overview of the basics of contract law, which are applicable in most situations.

Elements of a Contract

A *contract* is a mutual oral or written agreement under which two or more parties have undertaken an obligation to render performance. To be enforceable, a contract generally must contain the following elements:

- Lawful subject matter or objective
- Competent parties
- Intent to be legally bound
- Agreement
- Legal consideration
- Form permitted by law

Lawful Subject Matter or Objective

To be enforceable, the subject of the contract must not be contrary to law or public policy.

Competent Parties

The parties to the agreement must have the legal right or capacity to make a contract. This generally means that the individual parties must be of lawful age and that other entities are properly and legally organized.

Intent to Be Legally Bound

To be enforceable, the parties to a contract must intend to be legally bound.

Agreement

To form a contract, the parties involved must agree to what the contract covers and the main terms of the deal.

Generally, agreement is reached by one party's acceptance of the other party's offer. An *offer* is an expression to another person of a willingness to be legally bound to a legal obligation by the stated terms. An *acceptance* is an expression of agreement to an offer made by another party. Generally, to become effective, an acceptance must be communicated.

Legal Consideration

In common law, a contract will not be enforceable unless it is supported by *consideration*. Thus, in most cases, consideration is required for a contract to be enforceable in the United States and the United Kingdom; however, the doctrine of consideration is irrelevant in many jurisdictions, such as France, Germany, and China. In basic terms, to be supported by consideration, the parties to a contract must exchange something of value. Consideration may take the form of money, services, or circumscription of action, and it must provide some legal benefit or detriment to the parties involved.

Form Permitted by Law

To be enforceable, a contract must be in a form permitted by law. For example, some types of contracts must be in writing to be enforced.

Breach of Contract

A victim of procurement fraud might be able to recover fraud losses by bringing a breach of contract action. A breach of contract occurs when one party fails to perform, or announces that it does not intend to perform, without just cause. If a party breaches, the other party may sue for damages—the loss caused by the other party's failure to perform—or in some instances, for specific performance (i.e., an order from the court compelling the defaulting party to perform).

Methods of Procurement

There are various contracting methods that a procuring entity might use to acquire goods or services. The choice of method generally depends on the complexity of the procurement. Procurement methods range from using a purchasing card (p-card) for small-dollar, off-the-shelf items to a negotiated multi-million-dollar contract for financial computer terminals.

Although there are various methods of procurement, purchasers typically use processes that provide open and free competition.

Specifically, organizations often procure goods and services through the following means:

- Competitive bidding using sealed bids
- Contracting by negotiation
- Simplified acquisition procedures

Competitive Bidding Using Sealed Bids

One method of procurement is competitive bidding using sealed bids. This method employs competitive, sealed bids, containing price and terms, from prospective contractors to a procurement entity that awards the contract to the bidder with the best price and terms. This method of procurement is designed to place all bidders on a plane of equality, requiring prospective contractors to bid on the same terms and conditions.

A procuring entity typically uses sealed bidding when the following conditions are present:

- The entity's requirements are clear, accurate, and complete.
- The dollar value of the purchase is large enough to justify the resources needed to conduct a sealed bid.
- There is enough time to solicit, obtain, and evaluate the bids.
- The contract award will be made on the basis of price.
- It is not necessary to have discussions with the responding bidders.
- There is a reasonable expectation that the procuring entity will receive more than one sealed bid.

This type of competitive bidding process uses a solicitation document called an invitation for bid (IFB), which typically contains a purchase description, the conditions for purchase, all contractual terms, and the deadlines for submitting bids. IFBs are publicly solicited. This process reduces the opportunity for procurement fraud.

Contracting by Negotiation

An organization might obtain goods or services through contracting by negotiation, which is a method of procurement whereby the procuring entity secures a procurement agreement through discussion and bargaining with prospective contractors. There are two main methods of contracting by negotiation:

- Competitive negotiation using a request for proposal (RFP) or a request for quotation (RFQ)
- Sole-source contracting

Competitive Negotiation

Competitive negotiation permits bargaining between the procuring entity and prospective contractors before the contract is awarded. Organizations use this process when cost is not the most important factor of evaluation, and typically when:

- Sealed bids are not appropriate.
- The procuring entity needs to conduct discussions with potential providers because of differences in laws, regulations, or business practices.
- The acquisition is complex or vague.
- The procuring entity cannot accurately determine the risks.
- There is a relatively long, drawn-out production time.
- The procuring entity is contracting for a production effort (and not a specific item for delivery).

In general, when engaging in competitive negotiation, procuring entities issue a document to solicit proposals from prospective contractors on how they intend to address the procuring entity's needs and price quotes for implementing their proposed solutions. After the procuring entity receives the proposals, it negotiates with prospective contractors. Typically, this method allows the potential contractors to revise their offers before the contract is awarded.

Competitive negotiation allows for more flexibility in awarding contracts than competitive bidding, but it is time consuming.

Sole-Source Contracting

Although most procurement transactions are conducted in a manner that provides open and free competition, one exception is sole-source contracting.

Sole-source contracting is a noncompetitive procurement process accomplished through the solicitation of only one source. Sole-source contracting does not require a bid or quotes, and a sole source purchase does not involve competition among prospective contractors. Therefore, this method does not provide for full and open competition.

In sole-source procurement, the purchasing entity can negotiate by having back-and-forth discussions with the vendor to agree upon technical approach and price.

Additionally, because sole-source contracting does not provide for full and open competition, organizations that use this form of procurement typically require justification for its use. For example, in the United States, the Federal Acquisition Regulation (FAR), the system of regulations that applies to the government's procurement of goods and services, provides the following seven reasons that can be invoked to justify sole-source contracting:

- Only one responsible source and no other supplies or services will satisfy agency requirements
- Unusual and compelling urgency
- Industrial mobilization; engineering, developmental, or research capability; or expert services
- International agreement
- Authorized or required by statute
- National security
- Public interest

Simplified Acquisition Procedures

Simplified acquisition procedures are designed to speed up the procurement process by minimizing applicable rules, and they are generally used to acquire small items or services.

Typically, simplified acquisition procedures apply to purchases for goods or services valued at an amount that falls below predetermined monetary thresholds. For example, an organization's purchasing guidelines might provide: Employees may purchase needed work-related or administrative items from any vendor they wish if the purchase does not exceed \$250.

Simplified acquisition procedures offer a number of advantages over other methods of procurement, including simplicity, a reduced decision cycle, and lower administrative costs.

In general, simplified acquisition procedures might include any of the following contracting mechanisms:

- Charge accounts
- Purchasing cards
- Purchase orders
- Petty cash funds

Charge Accounts

Charge accounts are a simplified way for management to meet anticipated, repetitive needs for services and products from trusted suppliers. A *charge account* is a pre-arranged agreement with an organization that is signed before any business is conducted.

They allow management to order and pay for supplies and services from approved vendors several times a year. Therefore, these agreements simplify the purchasing process.

Purchasing Cards

A *purchasing card* (*p-card*, *PCard*, or *corporate credit card*) is an organizational charge card that allows employees to purchase goods and services without using a traditional purchasing process. Entities use p-cards to streamline their purchasing process, which helps to reduce cost. Typically, p-cards will have guidelines and spending limits for employees who use them.

Purchase Orders

A *purchase order* (*PO*) is a commercial document issued from a buyer to a seller that represents the formal and final approval of a purchasing transaction between the purchaser and vendor. It is a formal request to deliver goods or services according to the agreed-upon terms and prices.

POs can be used to keep track of purchasing activities, to evaluate the goods or services provided by suppliers, and to determine if items are delivered on time.

Typically, a PO identifies:

- The vendor
- The goods or service the vendor will provide to the buyer
- The types, quantities, and agreed-upon prices for the goods or services
- The delivery dates and terms of deliveries

- Freight
- The terms of payment
- Any other obligations and conditions related to the purchase

Sending a PO to a seller constitutes a legal offer to buy products or services, and a PO becomes a binding contract when accepted by the seller.

Petty Cash Funds

A *petty cash fund* is an amount of cash that is kept entirely separate from an organization's general cash and is intended to be used for small, incidental purchases. Thus, petty cash funds provide a simple and economic method of making small cash purchases (e.g., postage dues and delivery fees).

Generally, one person, called the custodian or cashier, is responsible for controlling the petty cash fund and documenting the disbursements made from the fund.

Phases in the Procurement Process

Although there are various methods that a procuring entity might use to acquire goods or services, purchasers typically use bidding processes that provide open and free competition. This discussion examines the phases of procurement processes employing competitive bidding mechanisms.

To review, in competitive bidding using sealed bids, each bidder competes for a contract based on the bid specifications set forth by the purchasing company. Contractors, suppliers, or vendors submit confidential bids stating the price at which they will complete a proposed contract in accordance with the purchaser's bid specifications. Accordingly, competitive procurement processes require contractors to bid competitively on contracts, and they are designed to maximize the benefits of free and open competition.

Competitive bidding, however, can create a dangerously competitive environment that is conducive to fraud, and any advantage one bidder can gain over competitors is valuable. Consequently, procurement through competitive bidding is susceptible to fraud.

For the purpose of fraud detection, procurement processes that employ competitive bidding mechanisms can be reduced to four basic stages:

1. The presolicitation phase
2. The solicitation phase
3. The bid evaluation and award phase
4. The post-award and administration phase

Fraud can occur in each of these phases, and the following discussion explaining the phases of procurement contains corresponding flowcharts showing the types of procurement fraud schemes that occur during each of them. The procurement fraud schemes used in the flowcharts are discussed in the “Categories of Procurement Fraud Schemes” section that follows.

The Presolicitation Phase

In the presolicitation phase, the procuring entity identifies its needs, develops the bid specifications (what, how much, and how good), determines the method to use for acquiring the goods or services, and develops the criteria used to award the contract.

Bid specifications are a list of elements, measurements, materials, characteristics, required functions, and other specific information detailing the goods and services that a procuring entity needs from a contractor.

The following flowchart shows the types of procurement fraud schemes that occur during the presolicitation phase.

Presolicitation Phase

The Solicitation Phase

The solicitation phase involves the bid solicitation, bid preparation, and bid submission. During this phase, the procuring entity prepares the solicitation document, provides notices of solicitation, and issues the solicitation document. After the procuring entity issues the solicitation document, the bidders prepare and submit their bids or proposals.

The following flowchart shows the types of procurement fraud schemes that occur during the solicitation phase.

Solicitation Phase

The Bid Evaluation and Award Phase

In the bid evaluation and award phase, the procuring employees evaluate the bids or proposals, conduct discussions and negotiations, and give the bidders an opportunity to revise their proposals. Procuring employees then select the winning bid or proposal.

The following flowchart shows the types of procurement fraud schemes that occur during the bid evaluation and award phase.

Bid Evaluation and Award Phase

The Post-Award and Administration Phase

During the post-award and administration phase, the contracting parties fulfill their respective duties through the performance of their contractual obligations. Activities that occur during this phase include contract modifications (i.e., change orders); review of completed portions and release of monies; and assessment of deliverables for compliance with the contract terms, including quality control.

The following flowchart shows the types of procurement fraud schemes that occur during the post-award and administration phase.

Post-Award and Administration Phase

Categories of Procurement Fraud Schemes

Although there are many types of procurement fraud schemes, a discussion of every different type is beyond the scope of this material. Instead, this discussion focuses on procurement fraud schemes that fall under the following categories:

- Schemes involving collusion among contractors
- Schemes involving collusion between contractors and procurement employees
- Defective pricing schemes in negotiated contracts
- Schemes in the post-award and administration phase

Collusion Among Contractors

Schemes involving collusion among contractors seek to circumvent the competitive bidding process. In these schemes, competitors in the same market collude to defeat competition or to inflate the prices of goods and services artificially. When competitors commit such schemes, the procuring entity is cheated out of its right to the benefits of free and open competition.

The most common forms of collusion between competitors involve the following types of schemes:

- Complementary bidding
- Bid rotation
- Bid suppression
- Market division

Complementary Bidding

Complementary bidding (also known as *protective*, *shadow*, or *cover bidding*) occurs when competitors submit token bids that are not serious attempts to win the contract. Token bids give the appearance of genuine bidding, but, by submitting token bids, the conspirators can influence the contract price and who is awarded the contract.

Often, conspirators in complementary bidding schemes submit token bids that:

- Are too high to be accepted
- Appear to be competitive in price but deliberately fail to meet other requirements
- Contain special terms that will not be acceptable to the buyer

Bid Rotation

Bid rotation, also known as *bid pooling*, occurs when two or more contractors conspire to alternate the business among themselves on a rotating basis. Instead of engaging in

competitive contracting, the bidders exchange information on contract solicitations to guarantee that each contractor will win a share of the purchasing entity's business.

EXAMPLE

Vendors Ace, Binko, and Cooper are up for three separate contracts, and they agree that Ace's bid will be the lowest on the first contract, Binko's bid will be the lowest on the second contract, and Cooper's bid will be the lowest on the third contract. None of the vendors will get all three jobs, but they are all guaranteed to get at least one. Furthermore, because they plan their bids ahead of time, they can conspire to raise their prices.

Additionally, bid rotation schemes might be coupled with a scheme involving an agreement that the winning bidder will award subcontracts to losing bidders. This allows losing bidders to improve their cash flow as they wait for their turn to win. Similarly, losing bidders might receive a percentage of the winning company's profits.

Bid Suppression

Bid suppression occurs when two or more contractors enter into an illegal agreement whereby at least one of the conspirators refrains from bidding or withdraws a previously submitted bid. The goal of these schemes is to ensure that a particular competitor's bid is accepted.

Bid suppression schemes, however, can take on other forms. Because many schemes involving collusion among competitors require that a limited number of bidders agree to the conspiracy, price inflation should become apparent if a new or uncooperative bidder enters the competition. To prevent this, conspirators might pay off outside companies to refrain from bidding or withdraw an already submitted bid. Conspirators might also use more forceful means to discourage uncooperative entities from participating in the bidding process. For example, to protect their monopoly, conspirators might fabricate bid protests or coerce suppliers and subcontractors to avoid dealing with non-cooperating companies.

Market Division

Market division (or *market allocation*) schemes involve agreements among competitors to divide and allocate markets and to refrain from competing in each other's designated portion of the market. In these schemes, the competitors generally divide the markets according to geographic area (i.e., the competitors take turns on contracts according to the geographic area), or they make divisions based on the customer (i.e., the competitors allocate specific customers or types of customers among themselves).

The result of these schemes is that competing firms will not bid against each other, or they will submit only complementary bids when a solicitation for bids is made by a customer or in an area not assigned to them. The customer thereby loses the benefit of true competition and ends up paying a higher price than would be dictated by fair bidding under normal economic forces.

Corrupt contractors often conceal market division schemes by submitting bids from *shell companies* (i.e., companies that have no physical presence and generate little independent economic value). Submitting bids from fictitious entities gives the appearance of competition. Furthermore, real contractors can raise their prices because the other bids are fraudulent and are sure to be higher than their own. In effect, the bids from fictitious suppliers serve to validate the exaggerated quote from the winning contractor.

Red Flags of Schemes Involving Collusion Among Contractors

Common red flags of schemes involving collusion among contractors include:

- The industry has limited competition.
- The same contractors bid on each project or product.
- The winning bid appears too high.
- All contractors submit consistently high bids.
- Qualified contractors do not submit bids.
- The winning bidder subcontracts work to one or more losing bidders or to non-bidders.
- Bids appear to be complementary bids by companies unqualified to perform the work.
- Some bids fail to conform to the essential requirements of the solicitation documents (i.e., some bids do not comply with bid specifications).
- Some losing bids were poorly prepared.
- Fewer competitors than usual submit bids on a project or product.
- When a new contractor enters the competition, the bid prices begin to fall.
- There is a rotational pattern to winning bidders (e.g., geographical, customer, job, or type of work).
- There is evidence of collusion in the bids (e.g., bidders make the same mathematical or spelling errors; bids are prepared using the same typeface, handwriting, stationery, or envelope; or competitors submit identical bids).
- There is a pattern where the last party to bid wins the contract.
- There are patterns of conduct by bidders or their employees that suggest the possibility of collusion (e.g., competitors regularly socialize, hold meetings, visit each other's offices, or subcontract with each other).

Collusion Between Contractors and Employees

Often, procurement fraud schemes involve collusion between contractors and the procuring entity's employees. The manner in which these schemes are perpetrated generally depends on the corrupt employee's level of influence. The more power a person has over the bidding process, the more likely it is that the person can influence which entity is awarded the contract. Therefore, procurement employees involved in procurement fraud schemes tend to have a good measure of influence on the competitive bidding process.

Various types of procurement employees are potential targets for corrupt contractors, including buyers, contracting officials, engineers and technical representatives, quality or product assurance representatives, subcontractor liaison employees, and anyone else with authority over the awarding of contracts.

Frequently, when a vendor bribes an employee of the purchasing organization to assist with a scheme, the cost of the bribe is included in the corrupt vendor's bid. Therefore, the purchasing company ends up bearing the cost of the illicit payment.

Procurement fraud schemes involving the purchasing entity's contractors and employees generally include the following:

- Need recognition
- Bid tailoring
- Bid manipulation
- Leaking bid data
- Bid splitting
- Unjustified sole-source awards or other noncompetitive methods of procurement

Need Recognition

Generally, procurement actions begin with the procuring entity making a determination of its general needs. These initial determinations include assessments of the types and amounts of goods or services required to meet the entity's needs. In need recognition schemes, procurement employees convince their employer that it needs excessive or unnecessary products or services. Accordingly, need recognition schemes occur in the presolicitation phase.

Often, in need recognition schemes, purchasing entity employees receive a bribe or kickback for convincing their employer to recognize a need for a particular product or service.

There are several red flags that might indicate a need recognition scheme. An organization with unusually high requirements for stock and inventory levels might reveal a situation in which a corrupt employee is seeking to justify unnecessary purchases from a certain supplier. Likewise, if an organization's materials are not being ordered at the optimal reorder point, this should raise a red flag. An employee might also justify unnecessary purchases of inventory by writing off large numbers of surplus items as scrap. As these items leave the inventory, they open up spaces to justify additional purchases. Another indicator of a need recognition scheme is a need that is defined in a way that can only be met by a certain supplier or contractor. In addition, the failure to develop a satisfactory list of backup suppliers might reveal an unusually strong attachment to a primary supplier—an attachment that is explainable by the acceptance of bribes from that supplier.

Other common red flags of need recognition schemes include:

- The assessment of needs is not adequately or accurately developed.
- There is no list of backup suppliers for items, spare parts, and services continually purchased from a single source.
- Estimates are either not prepared or are prepared after solicitations are requested.
- Items, parts, and services are obtained from a single source.
- A suspect employee displays sudden wealth, pays down debts, or lives beyond their means.
- A suspect employee has an outside business.
- Multiple purchases are made that fall below the threshold limit.
- Purchases are made without receiving reports.

Bid Tailoring

Bid tailoring schemes (also known as specifications schemes) occur during the presolicitation phase. In these schemes, an employee with procurement responsibilities, often in collusion with a contractor, drafts bid specifications in a way that gives an unfair advantage to a certain contractor.

Again, *bid specifications* are a list of elements, measurements, materials, characteristics, required functions, and other specific information detailing the goods and services that a procuring entity needs from a contractor. Specifications assist prospective contractors in the bidding process, informing them of what they are required to do and providing a firm basis for making bids, and they provide procurement officials with a firm basis for selecting bids.

There are three primary methods used to commit bid-tailoring schemes. One method involves drafting narrow specifications. In these schemes, a corrupt employee tailors the bid specifications to accommodate a vendor's capabilities and to eliminate other competitors so that the favored contractor is effectively guaranteed to win the contract. For instance, the tailored bid might require potential contractors to have a certain percentage of female or minority ownership. Such a requirement is not illegal, but if it is placed in the specifications as a result of a bribe, then the employee has sold their influence to benefit a dishonest vendor.

A second method involves drafting broad specifications. In these schemes, a corrupt employee of the buyer designs unduly broad qualification standards to qualify an otherwise unqualified contractor.

A third method involves drafting vague specifications. In these schemes, the buyer's personnel and the contractor collude to write vague specifications or intentionally omit bid specifications. This enables subsequent contract amendments, allowing the contractor to raise the contract's price.

Some common red flags of bid tailoring include:

- Weak controls over the bidding process
- Only one or a few bidders respond to bid requests
- Contract is not rebid even though fewer than the minimum number of bids are received
- Similarity between specifications and the winning contractor's product or services
- Bid specifications and statements of work are tailored to fit the products or capabilities of a single contractor
- Unusual or unreasonably narrow or broad specifications for the type of goods or services being procured
- Requests for bid submissions do not provide clear bid submission information (e.g., no clear time, place, or manner of submitting bids)
- Unexplained changes in contract specifications from previous proposals or similar items
- High number of competitive awards to one supplier
- Socialization or personal contacts among contracting personnel and bidders
- Specifications developed by or in consultation with a contractor who is permitted to compete in the procurement
- High number of change orders for one supplier

Bid Manipulation

In bid manipulation schemes, a procuring employee manipulates the bidding process to benefit a favored contractor or supplier. Thus, these schemes occur during the solicitation and evaluation phases.

In short, bid manipulation involves a fraudster who attempts to influence the selection of a contractor by restricting the pool of competitors from whom bids are sought. Therefore, in these schemes, a corrupt vendor persuades a purchasing company employee to ensure that one or more of the vendor's competitors cannot bid on the contract, thereby improving that vendor's chances of winning the contract.

Some common ways to commit these schemes include:

- Using obscure publications to publish bid solicitations
- Publishing bid solicitations during holiday periods
- Accepting late bids or falsifying the bid log
- Altering bids
- Extending bid opening dates without justification
- Opening bids prematurely
- Releasing confidential information
- Discarding or losing a bid or proposal
- Disqualifying bids for improper reasons (e.g., voiding bids for alleged errors in specifications)
- Adding new vendors to the qualified bidder list for no apparent reason
- Limiting the time for submitting bids so that only those with advance information have adequate time to prepare bids or proposals

A variation of these schemes involves a corrupt sales representative who deals on behalf of a number of potential bidders. The sales representative bribes a contracting official to rig the solicitation process, ensuring that only those companies that the sales representative represents will get to submit bids. Likewise, in some sectors, it is not uncommon for buyers to “require” that bidders be represented by certain sales or manufacturing representatives. To protect their client's interest, these representatives might pay a kickback to the buyer. The result of such transactions is that the purchasing company is deprived of the ability to get the best price on its contract.

Some common red flags of bid manipulation schemes include:

- Weak controls over the bidding procedures are present.
- There is evidence of changes to bids after they were received.
- The winning bid is voided for errors and the job is rebid or awarded to another contractor.
- An otherwise qualified bidder is disqualified for seemingly arbitrary, false, frivolous, or personal reasons.
- A procurement employee accepts late bids.
- The contract is awarded to a non-responsive bidder.
- Competing bids are lost.
- Bid deadlines are changed.
- Despite receiving fewer than the minimum number of bids, the contract is not rebid.
- Invitations for bids are sent to unqualified contractors.
- Invitations for bids are sent to contractors that previously declined to bid.

Leaking Bid Data

Competitive bids are confidential. They are supposed to remain sealed until a specified date when all bids are opened and reviewed by the procuring entity. Accordingly, employees of a procuring entity can leak pre-bid information or confidential information from competing bidders to a favored bidder, giving that bidder an unfair advantage in the bidding process. Thus, in such schemes, the employee does not alter the specifications to suit the vendor; instead, the employee gives the favored vendor a head start on planning their bid and preparing for the job.

Typically, these schemes involve a corrupt vendor who pays a procurement employee for the right to see the specifications earlier than the competition. Consequently, the person or persons who have access to sealed bids are often the targets of unethical vendors seeking an advantage in the process.

EXAMPLE

Gifts and cash payments were given to a majority owner of a company in exchange for preferential treatment during the bidding process. The supplier who paid the bribes was allowed to see his competitors' bids and adjust his own bids accordingly.

Leaking schemes might also involve measures to restrict the time for submitting bids. Because leaking schemes give favored suppliers advance notice of contracts, they are able to develop their bids before their competition. And if a procurement employee also restricts the time for

submitting bids, the employee will limit the period bidders have for developing bid proposals, and the supplier with advance knowledge will have an advantage over the competition.

Some common red flags of leaking bid data schemes include:

- The procuring entity has weak controls over its contracting system.
- The winning bid is just under the next lowest bid.
- The winning bid is unusually close to the procuring entity's estimates.
- The last party to bid wins the contract.
- The contract is unnecessarily rebid.
- A contractor submits false documentation to get a late bid accepted.
- Contracting personnel provides information or advice about contracts to a contractor on a preferential basis.

Bid Splitting

In general, procuring entities must use competitive methods for projects over a certain amount. To avoid this requirement, a dishonest employee might break up a large project into several small projects that fall below the mandatory bidding level and award some or all of the component jobs to a contractor with whom the employee is conspiring.

Some common red flags of bid splitting schemes include:

- Two or more similar or identical procurements from the same supplier in amounts just under upper-level review or competitive-bidding limits
- Two or more consecutive related procurements from the same contractor that fall just below the competitive-bidding or upper-level review limits
- Unjustified split purchases that fall under the competitive-bidding or upper-level review limits
- Sequential purchases just under the upper-level review or competitive-bidding limits
- Sequential purchases under the upper-level review or competitive-bidding limits that are followed by change orders

Unjustified Sole-Source Awards or Other Noncompetitive Methods of Procurement

Noncompetitive methods of procurement, like sole-source contracting, exclude competition; therefore, such methods can be used improperly to eliminate competition and steer contracts to a particular vendor.

Again, sole-source contracting is a noncompetitive procurement process accomplished through the solicitation of only one source, thereby limiting full and open competition.

Sole-source contracting is more vulnerable to fraud than competitive methods because it provides a greater freedom for manipulation and collusion with a vendor or contractor; consequently, procurement organizations typically require justification to use this form of procurement. Typically, justification occurs when the goods or services are available only from a single source, when exigent circumstances do not permit delay resulting from a competitive solicitation, or when solicitation is deemed inadequate after soliciting a number of sources.

Additionally, in cases involving unjustified sole-source awards, the supplier typically charges a much higher price than the company could have obtained through bidding.

EXAMPLE

A requisitioner distorted the requirements of a contract up for bid, claiming the specifications called for a sole-source provider. Based on the requisitioner's information, competitive bidding was disregarded, and the contract was awarded to a particular supplier. A review of other bids received at a later date showed that certain materials were available for up to \$70,000 less than what the company paid in the sole-source arrangement. The employee had helped divert the job to the contractor in return for a promise of future employment.

Some common red flags of unjustified sole-source award schemes include:

- Frequent use of sole-source procurement contracts
- High number of sole-source awards to one supplier
- Requests for sole-source procurements when there is an available pool of contractors to compete for the contract
- Procuring entity did not keep accurate minutes of pre-bid meetings
- False statements made to justify noncompetitive method of procurement
- Justifications for noncompetitive method signed or approved by employees without authority
- Employee fails to obtain the required review for sole-source justifications
- Sole-source justifications developed by or in consultation with a contractor who is permitted to compete in the procurement

Defective Pricing Schemes in Negotiated Contracts

Defective pricing arises when contractors intentionally use inaccurate cost or pricing data to inflate costs in *negotiated contracts* (i.e., the contracting method that permits negotiations between the procuring entity and prospective contractors).

Defective pricing schemes are more limited than other forms of procurement fraud because they primarily occur in negotiated contracts. Typically, procuring entities use negotiated contracting when conditions are not appropriate for competitive, sealed bidding.

Generally, when engaging in negotiated contracting, contractors submit cost or pricing data. Examples of cost or pricing data include information such as vendor quotes or bids, make/buy decisions, known upcoming production changes, already-bargained-for discounts, and so on. In negotiated contracts, contractors can submit defective pricing data to inflate the contract price. A contractor submits defective cost or pricing data when more current, more complete, or more accurate data existed, but was not disclosed to the procuring entity, resulting in an increase in the contract price.

However, it should be noted that not every instance of defective pricing is the result of the contractor's fraudulent behavior. In fact, defective data might be submitted for various non-fraudulent reasons, such as negligence, accident, incompetence, mistake, and so on.

For information regarding country-specific considerations related to defective pricing schemes, see the content on "Defective Pricing in Government Contracts" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

Methods of Defective Pricing

A contractor can use various defective pricing schemes to increase the cost of the contract and thereby its profits, but, generally, defective pricing schemes involve inflated labor costs or inflated material costs. A contractor can inflate labor costs by:

- Using outdated cost schedules
- Using lower-wage personnel to perform work at higher rates
- Using salaried personnel to perform uncompensated overtime
- Failing to account for learning-curve cost reductions
- Subcontracting to affiliated companies at inflated rates

A contractor can inflate material costs by:

- Failing to disclose discounts and credits
- Using outdated standard costs
- Using small-quantity costs to price large-quantity purchases
- Subcontracting to or purchasing from affiliated companies at inflated prices
- Failing to disclose residual inventory
- Using phantom suppliers to inflate costs
- Failing to disclose changes in make-or-buy decisions
- Estimating costs based on invalid cost allocation methods
- Using unsupported cost escalation factors

Red Flags of Defective Pricing Schemes

The following are general red flags that relate directly to defective pricing schemes:

- Contractor provides inadequate, inaccurate, or incomplete documentation to support cost proposals.
- Contractor is late in providing, delays providing, or cannot provide supporting cost or pricing data.
- Contractor's cost estimates are inconsistent with its prices (i.e., discrepancy between quoted prices and actual prices).
- Contractor uses out-of-date pricing information (e.g., outdated cost schedules) in cost proposals.
- Contractor fails to update cost or pricing data when past activity showed that costs or prices have decreased.
- Contractor fails to disclose internal documents on discounts, rebates, and so on.
- Contractor fails to disclose information regarding significant cost issues that reduce proposal costs.
- Contractor uses vendors or subcontractors during contract performance that are different from the ones named in the proposal or contract.
- Materials, supplies, or components that the contractor used in production are different than those listed in the proposal or contract.
- Contractor delays releasing information that could result in price reductions.
- There is evidence of falsifications or alterations of documentation used to support cost calculations.
- Contractor has unrealistically high profit margins on completed work.
- Contractor fails to correct known system deficiencies that lead to defective pricing.
- Unqualified personnel developed cost or pricing data used in contractor's estimating process.

Performance Schemes

This discussion examines procurement fraud schemes that occur during the award and performance stage of the procurement process, including:

- Nonconforming goods or services schemes
- Change order abuse
- Cost mischarging schemes

Nonconforming Goods or Services

Nonconforming goods or services fraud, also known as *product substitution* or *failure to meet contract specifications*, refers to attempts by contractors to deliver goods or services to the procuring entity that do not conform to the underlying contract specifications. Once contractors deliver goods that do not conform to the contract, they bill and receive payment for conforming goods or services without informing the purchaser of the deficiency.

These schemes can involve a wide variety of conduct, but, generally, they include any deliberate departures from contract requirements to increase profits or comply with contract time schedules.

An unintentional failure to meet contract specifications is not fraud, but it might constitute a breach of contract. Contractors who knowingly deliver goods or services that do not meet specifications might be guilty of fraud if they falsely represent that they have complied with the contract or deliberately conceal their failure to do so.

Often, contractors substitute goods or services delivered to the purchaser. Substitution is particularly attractive in contracts calling for expensive, high-grade materials that can be replaced by comparable, much less expensive products. Substitutions often involve component parts that are not easily detected.

Similarly, the potential for a product substitution case is greatest where the procuring entity relies on contractor integrity to ensure that it gets what it paid for.

This type of scheme can be committed by the contractor acting alone, or it can be facilitated by procurement or inspection personnel as the result of corruption. In nonconforming fraud schemes involving corruption, the dishonest supplier might give gifts or favors to inspectors or pay kickbacks to contracting officials to facilitate the scheme. The supplier would then submit false documentation to conceal it.

A contractor who repeatedly fails to meet contract specifications without corrective action by inspectors or the customer's supervisory staff might indicate corruption.

A wide variety of fraudulent schemes might involve nonconforming goods or services. Some examples include:

- Delivering or using products or materials of lesser quality than specified in the underlying contract
- Substituting products or items for those specified under the agreement
- Employing less qualified staff than specified in the contract
- Delivering or using counterfeit, defective, reworked, or used parts
- Delivering or using materials that have not been tested
- Falsifying the test results of materials, products, or goods
- Making false certifications (i.e., statements that parts or materials are new, domestically manufactured, and meet the contract specifications concerning quality and quantity, or that the company is minority owned)

RED FLAGS OF NONCONFORMING GOODS OR SERVICES SCHEMES

The following is a list of potential red flags for nonconforming schemes:

- High percentage of returns for noncompliance with specifications
- Missing, altered, or modified product compliance certificate
- Compliance certificates signed by employees with no quality assurance responsibilities
- Materials testing done by supplier, using the supplier's own personnel and facilities
- Evidence that test or inspection results were falsified (e.g., documents appear altered or modified, test documents are illegible, signatures on documents are illegible, documents were signed by unqualified or inappropriate personnel, or test reports are similar or identical to sample descriptions and test results)
- Highest profit product lines have the highest number of material return authorizations or reshipments
- Discrepancy between product's description or normal appearance and actual appearance (e.g., a new product appears to be used)
- Used, surplus, or reworked parts are delivered
- Delivery of products that appear counterfeit (e.g., product packaging, appearance, and description do not appear genuine; items that are consistently defaced in the same area; items that appear different from each other)
- Offers by contractors to select the sample and prepare it for testing

- Delivery of look-alike goods
- Unusually high number of early replacements
- Contractor restricts or avoids inspections of goods or services upon delivery

DETECTING NONCONFORMING GOODS OR SERVICES SCHEMES

To detect nonconforming schemes, the fraud examiner should, at a minimum, examine the following for red flags:

- Contract or purchase order (PO) specifications
- Contractor's statements, claims, invoices, and supporting documents
- Received product
- Test and inspection results for the relevant period, searching for discrepancies between tests and inspection results and contract specifications

To detect nonconforming schemes through more extensive methods, the fraud examiner should:

- Review correspondence and contract files for indications of noncompliance with specifications.
- Request assistance from outside technical personnel to conduct after-the-fact tests.
- Inspect or test questioned goods or materials by examining packaging, appearance, and description to determine if the items are appropriate.
- Segregate and identify the source of the suspect goods or materials.
- Review inspection reports to determine whether the work performed and materials used in a project were inspected and considered acceptable.
- Review the contractor's books, payroll, and expense records to see if they incurred necessary costs to comply with contract specifications.
- Review the inspection and testing reports of questioned goods or materials.
- Conduct routine and unannounced inspections and tests of questioned goods or materials.
- Examine the contractor's books and manufacturing or purchase records for additional evidence, looking for discrepancies between claimed and actual costs, contractors, etc.
- Interview procurement personnel about the presence of any red flags or other indications of noncompliance.
- Search and review external records (e.g., court records, prior complaints, audit reports, investigative reports, media sources) to determine if there is any history of misconduct.

Change Order Abuse

A *change order* is a written agreement between the procuring entity and the contractor to make changes in a signed contract.

Change order abuse is a performance scheme that involves collusion between the contractor and personnel from the procuring entity. In change order abuses, a corrupt contractor submits a low bid to ensure that it wins the contract award, but, after the procuring entity awards the contract, the corrupt contractor increases their price with subsequent change orders. If successful, these schemes will, at the very least, cause the procuring entity to lose any advantage received through the competitive bidding process.

Similarly, a dishonest contractor, acting in collusion with contract personnel, can use the change order process to improperly extend or expand contracts and avoid rebidding.

Change orders generally receive less scrutiny than the process used to acquire the underlying contract, making them a popular way to fraudulently access funds or generate funds for kickbacks.

Even though change orders are inevitable and can develop for various reasons (e.g., design error, ambiguous specifications or omissions in specifications, change in scope, weather delays, improvement in time or cost, building code changes), fraud examiners should view all contract change orders carefully.

RED FLAGS OF CHANGE ORDER ABUSE

When a change order occurs, fraud examiners should immediately be concerned about whether the change was accidental or planned. The following list of red flags can help make this determination.

- Poor contractor internal controls over determining the need for change orders (e.g., management officials fail to ensure that all proposed change orders are necessary for work that was not known or contemplated at the time the contract was awarded)
- Procurement employee acts outside normal scope of duties
- Numerous change orders justified on a variety of grounds, including alleged change in prices, inflation, unavailability of specific materials or equipment, and the need to substitute more expensive alternatives
- Employee of procuring entity approves numerous unexplained or unjustified change orders for the same contractor

- Repeated pattern of change orders that increases the price, scope, or period of an agreement, issued after the procuring entity awards the contract
- Questionable, undocumented, or frequent change orders awarded to a particular contractor
- After contract is awarded, bid specifications that lack detail (the requirements are vague) are clarified by issuing a change order
- Poorly drafted requests for change orders
- Pattern of change orders just below threshold limit
- Employee of procuring entity who is directly involved in both determining requirements and procuring the item
- High turnover rate among procurement personnel
- Period of an agreement is extended by change orders instead of rebidding

DETECTING CHANGE ORDER ABUSE

Fraud examiners can detect change order abuse by engaging in the following activities:

- Examining contract change orders that add new items
- Examining contract change orders that increase the scope, quantity, or price of the existing contract
- Analyzing contract change orders for red flags
- Interviewing complaining contractors, unsuccessful bidders, and procurement personnel about the presence of any red flags
- Searching and reviewing external records (e.g., court records, prior complaints, audit reports, investigative reports, media sources) to determine if there is any history of misconduct

Cost Mischarging Schemes

Cost mischarging schemes, which take place during the performance stage of the procurement process, occur when a contractor charges the procuring entity for costs that are not allowable, are not reasonable, or cannot be allocated to the contract directly or indirectly.

Often, contractors contend that a cost mischarge was merely a mistake, and the issue as to whether a mischarge was a mistake or a crime often depends on the contractor's intent. Thus, when investigating cost mischarging schemes, fraud examiners should investigate the issue of intent.

Here are some common methods contractors use to mischarge costs:

- Charging the same cost to more than one contract
- Charging nonexistent costs or costs at inflated amounts
- Charging unallowable costs (e.g., entertainment or advertising) to the contract
- Charging costs to the wrong category or contract
- Failing to disclose discounts and credits
- Using outdated standard costs
- Colluding with contractors directly to charge high prices and rebating part of the price increase without disclosure
- Using phantom suppliers to inflate costs
- Falsifying supporting documentation

RED FLAGS OF COST MISCHARGING SCHEMES

Red flags of cost mischarging schemes include:

- Contractor refuses, delays, or is unable to provide complete supporting data.
- Contractor's supporting documents are missing or unavailable for review.
- Contractor's supporting documents are of poor quality.
- Contractor provides different supporting documents for the same item, and unit prices vary widely.
- There is evidence of falsifications or alterations to supporting data.
- Contractor fails to submit cost or pricing data that is current, accurate, and complete.
- Contractor fails to disclose internal documents on vendor discounts.
- Cost estimates are not consistent with contractor's prices.
- Repeated noncompliance with the contractor's disclosed bidding or estimating practices.
- Old, outdated standards used to support proposals.
- Contractor fails to disclose information regarding significant cost issues that will reduce proposal costs.
- Contractor uses unqualified personnel to develop cost or pricing data used in estimating process.
- Contractor uses vendors or subcontractors other than those listed in the proposal.
- Contractor repeatedly fails to disclose bidding or estimating practices.

THREE MAIN TYPES OF COST MISCHARGING SCHEMES

Generally, contractors commit one of three types of mischarges:

- Accounting mischarges
- Material mischarges
- Labor mischarges

ACCOUNTING MISCHARGES

Accounting mischarges occur when a contractor knowingly charges unallowable costs to the buyer by concealing or misrepresenting them as allowable costs, or by hiding them in accounts, such as office supplies, that are not usually closely audited. A variation of this type of scheme involves circumventing the limits for certain cost categories by charging those expenses to other cost categories that do not have such limits. For example, a contractor might charge bid and proposal costs or independent research and development costs, which are usually cost-based but limited to a fixed amount, to salaries and wages, repairs and maintenance, or other cost categories.

MATERIAL MISCHARGES

Occasionally, material costs are mischarged, both as to their reasonableness and their allocability. *Material* means physical inventory and component deliverables. It includes raw material and purchased parts, as well as subcontractor and intercompany transfers.

In most cases, material cost mischarging is confined to instances involving raw material or interchangeable parts. Mischarges of finished materials are infrequent because the nature of the items limits their use on other contracts. Similarly, mischarging of specialized material is infrequent because the special character of such items makes it impossible for them to go undetected.

Common methods used to mischarge material costs include:

- Charging material costs incurred on a fixed-price contract to a cost-type contract
- Applying inappropriate indirect rates to material costs
- Charging at standard rather than actual rates
- Making unrecorded transfers of materials to another contract
- Purchasing excessive materials on one contract and using them on another contract
- Purchasing materials from a subsidiary or affiliated company at inflated prices
- Manipulating inventory pricing methods to inflate material values

- Charging materials from inventory at current high prices rather than the actual lower purchase prices
- Using small quantity costs to price large quantity purchases
- Obtaining vendor quotes from high-priced suppliers and purchasing cheaper items elsewhere

Below is a list of red flags of material cost mischarging schemes:

- Previously delivered items are transferred from ongoing jobs to open work orders.
- Items scheduled for delivery in the distant future are transferred from ongoing jobs to open work orders.
- The contractor transfers items at costs that are substantially different (higher or lower) from actual costs.
- There are mass transfers of items from one job order to various other job orders.
- Materials, supplies, or components used in production are different than those used in the proposal or contract.
- The contractor includes unnecessary or obsolete items in proposals.
- The contractor charges costs to the original job order when there is no physical inventory left on the job site.
- There is an increase in transfers of items to inventory write-off or a scrap account.
- The contractor makes transfers to any type of holding account.
- The contractor does not properly account for the materials.
- There are initial billings for actual material costs in excess of negotiated costs.
- Later billings show a downward adjustment in material costs as labor or overhead costs increase.
- Improper billing costs become apparent.
- Vague terms are used to bid materials based solely on management's judgment or rough estimates.
- The contractor failed to report excess or residual inventory.
- The contractor gives poor explanations for a high percentage of noncompetitive subcontractor awards.
- There is no clear audit trail to verify propriety of material charges.
- Internal controls over the shipping, receiving, and warehouse receipt for goods or services are weak.
- Weak internal controls allow numerous opportunities to adjust material charges.

Material mischarges can be detected by engaging in the following activities:

- Examining contract and cost files for red flags
- Examining material cost transfers, which can include transfers:
 - From government contracts to commercial
 - Through any type of suspense or holding account
 - From ongoing jobs to jobs not scheduled for delivery until a much later date
 - From prior lot work orders to current or future work orders
 - To inventory write-off accounts
 - To scrap accounts
- Determining if contract costs have exceeded or are expected to exceed the contract value because they should not be diverted to other cost objectives
- Comparing contract charges to determine if materials are properly charged to the job (too much or the wrong materials)
- Examining materials ordered and charged in excess of contract requirements
- Examining seemingly unrelated materials charged on routing slips
- Examining material standards not updated over periods when there are improvements in manufacturing technology or product design
- Comparing material costs over a specific period to identify any unusual changes and determining the reason for the changes
- Reviewing the standard and actual costs of materials to determine if any significant differences exist between the two
- Investigating the contractor to determine ownership and searching for any signs of corruption
- Scanning the general ledger, accounts receivable subsidiary ledger, and sales journal for unusual adjusting entries

LABOR MISCHARGES

In the performance of contracts, labor costs are typically the most significant costs incurred, and they form the basis for estimating labor for future contracts.

Labor costs are made up of direct labor charges to the contract and indirect labor charges allocated to the contract through a factor or rate. *Direct labor charges* are contract costs identified specifically with a contract. In general, direct labor costs are calculated by multiplying all project hours with the labor rates, which are based on actual employee wages or represent wages paid, and they are summarized for all employees within the applicable allocation unit. Indirect labor costs are those identified in two or more cost objectives.

Labor mischarging occurs when the contractor charges the procuring entity for work that was not actually performed. Labor costs are more susceptible to mischarging than material costs because, unlike other items of cost, labor is not supported by external documentation or physical evidence to provide an independent check or balance, and employee labor can readily be charged to any contract. Moreover, the only way to ensure that labor costs are charged to the correct account is to actually observe each employee's work (to determine which contract the employee is working), and then review the accounting records to verify that the employee's cost is charged to the proper contract.

It should be noted that even though an incorrect labor charge might be an indicator of fraud, it might also be the result of poor business practices or weak internal controls.

Labor costs can be inflated by various means, including:

- Reporting inflated salaries and consulting fees
- Using outdated salary and fee schedules
- Charging lower rate personnel at higher rates
- Failing to account for learning-curve cost reductions
- Transferring labor costs from fixed-price contracts to cost-type contracts
- Falsifying the labor distribution
- Billing for the type of service performed rather than the actual employee hours spent performing the work
- Billing for employees' expenses that were not incurred
- Fictitious time cards
- Altering time cards

Common red flags of labor cost mischarging schemes include:

- Billings not in line with estimates
- Excessive or unusual labor charges
- Sudden, significant shifts in labor charge levels
- Labor charges inconsistent with contract progress
- Vague or minimal education, credential, and experience qualification requirements for labor hour contract positions
- Procuring entity personnel who do not review or challenge qualifications of key contractor employees
- Contractor has high employee turnover rate among procurement personnel
- Contractor must hire large numbers of personnel quickly

- Contractor personnel rarely take vacation
- Significant increases in charges to overhead accounts (e.g., idle time, down time, and non-applied time)
- Contractor with a mix of cost-type and fixed-price contracts
- Increased labor hours with no corresponding increases in material used or units shipped
- Actual hours and dollars consistently at or near budgeted amounts
- Labor standards not updated after contractor improves its manufacturing technology
- Unavailable supporting documentation for proposed standards
- Lost personnel files
- No audit trail to verify propriety of labor charges
- Weak internal controls that provide numerous opportunities to adjust labor charges

Labor mischarges can be detected by engaging in the following activities:

- Examining labor cost records for the presence of red flags
- Reviewing audit reports, reimbursement requests, construction reports, engineering reports, and so on
- Conducting site visits to verify that selected employees' labor costs are being properly charged to the work actually being performed
- Examining time cards, totaling the hours expended on the contract, and comparing them to the hours billed
- Noting, in particular, repeated instances or a pattern of labor charges that increase the cost of cost-plus contracts
- Reviewing journal entries used to transfer labor costs
- Comparing labor costs over a specific period to identify any unusual changes and determining the reason for the changes
- Reviewing the standard and actual labor rates to determine if there are any significant differences between the two
- Calculating the percentage of total direct labor charged to each contract to determine which had the highest percentage of direct labor charges
- Reviewing and comparing the labor distribution summaries with payroll records to determine whether the total labor distributions agree with the total labor charges
- Comparing the direct and indirect labor account totals from the prior year to the current year and noting the percentage change
- Determining the percentage of total direct labor charged to each contract or work order to reveal which charge numbers had the highest percentage of direct labor charges
- Analyzing the labor charges to determine if there were any shifts in charging patterns

- Preparing a schedule of salary or wage changes and comparing it to contract award dates and labor rates
- Looking for terminated employees who are charged to contracts
- Comparing employee personnel records to contract position qualification requirements
- Interviewing individuals who changed their charging patterns during the year
- Searching and reviewing external records (e.g., court records, prior complaints, audit reports, investigative reports, media sources) to find any history of misconduct

Preventing Contract and Procurement Fraud

Procurement schemes have certain characteristics that make them difficult to detect and prevent. This is partly because these schemes can take on various forms, can occur in any stage of the procurement process, and tend to take place over a long period. Adding to this difficulty is the fact that most perpetrators have specialized knowledge that allows them to exploit weaknesses in the procurement system, concealing most fraud indicators from anyone not involved in the acquisition process.

Nevertheless, management should take steps to prevent and detect procurement fraud. Generally, such efforts should include, among other things, the following elements:

- Employee education
- Internal controls
- Monitoring procurement activities
- Vendor management

Employee Education

Management should educate their employees about procurement fraud, but, generally, organizations should focus education efforts on employees who are in the best position to identify vulnerabilities or red flags of procurement fraud. In fact, there is no greater tool in the detection of procurement fraud than a network of employees who are knowledgeable about fraud and look for indicators of their organization's vulnerabilities.

Internal Controls

Management must also analyze its organization's internal controls and enhance them as necessary to eliminate procurement risks. Key internal controls include, but are not limited to:

- Separation of duties
- Supervisory controls

- Receiving controls
- Authorization/approval controls
- Reconciliation controls
- Recording controls

Monitoring Procurement Activities

It is important for companies to implement a continuous, self-auditing program to monitor the performance of their procurement activities. Continuous monitoring uses data analytics on a perpetual basis, thereby allowing management to identify and report fraudulent activity more rapidly. That is, data collected from continuous monitoring can help surveil procurement fraud threats and vulnerabilities, detect red flags of procurement fraud, improve the effectiveness of anti-corruption controls, and, based on key risk indicators and high-risk areas, be used to prioritize and focus management's compliance efforts.

Vendor Management

All organizations rely on outside vendors to assist them in their business and, because vendors often perpetrate fraud against their customers in many ways, management should take steps to prevent and detect criminal conduct by its vendors.

Vendor management should include, among other things:

- Vendor background checks
- Controls for vendor master file management
- Vendor monitoring

Vendor Background Checks

Management must conduct adequate due diligence to identify and select competent and qualified vendors, such as reviewing their business reputation, financial soundness, and experience.

Controls for Vendor Master File Management

Effective vendor management requires strong controls for vendor master file management.

The *vendor master file* is a database that contains a record of all vendors with whom a company conducts business. The vendor master file contains valuable records, including records for purchasing functions (e.g., vendor name and address, contact information, and purchasing terms) and accounts payable functions (e.g., the purchasing terms, remittance address, and

general ledger account number). It also contains records regarding suppliers, for both purchasing and accounts payable functions. Mainly, the vendor's name and address, contact, and terms are needed when placing purchase orders (POs), and the terms, remittance address, and general ledger account number are needed for tracking accounts payable invoices.

In most organizations, members of the purchasing department approve new vendors, and accounts payable personnel set up new vendors in the entity's accounting system.

To manage vendors, a procuring entity must establish clear procedures for setting up new vendors and changing vendor master files. For example, procuring entities should require accounts payable personnel to verify new vendors (i.e., ensure that the vendors are qualified) by conducting a vendor background check before entering them into the vendor master file.

Also, the person responsible for the vendor master file should not be authorized to approve invoices for payment or to sign checks.

In addition, procurement entities must maintain an accurate and up-to-date vendor master file. An inaccurate or incomplete vendor master file can result in greater risks of duplicate payments, unfavorable payment terms, and noncompliance with regulations. Thus, the vendor master file should be updated continuously and reviewed on a regular basis for inaccurate or incomplete records.

Moreover, purchasing entities should monitor the application of the accounts payable policies on vendor master files.

Vendor Monitoring

Procuring entities must also use monitoring and auditing systems reasonably designed to detect criminal conduct by their vendors. The procedures to monitor vendors are similar to those used to evaluate vendors, and they should be based on red flags of vendor schemes that pose the greatest risk.

OVERVIEW OF THE LEGAL SYSTEM

By its nature, fraud examination is a law-intensive field. Legal issues related to fraud are often complex, and their interpretation might require professional legal assistance. CFEs should always consult with legal advisors if legal questions arise during a fraud examination.

Even with the availability of legal guidance, however, a fraud examiner should be familiar with certain aspects of the law. Often, the success of an investigation hinges on the fraud examiner following the proper legal procedures, whether dealing with a suspect's rights, collecting documents, or interviewing witnesses.

Basic Concepts of the Law

The structure and substance of the legal system in each jurisdiction can vary significantly, and so legal issues that arise in fraud examinations will also be different from place to place. The materials in the Law section of the *Fraud Examiners Manual* are designed to explain the common types of legal systems and approaches to fraud-related issues. White-collar crime often crosses jurisdictional borders, and so fraud examiners should be familiar with their home jurisdiction's legal processes, as well as have a basic understanding of the systems that they might encounter in foreign jurisdictions.

Types of Law

There are different types of law that are determinative to the outcome of legal disputes. The main types include constitutional law, statutory law, common law, administrative law, and international law.

Constitutional Law

Constitutional law is the body of law established by a sovereignty's constitution, and it deals with the fundamental principles by which a government exercises its authority.

Constitutions are government charters. They establish and empower the various branches of government, and they set up the rights and obligations of individuals under the government's jurisdiction.

For more detailed examples of how constitutional law works in different jurisdictions, see the content on “Constitutional Law” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Statutory Law

Statutory law is written law created by a legislature or other governing authority, and it includes statutes and codes passed by the local, regional, or national legislatures (and regulations passed by administrative bodies). In most jurisdictions, criminal law is based on statutes and codes.

Common Law

The common law consists of the usages and customs of a society as interpreted by the judiciary; it is often referred to as *judge-made* law. In most common law jurisdictions, civil actions can be based on either statutory or common law.

Administrative Law

Administrative law is concerned with the rules and procedures of administrative agencies of government. Administrative agencies have the authority to legislate, adjudicate, and enforce laws within their specific areas of delegated power. Typically, administrative agencies exist in the executive branch and are created and assigned specific tasks by the legislature.

International Law

International law is the body of legal rules, regulations, and accepted practices observed by nations, and it defines nations’ legal responsibilities in their conduct with each other and with private individuals and transnational companies. International law is enforced primarily through diplomacy and for reasons of courtesy or expediency.

Sources of international law include international conventions and treaties, international customs (i.e., international law that derive from custom), general principles of law recognized by the legal systems of civilized nations, the decisions of international and municipal courts, and the publications of scholars.

Substantive and Procedural Law

Law can be categorized as substantive or procedural law.

Substantive law defines the type of conduct permissible and the penalties for violation; it is composed of the basic laws of rights and duties. When people say an act is “against the law,” they are referring to substantive law.

Substantive law can be further subdivided into public and private law. *Public law* governs the relationship between individuals and the state; it involves such areas as: constitutional law, administrative law, and criminal law. *Private law* encompasses those areas where the legal system is used to resolve disputes between private parties. Examples of private laws are the laws concerning real property, contracts, civil wrongs (e.g., negligence), wills and estates, intellectual property, business organization law, and so on.

Procedural law defines the rules by which individual cases are decided; it sets out the rules of the legal system, including the procedures to be followed in hearing a grievance. Procedural law might include deadlines, filing requirements, steps to follow in bringing a claim, rules of evidence, and so on. Substantive law sets the terms of any dispute; procedural law dictates *how* a legal dispute is handled.

For country-specific information regarding how procedural law works, see the content on “Procedural Law” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Types of Legal Systems

Despite the wide variety of legal systems—from the power structures of governments to the judicial processes—there are patterns of legal systems in certain countries that makes it easier to evaluate the legal process in each jurisdiction. These patterns arise due to a combination of factors, such as regional ties, former colonial influences, and international initiatives to conform laws to model standards.

Systems of Government

The most fundamental element to understanding a particular jurisdiction’s legal system is to identify the structure of its government. To know the laws that apply to a case, it is necessary to determine the system of government in the relevant jurisdictions. For example, suppose that a person in Montreal, Canada, has engaged in questionable banking transactions. Which laws would determine whether the conduct was fraudulent—the laws of the Canadian federal government, the laws of the provincial government of Quebec, local laws, or a combination?

Additionally, what sources of law apply to determine the suspect's rights regarding a potential investigation? Understanding the system of government can help answer these questions.

There are various ways to classify systems of government, but one of the most helpful for understanding the laws of a particular jurisdiction is whether the system uses a federal or unitary power structure. Moreover, almost every modern-day government can be classified as being either unitary or federal in nature.

The majority of countries are *unitary systems*, meaning that a central government holds all governmental power within the nation. This central government may delegate power to created agencies and regional governments, but it remains the supreme governmental authority in the country. While delegated powers might include law-making authority, substantive laws regarding criminal misconduct, including most fraudulent acts, are typically directly legislated by the central government.

The other major structural system of government, the *federal system*, features both a national government (typically called the *federal government*), along with semi-autonomous regional governments (often called *states* or *provinces*). Unlike unitary systems, not all governmental powers are held by a central authority. Rather than being delegated powers, the state or provincial governments are reserved certain independent powers. The relative strength of state or provincial governments to that of their respective federal government varies from country to country, but normally the federal government has wider authority.

Federal and state or provincial governments are likely to share the space of fraud-related laws. For instance, a state or provincial government might prohibit embezzlement from any party within its jurisdiction, while the federal government has a separate law prohibiting embezzlement against national banks. The laws among states and provinces and the federal government also might differ. For example, one province might restrict pre-employment criminal background checks, but the other provinces and the federal government might not.

While not always the case, geographically large countries tend to be federations, such as Russia, Canada, the United States, Brazil, Australia, and India.

One government body that does not easily fit either a unitary or federal classification is the European Union (EU), which is made up of many countries that are generally considered autonomous. At the same time, the EU has considerable power to create mandatory

directives for members to implement substantive and procedural laws. Each member institutes its own version of substantive laws required by the EU, so the laws of the relevant country are the primary determinant of legal issues in fraud cases occurring there.

Common Law and Civil Law Judicial Systems

In addition to classifying countries based on federal or unitary power structures, almost every country can be classified as having either a common law or a civil law judicial system; knowing the differences between the two is essential to understanding how legal and judicial processes work in foreign jurisdictions. Both systems tend to adopt a certain method of fact-finding—adversarial or inquisitorial, respectively. Regardless of which type of legal system is used, most countries develop their own variation or incorporate other features into their systems.

Common Law Systems

In most *common law systems*, there are laws that judges develop through court decisions (called the *common law*), as well as codes and statutes that establish laws. As opposed to legislative statutes, the common law is developed on a case-by-case basis. Again, the common law is a system of legal principles developed by judges through decisions made in courts. It consists of the usages and customs of a society as interpreted by the judiciary, and it is often referred to as *judge-made law*. Common law originated as a legal system in England, and some of the principles established hundreds of years ago in court decisions remain influential to contemporary legal issues. Today, common law systems exist in the United Kingdom, the United States, India, Australia, and many other countries that were once part of the British Empire or were influenced by such legal systems.

In common law countries, there are two sources of substantive law: statutory law and common law. Again, *statutory law* includes statutes passed by legislatures (and regulations passed by administrative bodies).

In the modern era of law, the trend in common law countries has been to move away from rules that originate in common law and instead rely on statutory law—laws created by a legislature or other governing authority—as the basis of a dispute.

However, an additional feature of the common law system that remains important is the precedential value of court decisions. Due to the ambiguity or incompleteness of statutes, legal disputes often arise in which parties support competing interpretations of a law.

To decide disputes in common law systems, judges analyze prior cases with similar circumstances and apply the basic principles set forth in those cases to the problem at hand.

In common law systems, judges, particularly at the appellate level, often set out the reasons for their decisions in a written opinion, and these written decisions serve to guide judges in deciding cases of a similar nature. Decisions that establish particular legal principles are called *precedent*. Under the doctrine of *stare decisis*, lower courts are bound to follow the precedents of higher courts until or unless the rule of law established is overturned by a higher court or the legislature. The body of judicial opinions is sometimes referred to as *case law*.

If the legislature believes that a court's interpretation of a statute is incorrect, it may amend the statute to make it clearer.

The distinction between statutory law and common law is relevant to establishing the legal elements of a potential fraud in common law systems. Although criminal fraud statutes outlaw certain behavior, they often contain provisions that do not have any obvious connection to basic principles of right and wrong. Thus, fraud examiners preparing criminal cases must be familiar with the specific technical elements of the applicable statutes, and they must carefully review the evidence to make certain that all essential elements of proof are met.

In contrast to criminal fraud statutes, civil cases brought under the common law usually contain fewer technical elements and incorporate traditional principles of fairness and morality. For example, a plaintiff may file a common law claim for fraud by alleging simply that the defendant misrepresented important facts upon which the plaintiff relied, resulting in loss to the plaintiff.

Civil Law Systems

In contrast to common law systems, *civil law systems* apply laws from an accepted set of codified principles or compiled statutes. Individual cases are then decided in accordance with these basic tenets. Under a civil law system, the judges or judicial administrators are bound only by the civil code and not by the previous decisions of other courts. In deciding legal issues, a civil law judge applies the various codified principles to each case. However, *lacunae*—gaps in the law—are sometimes present, and judges may seek to fill in such gaps by looking to other authorities or similar laws, including judicial decisions.

Civil law and common law systems may exist within the same country. For example, in Canada, the legal system in the province of Quebec is not based on the British tradition of common law (as in the other provinces); instead, it is more influenced by the French and Roman civil law systems.

Although there are many differences between common law and civil law systems, they are not entirely different. Both systems contain many of the same basic principles. The main distinction between the two is that judges under common law systems are bound by precedent while judges under civil law systems are not; instead, judges under civil law systems are bound by the civil code. Judges in civil law systems have to interpret the code, but they need not rely on previous cases in doing so. As a practical matter, however, most civil judges do consider previous decisions to guide their interpretations of the code.

Furthermore, much of the distinction between civil and common law systems is procedural—involving how the case will be decided. The substantive law outlined in this manual usually exists in some variation whether a civil or common law system is in place. For instance, the elements of the crime of embezzlement (intentionally and wrongfully stealing or converting the property of another that has been entrusted to the accused) are standard throughout most countries, regardless of whether the system is based on civil or common law.

Note that the concept of a *civil law system* should not be confused with the terms *civil law* and *criminal law*. *Civil law* is the body of law that provides remedies for violations of private rights, and a civil action is a legal action that does not result in a criminal fine or incarceration. A civil suit in this context has nothing to do with whether the legal system used by the particular government is a civil law jurisdiction or a common law jurisdiction. Most often, *civil* refers to a suit between two private parties. Conversely, *criminal law* is the body of law pertaining to crimes against the state or conduct that harms society. Thus, in this context, *civil* is used to differentiate a civil action from a criminal charge.

Adversarial and Inquisitorial Processes

Adversarial and *inquisitorial* judicial processes refer to the approach that courts take to discover evidence in a case. Theoretically, neither of these processes is exclusive of common law or civil law systems. Civil law jurisdictions, however, almost always favor an inquisitorial process, while common law systems typically feature an adversarial system. The United States, for example, is a common law jurisdiction with an adversarial process. Adversarial and inquisitorial techniques can also be employed in the same country under different circumstances.

ADVERSARIAL PROCESSES

Adversarial processes are those in which the parties to a proceeding drive the discovery process (the search for evidence). The theory behind this approach is that the competing interests of the parties will serve to expose the relevant facts of the case.

In adversarial systems, the parties to the litigation gather and present the evidence to the court. For example, the parties (usually through legal counsel) conduct questioning of fact and expert witnesses. The fact finder of the court, which can be a judge, jury, or administrator, is unaware of the details of the case until the parties present evidence. Judges facilitate the production of evidence between the parties, but they generally do not seek evidence on the court's behalf.

One of the distinct features of the adversarial process is its approach to criminal procedure, where the rights of defendants are of paramount concern. Most adversarial court systems do not require defendants to testify. Also, defendants are given the presumption of innocence, which puts the burden of proof on the government to prove the criminal accusations.

INQUISITORIAL PROCESSES

An *inquisitorial* process refers to a fact-finding approach that places the primary responsibility of discovering evidence on the presiding judge.

In an inquisitorial process, the primary goal is to find the truth. Rather than serving as a referee over the parties' production of evidence, the judge is actively involved in discovery. For instance, judges may request relevant documents on their own accord and ask factual questions of witnesses themselves. As a result, attorneys play a smaller role in the evidentiary process than in an adversarial process.

Criminal rights are generally less emphasized in inquisitorial trials than in adversarial systems; the former system focuses on getting to the truth of the matter. One of the most significant departures from the adversarial process is that defendants in criminal inquisitorial proceedings may be called to testify (whereas in adversarial systems, the defendant may testify but does not have to do so). Note that civil (as opposed to criminal) proceedings under both adversarial and inquisitorial processes typically allow the defendant to be called to testify.

Furthermore, once the trial is underway, the presumption of innocence in inquisitorial processes is not generally as strong as in an adversarial, common law system. Instead, inquisitorial processes focus on not trying a person unless there is strong evidence to believe that the suspect is likely guilty.

ROLE OF JURIES

While juries can be found in both adversarial and inquisitorial jurisdictions, most adversarial jurisdictions actively use juries as the fact-finding body, while the judge decides issues of law. However, some cases in adversarial jurisdictions (often called *bench trials*) are decided factually and legally by a judge.

The judge in an inquisitorial process both serves as the traditional fact finder and makes determinations on issues of law. However, some inquisitorial systems use juries, laypersons, or a combination of judges (or legal professionals) and laypersons in serious cases.

International Issues in Fraud Cases

Fraud has never been a strictly domestic issue, but the digital age and the ease with which activity among parties of different countries is conducted have made fraud more of a global issue than ever before. Fraud cases involving assets or parties from diverse jurisdictions can lead to several legal issues of which fraud examiners should be aware.

Choice of Law

Which court has jurisdiction over an issue could depend on several factors, such as a party's presence in the jurisdiction where the court is located. A similar issue is that courts must choose which jurisdiction's laws to apply to each issue in a case. Problems arise because the outcome of a case might depend on which jurisdiction's laws are applied. In other words, conduct that is fraudulent in one jurisdiction might be legal, carry different penalties, or result in different remedies in another jurisdiction.

In terms of procedural law, almost every court applies the procedural rules of its own jurisdiction (which includes choice-of-law rules). However, the way that courts choose substantive law is less consistent. Generally, most courts consider some mix of the following factors to determine which jurisdiction's laws apply:

- The nationality of the parties to the litigation
- The current residence of the parties (whether temporary or permanent)

- The parties' current or past physical presence in the relevant jurisdictions
- The jurisdiction where the transaction or underlying cause of action occurred

In addition, when a dispute involves real property, the laws of the country where the property is located usually apply to resolve questions of ownership.

Enforcement of Judgments

After a fraud is discovered, fraud examiners might need to assist in making a recommendation concerning the recovery of lost assets. In cases involving suspects in foreign jurisdictions, this task can be complicated by the ability to obtain and enforce a judgment against a particular defendant. For instance, a domestic judgment against a foreign defendant is usually helpful for recovering the defendant's assets located in the domestic country, but it might be worthless for obtaining the defendant's assets in a foreign country.

Some, but not all, countries enforce foreign judgments concerning parties or assets within their jurisdiction. Whether the country will enforce a foreign court's judgment usually depends on the circumstances in which the internal laws of the jurisdiction recognize foreign judgments and whether the two countries of each court have an enforcement treaty.

Alternatively, a fraud victim could seek to obtain a judgment against a foreign suspect in the suspect's home country. The cost and feasibility of this endeavor can vary widely. Therefore, whether an enforcement action against a foreign defendant is sought is a legal issue, and fraud examiners should consult legal counsel in making a recommendation.

Court Systems

Countries have different types of court systems. Many courts follow a tiered court system in which there are trial courts and appellate courts. In such systems, the trial court conducts the trial and issues a judgment. Then, the lower level appellate courts review the trial court's rulings and procedures and issue a decision. The lower level appellate court's ruling is then subject to review by subsequent levels of appellate review.

Courts are defined by their jurisdiction and venue. *Jurisdiction* is the power of a court to hear and decide a given case; it refers to both the subject matter and people over which lawful authority may be exercised by a court. For instance, a country might have a system of probate courts that only have jurisdiction to hear cases whose subject matter is related to wills,

inheritance, and other probate matters. Some countries have low-level trial courts that only have jurisdiction to hear matters under a certain monetary amount. Similarly, a court's jurisdiction is defined by the parties that it may hear a case about. For example, courts usually do not have jurisdiction over foreign parties who have never been to and have had no business or presence in the court's jurisdiction.

Venue refers to the geographical area covered by the court; it is the physical location where the lawsuit is to be tried. Venue is technically an element of the court's jurisdiction. This issue may be important in deciding where to file charges or claims.

A particular court's jurisdiction is defined by the laws of its jurisdiction, but, generally, there are three common elements to consider when determining whether a given court has the power to hear and determine a case. First, does the court hear cases of the type in question? For example, if a plaintiff brings a civil complaint claiming \$500,000 in damages, the plaintiff needs a court that hears civil complaints of that magnitude.

Second, does the court have the authority to exercise its power over a particular defendant or piece of property? This element usually requires the party to have some sort of current or past presence or activity within the jurisdiction.

Third, most jurisdictions require the court to have proper venue as an element of jurisdiction. Rules of venue can be based on a mixture of factors, including convenience to the parties (e.g., where they reside) and where the acts that underlie the case occurred. In some instances, there will be multiple courts that have jurisdiction over a case, and the parties that believe they are subject to prejudice in a court will seek to change the venue to a court more favorable to themselves.

For more detailed information on how court systems work in different jurisdictions, see the content on "Specific Court Systems" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

Civil and Criminal Actions for Fraud

Fraud may be prosecuted criminally, civilly, or both, in sequence or simultaneously, but there are a number of differences between criminal and civil actions with which CFEs should be familiar. The following is a brief overview of civil and criminal actions as they relate to fraud.

For a more detailed description of differences between civil and criminal actions in different jurisdictions, see the content on “Criminal Versus Civil Actions for Fraud” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Criminal Actions

A *criminal action* begins with a complaint brought by the government, acting on behalf of citizens and the interest of the jurisdiction, against a person accused of violating a law. Increasingly, most criminal offenses are codified in statutes or regulations.

Typically, to be guilty of a crime, defendants must be found to have committed an offending act (called the *actus reus*) and to have the requisite culpable mental state when they committed the act (called the *mens rea*). The *actus reus* may involve the full act of committing a crime or merely the initial steps for crimes of attempt. Different offenses require different levels of *mens rea*, such as actual intent, recklessness, or, in some circumstances, no more than gross negligence.

Some criminal offenses, however, are strict liability offenses, which are offenses in which the government does not have to prove the defendant’s intent.

Criminal cases are punished by outcomes such as imprisonment, fines, orders of restitution, probation, and community service.

Civil Actions

A *civil action*, as opposed to a criminal action, is an action for wrongdoing that does not result in a criminal fine or incarceration. In contrast to criminal actions, which are brought by the government, civil actions may be brought by private individuals or organizations, usually without the involvement or permission of the government or court. However, government entities may also bring civil actions to pursue noncriminal remedies against other parties. Civil actions, if successful, result in an award of civil remedies.

There are a variety of substantive civil causes of action, but the two main causes that fraud examiners are likely to come across are contract actions and civil wrongs (or delicts).

Contract Actions

Contract actions are civil actions based on contract obligations. A *contract* is an oral or written mutual agreement between two or more individuals or entities that the law will enforce in some way.

Most contract actions are breach of contract lawsuits. A *breach of contract* occurs when one or both parties fail to perform, or announce that they do not intend to perform, without just cause. If a party breaches, the other party may sue for damages—the loss caused by the other party’s failure to perform—or, in some instances, for specific performance (i.e., an order from the court compelling the defaulting party to perform).

Civil Wrong and Delict Actions

In common law jurisdictions, a *civil wrong* is a private wrong, such as fraud, that does not arise out of contractual obligations.

In civil law jurisdictions, the equivalent of a civil wrong is often called a delict. A *delict* is a culpable, wrongful act that causes injuries and results in liability for the person who committed the act.

To successfully bring a civil wrong or delict action, there are generally three requirements:

- A party must owe a duty to another party.
- The party that owes the duty breaches that duty.
- The breach results in losses.

A person who suffers a civil wrong is entitled to receive compensation for damages from the party responsible for the act.

Parallel Proceedings

Parallel proceedings are simultaneous criminal and civil actions against the same defendant that are based upon a single set of facts. For example, a victim of fraud might sue the fraudster in civil court while the fraudster is being prosecuted in criminal court. Some jurisdictions permit parallel proceedings, while others do not.

In jurisdictions that allow parallel proceedings, the government or the defendant can generally petition one of the courts for a *stay of proceedings* to have a proceeding temporarily suspended.

A court might order a stay of proceedings if it determines that the parallel proceeding would harm the government's case or unduly prejudice the defendant. However, most courts are reluctant to grant a stay of proceedings under these circumstances.

For additional information regarding how parallel proceedings work in specific jurisdictions, see the content on "Criminal Versus Civil Actions for Fraud" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

Administrative Proceedings

In addition to civil and criminal actions, fraud cases are sometimes resolved in administrative proceedings. *Administrative proceedings* are non-judicial proceedings conducted by government agencies. In some jurisdictions, for example, the government agency responsible for collecting taxes also has the authority to adjudicate certain cases involving tax fraud.

Generally, administrative proceedings operate like civil courts with their own rules of evidence and procedure. In some administrative proceedings, the presiding officer is a special administrative judge; in others, the ultimate decision-maker is a board or tribunal.

Administrative Penalties

Imprisonment and other criminal penalties are not generally imposed in administrative proceedings. Although administrative penalties vary by jurisdiction, some common types of administrative penalties include the following:

- Monetary fines and penalties
- License suspension or revocation
- Debarment

Monetary Fines and Penalties

Monetary fines and penalties are imposed to punish the defendant for violating a law. This includes the payment of monetary damages, which are awarded to compensate victims for damages caused by fraud.

License Suspension or Revocation

Administrative proceedings can result in the suspension or revocation of a professional license. For example, a government medical board might revoke a doctor's license to practice medicine after determining that the doctor engaged in health care fraud.

Debarment

Under some laws, individuals and businesses can be debarred (i.e., excluded) from participating in government programs. For example, a contractor who engages in procurement fraud might be prohibited from bidding on government contracts in the future.

Debarment can be temporary or permanent, and debarred parties are often added to a list that is maintained by the government agency and viewable by the public.

THE LAW RELATED TO FRAUD

Countries use a wide variety of laws and regulations to prohibit fraud and related crimes. This chapter covers some of the most common types of offenses, as well as several important laws and initiatives designed to combat fraud and corruption. It is important to keep in mind, however, that the legal systems in different countries or jurisdictions can vary dramatically. Thus, fraud examiners should always consult with counsel regarding local laws and regulations.

Definition of *Fraud*

Black's Law Dictionary defines *fraud* as:

a knowing misrepresentation of the truth or concealment of a material fact to induce another to act to his or her detriment.

Fraud includes any intentional or deliberate act to deprive another of property or money by guile, deception, or other unfair means.

Principal Types of Fraud

The principal categories of fraud (also known as *white-collar crime*) are:

- Fraudulent misrepresentation of material facts (or false pretenses)
- Negligent misrepresentation
- Concealment of material facts
- Bribery
- Illegal gratuity
- Economic extortion
- Conflicts of interest
- Forgery
- Theft of money or property
- Breach of contract
- Breach of fiduciary duty
- Gross negligence
- Conspiracy
- Mail fraud

- Wire fraud
- Obstruction of justice
- Perjury
- False claims and statements to government agencies

These categories are discussed in detail below. For information regarding U.S. anti-fraud legislation that relates to most of the aforementioned types of fraud, see the content on “Anti-Fraud Legislation” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Fraudulent Misrepresentation of Material Facts

Fraudulent misrepresentation of material facts is most often thought of when the term *fraud* is used. Misrepresentation cases can be prosecuted criminally or civilly. The gist of the offense is the deliberate making of false statements to induce the intended victim to part with money or property.

The specific elements of proof required to establish a misrepresentation claim vary somewhat according to where the fraud occurred and whether the case is brought as a criminal or civil action, but the elements normally include:

- The defendant made a false statement (i.e., a misrepresentation of fact).
- The false statement was *material* (i.e., the statement was sufficiently important or relevant to influence decision-making).
- The defendant knew the representation was false.
- The victim relied on the misrepresentation.
- The victim suffered damages as a result of the misrepresentation.

Although it might be necessary to prove that the victim relied upon the false statements and actually suffered a loss in a civil case, these elements of proof might not be necessary in a criminal prosecution. In addition, in some statutes, materiality is assumed and need not be proved.

Normally, only material false statements may serve as the basis for a misrepresentation of material facts case. *Materiality* usually refers to statements sufficiently important or relevant to a reasonable person in acting or making a decision. For example, a claim that a company enjoyed a 50% growth in profits would probably be material to a prospective investor,

whereas a statement that the company was considering moving its headquarters from Toronto to New York City might not be. The materiality of allegedly false statements is often a central issue in securities fraud cases.

Moreover, in most instances, only false representations of “presently existing facts” can establish liability for misrepresentation claims. That is, opinions by nonexperts, speculative statements about future events, and other general assertions, even if made with the intent to mislead, may not provide the basis for a misrepresentation claim because such statements are not material facts. For example, a used car salesperson who assures a customer that a twenty-year-old car, which was towed into the lot, will give the customer “years of driving pleasure” probably cannot be held liable for misrepresentation. The salesperson, however, could be liable for telling the customer that the car has been driven only 15,000 miles while knowing that it has been driven 150,000 miles.

The general rule that opinions or speculative statements cannot give rise to a successful misrepresentation claim is often applied to prevent fraud claims in contract disputes. A party to a contract who promises to perform certain services by a particular date but fails to do so normally cannot be prosecuted for fraud unless the plaintiff can demonstrate that the defendant had the intent not to perform the promised services when the contract was made. Of course, the other party may file an action for breach of contract.

Also, the general rule precluding fraud actions based on opinions or speculative statements is subject to certain exceptions, principally cases involving opinions provided by professional advisers such as certified public accountants (CPAs). That is, people who hold themselves out as having special expertise on which another party reasonably relies may be liable for a false opinion that is within that area of special expertise. For example, independent accountants may be liable for misrepresentation if they do any of the following:

- Falsely certify that a financial statement fairly presents the financial condition of the audited company
- Falsely state that the audit was conducted in accordance with generally accepted accounting principles
- Deliberately distort the audit results

In almost all fraud cases, the party alleging fraud must prove that a false statement was intentional and part of a deliberate scheme to defraud. A person intentionally makes a false statement if it is their desire to cause social harm or if they act with knowledge that social

harm will almost certainly result from their actions. In some instances, particularly those involving civil actions for fraud and securities cases, the intent requirement is met if the party alleging fraud is able to show that the false statements were made *recklessly*; that is, with complete disregard for truth or falsity.

Moreover, there is no such thing as an accidental or negligent fraud. For example, mistakenly entering incorrect numbers on a financial statement is not fraud; however, knowingly entering incorrect numbers with the intent that someone will take action in reliance on them is fraud if the other elements are present.

Negligent Misrepresentation

Although a misrepresentation fraud case may not be based on negligent or accidental misrepresentations, in some instances, civil liability may arise from negligent misrepresentation. Negligent misrepresentation occurs in situations where there is a special relationship that imposes a duty on the defendant to provide correct information to the plaintiff.

Generally, the specific elements required to establish a negligent misrepresentation claim are as follows:

- The defendant made a misrepresentation of a material fact.
- The misrepresentation was made pursuant to a special relationship that imposed a duty on the defendant to provide correct information.
- The defendant had no reasonable basis to believe the misrepresentation to be true.
- The victim relied on the misrepresentation, and the reliance was reasonable.
- The victim suffered damages as a result.

The main difference between fraudulent misrepresentation and negligent misrepresentation is that fraudulent misrepresentation requires that the statements be made intentionally and as a part of a deliberate scheme to defraud, whereas negligent misrepresentation only requires that the statement was made while having no reasonable basis to believe it to be true.

This civil action is appropriate if a party suffered a loss because of the carelessness or negligence of another party upon which the first party was entitled to rely. For example, a false statement regarding the value of a closely held company's stock that is negligently made to a prospective purchaser could give rise to a misrepresentation claim. Similarly, a false statement regarding the accuracy of a company's financial statements that is negligently made to a prospective purchaser could also give rise to this type of claim.

Concealment of Material Facts

An action for fraud may be based on the concealment of material facts, but only if the defendant had a duty in the circumstances to disclose. The essential elements of fraud based on the failure to disclose material facts are:

- The defendant had knowledge of a material fact.
- The defendant had a duty to disclose the material fact.
- The defendant failed to disclose the material fact.
- The defendant acted with intent to mislead or deceive the victim(s).

The duty to disclose usually depends on the relationship between the parties. Those people who occupy a special relationship of trust, such as the officers or directors of a corporation, a lawyer, accountant, trustee, stockbroker, or other agent, may be found to have a duty to completely disclose material facts to the parties who rely upon them. Statutes might expand the duty to disclose to areas in which traditionally there was no such duty, such as to the sellers of personal or real property or to the purchasers or sellers of securities.

Proof that the concealed fact was material is probably the most important element in a concealment case; there can be no liability if the withheld information was not material (i.e., the information would not have affected the other party's actions or decisions).

Also, it is not necessary to prove that the defendant knew for certain that the victim would be harmed. It is only necessary to prove that the defendant's intention was to mislead or deceive the victim.

In addition to being liable for fraudulent concealment, a defendant might be liable for negligent failure to discover and disclose material facts. An accountant, for example, might be liable for failure to discover or report material facts in a financial statement or audit. Of course, as with negligent misrepresentation, the penalties are less severe for negligent concealment than fraudulent concealment, and there is no criminal liability for negligent concealment.

Bribery

Bribery is a form of corruption that may be defined as the offering, giving, receiving, or soliciting of anything of value to influence an act or a decision.

Types of Bribery Schemes

Bribery schemes are classified into two types: official bribery and commercial bribery.

OFFICIAL BRIBERY

Official bribery refers to the corruption of a public official to influence an official act of government. Illegal payments to public officials can be prosecuted as official bribery, and they can give rise to stiff penalties. The elements of official bribery vary by jurisdiction, but they generally include:

- The defendant gave or received (offered or solicited) a thing of value.
- The recipient was (or was selected to be) a public official.
- The defendant acted with corrupt intent.
- The defendant's scheme was designed to influence an official act or duty of the recipient.

COMMERCIAL BRIBERY

In contrast, *commercial bribery* refers to the corruption of a private individual to gain a commercial or business advantage. That is, in commercial bribery schemes, something of value is offered to influence a business decision rather than an official act. In some countries, commercial bribery might be referred to as *secret commissions*.

Commercial bribery may not be a crime in every jurisdiction. For example, in the United States, there is no federal statute that prohibits commercial bribery, but many states outlaw the practice. Canada and the United Kingdom, however, do criminalize commercial bribery. If a jurisdiction does not have a commercial bribery statute, it may still prosecute commercial bribery schemes under other fraud statutes on the theory that the payment of a commercial bribe defrauds the business owner of the right to an employee's unbiased and loyal services.

The elements of commercial bribery vary by jurisdiction, but they typically include:

- The defendant gave or received a thing of value.
- The defendant acted with corrupt intent.
- The defendant's scheme was designed to influence the recipient's action in a business decision.
- The defendant acted without the victim's knowledge or consent.

Commercial bribery requires a lack of knowledge or consent on the principal's part, and the "without the knowledge or consent of the principal" element is included on the theory that a private business owner is not defrauded if the owner knows of or allows employees to accept gifts, favors, or other payments from vendors or other business contacts.

Methods of Making Corrupt Payments

To establish a bribery claim, the party bringing the action must prove that the defendant offered a thing of value, and generally, the item of value element necessary to establish a bribery scheme is defined broadly. That is, in bribery schemes, the *thing of value* is not limited to cash or money. Any tangible benefit given or received with the intent to corruptly influence the recipient may constitute an illegal payment. Courts have held that such things as lavish gifts and entertainment, payment of vacation travel and lodging expenses, payment of credit card bills, loans, promises of future employment, and interests in businesses, can be bribes if they were given or received with the intent to influence or be influenced.

Corrupt Influence

To establish a bribery claim, the party bringing the action must prove that the defendant acted with corrupt influence. Proof of corrupt influence often involves demonstrating that the person receiving the bribe favored the bribe-payer in some improper or unusual way. For example, corrupt influence often is established by showing that the person receiving the bribe:

- Provided preferential treatment to the bribe-payer
- Bent or broke the rules
- Took extraordinary steps to assist the bribe-payer
- Allowed the bribe-payer to defraud the agency or company

Although, to prove corrupt influence, it is not necessary that the prosecution or plaintiff demonstrate that the bribe-taker acted improperly; a bribe might be paid to induce an official to perform an act that otherwise would be legal, or an act that the official might have performed without a bribe. Bribery schemes involving these circumstances, however, are difficult to prove and lack appeal for prosecution.

Illegal Gratuity

Illegal gratuities are items of value given to reward a decision, often after the recipient has made the decision. Illegal gratuities are similar to official bribery schemes, and most illegal gratuity laws outlaw gratuities in the public sector.

In general, the elements of an illegal gratuity are:

- A thing of value
- Given, offered, or promised to (or demanded, sought, received, or accepted by)
- A (present, former, or future) public official
- For or because of any official act performed or to be performed by that public official

The major difference between an official bribe and an illegal gratuity is that an illegal gratuity charge does not require proof that the gratuity was given for the purpose of influencing an official act. That is, an illegal gratuity charge only requires that the gratuity be given for, or because of, an official act.

In the typical illegal gratuity scenario, a decision is made that happens to benefit a certain person or company. The party who benefited from the decision then gives a gift to the person who made the decision. The gifts are merely offered as a thank-you for something that has been done.

Economic Extortion

An extortion case is often the flip side of a bribery case. *Extortion* is defined as the obtaining of property, money, or services from another by using coercion. Coercion can take many forms, but it generally involves the threat or use of physical force, property damage, or reputational damage. A demand for a bribe or kickback, coupled with a threat of adverse action if the payment is not paid, might also constitute extortion.

Generally, extortion is not a defense to bribery. That is, a person who makes a bribe payment upon demand of the recipient still is culpable for bribery. In some jurisdictions, however, extortion may be a defense in certain circumstances.

Conflicts of Interest

A *conflict of interest* occurs when an employee or *agent*—someone who is authorized to act on behalf of a principal—has an undisclosed personal or economic interest in a matter that could influence their professional role. It encompasses a conflict between the professional duties and the private interest of an employee or agent, in which the employee or agent's private interest could improperly influence the performance of their professional duties and responsibilities.

Conflicts of interest involve a state of opposition between an individual's personal and professional interests, and they can occur in various ways. For example, a conflict may occur when a procurement employee accepts inappropriate gifts, favors, or kickbacks from vendors, or when an employee engages in unapproved employment discussions with current or prospective contractors or suppliers.

Statutes (in some cases) or common law prohibit people from engaging in conduct that involves a conflict of interest.

Elements of a typical civil claim for conflict of interest include:

- The defendant is an agent of a principal or employer.
- The agent takes an interest in a transaction.
- The agent's interest is actually or potentially adverse to the principal (i.e., the interest is one that could cause the agent or employee to place their personal interests ahead of the principal or employer).
- The agent did not disclose the interest and obtain approval by the principal.

Conflicts of interest do not necessarily constitute legal violations, as long as they are properly disclosed. Thus, for a conflict of interest claim to be actionable, the conflict must be undisclosed.

Conflicts of interest occur in principal-agent relationships. A principal-agent relationship is an arrangement in which one person (the "agent") is authorized to make decisions on behalf of another person or entity (the "principal"). Common principal-agent relationships include principal and agent, employer and employee, principal and independent contractor, client and attorney, client and accountant, property owner and real estate agent, and the public and government official.

Trust is central to the principal-agent relationship, and conflicts of interest exist when there is an incompatibility between an agent's personal interest and their duties and responsibilities in serving their principal.

An *agent* is any person who, under the law, owes a duty of loyalty to another. Officers, directors, employees, public officials, trustees, brokers, independent contractors, lawyers, and accountants all function as agents. People who do not occupy positions of trust with another party, such as arm's-length commercial parties, are not subject to conflict of interest restrictions.

A *principal* is an entity that authorizes an agent to act on its behalf. In a principal-agent relationship, the agent acts on behalf of the principal, and the agent should not have a conflict of interest in carrying out the act on behalf of the principal.

All of the following situations might give rise to a conflict of interest claim:

- An employer's interests are directly or indirectly affected or likely to be affected in some negative way by the private actions of an employee.
- The private actions of employees impair their ability to pursue the interests of their employers.

- The private actions of employees compromise their employer's business interests.
- The private actions of employees leave them in a position of gain or potential gain at the expense of their employer.
- Employees use knowledge or information learned through their employment to pursue their own private interests.

If the defendant in a civil conflict of interest case is found liable, they may be ordered to repay any losses that the conflict caused and “disgorge” any profits they earned because of the conflict, even if there was no actual loss to the principal. The “disloyal” party also might be required to forfeit all compensation received during the period of disloyalty. The victim of a conflict of interest also may void any contracts entered into on its behalf that were the result of or influenced by the conflict.

Forgery

A *forgery* is any writing prepared with the intent to deceive or defraud. The crime of forgery occurs when an individual, with intent to defraud, makes or alters a document apparently capable of defrauding another.

A document is not a forgery just because it contains a false representation. To constitute a forgery, the writing as a whole must have apparent legal significance. In addition, forgery occurs not only when an entire writing or instrument is created but also when there is any material alteration that affects the legal significance of the document or whenever a signature on a writing is fraudulently procured from a person who does not know what they are signing. Furthermore, the forgery is committed even if no one is actually defrauded.

Theft of Money or Property

Theft is a term often used to describe a wide variety of fraudulent conduct that encompasses many forms of deceitful taking of property belonging to others. As used here, however, the term *theft* is limited to embezzlement, larceny, and misappropriation of trade secrets and proprietary information.

Embezzlement

Embezzlement is the wrongful appropriation of money or property by a person to whom it has been lawfully entrusted (or to whom lawful possession was given). Embezzlement involves a breach of trust, although it is not necessary to show a *fiduciary relationship*—a relationship of

confidence, trust, or good faith—between the parties. The elements of embezzlement vary somewhat by jurisdiction, but generally are:

- The defendant took or converted
- Without the knowledge or consent of the owner
- Money or property of another
- That was entrusted to the defendant (the defendant had lawful possession of the property)

Larceny

Larceny is defined as the wrongful taking of money or property of another with the intent to convert or to deprive the owner of its possession and use. Unlike in embezzlement schemes, in larceny, the defendant never has lawful possession of the property. The elements of larceny typically include:

- Unlawfully taking or carrying away
- Money or property of another
- Without the consent of the owner
- With the intent to permanently deprive the owner of its use or possession

Larceny differs from embezzlement, and the difference centers on who has legal custody over the stolen articles. Larcenists take an item from its rightful owner without ever having had legal custody of that item. Embezzlers, conversely, take something in which they have lawful possession. Thus, the major distinction between larceny and embezzlement lies in the issue of whether the thief had been lawfully entrusted with the stolen articles.

Although larceny was an offense under the common law of England, it has been abolished in England and Wales, Northern Ireland, and the Republic of Ireland. In England and Wales, larceny was replaced by the broader offense of theft under the Theft Act 1968, and in Northern Ireland, larceny was replaced by the offense of theft under the Theft Act (Northern Ireland) 1969. (Scotland has a separate criminal law framework that differs from the one in England and Wales.) Accordingly, the terms *theft* and *larceny* are sometimes used synonymously. Larceny does, however, remain an offense in the United States and New South Wales, Australia.

Misappropriation of Trade Secrets

Misappropriation is the intentional, illegal use of the property, funds, or ideas of another person for an unauthorized purpose. In the fraud context, misappropriation claims generally involve trade secrets or other proprietary information.

Trade secrets include not only secret formulas and processes, but the term also refers to more mundane proprietary information, such as customer lists, sales figures, business plans, vendor contracts, blueprints and construction plans, bidding systems, computer programs, test data, pricing information, recipes, marketing plans, manufacturing processes, business forms, or any other confidential information that has a value to the business and would be potentially harmful if disclosed.

The definition of what constitutes a trade secret depends on the organization, industry, and jurisdiction, but the following three characteristics are common to most definitions:

- The information is not generally known to the relevant portion of the public.
- The information confers some sort of economic benefit on its holder (where this benefit must derive specifically from its not being generally known, not just from the value of the information itself).
- The information is the subject of reasonable efforts to maintain its secrecy.

The elements of a typical claim for misappropriation of trade secrets are:

- The defendant possessed information of value.
- The information was treated confidentially.
- The defendant took or used the information by breach of an agreement, confidential relationship, or other improper means.

Organizations and individuals can maintain legal protection over trade secrets by taking reasonable steps to keep the information secret. Safeguarding trade secrets should include measures such as security policies and procedures that protect sensitive information and mitigate risks associated with information security breaches, awareness training, physically securing the information to prevent unauthorized access and use, and strict limitations on distribution of the information.

The owners of the information also should enforce restrictive agreements and act promptly to remedy any inadvertent disclosures. Failure to do so might be construed as a waiver of confidentiality and make it impossible to prevent future use or disclosures.

Also, employers should consider requiring that all employees sign nondisclosure and noncompetition agreements upon the commencement and termination of employment. Such agreement can provide employers with legal recourse against those who misappropriate proprietary information.

Generally, a *nondisclosure agreement* is a written agreement providing that signatory employees must keep all trade secrets and proprietary information learned during their employment confidential. Nondisclosure agreements serve the following functions:

- They delineate the confidentiality expectations the employer has for its employees.
- They demonstrate that the employer is serious about protecting trade secrets and proprietary information.
- They show the reasonable efforts that the employer takes to maintain the secrecy of its confidential information.

A *noncompetition agreement* is an agreement whereby one party (usually an employee) agrees not to work for or start a company in competition against another party (usually the employer) within a certain period. Such agreements usually take effect after the employer-employee relationship has ended.

While noncompetition agreements can be useful for a variety of reasons, such as protecting trade secrets or goodwill, there are a number of legal issues that limit their effectiveness. For example, courts in some jurisdictions have held that such agreements are against public policy because they limit the future employment of a person; therefore, in these jurisdictions, noncompetition agreements are unenforceable. Moreover, even in jurisdictions that uphold these agreements, they will only do so if the agreements satisfy the following three elements:

- The agreement is supported by consideration at the time it is signed. If the employment agreement and the noncompetition agreement are signed at the same time (or if the noncompetition agreement is signed before the employee begins employment), the employment itself will be sufficient consideration for the promise not to compete. If, however, an employee signs the noncompetition agreement after beginning employment, the agreement generally will be invalid unless the employee receives something of value (besides the promise of continued employment) in exchange for the promise (e.g., a promotion or additional benefit that was not part of the original employment agreement).
- The agreement protects a legitimate business interest of the employer (e.g., confidential information and goodwill developed by an employer in terms of customer relations).
- The agreement is reasonable in scope, geography, and duration. Courts generally only enforce noncompetition agreements to the extent necessary to protect the employer. Thus, to be enforceable, such agreements must contain reasonable limitations to the scope, geographical area, and time in which a party may not compete.

Additionally, any noncompetition signed by an at-will employee who is not covered by an employment agreement would be unenforceable. Therefore, before instituting a noncompetition agreement, management should consult with legal counsel to make sure the agreement is valid and enforceable under the applicable law.

Furthermore, a person accused of misappropriating trade secrets might raise several defenses. The most typical defense is that the accused developed the information independently. The accused also might defend a misappropriation claim by showing that the information was not in fact a secret, that they were authorized to use the information, or that the owner had abandoned the trade secret.

CIVIL ACTION FOR MISAPPROPRIATION OF TRADE SECRETS

In most jurisdictions, a victim of trade secret theft may file a civil action for damages or request an *injunction*—a court order by which a party is required to perform, or is restrained from performing, a specific act—under various types of laws. Civil damages for misappropriation of trade secrets might include reimbursement for actual losses caused by the defendant, such as lost profits, reimbursement of development expenses and overhead costs, and the cost of efforts to protect the secret or recover damages, as well as for reduction in the value of business. Damages also can be measured by the defendant's profits, which may be ordered to be paid to the plaintiff. Punitive damages and attorney's fees also may be awarded.

In addition to or in lieu of monetary damages, the plaintiff in a civil action for misappropriation of trade secrets also may obtain an injunction prohibiting further use of the information. But injunctions are difficult to obtain. To obtain an injunction, the plaintiff must establish that an injunction is warranted. Generally, to demonstrate that an injunction is warranted, the plaintiff must establish that:

- The plaintiff is the proper owner of the trade secret.
- An unauthorized person has taken or used the trade secret.
- There is a high probability of improper disclosure.
- The injunction is necessary to prevent the plaintiff from suffering immediate and irreparable harm that cannot be adequately compensated by monetary damages.
- The plaintiff probably will win the underlying case for misappropriation of trade secrets.

Injunctions have been issued in trade secret cases to:

- Prevent the use of stolen information.
- Prohibit an employee in possession of a trade secret from accepting employment with a competitor.
- Order the wrongdoer to return the misappropriated information.

Breach of Contract

If the fraudster has any kind of a contractual relationship with the victim, there may be a breach of contract claim. A *breach of contract* occurs when one party to a contract fails to perform, or announces that it does not intend to perform, their contractual obligations without just cause. A breach of contract claim can arise under an oral or written contract.

Many jurisdictions have recognized certain implied or unwritten duties as a part of almost every contract. For instance, some courts have held that it is an implicit part of a contract that each party will use their best efforts to fulfill their duties under the contract. A similar duty that has been recognized in some jurisdictions is the duty imposed on each party to deal with each other in good faith. If a party to a contract, including employment contracts, breaches the duty of good faith, the non-breaching party may have a civil claim for breach of contract.

Breach of Fiduciary Duty

People in a position of trust or *fiduciary relationship*—such as officers, directors, high-level employees of a corporation or business, and agents and brokers—owe certain duties to their principals or employers, and any action that runs afoul of such fiduciary duties constitutes a breach.

Establishing a breach of fiduciary duty claim is easier than establishing a claim for fraud because a breach of fiduciary duty claim does not require proof of wrongful intent. In fact, to state a claim for breach of fiduciary duty, the plaintiff must show only that the defendant:

- Occupied a position of trust or fiduciary responsibility with respect to the plaintiff (e.g., was an employee or agent)
- Breached that duty to advance a personal interest

The principal fiduciary duties are loyalty and care.

Duty of Loyalty

The *duty of loyalty* requires that the employee/agent act solely in the best interest of the employer/principal, free of any self-dealing, conflicts of interest, or other abuse of the principal for personal advantage. Employees/agents who owe a duty of loyalty must act solely in the best interest of their principal and may not seek to advance their personal interests to the detriment of their principal. Accordingly, corporate directors, officers, and employees are barred from using corporate property or assets for their personal pursuits or taking corporate opportunities for themselves.

Additionally, if an employee/agent commits a more traditional form of fraudulent conduct, such as embezzlement, theft, acceptance of a kickback, and conflict of interest, the conduct also violates the employee/agent's duty of loyalty and may be redressed as such in addition to or instead of the underlying offense.

Duty of Care

The *duty of care* means that people in a fiduciary relationship must act with such care as an ordinarily prudent person would employ in similar positions. Corporate officers, directors, or high-level employees, as well as other people in a fiduciary relationship, must conduct their business affairs prudently with the skill and attention normally exercised by people in similar positions. Fiduciaries who act carelessly or recklessly are responsible for any resulting loss to the corporate shareholders or other principals. Damages may be recovered in a civil action for negligence, mismanagement, or waste of corporate assets.

People in a fiduciary relationship, however, are not guarantors against all business reverses or errors in judgment. In many countries, the *business judgment rule* protects corporate officers and directors from liability for judgments that were made in good faith (e.g., free of self-dealings or conflicts) and appeared to be prudent based on the then-known circumstances. Corporate defendants in such cases might raise the business judgment rule in defense by showing that they had no reasonable grounds to suspect such conduct or that the cost of prevention or recovery was too high compared to the anticipated returns.

Corporate officers breach their duty of loyalty if they accept kickbacks, engage in a conflict of interest, or are otherwise disloyal, but corporate officers who carelessly fail to prevent such conduct, enforce controls, or pursue recovery of losses might breach their duty of care.

Breach of Fiduciary Duty Claims

Generally, a breach of fiduciary duty claim is a civil wrong that is redressible by a civil action for recovery of damages. Typically, a plaintiff who brings a successful breach of fiduciary duty claim may receive damages for lost profits and recover profits that the disloyal employee/agent earned—in some instances even the salary paid to the employee or agent during the period of disloyalty. The plaintiff may recover profits earned by the disloyal agent even if the principal did not suffer an actual loss. The plaintiff also may void any contracts entered into on its behalf that were the result of or were influenced by the employee or agent's disloyalty.

Gross Negligence

Gross negligence is a civil cause of action, and it is generally defined as the intentional failure to perform a duty in reckless disregard of the consequences to the victim. Although the exact definition varies by jurisdiction, the basic elements of this civil cause of action are that the defendant committed an intentional act, knowing that it was at least substantially likely to cause harm to the victim.

In the employment context, employees have a duty to act in the best interests of their employers. So, if an employee consciously steals from their employer, the employee has breached their duty to act in the best interest of their employer and caused harm to their employer. Further, if the employee knew that the harm resulting from their wrongful act was likely to occur when they committed the act, their actions may rise to the level of gross negligence.

Generally, punitive or exemplary damages are available if the defendant is found liable for gross negligence.

Conspiracy

Conspiracy refers to a situation in which two or more people agree to commit an illegal act. In most jurisdictions, the crime of conspiracy is actually a separate criminal offense from the underlying crime, meaning that the underlying crime (e.g., bank fraud, bribery, securities fraud) and the conspiracy to commit it are two separate offenses.

The essential elements that must be shown to prove a conspiracy are as follows:

- The defendant entered into an agreement with at least one other person to commit an illegal act.
- The defendant knew the purpose of the agreement and intentionally joined in the agreement.
- At least one of the conspirators knowingly committed at least one overt act in furtherance of the conspiracy.

Under the first element, the government must prove that the defendant reached an agreement or understanding to commit an illegal act with at least one other person. The conspirators must agree about the precise illegal act.

Under the second element, the government must establish that the defendant knew of the conspiracy's existence and its objective. The government, however, does not have to establish that the defendant knew all the details or objectives of the conspiracy, and it does not have to prove that the defendant knew the identity of all the participants in the conspiracy.

Finally, the purpose of the conspiracy need not be accomplished for a violation to occur, but at least one of the co-conspirators must have carried out at least one overt act in furtherance of the conspiracy. The overt act must be an independent act that comes after the agreement to commit the illegal act and that is performed for the purpose of carrying out the conspiracy's objective. The overt act, however, need not be criminal and could be as innocuous as making a phone call or writing a letter.

Conspiracy counts are favored by prosecutors in some jurisdictions because they provide evidentiary and pleading advantages. If a conspiracy is shown, the acts and statements of one co-conspirator may generally be admitted into evidence against all, and each co-conspirator may be convicted for the underlying substantive offense (e.g., destroying government property) committed by any one of its members.

In some jurisdictions, a corporation cannot conspire with one of its own employees to commit an offense because the employee and employer are legally viewed as one. A corporation, however, can conspire with other business entities or third parties to commit conspiracy.

Mail Fraud

Some jurisdictions, such as Canada and the United States, have laws that prohibit mail fraud. Mail fraud laws generally prohibit the use of the country's mail system to perpetrate fraud. In the United States, the mail fraud statute also applies to the use of private interstate commercial carriers (e.g., FedEx, UPS, and DHL) in connection with a fraud scheme.

Mail fraud laws generally give the government broad authority to prosecute fraud schemes, even if parts of the scheme occur in another country. For example, an international Ponzi scheme perpetrated from Nigeria could be prosecuted under the U.S. mail fraud statute if the Nigerian fraudsters used the U.S. mail system to advance the scheme in a significant way.

Wire Fraud

In addition to the mail fraud statute, the United States also has a wire fraud statute. The U.S. wire fraud statute makes it a crime to defraud a victim of money or property by means of wire or other electronic communications (e.g., computer, telephone, radio, or television) in foreign or interstate commerce.

Unlike mail fraud, the wire fraud statute requires an interstate or foreign communication to constitute a violation. Thus, a wire communication does not violate the federal wire fraud statute unless it traveled via interstate or international (foreign) commerce in furtherance of the scheme.

Fraud examiners should be aware of the U.S. wire fraud statute because, while it is unique to the United States, the wire fraud statute gives the U.S. federal government broad jurisdiction over a wide range of fraudulent activity, including some fraud schemes that originate outside of the United States.

Obstruction of Justice

Obstruction of justice occurs when an individual engages in an act designed to impede or obstruct the investigation or trial of other substantive offenses. Prosecutors usually are pleased to discover such violations by defendants because they add a more sinister flavor to what might be colorless white-collar charges, and such actions can help to prove criminal intent.

Jurisdictions might have several criminal obstruction statutes. Some common types of obstruction statutes are those that prohibit:

- Influencing or injuring any officer of the court or juror by force, threats of force, intimidating communications, or corrupt influence
- Influencing a juror through a writing
- Stealing or altering records or processes by parties that are not privy to the records
- Using force or threats of force to obstruct or interfere with a court order
- Destroying documents related to a future proceeding
- Tampering with a witness, victim, or an informant (e.g., killing or attempting to kill, using force or threats of force, intimidating, influencing with bribes or other corrupt means, misleading, or harassing the protected parties)
- Influencing, obstructing, or impeding a government auditor in the performance of their official duties
- Obstructing the examination of a financial institution

Perjury

Perjury is an intentional false statement given under oath on a material point at issue. The basic elements for the crime of perjury are as follows:

- The defendant made a false statement.
- The defendant made the false statement while under oath.
- The false statement was material or relevant to the proceeding.
- The defendant made the statement with knowledge of its falsity.

Laws that criminalize perjury, however, do not require that the false statement be given in a court of law. Generally, the forum for a perjurious statement includes any court, depositions in connection with litigation, bail hearings, venue hearings, suppression hearings, and so on. Thus, an individual can commit perjury for false statements made somewhere other than a court of law.

Also, for a statement to be perjurious, it must be material. Generally, a statement is material if it tends to influence, or is capable of influencing, the decision of the decision-making body to whom it is addressed.

False Claims and Statements to Government Agencies

Laws prohibiting false claims and statements to government agencies make it illegal for a person to lie to, or conceal material information from, a government agency. A *false claim* is an assertion of a right to government money, property, or services that contains a misrepresentation. A *false statement* is an oral or written communication, declaration, or assertion that is factually untrue.

Elements of False Claim or Statement Violations

Generally, to prove a violation, the government must show that the defendant:

- Knowingly and willfully (or with reckless disregard for truth or falsity)
- Made a false claim or statement (or used a false document)
- That was *material* (i.e., sufficiently important or relevant to influence decision-making)
- Regarding a matter within the jurisdiction of a government agency
- With knowledge of its falsity

An act is done knowingly and willfully if it is done voluntarily and intentionally and not by mistake or another innocent reason. Thus, an individual can be found guilty for making a false statement or claim only if the individual knew the statement or claim was false at the time it was made.

Also, the following are general rules with regard to laws criminalizing false claims and statements to government agencies:

- An individual can be found guilty for making a false claim or statement even if the claim or statement is not made directly to a governmental department or agency. That is, a false claim or statement can be made to a third party as long as it involves a matter within the jurisdiction of a governmental department or agency.
- An individual can be found guilty for making a false claim or statement even if the government was not deceived by the falsity.
- An individual can be found guilty for making a false claim or statement even if the government did not rely on the falsity.
- An individual can be found guilty for making a false claim or statement even if the government did not suffer a loss in reliance on the falsity.
- For an individual to be found guilty of making a false claim or statement, the claim or statement at issue must have been capable of influencing the government entity involved.

Often, countries have various related laws that criminalize false or fraudulent statements to government agencies. Common types of false claims and statement laws of greatest importance to fraud examiners include:

- Laws that prohibit the making of fraudulent demands for money against the government
- Laws that prohibit false statements or reports on credit applications or related document submitted to a bank or credit institution
- Laws that prohibit schemes to obtain money or property from governments by means of false or fraudulent pretenses involving government contracts

International Initiatives Against Fraud and Corruption

Introduction

There are a range of different international instruments designed to combat fraud and corruption, including international treaties, European Union (EU) instruments for member countries, domestic laws, and non-legally binding instruments. This section introduces some of the major international tools, including those related to anti-corruption, anti-money laundering, and banking and financial system regulation and supervision.

International Anti-Corruption Instruments

The international effort to combat corruption gained significant momentum in the 1990s. Until that time, only the United States had criminalized the bribery of foreign public officials with the passage of its Foreign Corrupt Practices Act (FCPA) in 1977. The FCPA effectively put companies operating within the United States at a competitive disadvantage, leading business groups to petition for a weakening of the FCPA's provisions.

Previous attempts to establish multinational initiatives against corruption failed largely as a result of security concerns related to the Cold War. However, the end of that conflict and the growing trend toward economic integration created a far more receptive political climate. Simultaneously, increased media coverage of financial matters, facilitated in part by the emergent internet, brought greater public attention to bribery and corrupt trade practices. In addition, contemporary campaigns to promote democratic principles throughout the world had targeted corruption as an inherent obstacle to good governance.

Recognizing the limited impact unilateral efforts can have on a global issue like corruption, international organizations developed strategies to combat corruption through coordinated domestic measures. Starting with the work of the Organisation for Economic Co-operation and Development (OECD), this movement has continued to grow and has produced increasingly ambitious endeavors. Despite the progress already made, however, corruption remains a serious concern.

This section introduces the major international anti-corruption instruments, beginning with those concerning the OECD. An overview of the more recent UN Convention and several regional conventions follows. And because the FCPA and the UK Bribery Act 2010 have an extraterritorial effect on multinational companies, this section contains a brief discussion of each of these laws.

The Organisation for Economic Co-operation and Development

Formed in 1961, the OECD is an intergovernmental institution dedicated to democracy and the market economy. It operates as a forum for governments to cultivate and advance social and economic policies that expand world trade, promote sustainable economic development, and improve living standards. Members compare policy experiences to identify sound practices for the resolution of common problems.

The OECD coordinates domestic and international policy through either soft law or legally binding agreements. *Soft law* refers to guidelines, resolutions, codes of conduct, and other quasi-legal instruments that are not directly enforceable. The OECD Recommendations discussed below are examples of soft law. In contrast, the OECD Convention on Combating Bribery of Foreign Public Officials in International Business Transactions is a legally binding agreement.

At present, the OECD consists of 37 member countries: Australia, Austria, Belgium, Canada, Chile, Colombia, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, South Korea, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, the Slovak Republic, Slovenia, Spain, Sweden, Switzerland, Turkey, the United Kingdom, and the United States. Joining the OECD in 2020, Colombia is the most recent member. The OECD suspended membership talks with Russia in 2014 due to its role in the Crimean crisis.

THE OECD'S RECOMMENDATION ON COMBATING BRIBERY IN INTERNATIONAL BUSINESS

The OECD formed an ad hoc working group in 1989 to explore corruption in international trade. After conducting a comparative review of member countries' laws and regulations, the group published the *Recommendation on Combating Bribery in International Business* (Recommendation) in 1994.

The Recommendation was designed to combat corruption in international business by urging member states to adopt effective measures to detect, prevent, and combat bribery of foreign public officials in international business. Thus, it targets only acts of bribery aimed at public-sector officials, and it is silent regarding bribery confined to the private sector.

The Recommendation defines *bribery* as the act of offering and giving any undue benefit to obtain or retain business.

As a result, the Recommendation targets the *supply side* of bribery—the offering side of the bribery bargain. It does not address the *demand side*—the solicitation and receipt of bribes. In doing so, the Recommendation avoids complicated jurisdictional issues and interference with the sovereignty of non-member countries.

The Recommendation urges member states to deter and penalize the bribery of foreign public officials by taking “concrete and meaningful steps” to improve the following areas within their respective infrastructures:

- Criminal, civil, commercial, and administrative laws
- Tax systems and regulations
- Banking and accounting requirements and practices
- Laws and regulations related to public subsidies, licenses, and contract procurement

In 1994, the OECD Working Group on Bribery in International Business Transactions (Working Group) was formalized and began to develop substantive provisions to be implemented in the four identified areas.

THE OECD’S TAX RECOMMENDATION AND REVISED RECOMMENDATION

In 1996, the Working Group responded to tax-related concerns by releasing the *Recommendation on the Tax Deductibility of Bribes to Foreign Public Officials* (Tax Recommendation). Bribery had become so entrenched in international business that some countries provided tax deductions for bribes paid to foreign officials. The Tax Recommendation calls on members to prohibit this practice.

In 1995, measures to address the remaining areas of concern were presented in the *Revised Recommendation on Combating Bribery in International Business* (Revised Recommendation). To strengthen banking and accounting standards, the Revised Recommendation advocates that OECD members take the following steps:

- Prohibit off-book transactions and accounts.
- Require companies to maintain adequate records of income and expenditures and to disclose material contingent liabilities in financial statements.
- Establish and maintain standards to ensure independence when financial statements are audited externally.
- Encourage companies to adopt internal controls and standards of conduct that provide protection and channels for reporting violations.
- Suspend companies that have bribed foreign officials from competing for public contracts.

- Incorporate anti-corruption provisions into bilateral aid-funded procurements and international development institutions.
- Cooperate fully with other countries and international bodies in the investigation and prosecution of bribery cases.

The Working Group's main objective in creating the Revised Recommendation was the criminalization of bribery of foreign public officials, yet this goal presented substantial challenges. Fundamental differences in national legal systems prevented the formulation of provisions that could be implemented uniformly. In addition, many OECD members were not content to address such a critical matter through soft law alone, while others feared that negotiating a legally binding convention would result in considerable delays.

Ultimately, the working group used the Revised Recommendation to advise members to criminalize the bribery of foreign public officials and announce the commencement of negotiations for a binding convention.

THE OECD CONVENTION ON COMBATING BRIBERY OF FOREIGN PUBLIC OFFICIALS IN INTERNATIONAL BUSINESS TRANSACTIONS

The OECD Convention on Combating Bribery of Foreign Public Officials in International Business Transactions (OECD Anti-Bribery Convention) is a legally binding agreement that sets a uniform, minimum standard that signatory countries must implement through national legislation. Of course, countries may adopt laws that exceed that standard; the following section provides several examples of such legislation.

Signatory countries commit themselves to criminalizing the bribery of foreign public officials through domestic legislation, and any differences in such laws are accepted if they produce equivalent results (i.e., effective prosecution or sanctions).

The OECD Anti-Bribery Convention defines *bribery* as intentionally offering, promising, or giving an undue benefit, either directly or through an intermediary, in order to obtain business or an improper advantage in the course of international trade.

Like the Recommendation, the OECD Anti-Bribery Convention applies only to the supply side of bribery and only to acts aimed at foreign public officials (i.e., public-sector officials).

The OECD Anti-Bribery Convention defines a *foreign public official* as any person who:

- Holds a legislative, administrative, or judicial office in a foreign country either by election or appointment
- Exercises a public function for a foreign country, public agency, or public enterprise
- Acts as an official or agent for a public international organization

The OECD Anti-Bribery Convention specifies that bribes involve any form of undue benefit or advantage, including both pecuniary gains—money, membership to a club, or the promise of a scholarship—and non-pecuniary gains, like favorable publicity.

Additionally, signatory countries are required to establish jurisdiction over acts of foreign bribery that occur, either in whole or in part, within their respective territories. Countries that exercise jurisdiction to prosecute nationals for offenses committed abroad must likewise establish jurisdiction over acts of foreign bribery. Furthermore, the OECD Anti-Bribery Convention requires enhanced mutual legal assistance between countries in the investigation and prosecution of foreign bribery, including the extradition of nationals.

Moreover, signatory countries must establish effective, proportionate, and dissuasive criminal penalties for the offense of foreign bribery. The OECD Anti-Bribery Convention stipulates that such penalties must be comparable to the respective penalties each country enforces for domestic bribery. Countries that do not apply criminal penalties to legal persons for domestic bribery must impose noncriminal sanctions for acts of foreign bribery. Parties to the OECD Anti-Bribery Convention must also take reasonable steps to assure the seizure and confiscation of bribes and the assets derived from bribery. Finally, where domestic bribery qualifies as a predicate act for money laundering, foreign bribery must also constitute a predicate act.

The Working Group monitors the implementation of the OECD Anti-Bribery Convention through a rigorous peer review process conducted over the course of multiple phases.

OECD'S RECOMMENDATIONS FOR FURTHER COMBATING BRIBERY OF FOREIGN OFFICIALS

In 2009, the Working Group issued two additional recommendations for further combating bribery of foreign public officials in international business transactions. For the most part, these instruments merely reinforce the earlier Recommendation and OECD Anti-Bribery Convention. They encourage member countries to review, evaluate, and, where necessary,

strengthen the laws and regulations relevant to the fight against foreign bribery. Members are specifically advised to re-examine standards pertaining to:

- The adequacy of accounting requirements
- The independence of external audits
- Corporate internal controls and compliance programs
- The suspension of public advantages for enterprises that have engaged in foreign bribery

The 2009 recommendations introduced several new provisions as well. The 2009 recommendations encouraged member countries to launch initiatives to raise awareness within both the public and private sectors of the fight against foreign bribery, and they call for measures to improve reporting acts of foreign bribery. According to the 2009 recommendations, easily accessible channels should exist to report suspected acts of bribery to the appropriate authorities, and safeguards should be in place to protect individuals who, in good faith, file a report from discrimination or disciplinary actions.

OECD'S GUIDELINES FOR MULTINATIONAL ENTERPRISES

The OECD Guidelines for Multinational Enterprises (OECD Guidelines) are a form of soft law, and they contain principles and standards designed to engage corporations in the fight against corruption.

The OECD Guidelines seek to combat corruption in a number of ways. They discourage all forms of bribery, including illegal contributions to political parties and candidates, and they recommend the adoption of self-regulatory practices and compliance programs to maintain high standards for accounting, auditing, and disclosing financial statements.

Furthermore, the OECD Guidelines encourage companies' management to enhance the transparency of their anti-corruption activities to raise greater awareness within their communities, and they propose principles to halt anti-competitive activities such as price fixing and bid rigging.

Finally, the OECD Guidelines include provisions intended to protect consumer, employee, and environmental interests.

OECD'S GOOD PRACTICE GUIDANCE ON INTERNAL CONTROLS, ETHICS, AND COMPLIANCE

On February 18, 2010, the OECD Council, which exercises the decision-making power of the OECD, adopted the Good Practice Guidance on Internal Controls, Ethics, and Compliance (Good Practice Guidance). The Guidance sets forth certain best practices for establishing an anti-corruption compliance program.

The Good Practice Guidance identifies key features for effective compliance programs to detect and prevent the bribery of foreign officials. Businesses are encouraged to adapt such features to suit their unique circumstances and incorporate the identified practices to complement their overall compliance framework. In addition, professional organizations and associations may be consulted for further information and resources.

In general, the Good Practice Guidance recommends that organizational management adhere to the following measures when establishing compliance programs:

- Establish a clear and unambiguous policy prohibiting the bribery of foreign officials.
- Create an ethical environment, and ensure that the anti-corruption policy has strong, explicit support from senior management.
- Provide that compliance with anti-bribery program is the duty of every employee.
- Make senior management responsible for implementation and oversight of the anti-corruption policies, standards, and procedures.
- Design the compliance program to detect and prevent corruption, and it should include policies covering gifts; hospitality, entertainment, and expenses; customer travel; political contributions; charitable donations and sponsorships; facilitation payments; and solicitation and extortion.
- Make the program applicable to third party business partners (e.g., agents and other intermediaries, consultants, representatives, distributors, contractors, suppliers, consortia, and joint venture partners).
- Create an internal controls system designed to ensure compliance with the prohibition of bribing foreign officials.
- Implement mechanisms to ensure that anti-corruption policies, standards, and procedures are communicated effectively to all employees and, where appropriate, agents and business partners.
- Implement appropriate measures to encourage and provide support for employees to comply with the compliance program.

- Institute appropriate disciplinary measures for violations of anti-corruption laws, policies, and procedures, as well as remedial actions to prevent recurrences of such misconduct.
- Install a system that provides guidance and advice to employees regarding anti-corruption issues.
- Conduct periodic testing of the anti-corruption program to evaluate and improve its effectiveness.

The Working Group began to monitor countries' progress in encouraging their companies to implement the provisions contained in the guidance in March 2010.

United Nations Convention against Corruption

The United Nations (UN), an international organization with a membership that includes almost every nation, also produces initiatives against bribery and corruption. The United Nations Convention against Corruption (UNCAC) is an important instrument in the international fight against corruption, and it represents the significant progress that has been made over the past few decades. The UNCAC was concluded in 2003 and went into force in 2005. It remains open to accession by any country or regional economic integration organization and, at present, has been signed by 140 members.

The UNCAC is considerably broader in scope than the OECD Convention. It establishes a framework to combat all forms of corruption, including bribery, extortion, embezzlement, trading in official influence, and general abuses of power. The UNCAC introduces standards for member states to incorporate into national legislation to address corruption in both the private and public sectors. The measures and provisions contained therein are intended to respect the fundamental principles of members' respective legal systems while focusing on four specific areas of concern:

- Prevention
- Criminalization
- Asset recovery
- International cooperation

PREVENTION

The UNCAC devotes its first chapter to preventive measures aimed at both the public and private sectors. Member states must ensure the existence of independent anti-corruption bodies that oversee implementation of the UNCAC policies and disseminate relevant information. Such policies include the development of safeguards to ensure civil servants are

hired, retained, and promoted based on objective criteria. Once recruited, civil servants must be subject to codes of conduct and reporting requirements to enhance transparency and accountability in the management of public finances. Member states must also take the necessary steps to ensure the independence of the judiciary and prosecution services.

Regarding the private sector, member states must improve accounting and auditing standards to require the maintenance of books and records and the disclosure of financial statements. The UNCAC also mandates regulations to deter and detect all forms of money laundering by any bank or financial institution. Additional measures call for professional codes of conduct, rules to prevent conflicts of interest, and greater cooperation between law enforcement agencies and private entities. Finally, member states are encouraged to engage civil society, including community groups and non-governmental organization, in the fight against corruption.

CRIMINALIZATION

As noted above, the UNCAC addresses all forms of corruption, not bribery alone. The UNCAC lists specific acts of corruption, but it does not require member states to criminalize every one of them. Instead, it requires member states to criminalize only certain acts of corruption, and to merely consider criminalizing others. Specifically, members to the UNCAC must establish a criminal offense for the following acts of corruption:

- The supply and demand of bribes to domestic public officials
- The supply of bribes to foreign public officials
- Money laundering
- The embezzlement, misappropriation, or diversion of public property by domestic officials

Member states are encouraged, but not obligated, to criminalize the following acts of corruption:

- The demand of bribes by foreign public officials
- The supply and demand of bribes by private sector actors
- Trading in influence
- The abuse of official functions or position
- Illicit enrichment
- Embezzlement by private sector actors
- The concealment or retention of proceeds of a crime
- The obstruction of justice

Similar to the OECD Convention, the UNCAC requires member states to establish liability for legal persons and to exercise jurisdiction over acts of corruption committed within their territories or by their nationals. In addition, any legislation criminalizing an act of corruption must include knowledge or specific intent as an element of the offense.

ASSET RECOVERY

Perhaps the most significant achievement of the UNCAC, and a major influence in many countries' decision to ratify, is the agreement on asset recovery. Stated as a fundamental principle, asset recovery is particularly important to developing countries, which are vulnerable to corruption and in need of resources for reconstruction and rehabilitation programs. Reaching consensus on the issue required intensive negotiations to balance the needs of countries seeking recovery against the legal and procedural safeguards of countries providing assistance. Effective implementation of the asset recovery provisions will both remedy one of the worst effects of corruption and send a message that illegal assets cannot be hidden anywhere.

Member states must implement the necessary mechanisms to detect and prevent the transfer of assets obtained through illicit activities. Authorities must have competence to confiscate, seize, or freeze any such assets. All parties to the UNCAC must permit one another to initiate legal action in their respective courts. Generally, a requesting state will recover the contested assets if it is able to prove ownership, and in certain circumstances the assets will be returned directly to the victims.

INTERNATIONAL COOPERATION

Parties to the UNCAC agree to cooperate with one another in the fight against corruption, including the prevention, investigation, and prosecution of any offense. Cooperation is mandatory in criminal matters, but only encouraged in civil and administrative issues. Countries must assist one another in gathering and sharing evidence, returning the proceeds of illicit activity, and extraditing offenders for effective prosecution.

Major Regional Initiatives Against Corruption

This discussion provides an overview of several regional anti-corruption conventions, including the:

- Inter-American Convention Against Corruption
- European Union Convention on the Fight Against Corruption Involving Officials of the European Communities or Officials of Member States

- Council of Europe Criminal Law Convention on Corruption
- African Union Convention on Preventing and Combating Corruption

INTER-AMERICAN CONVENTION AGAINST CORRUPTION

While the OECD is generally credited with setting the international trend against corruption, the *Inter-American Convention Against Corruption* (IACAC) was actually the first legally binding convention to address the issue. It went into effect in March 1997 and has been ratified by all 35 members of the Organization of American States (OAS).

The stated purpose of the IACAC is to promote and regulate cooperation among members to prevent, detect, punish, and eradicate corruption.

The IACAC requires signatories to:

- Consider preventive measures, such as codes of conduct, transparent systems for the hiring of public servants and expenditure of public funds, and the encouragement of active participation by civil society in the fight against corruption.
- Establish a criminal offense for both the supply and demand of bribes aimed at domestic and foreign officials.
- Provide legal and technical assistance to one another for the effective prosecution of acts of bribery, including the extradition of nationals and the freezing, seizure, and forfeiture of identified property and assets.

EUROPEAN UNION CONVENTION ON THE FIGHT AGAINST CORRUPTION INVOLVING OFFICIALS OF THE EUROPEAN COMMUNITIES OR OFFICIALS OF MEMBER STATES

The EU Convention on the Fight Against Corruption came into effect in May 1997. Its scope is narrowly tailored to prevent the supply and demand of bribes aimed only at officials of the EU and EU member states. Such officials may include ministers, members of national parliaments, members of the judiciary and the courts of auditors, and members of the EU Commission, European Parliament, and the Court of Justice. EU member states are to cooperate fully in the prosecution and extradition of offenders. The Convention does require national legislation to incorporate the principle of *ne bis in idem*. The principle, which translates from Latin as “not twice for the same,” prohibits prosecution in two member states based on the same underlying facts.

COUNCIL OF EUROPE CRIMINAL LAW CONVENTION ON CORRUPTION

The Council of Europe (CoE) is distinct from the EU and focuses its efforts on human rights, the rule of law, democratic development, and cultural cooperation. It is currently comprised of 47 nations and membership is open to any European state. Other countries, including the United States and Japan, have observer status and may participate in the CoE committees, and several conventions are open to accession by non-member countries.

The CoE Criminal Law Convention on Corruption (the Convention) was concluded in January 1999 and contains measures to address a wide range of corrupt behavior and encourage mutual assistance. Signatory countries must establish a criminal offense for:

- The supply and demand of bribes involving domestic and foreign public officials, members of domestic and foreign public assemblies, officials of international organizations, and judges and officials of international courts
- The supply and demand of bribes within the private sector
- Trading in influences or influence peddling (i.e., using one's influence in government or connections with people in authority to obtain preferential treatment)
- Money laundering and fraudulent recordkeeping and accounting practices

Liability must apply to corporate entities as well as individuals. The Convention also calls for cooperation between national authorities for gathering evidence, confiscating corrupt proceeds, protecting witnesses, and extraditing offenders.

AFRICAN UNION CONVENTION ON PREVENTING AND COMBATING CORRUPTION

The African Union Convention on Preventing and Combating Corruption (AU Convention) was adopted in 2003 by the African Union (AU) and went into effect in 2006. The AU Convention has been signed by 49 nations, and it has been ratified by 43 of those signatories. It is a comprehensive instrument based on the promotion of democratic principles and social justice, transparency in governance, and respect for human rights. In addition to criminalizing acts of corruption, member states agree to adopt preventive measures, increase public access to information, and involve the media and civil society in the fight against corruption.

Members must adopt national legislation necessary to establish criminal offenses for a wide range of corrupt activity, including:

- The supply and demand of bribes aimed at both the public and private sectors
- Embezzlement of public funds

- Illicit enrichment
- Money laundering

The AU Convention requires cooperation among members, extradition of offenders, and confiscation and seizure of illegal proceeds. All offenders must receive a fair trial conducted in accordance with the minimum guarantees set forth in the African Charter on Human and Peoples' Rights.

The U.S. Foreign Corrupt Practices Act

The U.S. Congress originally enacted the FCPA in 1977 to prohibit making corrupt payments to foreign officials or political organizations. Since its enactment, the FCPA has had an enormous impact on the way organizations around the world conduct business. While only enforced by the United States, the FCPA is a law with international reach because businesses within its scope may violate the statute anywhere in the world.

The FCPA has two principal components: the anti-bribery provisions and the accounting provisions. In short, the anti-bribery provisions make it unlawful to bribe foreign government officials to obtain or retain business, and the accounting provisions require publicly traded companies subject to the FCPA's jurisdiction to keep accurate books and records and adopt internal controls to prevent improper use of corporate funds.

FCPA'S ANTI-BRIBERY PROVISIONS (15 U.S.C. § 78dd)

The FCPA's anti-bribery provisions make it unlawful for regulated parties (i.e., any citizen, national, or resident of the United States; any U.S. business entity; any company that has securities registered in the United States or is required to file reports with the U.S. Securities and Exchange Commission [SEC]; and foreign nationals and businesses taking action in the United States) to bribe foreign government officials to obtain or retain business. Specifically, the provisions prohibit corrupt offers or payments to foreign government officials, political parties, political party officials or candidates, or to any person for payment to such foreign officials for an improper advantage.

ELEMENTS OF A BRIBERY VIOLATION

With respect to the basic prohibition of bribery, there are five elements that must be met to constitute a violation:

- A regulated party
- Makes a payment or offer

- To a foreign official
- With corrupt intent
- For the purposes of influencing a business purpose

First, under the FCPA, U.S. jurisdiction over corrupt payments to foreign officials depends on whether the violator is a regulated party. That is, only regulated parties, such as issuers, domestic concerns, and foreign nationals or businesses, are subject to FCPA jurisdiction. An *issuer* is a corporation that has issued securities that have been registered in the United States or that is required to file periodic reports with the SEC.

A *domestic concern* is any citizen, national, or resident of the United States, or any business entity that has its principal place of business in the United States or that is organized under the laws of a state, territory, possession, or commonwealth of the United States. Moreover, the FCPA applies extraterritorially to U.S. citizens working for foreign subsidiaries of domestic companies.

Also, a foreign national or business is subject to the FCPA if it takes any act in furtherance of a corrupt payment within U.S. territory.

Additionally, the agents, subsidiaries, or other third-party representatives who act on behalf of an issuer, a domestic concern, or a foreign national or business are liable under the same conditions as the issuer, domestic concern, or foreign national or business.

Finally, U.S. parent companies (issuers or domestic concerns) may be held liable for the acts of foreign subsidiaries where they authorized, directed, or controlled the activity in question.

Second, the FCPA prohibits paying, offering, promising to pay, or authorizing to pay or offer money or anything of value to obtain or retain business. Thus, an offer or promise of a corrupt payment can violate the FCPA.

Under the FCPA, *anything of value* is broadly defined and can include any of the following:

- Money, cash, and cash equivalent
- Travel expenses and non-monetary gifts
- Charitable contributions or donations
- In-kind service

- Benefit to third persons with connection to government officials (e.g., scholarship to foreign official's relative)
- Overpayments for shares
- Loans at favorable interest rate

Third, the prohibition extends only to corrupt payments to a foreign official. The term *foreign official* means any officer or employee of a foreign government, a public international organization or any department or agency thereof, or any person acting in an official capacity. Foreign officials include:

- Members of any branch of a foreign government
- Employees of any entity substantially owned or controlled by a foreign government
- Consultants who hold government positions
- Any official or candidate of a foreign political party
- Officials of public international organizations

Fourth, to constitute a prohibited payment under the FCPA, the person making or authorizing it must have a corrupt intent. That is, it must be intended that the payment induce its recipient to misuse their official position to provide an improper business advantage.

Moreover, the government does not need to show that the defendant knew their conduct violated the FCPA, and corrupt intent can be inferred from the evidence.

Fifth, to constitute a violation, the payment must be made for a business purpose. That is, the payment must be made to assist the payer “in obtaining or retaining business for or with, or directing business to, any person.” The U.S. government interprets this requirement broadly, and it covers payments made to secure a large variety of unfair business advantages, including obtaining or retaining contracts, influencing the procurement process, reducing or eliminating customs duties, securing favorable tax treatment, obtaining government action to prevent competitors from entering a market, influencing the adjudication of lawsuits or enforcement actions, obtaining exceptions to regulations, and circumventing a licensing or permit requirement.¹ The business to be obtained, however, does not need to be with a foreign government or foreign government instrumentality.

¹ U.S. Department of Justice and U.S. Securities and Exchange Commission, *A Resource Guide to the U.S. Foreign Corrupt Practices Act* (Nov. 14, 2012).

EXCEPTION FOR FACILITATING PAYMENTS

The FCPA does not prohibit all payments to foreign officials; it contains an explicit exception for certain types of payments, known as *facilitating payments*, or *grease payments*, made to expedite or secure performance of a routine governmental action by a foreign official, political party, or party official that relates to the performance of their ordinary and routine functions.

This exception is designed to allow companies to avoid liability where small amounts are paid to expedite certain routine, non-discretionary government acts. According to *A Resource Guide to the U.S. Foreign Corrupt Practices Act (Resource Guide)*, a guide developed by the SEC and U.S. Department of Justice (DOJ), examples of facilitating payments include actions that are ordinarily and commonly performed by a foreign official in:

- Obtaining permits, licenses, or other official documents to qualify a person to do business in a foreign country
- Processing governmental papers, such as visas and work orders
- Providing police protection, mail pickup and delivery, or scheduling inspections associated with contract performance or inspections related to transit of goods across the country
- Providing phone service, power and water supply, loading and unloading cargo, or protecting perishable products or commodities from deterioration

CRIMINAL ENFORCEMENT OF FCPA'S ANTI-BRIBERY PROVISIONS

The DOJ is responsible for all criminal enforcement of the FCPA. Under the anti-bribery provisions, corporations and other business entities are subject to a fine of up to \$2 million per violation, while officers, directors, stockholders, employees, and agents are subject to a fine of up to \$100,000 and imprisonment for up to five years. Fines imposed on individuals may not be paid by their employer or principal.

Furthermore, violators of the bribery provisions may be prohibited from participating in future federal contracts.

CIVIL ENFORCEMENT OF FCPA'S ANTI-BRIBERY PROVISIONS

Civil enforcement of the anti-bribery provisions of the FCPA is shared by the SEC and the DOJ. The primary civil enforcement tool is an injunction, though the FCPA also provides for monetary penalties. The maximum civil penalty for a violation by any firm, as well as by any officer, director, employee, or agent, is \$10,000 per occurrence. In addition, in an SEC

enforcement action, the court may impose an additional fine not to exceed the greater of (1) the gross amount of the pecuniary gain to the defendant as a result of the violation, or (2) a specified dollar limitation based on the flagrancy of the violation.

FCPA ACCOUNTING PROVISIONS (15 U.S.C. § 78m)

In addition to outlawing bribery payments, the FCPA contains separate accounting provisions for certain entities already subject to the FCPA provisions. The U.S. Congress enacted the FCPA's accounting provisions as an additional deterrent to bribery based on its conclusion that U.S. companies concealed most bribes in their corporate books. Essentially, the accounting provisions are designed to compel corporate transparency to prevent publicly traded entities from disguising bribes as legitimate commercial transactions.

The accounting provisions, however, are more limited in scope than the anti-bribery provisions; they apply to all issuers (companies with securities listed in the U.S. trading markets) and their subsidiaries.

The FCPA imposes two requirements with respect to the accounting provisions. Issuers must maintain accurate books and records, and they must adopt internal controls to prevent the improper use of corporate funds.

In addition, the FCPA requires that a covered entity make a good-faith effort to ensure that any company, including joint ventures, in which the U.S. company or one of its subsidiaries holds 50% or less of the voting power comply with the FCPA accounting provisions.

BOOKS AND RECORDS (RECORDKEEPING) PROVISION

The first major requirement of the accounting provisions is that all issuers must accurately record all transactions, keep receipts and other support for transactions, and keep records in a manner consistent with overall document retention and recordkeeping policies.

In practice, the books and records provisions are used to prevent three types of improprieties:

- The failure to record improper transactions
- The falsification of records to conceal improper transactions
- The creation of records that are quantitatively correct, but fail to specify the qualitative aspects of a transaction that might reveal the true purpose of a particular payment

INTERNAL CONTROLS PROVISION

The internal controls provision is designed to prevent unauthorized or unrecorded transactions. Under the internal controls provision, a company must maintain robust compliance policies and must take reasonable steps to ensure that its affiliates maintain suitable internal controls.

The SEC has considered several factors to determine the adequacy of a system of internal controls. The factors include:

- The role of the board of directors
- Communication of corporate procedures and policies
- Assignment of authority and responsibility
- Competence and integrity of personnel
- Accountability for performance and compliance with policies and procedures
- Objectivity and effectiveness of the internal audit function

SEC REGULATIONS REGARDING THE ACCOUNTING PROVISIONS

The SEC, which has rulemaking authority over the accounting provisions, has adopted two regulations enforcing the accounting provisions. First, Rule 13b2-1 makes it unlawful to falsify accounts, providing that “[n]o person shall, directly or indirectly, falsify or cause to be falsified, any book, record or account” required to be kept under the accounting provisions of the FCPA. Second, the SEC established Rule 13b2-2, which makes it unlawful for directors and officers to omit material facts or supply false information to auditors in connection with any audit or document required to be filed with the SEC.

ENFORCEMENT OF THE ACCOUNTING PROVISIONS

The FCPA’s accounting provisions are enforced by both the SEC and the DOJ. The SEC has authority to initiate civil enforcement actions and can impose civil fines and disgorgement on the company and individuals. The SEC has brought enforcement actions of the accounting provisions both in cases involving actual foreign bribes and in domestic transactions. The SEC can seek civil penalties of up to \$500,000 for covered entities and \$100,000 for individuals.

The DOJ is responsible for criminal prosecution of “willful” violations of the accounting provisions, and criminal penalties can include large fines and imprisonment. A willful violation of the accounting and controls provision is punishable by a fine up to \$25 million against entities, and a fine up to \$5 million and imprisonment up to 20 years against individuals.

Also, the FCPA provides that an individual may be held criminally liable for “knowingly” falsifying any book, records, or account, or circumventing or failing to implement a system of internal accounting controls. Knowing may include willful blindness or conscious attempts not to know. But no criminal liability is imposed for technical or insignificant accounting errors.

In addition, administrative and civil relief also is available for violations of the accounting provisions. A corporation or individual found in violation of the FCPA may be subject to debarment before many government agencies, and an indictment under the FCPA can also lead to the suspension of one’s right to do business with the government or the immediate suspension of export licenses for military defense equipment.

It is common for FCPA enforcement actions to involve a series of prohibited payments, making the total amount of penalties very large. For example, the DOJ’s enforcement action against the German conglomerate Siemens for violating the FCPA’s accounting provisions led to a settlement of \$800 million—\$450 million in penalties and \$350 million in profit disgorgement.

ANTI-CORRUPTION COMPLIANCE PROGRAMS

The FCPA encourages regulated organizations to implement effective compliance programs that are designed to prevent and detect criminal conduct. An *effective compliance program* is one that is reasonably designed, implemented, and enforced so that it will generally be effective in preventing and detecting criminal conduct. These programs are important because an organization that violates the FCPA is eligible for a reduced sentence if it has an effective compliance program.

The SEC and DOJ’s *Resource Guide* details the hallmarks of an effective corporate compliance program and defines them as follows:

- *Commitment from senior management and a clearly articulated policy against corruption:* Business managers must establish an ethical tone for the companies they lead, and organizations should have an anti-corruption policy that is clear.
- *Code of conduct and compliance policies and procedures:* Organizations should have a code of conduct and anti-corruption policies and procedures that are clear, practical, accessible, and enforceable.

- *Oversight, autonomy, and resources:* Organizations must develop a compliance infrastructure that includes designated responsibility to one or more senior corporate executives for implementing and overseeing the company's anti-corruption policies, standards, and procedures, and those assigned responsibility for the program should be granted the autonomy, authority, and resources to manage the program, enforce the program's requirements, and react to issues that arise under the program.
- *Risk assessment:* Organizations should conduct a risk assessment addressing the nature and extent of the risks relating to bribery and corruption to which they are exposed and develop their anti-corruption standards and procedures based on the assessments.
- *Training and continuing advice:* Management must periodically and appropriately train all employees and third parties (e.g., agents, contractors, subcontractors, vendors, distributors, partners) about the program's compliance requirements and procedures.
- *Incentives and disciplinary measures:* Organizations establish and adhere to a system of disciplinary measures for rule breakers and incentives for those who demonstrate good behavior.
- *Third-party due diligence and payments:* To the extent that an organization uses third parties, including agents, consultants, and distributors, it must implement appropriate due diligence and compliance requirements for the retention of such agents and business partners.
- *Confidential reporting and internal investigation:* Organizations should establish and communicate a reporting system whereby employees and other agents can confidentially report actual or potential criminal conduct without fear of retribution.
- *Continuous improvement:* Organizations should review and improve their compliance program's standards and procedures, including internal controls, ethics, and compliance programs, on a regular basis.

The UK Bribery Act

Parliament passed the UK Bribery Act in May 2010, updating the nation's anti-corruption laws for the first time in more than a century. The Act received Royal Assent on April 8, 2010, and it went into effect on July 1, 2011.

The UK Bribery Act is the United Kingdom's analogue of the FCPA, although with several distinctions. Both the UK Bribery Act and the FCPA make it a crime to offer foreign public officials bribes or to accept bribes from them in connection with international business transactions, and their prohibitions on bribing foreign government officials are broadly comparable. Thus, like the FCPA, the UK Bribery Act seeks to punish corruption on a global level, but the UK Bribery Act has an even broader application than the FCPA.

Also, the FCPA and the UK Bribery Act encourage regulated organizations to implement effective anti-corruption programs that are designed to prevent and detect corrupt conduct. But again, the UK Bribery Act is broader than the FCPA; even if an organization's anti-corruption program is sufficiently robust for the purpose of complying with the FCPA, it might not be sufficient for the purpose of complying with the UK Bribery Act. Therefore, it is important for international organizations to be aware of the differences between the FCPA and the UK Bribery Act.

In short, the UK Bribery Act contains a specific offense for the bribery of foreign public officials; it contains a general commercial bribery offense; and it creates a corporate offense of failure to prevent bribery.

SCOPE

Like the FCPA, the UK Bribery Act exercises broad jurisdiction over all individuals and corporate entities for acts of corruption when any part of the offense occurs in the United Kingdom. Furthermore, liability exists for acts committed outside the United Kingdom by individuals and entities with a close connection to the United Kingdom, including:

- British citizens, overseas citizens, overseas territories' citizens, and any person declared a British subject under the 1981 British Nationality Act
- Individuals who normally reside in the United Kingdom
- An entity incorporated under the law of any part of the United Kingdom

More specifically, foreign companies that have offices in the United Kingdom, employ UK citizens, or provide any services to a UK organization are responsible for complying with the UK Bribery Act. A listing on the London Stock Exchange will not, in itself, subject a company to the Act.

Therefore, any organization with any connection with the United Kingdom should assess and revise their anti-corruption programs with the UK Bribery Act's new standards and guidance in mind.

THREE CATEGORIES OF OFFENSES

The UK Bribery Act creates three categories of offenses:

- Bribing a foreign public official
- General commercial bribery offenses
- A corporate offense of failure to prevent bribery

BRIBERY OF FOREIGN OFFICIALS

Like the FCPA, the UK Bribery Act makes it an offense to bribe a foreign public official for the purpose of obtaining or retaining business or an advantage in the course of business. A *foreign public official*, as defined by the Act, is anyone who:

- Holds a legislative, administrative, or judicial position, either by election or appointment, in a country or territory outside the United Kingdom
- Exercises a public function for a country or territory outside the United Kingdom
- Acts as an official or agent for a public international organization

GENERAL COMMERCIAL BRIBERY

One way in which the UK Bribery Act has a broader application than the FCPA is that it covers bribery on a private level. That is, the UK Bribery Act, unlike the FCPA, has a commercial bribery offense. Whereas the FCPA only prohibits bribes involving foreign government officials, the UK Bribery Act goes further by making commercial bribery—bribes paid to people working in the private sector—a crime. Additionally, a person who improperly performs a relevant function in anticipation of receiving a benefit commits a general commercial bribery offense.

FAILURE TO PREVENT BRIBERY

The UK Bribery Act also creates an offense for the failure of a corporate entity to prevent bribery committed by associated persons. The term *associated persons* refers to any individual who performs services for or on behalf of the company, such as an employee, agent, or subsidiary.

A company can be liable for failing to prevent bribery offenses committed by associated persons if the corrupt act was for the purpose of securing or retaining business or some advantage for the company.

This is a *strict liability offense*, which means that no criminal intent is required (the government must prove only that the defendant performed the act; it does not have to prove that the defendant performed the conduct with any particular mental state).

The failure to prevent bribery is subject to a defense of having adequate procedures in place to prevent acts of bribery by associated persons. Unfortunately, the UK Bribery Act does not define *adequate procedures*, but the UK government provided guidance on what constitutes adequate procedures.

The UK's Ministry of Justice (MOJ) published final guidance for consultation as to what might constitute *adequate procedures*. In short, to be adequate, the procedures should be reasonably designed, implemented, and enforced so that they will generally be effective in preventing and detecting criminal conduct.

Specifically, the MOJ provided six principles to guide organizations to access the defense:

- *Proportionality*: Procedures in place should be proportional to the risk and size of the business; large businesses in industries with high risks of corruption need relatively higher measures than small companies with lower risks.
- *Top-level commitment*: High-level management should take an active role in demonstrating that the organization does not tolerate bribery.
- *Risk assessment*: Management assessed research in the organization's industry and places of business to determine the level of risk for bribery.
- *Due diligence*: The organization's management should know who it does business with, which might require gathering background information on trade partners (the focus is on trade partners that perform services on behalf of the organization).
- *Communication*: This includes communicating policies not only to employees, but to others who perform services for the organization; it also includes continued training.
- *Monitoring and review*: There should be periodic reviews of anti-bribery measures to keep them modern and reviews when entering new markets or other new forms of risk.

NO FACILITATION PAYMENTS EXCEPTION

Another way that the UK Bribery Act has a broader application than the FCPA concerns facilitating payments. The FCPA does not prohibit all payments to foreign officials; it contains an explicit exception for facilitating payments made to expedite or secure performance of a routine governmental action. The UK Bribery Act, however, makes no such exception.

ENFORCEMENT

The UK Bribery Act establishes severe penalties for violations. An individual convicted of either general bribery or the bribery of a foreign public official faces a penalty of up to ten years' imprisonment and a fine. A company convicted of either general bribery or the bribery of a foreign public official faces a fine. The failure to prevent an act of bribery by an associate party is also punishable by a fine. Note that the UK Bribery Act does not establish any upper limits on the fines that may be imposed.

The Serious Fraud Office (SFO) is responsible for enforcement of the UK Bribery Act. In recent years, the SFO has relied on *deferred prosecution agreements* (DPAs) to enforce the Act. A DPA is a voluntary, court-approved agreement under which the criminal prosecution of a company is deferred in exchange for the company's admission of wrongdoing and certain remedial measures. Such measures can include fines, increased compliance efforts, and compensation for victims. Under a DPA, the company will not be prosecuted if it complies with the terms of the agreement.

FCPA VERSUS UK BRIBERY ACT

The chart below compares key provisions of FCPA with the UK Bribery Act.

	FCPA	UK Bribery Act
Bribery of Private Entities	Applies to bribery of foreign government officials	Prohibits bribes paid to any person (not limited to foreign officials)
Corrupt Intent	Requires corrupt intent	Does not require corrupt intent
Corporate Strict Liability	Bribery charges must prove intent or negligence	Strict corporate liability offense for the failure to prevent bribery
Facilitating Payments	Exception for facilitating payments	No exception for facilitating payments

International Anti-Money Laundering Instruments

There are a number of international instruments related to money laundering. These include:

- Financial Action Task Force's (FATF) Forty Recommendations on Money Laundering
- FATF's Nine Special Recommendations on Combating Terrorist Financing
- UN Convention against Transnational Organized Crime
- Instruments developed by the Egmont Group of Financial Intelligence Units
- Instruments developed by the International Monetary Fund/World Bank

For more information on the various international instruments related to money laundering, see the "Money Laundering" chapter in this section of the *Fraud Examiners Manual*.

International Banking and Financial Systems

There are international instruments in the area of banking and financial system regulation and supervision, including:

- International Organization of Securities Commissions' Multilateral Memorandum of Understanding Concerning Consultation and Cooperation and the Exchange of Information
- Basel Committee on Banking Supervision Core Principles for Effective Banking Supervision
- Basel Committee on Banking Supervision Core Principles Methodology

Multilateral Memorandum of Understanding Concerning Consultation and Cooperation and the Exchange of Information

In 2002, the International Organization of Securities Commissions (IOSCO), an international organization comprising securities commissioners and administrators responsible for securities regulation and the administration of securities laws in their respective countries, approved a multilateral agreement on cooperation and global information exchange within the international community of securities regulators.

The agreement, known as the *Multilateral Memorandum of Understanding Concerning Consultation and Cooperation and the Exchange of Information* (IOSCO MMoU), was the first international standard for cooperation in dealing with breaches of stock exchange regulations.

IOSCO MMoU represents a common understanding amongst the signatory parties about how they will confer, collaborate, and exchange information for securities regulatory enforcement purposes. That is, IOSCO MMoU was designed to facilitate cross-border enforcement and exchange of information amongst stock exchange supervisory authorities.

IOSCO MMoU provides for different forms of cooperation, including assistance in obtaining statements, exchange of information upon request, and spontaneous exchange of information.

Core Principles for Effective Banking Supervision

The Core Principles for Effective Banking Supervision (Core Principles) is a set of supervisory guidelines the Basel Committee on Banking Supervision (BCBS) developed to provide a general framework for effective banking supervision. That is, they were designed to help countries assess their banking supervisory systems and identify areas for improvement and to promote more consistent and effective bank supervision in all countries. The Core Principles also serve as a reference document for national supervisors and international institutions.

Core Principles Methodology

The Core Principles Methodology, which the BCBS developed along with the Core Principles, serves as a tool for assessing compliance with the Core Principles.

BANKRUPTCY (INSOLVENCY) FRAUD

If a party, such as a person or business, cannot repay the debts it owes to creditors, it may file for bankruptcy to initiate a process whereby it can resolve its debts. While the types of parties that may file for bankruptcy might vary by jurisdiction, it is common for individuals, corporations, limited liability companies, partnerships, and other entities to be able to file for bankruptcy. For debtors, the biggest benefit of filing for bankruptcy is the potential partial or full discharge of debts. When a debt is discharged, the debtor is no longer required to pay it, and creditors cannot collect on it.

Bankruptcy fraud occurs when an individual or organization makes false or misleading representations in the course of petitioning for debt relief. Bankruptcies are governed by legislation, and illegal conduct related to bankruptcies is almost always a criminal offense.

Bankruptcy proceedings often play a substantial role in fraud examinations for two reasons. First, there are many fraud schemes that are perpetrated using the bankruptcy system. Additionally, for any investigation into financial crimes, fraud examiners need to be able to consider the role that bankruptcy might play if attempting to recover the victim's assets. Losses due to fraud might also cause a company or individual to file for bankruptcy, leading to an investigation into the source of the fraud.

Some additional country-specific information regarding how bankruptcy systems work that might not pertain to a global audience can be found in the “Supplemental Regional Information” section of this chapter located on [fraudexaminersmanual.com](https://www.fraudexaminersmanual.com).

Key Parties in the Bankruptcy System

Debtors

A *debtor* is an individual, partnership, corporation, or municipality that is the subject of a bankruptcy filing. *Municipality* refers to a political subdivision, public agency, or instrumentality of a state.

Debtors might have different goals in seeking bankruptcy. For example, a debtor seeks a liquidation bankruptcy to be relieved of all dischargeable debts and to either start over with a clean slate or to dissolve (depending on whether the debtor is an individual or a company).

But a debtor files for a reorganization bankruptcy if, despite its financial problems, it wants to reorganize and continue operating as a business. Liquidation and reorganization bankruptcies are discussed in more detail below.

Creditors

A *creditor* is a person to whom money is owed by a debtor. Many jurisdictions, including the United States, recognize a distinction between secured and unsecured creditors during bankruptcy proceedings.

Secured Creditors

A *secured creditor* is one who has a secured interest in some of the debtor's property, meaning that if the debtor defaults on payments to the creditor, the creditor may possess or liquidate the secured property to satisfy the debt.

Creditors with secured interests generally have priority over unsecured claims, meaning they normally get paid before unsecured claims in the distributions to creditors made by the trustee or debtor-in-possession. The most common example of a secured interest occurs when a lender finances a debtor's purchase of a particular property (e.g., a home or vehicle) and, as part of the debt agreement, takes a collateral interest in the financed property.

A secured creditor's claim is secured to the extent of the property's value on the petition date. When the debt is undersecured (i.e., the debt is secured by property that is worth less than the amount of the debt), the debt will be considered both unsecured and secured. For example, if a note for \$500 is secured by property having a value of \$400 on the petition date, there will be a secured claim for \$400 and an unsecured claim for \$100.

The method of establishing oneself as a secured creditor varies from jurisdiction to jurisdiction. There might be a filing requirement to register a financing statement with a public registry or a government agency.

Unsecured Creditors

An *unsecured creditor* is one that does not have any secured interests in the debtor's assets. If the debtor goes into bankruptcy, secured creditors receive payment before unsecured creditors. That is, in jurisdictions that recognize a distinction between secured and unsecured creditors, the secured creditors are entitled to payment before unsecured creditors in bankruptcy proceedings.

Preferential Creditors

Some jurisdictions also recognize a third type of creditor commonly referred to as *preferential* or *preferred creditors*. Preferential creditors may be paid before unsecured creditors and sometimes before secured creditors, depending on the specific laws of the jurisdiction and the terms of the applicable liquidation agreement. Employees are frequently treated as preferential creditors in the jurisdictions that recognize this class of creditor.

Courts

In many countries, bankruptcy is a court process. For example, in the United States, the United Kingdom, and Australia, bankruptcy is a formal, court-governed process used to eliminate and reorganize debt.

U.S. Bankruptcy Courts

Bankruptcy is a federal court process in the United States. All bankruptcy cases are filed in federal court, and many are filed in the local district of the U.S. bankruptcy court. U.S. district courts have jurisdiction over bankruptcy proceedings, but, in practice, virtually all cases are deferred to the U.S. bankruptcy courts.

United Kingdom

In the United Kingdom, bankruptcy petitions are usually presented in the High Court in London or in a county court near to where the filing party lives or trades.

Australia

In Australia, bankruptcy cases may be heard by the Federal Court or the Federal Circuit Court.

Bankruptcy Agencies

Some countries have government agencies that are responsible for overseeing bankruptcies. For example, in the United States, the U.S. Trustee Program (USTP) is responsible for administering bankruptcy cases. In Canada, the Office of the Superintendent of Bankruptcy (OSB) is a federal agency tasked with ensuring that bankruptcies are administered in a fair and orderly manner.

Bankruptcy Trustees

Some countries, such as the United States, the United Kingdom, and Canada, use trustees to administer bankruptcy estates. A *trustee* is an entity that holds property, authority, or a position of trust for the benefit of another entity. A *bankruptcy trustee* is a neutral professional assigned to administer an estate in bankruptcy.

For additional information regarding key parties in the bankruptcy systems of specific jurisdictions, see the content on “Key Parties in the Bankruptcy System” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Types of Bankruptcy Filings

The structure of bankruptcy proceedings varies by jurisdiction, so it is important to study the rules of the relevant jurisdiction when dealing with potential bankruptcy fraud. However, there are common types of bankruptcy filings, and most countries have adopted a similar version of at least one. The particular terms might change, but three common types of bankruptcy designed to deal with different debt situations are liquidation, reorganization, and debt adjustment.

Additional information regarding how these types of filings work in the United States can be found in the discussion of the U.S. Bankruptcy Code. See the content on “The Bankruptcy System” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Liquidation

Liquidation is the most basic type of bankruptcy proceeding and involves accounting for all dischargeable debts the subject owes, identifying all of the subject’s assets, and liquidating nonexempt assets to pay off creditors. This process allows the debtor to get a court or administrative order under which some or all debts may be eliminated.

Each jurisdiction determines what exceptions exist in terms of debts that may not be discharged and assets that may not be liquidated. Some debts, like taxes owed or child support payments, might be non-dischargeable, meaning the bankruptcy will not wipe these debts away. Typical items that may not be liquidated include the debtor’s primary residence, items of nominal value, or assets deemed necessary for the debtor to maintain employment.

However, there might be exceptions to protected assets that allow creditors to reach them. Frequently, bankruptcy laws will not protect assets that were obtained through fraudulent means, even if they are normally subject to protection. The laws might also only protect assets up to a certain amount (e.g., a debtor's luxury home is liquidated in bankruptcy and the debtor is only entitled to 20% of the sale price).

Reorganization

Unlike liquidation, which seeks to give the debtor a fresh start, the purpose of *reorganization* bankruptcy is to allow the debtor respite from creditors so that the debtor can reorganize its financial affairs and continue as a going concern. The hope is that the debtor will be able to pay the creditors back more of the debt in the long run by staying in business than if the entire business was ended and liquidated. However, debt is often restructured and reduced to some extent. Some reorganization proceedings involve putting the debtor's business under receivership for a certain period to ensure as much debt is paid back as possible.

Many countries allow business entities to go through reorganization bankruptcies. Some countries also allow individuals to use reorganization.

Debt Adjustment

Debt adjustment is another alternative to liquidation that allows a debtor pay off debts over time in accordance with a court-approved plan. Under this type of case, the debtor may keep certain property that the debtor would not be allowed to retain in a liquidation bankruptcy. Typically, the court reviews the debtor's financial situation and comes up with a plan to repay creditors. This type of bankruptcy, if available, is primarily for individuals.

Bankruptcy Schemes

Bankruptcy fraud can take on many forms. But generally, bankruptcy fraud occurs when an individual knowingly engages in prohibited conduct during the pendency of a bankruptcy proceeding with a fraudulent intent to defeat the bankruptcy laws.

The following are some common bankruptcy schemes.

Concealed Assets

The most common type of bankruptcy fraud scheme involves the concealment of assets rightfully belonging to the debtor's estate to avoid forfeiting the assets in bankruptcy. In these

schemes, concealed assets might include cash, consumer property, houses, and interests in partnerships and corporations, as well as lawsuits in which the debtor is a plaintiff. Concealed assets might also include the debtor's books and records.

Fraudulent Conveyance

Debtors often attempt to conceal their assets by transferring the assets to another person or a company. A transfer is a *fraudulent conveyance* if the purpose of the transfer is to hinder, delay, or defraud a creditor. Many countries have laws that prohibit fraudulent conveyances.

Depending on the law, a court or a bankruptcy trustee might have the power to set aside a fraudulent conveyance and seize the assets that were fraudulently conveyed.

The Planned Bustout

A *bustout* is a planned and fraudulent bankruptcy. It can take many different forms, but the basic approach is for an apparently legitimate business to order large quantities of inventory or other goods on credit, and then dispose of those goods through legitimate or illegitimate channels. Because the point of the bustout scheme is to quickly resell the goods for cash, the fraudster is likely to purchase more liquid items like inventory than real estate, insurance policies, or services. The perpetrator then closes shop, absconding with the proceeds and leaving the suppliers unpaid. The debtor might then go into bankruptcy. Often, by this point the debtor has already made false accounting entries or taken other steps to conceal the assets or make the sales look legitimate. Other times, debtors simply flee the jurisdiction or do not show up at the proceedings.

Bustout schemes are planned and perpetrated by individuals both before and after the formation of the new business entity. Other characteristics of bustout schemes include:

- They are planned from the beginning.
- Sometimes organized crime is involved.
- Credit is established with numerous vendors; prompt payments are made to all vendors; and vendors feel comfortable in dealings, thereby extending existing credit lines.
- Perpetrators build inventory by ordering everything they can from vendors; they promise to pay soon and order more merchandise.
- Perpetrators sell out inventory at deep discount or move it before vendors can take possession of it.
- The business fails or closes up, files bankruptcy, or creditors beat them to it with involuntary bankruptcy.

Detection

Some red flags that signal that a bustout scheme might be in process include:

- A business relationship exists that is based principally on trust. Creditors are willing to offer extended terms for payment, hold checks, or take post-dated checks, all of which makes them vulnerable.
- The buyers have a history of purchasing goods for an unreasonable discount.
- Many bank accounts exist, which indicates a possible kiting scheme. The perpetrator occasionally pays some creditors with funds generated by floating checks between bank accounts.
- Inexplicably large purchases of inventory or goods (e.g., perishable goods that could not likely be sold to customers before going bad) are made.

Prevention

To help prevent this type of bankruptcy fraud, lenders and suppliers should evaluate potential customers carefully before extending credit by performing due diligence and obtaining detailed background information. Lenders and suppliers should at times visit their customers' locations to verify the businesses' legitimacy.

Multiple Filings

Multiple filing schemes occur when the same debtor files for bankruptcy several times, using either false information or real information, in several different jurisdictions. Generally, debtors will make multiple filings to obtain an automatic stay, which occurs at the beginning of a bankruptcy proceeding and prevents creditors from continuing attempts to collect debts from the petitioner. The automatic stay occurs once the debtor files the initial bankruptcy petition. Usually, in these schemes, the petitions are dismissed for failure to file the required statements or to appear for examination. False statements on petitions are common, including a denial that the debtor has filed any previous petition.

Credit Card Bustout

In a credit card bustout scheme, the debtor intentionally runs up a number of credit cards to their limit and files bankruptcy with no intent to repay. The credit card debts might include purchases for jewelry, luxury items, or other personal property that are not disclosed on the schedules. Credit card debt also might include large cash advances taken prior to filing the bankruptcy petition.

Forged Filings

Bankruptcy petitions are sometimes filed using forged documents, and often, the filings are made using stolen identities, usually as part of a larger scheme using an assumed identity. If someone files for bankruptcy using a stolen identity, it can take years to correct the credit records of the person whose identity was stolen. Alternatively, a debtor might file for bankruptcy using a name obtained from obituary notices.

Typing Services or Petition Mills

These schemes involve companies that file bankruptcy petitions on behalf of others. Typically, these entities target low-income and unsuspecting clients. To obtain cooperation, they might promise to erase the person's poor credit record or offer some other fake financial service. Often, in these schemes, the filing entity has held itself out to be a renter's rights group and has not told the client how it will accomplish what it has promised. And, in some cases, the debtor is not even aware of the filing or the bankruptcy's effect on the debtor's credit rating.

Additionally, to carry out these schemes, the petition mill might file false documents for debtors with deliberately wrong government identification numbers or other incorrect information. The petitions filed in these schemes often contain numerous false statements.

Cross-Border Insolvency Regimes

Many of the world's major economies are subject to some form of cross-border insolvency regime. A *cross-border insolvency* is an insolvency in which the insolvent debtor has assets in more than one country or where some of the insolvent debtor's creditors are from different countries. *Cross-border insolvency regimes* are legal frameworks designed to specifically address cross-border insolvency proceedings. The lack of a specific cross-border insolvency framework often leaves courts with inadequate tools and disorganized approaches that can make cross-border insolvency proceedings unpredictable and time-consuming.

The United Nations Commission on International Trade Law (UNCITRAL) Model Law on Cross-Border Insolvency is a model law that established the international standard for cross-border insolvency frameworks. More than forty jurisdictions have adopted legislation based on the Model Law, including the United States, Japan, the United Kingdom, Australia, Canada, and South Korea. The Model Law was designed to assist countries in equipping their insolvency laws with a legal framework that can effectively address cross-border insolvency proceedings.

In addition, all member states of the European Union (EU) are bound by the EU Insolvency Regulation, which establishes a regional cross-border insolvency regime for insolvency cases arising within the EU.

However, there is an absence of cross-border insolvency regimes in many major emerging economies. As these economies become increasingly globalized, professionals will likely push for legislation that addresses the prospect of cross-border insolvencies.

The World Bank Principles

Introduction

To assist countries in developing effective insolvency systems and thereby improve the stability of the international financial system, the World Bank developed the Principles for Effective Insolvency and Creditor/Debtor Regimes (World Bank Principles). Last updated in 2015, the World Bank Principles are a distillation of international best practices for designing a national insolvency system.

This section contains a brief summary of the World Bank Principles. The full text of the World Bank Principles is available at <http://pubdocs.worldbank.org/en/919511468425523509/ICR-Principles-Insolvency-Creditor-Debtor-Regimes-2016.pdf>.

Objectives and Scope of the World Bank Principles

The World Bank Principles are designed to be flexible enough to serve as a benchmark for the insolvency system of any country. In addition, they are based on the following fundamental propositions:

- *Effective systems respond to national needs and problems.* These systems must be founded upon the country's broader cultural, economic, legal, and social context.
- *Transparency, accountability, and predictability are fundamental to sound credit relationships.* Healthy credit relationships require access to accurate information and predictable legal mechanisms for the enforcement, recovery, and restructuring of debt.
- *Legal and institutional mechanisms must align incentives and disincentives across a broad spectrum of market-based systems—commercial, corporate, financial, and social.* In designing their insolvency systems, countries must consider a broad range of laws and policies.

While the World Bank Principles are based on international best practices, they are intended to be broad and flexible. The laws of a country must be shaped to fit its unique circumstances. Countries must also continue to adapt as markets change and global competition increases.

Credit Environment

Compatible Credit and Enforcement Systems

The credit system should be supported by efficient, transparent, and reliable methods for recovering debt, including the seizure and sale of movable, immovable, and intangible assets. A creditor's ability to seize and sell a debtor's property is the most efficient means of ensuring prompt payment, and it is more effective than the threat of an insolvency proceeding. An effective system for secured credit is especially important in developing countries.

Collateral Systems

Secured transactions play an important role in any market economy. Therefore, a country's legal framework should address the creation, recognition, and enforcement of security rights in all types of assets—movable and immovable, tangible and intangible—including inventories, receivables, proceeds, and future property, as well as possessory and nonpossessory rights. There should be effective notice and registration rules for all types of property and clear rules of priority for competing claims. A reliable, affordable public registry system is essential. If several registries exist, they should be integrated to the extent possible.

Enforcement Systems

Every country needs a predictable, transparent, and affordable system for enforcing both unsecured and secured credit claims outside of insolvency. A sound insolvency system is also essential. These systems must work efficiently together.

Insolvency Law Systems

Insolvency systems should aspire to the following aims and objectives:

- Integrate with a country's broader legal and commercial systems.
- Maximize the value of a firm's assets and recoveries by creditors.
- Provide for the efficient liquidation of both nonviable businesses and businesses whose liquidation is likely to produce a greater return to creditors and reorganization of viable businesses.
- Strike a careful balance between liquidation and reorganization, allowing for easy conversion of proceedings from one proceeding to another.

- Provide for equitable treatment of similarly situated creditors, including similarly situated foreign and domestic creditors.
- Provide for timely, efficient, and impartial resolution of insolvencies.
- Prevent the improper use of the insolvency system.
- Prevent the premature dismemberment of a debtor's assets by individual creditors seeking quick judgments.
- Provide a transparent procedure that contains, and consistently applies, clear risk allocation rules and incentives for gathering and dispensing information.
- Recognize existing creditor rights and respect the priority of claims with a predictable and established process.
- Establish a framework for cross-border insolvencies, with recognition of foreign proceedings.

Where an enterprise is not viable, the law should provide for swift and efficient liquidation, which may include the preservation and sale of the business, as distinct from the legal entity. Where an enterprise is viable and can be rehabilitated, its assets are often more valuable if retained in a rehabilitated business than if sold in a liquidation. The rescue of a business should be promoted through formal and informal procedures, which protect all those involved, permit the negotiation of a commercial plan, enable a majority of creditors in favor of a plan or other course of action to bind all other creditors (subject to appropriate protections), and provide for supervision to ensure that the process is not subject to abuse.

Selected Anti-Fraud Requirements

Under the World Bank Principles, countries should adopt the following anti-fraud policies.

Administrative Powers

Most bankruptcy processes, whether through a court or otherwise, appoint a person or group with administrative powers to oversee the process. The name of this appointee varies among jurisdictions but is often called the *administrator*, *trustee*, *receiver*, *examiner*, or *supervisor*. The World Bank Principles recommend that the administrator have broad powers, including:

- The right to cancel fraudulent contracts or transactions entered into by the debtor
- The power to collect, preserve, and dispose of the debtor's property
- The ability to interfere with contracts to meet the objectives of the insolvency process
- The power to examine the debtor, the debtor's agents, or other people with knowledge of the debtor's affairs and compel them to provide relevant information

Governance and Management

In liquidation proceedings, an independent insolvency representative who has the authority to administer the estate in the interest of creditors should replace a company's management. In creditor-initiated filings, where circumstances warrant, an interim administrator with limited functions should be appointed to monitor the business to ensure that creditor interests are protected.

According to the World Bank Principles, there are three preferred approaches in reorganization proceedings:

- Exclusive control of the proceeding is entrusted to an independent insolvency representative.
- Governance responsibilities remain invested in management.
- Supervision of management is undertaken by an impartial and independent insolvency representative or supervisor.

Under the second and third approaches, complete administration power should be shifted to the insolvency representative if management is incompetent, negligent, or has engaged in fraud or other misbehavior.

Avoidable Transactions

A country's laws should permit transactions by the debtor to be avoided (i.e., canceled) under certain circumstances. Such avoidable transactions include transactions that occur after the commencement of the insolvency proceeding if they are not consistent with the debtor's ordinary course of business or engaged in as part of an approved administration. There should be narrow exceptions protecting parties who lacked notice.

Additionally, certain transactions prior to the application for, or the date of, commencement of the insolvency proceeding should be avoidable, including fraudulent and preferential transfers made when the enterprise was insolvent or that rendered the enterprise insolvent. The suspect period, during which payments are presumed to be preferential and may be set aside, should be reasonably short with respect to general creditors. However, the period may be longer for gifts or when the person receiving the transfer is closely related to the debtor.

Integrity of the System

To ensure the integrity of the insolvency system, it should have the following characteristics:

- The system should guarantee security of tenure and adequate remuneration of judges, provide personal security for judicial officers and court buildings, and ensure that court opinions are based on firm rules and regulations to avoid corruption and undue influence.
- The court must be free of conflicts of interest, bias, and lapses in judicial ethics, objectivity, and impartiality.
- Individuals involved in a proceeding must be subject to rules and court orders designed to prevent fraud, abuse, and other illegal activity.

Competence and Integrity of Insolvency Representatives

The insolvency system should ensure that:

- There are objective, clearly established, and publicly available criteria for the insolvency representative.
- Insolvency representatives are competent.
- Insolvency representatives act with integrity, impartiality, and independence.
- Insolvency representatives, where acting as managers, are held to director and officer standards of accountability and are subject to removal for incompetence, negligence, fraud, or other wrongful conduct.

Transparency and Corporate Governance

Transparency and good corporate governance are essential elements of a strong lending system and corporate sector. Transparency exists when information is made readily available to other parties, creating an informed and communicative environment conducive to cooperation among all parties. Transparency and corporate governance are especially important in emerging markets.

Disclosure of basic information—including financial statements, operating statistics, and detailed cash flows—is recommended for sound risk assessment. Accounting and auditing standards should be compatible with international best practices. Transparency and strong corporate governance are needed in both domestic and cross-border transactions and at all phases of investment—at the inception when making a loan, when managing exposure while the loan is outstanding, and especially at the point when a borrower's financial difficulties become apparent and the lender is seeking to exit the loan. Ongoing monitoring is also important, whether before or during a restructuring or after a reorganization plan has been implemented.

Predictability

To ensure fair treatment of all parties and deter unacceptable practices, a country's legal framework and judicial process must be predictable and reliable. Corporate laws and regulations should guide the conduct of the borrower's shareholders. A corporation's board of directors should be responsible, accountable, and independent of management, subject to best practices on corporate governance. The law should be imposed impartially and consistently.

SECURITIES FRAUD

Securities fraud refers to deceptive practices in the purchase or sale of securities, and the term covers a broad range of illegal activities. *Securities* are fungible, negotiable financial instruments that represent an interest or a right in something else.

Securities are not inherently valuable. Their value stems from various factors, including the issuer's financial condition, markets, and competitive and regulatory climates. Thus, securities are not a commodity to be consumed; they more closely resemble currency being traded.

Many financial products and opportunities can be classified as securities, but what actually constitutes a security is often far from obvious to an untrained observer.

Most countries have laws that prohibit false statements and other fraudulent activity in connection with securities transactions, and although such laws vary by jurisdiction, most jurisdictions typically define securities fraud violations to include the following elements:

- The defendant made a material misstatement (false statement) or omission.
- The misstatement or omission was in connection with the purchase or sale of a security.
- The defendant acted with a specific intent to defraud.
- The victim relied on the misrepresentation or omission.
- The victim suffered economic loss caused by the misrepresentation or omission.

This section helps provide fraud examiners with the tools necessary to recognize a security and conduct a successful securities fraud investigation.

What Constitutes a Security?

In basic terms, a *security* is a fungible, negotiable financial instrument that represents an interest or a right in something else. This is a broad definition under which many types of instruments may be classified as securities.

The term *security*, however, is not a straightforward legal concept, and there is no standard definition. Moreover, countries define the term differently; therefore, what is considered a security varies from country to country. In addition, countries also vary in their use of the term itself. For example, the U.S. definition of a security is substitutable with *securities* in India and South Africa, *investments* in the United Kingdom, and *financial product* in Australia.

Accordingly, determining whether something is a security can be difficult. Nevertheless, establishing whether a financial instrument is a security is often necessary, because once a financial instrument is found to be a security, it will be governed by extensive rules and regulations. (In most cases involving allegations of securities fraud, however, the exact nature of the investment does not need to be determined.)

The various definitions for the term *security* also vary in scope. A narrow construction of the term might provide that a security refers only to stocks and bonds, but there are also various other instruments that may or may not be classified as securities.

One of the most elaborate definitions of *security* is set forth in the two main pieces of federal securities law in the United States: the U.S. Securities Act of 1933 (the 1933 Act) and the U.S. Securities Exchange Act of 1934 (the Exchange Act). The two laws present definitions that are functionally indistinguishable. Section 2(1) of the 1933 Act provides: “The term ‘security’ means any note, stock, treasury stock, security future, bond, debenture, evidence of indebtedness, certificate of interest or participation in any profit-sharing agreement, . . . investment contract, . . . or, in general, any interest or instrument commonly known as a ‘security’, . . . or any . . . guarantee of, or warrant or right to subscribe to or purchase, any of the foregoing.”

By including *investment contracts* within this definition of a *security*, U.S. lawmakers allowed this definition to include classes of financial instruments that are not specifically listed in it. Accordingly, under U.S. federal law, the default definition of a *security* is the term *investment contract*, which was defined in *SEC v. W.J. Howey Co.*, 328 U.S. 293 (1946). In *Howey*, the U.S. Supreme Court defined an investment contract as “a contract, transaction or scheme whereby a person invests his money in a common enterprise and is led to expect profits solely from the efforts of” someone other than the investor. Thus, in *Howey*, the U.S. Supreme Court established a four-factor test, which is known as the *Howey* test, to determine whether a financial instrument is an investment contract. All four factors must be present for an investment contract to exist.

But in the United States, the *Howey* test is not definitive. Each state has its own set of securities laws, and although a majority of the states use the *Howey* test, many states use the risk capital test as an alternative to the *Howey* test. This test allows the investor to play a more active role if the funds they contribute are part of the “risk capital” of the business. A person entrusts money or other capital to another with the expectation of deriving a profit. The success or failure of

the venture is dependent upon the managerial efforts of the other person. Several states have formally adopted this test, sometimes known as the Hawaii Market Test, as an alternative definition of *investment contract*. However, the U.S. Supreme Court has expressly declined to decide if this test should be used.

There is, however, a certain level of uniformity in how the term *security* is defined among European countries because European Union (EU) policymakers have made considerable efforts to harmonize securities law. In the United Kingdom, the Financial Services and Markets Act 2000 (FSMA), which is the primary legislation regulating securities markets in the United Kingdom, defines *investment* in terms similar to the U.S. *securities* definition. Under FSMA, an *investment* is a regulated activity that is specified in the classes of activity and categories of investment in Part II of Schedule 2 to the FSMA, which include:

- Securities
- Instruments creating or acknowledging indebtedness
- Government and public securities
- Instruments giving entitlement to investments
- Certificates representing securities
- Units in collective investment schemes
- Options
- Futures
- Contracts for differences
- Contracts of insurance
- Participation in Lloyd's syndicates
- Deposits
- Loans secured on land
- Rights in investments

The principal Australian securities laws—the Corporations Act of 2001—contains several definitions of a *security* and *securities*, but these definitions are aggregated, defined, and regulated as *financial products* in the context of financial market and services regulation.

India's definition of *securities* is akin to the U.S. definition, and its sole definition of *securities* is contained in Section 2(h) of the Securities Contracts (Regulation) Act 1956. Section 2(h) defines *securities* as:

(i) shares, scrips, stocks, bonds, debentures, debenture stock or other marketable securities of a like nature in or of any incorporated company or other body corporate; (ia) derivative; (ib) units or any other instrument issued by any collective investment scheme to the investors in such schemes; (ic) security receipt as defined in clause (zg) of section 2 of the Securitization and Reconstruction of Financial Assets and Enforcement of Security Interest Act, 2002; (id) units or any other such instrument issued to the investors under any mutual fund scheme; (ie) any certificate or instrument (by whatever name called), issued to an investor by any issuer being a special purpose distinct entity which possesses any debt or receivable, including mortgage debt, assigned to such entity, and acknowledging beneficial interest of such investor in such debt or receivable, including mortgage debt, as the case may be; (ii) Government securities; (ia) such other instruments as may be declared by the Central Government to be securities; (iii) rights or interest in securities.

In the Republic of South Africa, the definition of *securities* is found in the Securities Services Act, which provides:

(i) shares, stocks and depository receipts in public companies and other equivalent equities, other than shares in a share block company as defined in the Share Blocks Control Act, 1980 (Act No. 59 of 1980); (ii) notes; (iii) derivative instruments; (iv) bonds; (v) debentures; (vi) participatory interests in a collective investment scheme as defined in the Collective Investment Schemes Control Act, No. 45 of 2002, and units or any other form of participation in a foreign collective investment scheme approved by the Registrar of Collective Investment Schemes in terms of section 65 of that Act; (vii) units or any other form of participation in a collective investment scheme licensed or registered in a foreign country; (viii) instruments based on an index; (ix) the securities contemplated in subparagraphs (i) to (viii) that are listed on an external exchange; and (x) an instrument similar to one or more of the securities contemplated in subparagraphs (i) to (ix) declared by the registrar by notice in the Gazette to be a security for the purposes of this Act; (xi) rights in the securities referred to in subparagraphs (i) to (x); (b) excludes- (i) money market instruments except for the purposes of Chapter IV; and (ii) any security contemplated in paragraph (a) specified by the registrar by notice in the Gazette.

These definitions are important for numerous reasons. For one thing, investments classified as securities are subject to the rules and procedures set up by regulatory bodies like the United Kingdom's Financial Services Authority (FSA), which impose a host of reporting

and compliance obligations for securities. For another thing, whether an international transaction is classified as a security affects the jurisdictions under which it falls.

Although the definition of *securities* varies among jurisdictions, most of these definitions cover instruments that can easily be identified as securities. These more traditional securities are usually easy to spot.

Traditional Securities

Types of investments most commonly recognized as securities include: stocks, bonds, and certificates of deposit (CDs).

Stocks

A *stock* is an instrument that represents an ownership interest in a corporation and a claim on a proportional share in the corporation's assets and profits. Corporations raise capital through the sale of shares of stock, which entitle the lawful holder to dividends and other rights of ownership. There are many different classes of stock, including common, preferred, non-voting, and restricted.

Bonds

A *bond* is a debt instrument; it is a certificate of debt issued by a government or corporation guaranteeing payment, plus interest, on the original investment by a specified future date. A bond, like a loan, obligates the issuer to pay the bondholder a specified sum of money, usually at specified intervals, and to repay the amount of the loan at maturity. There are many types of bonds, including treasury bills, corporate bonds, municipal bonds, and junk bonds.

Although the term *junk bonds* has a negative connotation, these instruments are simply high-risk, below-investment-grade, commercial bonds.

Certificates of Deposit

CDs are interest-bearing investment products that provide limited access to the money invested and a modest rate of interest. Put differently, CDs are certificates of debt that are issued by financial institutions and that guarantee payment on the original investment, plus interest, by a specified future date. In these documents, banks acknowledge the receipt of money and promise to repay the money with interest.

CDs are intended to be held until maturity, at which time the money may be withdrawn together with the accrued interest. Many banks impose penalties on money that is withdrawn from a CD before maturity.

Futures and Options

Numerous securities fraud schemes involve futures contracts, option contracts, and over-the-counter (OTC) options (i.e., an option that does not trade on a major exchange). Futures and options are the main types of derivative instruments. *Derivatives* are financial instruments whose value is based on an underlying asset or economic factor.

There are two main types of financial markets for derivatives: exchange-traded and OTC. Thus, the contracts traded on these markets derive their values from an underlying asset or economic factor.

Futures and options are essentially methods of managing price risk, often called *hedging*. Futures and options can be used, for example, by farmers or international manufacturing companies as a form of insurance against adverse price or currency exchange rate changes. Many esoteric types of investment vehicles have been created, often using complex mathematical models, and these derivative products allow trading to take place in various indices known as *strips*, *collateralized mortgage obligations*, and *leaps*.

Trading derivatives is risky and, consequently, internal controls must be airtight in a firm that engages in hedging or trading activities using exchange-traded or OTC derivatives.

Futures Contracts

A *futures contract*, or *future*, is an agreement between buyers and sellers to make delivery (i.e., sell) or to take delivery of (i.e., buy) a given quantity and quality of a commodity at a specified price and on a specified future date.

Often, the underlying asset to a futures contract is commodities, and generally, futures contracts are bought and sold on commodities exchanges, which are similar to stock exchanges in that they function as a central marketplace and provide facilities to buy and sell commodities. A *commodity* is anything that can be turned to commercial advantage. Goods commonly sold on the commodities market include such items as soybeans, wheat, corn, pork bellies, rice, gold, and silver. In the commodities market, the basic instrument of exchange is the futures contract.

Futures contracts are a valuable tool that certain businesses (e.g., ranchers who are dependent on corn for feeding their cattle) rely on to reduce their exposure to price fluctuations of commodities. Prices of commodities are highly volatile, as they are affected by factors including, but not limited to, weather, industry, economy, employment, technology, and political and global events. Investors, who have no intention of taking delivery of the actual physical commodities, trade in commodity futures contracts with the goal of profiting from price fluctuations in the underlying commodity.

Futures contracts are standardized and contain terms with specifications such as the contract size, delivery months, commodity grade, location of delivery, and so on. Price and quantity are the only things negotiated by the counterparties to a trade. In the United States, agricultural, industrial, and financial futures are traded on organized exchanges known as contract markets.

Futures contracts are either physically delivered or cash settled. When futures contracts are physically delivered, the holder must either produce the underlying commodity or take delivery from the exchange. The possibility of delivery keeps futures contracts in line with their underlying cash markets. If a contract rises too high in price relative to the cash market, traders might sell futures with the intent of making delivery. This forces the futures price down and is the reason futures markets reflect the price of their underlying cash market.

Cash settlement is a method of settling futures contracts by cash rather than by physical delivery. The value of these contracts is derived from an underlying index value. When a futures contract is cash settled, traders will often use a calculated “fair value” to determine if the futures are high or low compared to the underlying index. If fair value indicates that futures are too high, a trader might sell futures, expecting the difference to narrow.

Futures contracts do not have any intrinsic value in and of themselves; their value is derived from the underlying commodity, index, or security. Because futures contracts “derive” their price from their underlying cash market, they are called derivatives.

THE PRINCIPLE OF OFFSET

One of the features of commodity futures markets that make them so liquid and cost effective is the principle of offset. In a futures contract, the delivery or sale of the product is assumed, and the investor has an obligation to fulfill the contract; therefore, buying or selling a futures contract does not necessarily mean that the investor will accept or make delivery of

the actual commodity itself. But the obligation of the buyer (to accept future delivery) and the obligation of the seller (to make future delivery) is not with each other; it is with the central clearing function of the exchange (exchanges may have a separate clearing corporation or the clearing may be a part of the exchange itself).

The primary means of fulfilling one's obligation under a future's contract is to enter into an off-setting contract. An *off-setting contract* is one in which a purchase (sale) of futures contracts is liquidated through the sale (purchase) of an equal number of futures contracts with the same delivery month, thus closing out a position. This legally cancels the outstanding obligation.

Each futures exchange has its own clearing organization that provides clearing services with respect to futures contracts. *Clearing* is the process by which a clearing organization acts as a third-party intermediary to futures contracts and assumes the role of the buyer and seller in such contracts so that it can reconcile the orders between the transacting parties.

That is, the clearing organization matches futures transactions and becomes counterparty to both sides of the trade, eliminating counterparty credit risk by guarantying both sides of the transaction. As a result, traders can liquidate their positions (obligations) by merely executing an equal and opposite offsetting transaction (selling out a long position or buying back a short one). Clearing also transfers funds between transacting parties when futures trades are marked to market at the end of each day.

TRADING ON MARGIN

Futures are traded on margin, which is the initial amount of money that is invested by both buyers and sellers of futures contracts to ensure performance on the terms of the contract (the making or taking delivery of the commodity or the cancellation of the contract by a subsequent offsetting trade). A margin in futures is not a down payment, as in securities, but rather a performance bond. A buyer puts up an initial margin at the time a futures market contract is established to act as security for a guarantee of contract fulfillment. Only a small percentage, usually about 5% of the contract's notional value, is required to establish a position (long or short) in a futures market (notional value is the contract size in units multiplied by the price per unit).

Margins are set by the exchange for each commodity and are raised or lowered from time to time to reflect changing market volatility and notional contract values. Brokerage firms may require greater margin of their customers but may not require less than what the exchange has

set. Each exchange will have a margin committee made up of exchange members and support personnel that monitors and evaluates the markets and makes margin changes as appropriate.

There are two types of margin: initial margin and maintenance margin. The *initial margin* is the amount of money per contract that must be present in the account when the position is initiated. That is, to buy securities on margin, an investor must deposit enough assets with a broker to meet the initial margin requirement for that purchase. The *maintenance (variation) margin* is the minimum amount of money per contract that must be maintained in the account while the position is open. That is, the maintenance margin is the amount investors must have in their account to maintain an open position. For example, a December corn contract had a closing price of \$2.84 1/4 per bushel. The notional value of this contract is \$14,212 (5,000 bushels x \$2.84 1/4). The initial margin requirement is \$810 per contract, which is 5.69% of the notional contract value, while maintenance margin is set at \$625 per contract, which is 4.39% of the notional contract value. Positions can be liquidated without customer authorization in accounts that violate margin requirements.

TRADING BASICS

A trader who buys futures contracts (assuming this is not an offsetting transaction) is long in the market and will profit if prices rise (e.g., if you bought a December corn contract at \$2.70 per bushel and the price rose to \$2.80 per bushel, you would have an unrealized profit of \$500 (10 cents x 5,000 bushels)). Because open commodity positions (transactions that are not offset) are marked to market at the end of the trading day, this \$500 profit will be credited to your trading account and is available as margin for additional contract purchases. This transfer of funds occurs through the clearing corporation of the exchange.

The transaction counterpart of the long buyer is the short seller. Using the previous example, if you sold a December corn contract at \$2.70 per bushel and the price rose to \$2.80 per bushel, you would have an unrealized loss of \$500 (.10 cents x 5,000 bushels). Again, open commodity positions are marked to market at the end of the trading day, meaning that this \$500 loss will be debited from your trading account.

Options

Options (or *option contracts*) are like futures contracts, but unlike futures, options do not impose obligations on the buyer and seller to make or take physical delivery of the commodity. An option contract confers a right—not an obligation—to the option buyer to take delivery of (i.e., buy) the underlying asset and imposes obligations on the option seller.

Options can be traded on exchanges, OTC, between individual business entities, or between individuals. Option contracts have widespread appeal and application, and they are used and abused. Businesses and individuals commonly use options in real estate, personal property, and interest rate transactions.

The main difference between option contracts and futures contracts is that options confer rights and impose obligations, whereas futures impose obligations. More specifically, an option contract confers a right—not an obligation—to the option buyer to take delivery of (i.e., buy) the underlying asset and imposes obligations on the option seller. Futures impose obligations on both the buyer and the seller to either make or take physical delivery of the commodity or to agree to cash settlement at contract expiration.

If an option is not exercised, it expires unexercised (most exchange-traded options expire worthless). In contrast, if a commodity contract is held to expiration, the investor who has the long position takes delivery of the commodity, and the investor in the short position makes delivery.

Again, the buyer of an option contract purchases the right, not the obligation, to buy or sell something at a specified price (exercise or strike price) by the expiration date of the option contract.

The object of the option contract (what the option is written on) is called the *underlying*. The value of the underlying is the main (but not only) factor from which the option contract derives its value.

Also, options are a zero-sum transaction, meaning that one investor must suffer a loss for another investor to gain.

Option trading, however, has conservative and speculative aspects. On the one hand, option contracts can be used to hedge other security positions or assets. On the other hand, option contracts enable a speculator to control large quantities of securities with a small amount of capital.

There are two kinds of options: calls and puts. A *call option* is the right, but not the obligation, to purchase the underlying security at the strike (exercise) price by the option's expiration date. A *put option* is the right, but not the obligation, to sell the underlying security at the strike (exercise) price by the option's expiration date.

In options transactions, the seller of a call option is the *call writer*, while the seller of the put option is the *put writer*. Option buyers pay a premium to option writers for the options they buy. Option writers (sellers) collect this premium for the options they write and are obligated to deliver the underlying security if the option is exercised.

Options come in various styles such as:

- *Plain vanilla option*: This is the most standard version of an option. Plain vanilla options have simple expiration dates and strike prices and no additional features.
- *Exotic option*: This option has more complex features than plain vanilla.
- *American option*: This option may be exercised on any trading day on or before expiration.
- *European option*: This option may only be exercised on expiration.

RELATIONSHIP OF THE UNDERLYING SECURITY TO AN OPTION

Options are derivatives; therefore, their value is derived primarily from the value of their underlying instruments. For example, XYZ common stock closed today at \$88.29 per share and the strike prices of the October 2008 XYZ calls ranged from \$65 per share to \$135 per share. The more that the share price of XYZ is above a particular strike price, the greater the value of that option. The stock price of \$88 per share is about \$23 over the strike price of the XYZ \$65 calls. The current premium for XYZ \$65 calls is \$22.90 per share. A trader who had previously bought this call option could sell it back into the market for about \$2,290 (\$22.90 x 100 shares) or could exercise the option and buy the stock at \$65 with the market at \$88.

Options can be *in the money*, *out of the money*, or *at the money*. A call option is in the money when the price of the underlying security exceeds its strike price. Likewise, a put option is in the money when the price of the underlying security is less than its strike price. Options are at the money when the price of the underlying security is about the same as the strike price. All other options are out of the money.

OPTION VALUES AND PREMIUMS

There are two values that make up option premiums: intrinsic value and time value.

To have any intrinsic value, an option must be in the money. Out of the money options have only time value. Returning to the previous example, the XYZ \$85 call closed today at a premium of \$5.70 per share. This call option is \$3 in the money because the underlying XYZ stock closed above the strike price at \$88 per share. The premium has \$3 intrinsic value, while the remaining \$2.70 is time value.

While the concept of *intrinsic value*—the difference between the underlying stock’s price and the strike price—is rather straightforward, the concept of time value is complex and beyond the scope of this writing. It is worth noting, however, that the mathematical formula for pricing option time value was first introduced by Fischer Black and Myron S. Scholes in 1973. The formula takes six factors into account: underlying price, strike price, time to expiration, volatility of the underlying, dividends, and interest rates.

OVER-THE-COUNTER OPTIONS

Again, options can be traded OTC. A security that does not trade on a major exchange is said to trade OTC. Unlike the floor trading in physical exchanges, OTC trading is conducted electronically, through direct contact with a market maker, or through communication among professional buyers and sellers. Banks, large brokerage firms, insurance companies, and many other businesses are active in the OTC options markets.

OTC options are not centrally cleared or standardized. These options are usually customized by the option writer to fit the needs of the option buyer. Because OTC options are not centrally cleared, counterparty credit risk can be a major concern and risk factor. The option is worthless if the option writer cannot perform.

OTC options can be plain vanilla or exotic. When traded OTC, exotic forms can be problematic for market participants, accountants, and auditors, but such problems are beyond the scope of this writing.

Investment Contracts

In many countries, such as in the United States, the term *security* includes investment contracts. The leading global definition of *investment contract* parallels the *Howey* test established by the U.S. Supreme Court, and it provides that a contract, transaction, or scheme is an investment contract if all of the following four elements are met:

- *There is an investment of money or other asset.*
- *The investment is in a common enterprise.* In very general terms, the common enterprise requirement means the success of the investor is dependent on the efforts and success of those seeking the investment of third parties (typically the promoter). The third party, who provides the entrepreneurial skill, shares in the profits (or losses) with the investor.
- *The investment was made with expectations of making a profit.* Profit is generally defined as either money received for the use of capital or capital appreciation.
- *The profits are to come solely from the efforts of people other than the investor.* To qualify as a security under this definition of investment contract, the essential managerial efforts, which affect the success or failure of the enterprise, must come from someone other than the investor. As a general rule, the more actively involved an investor is in the enterprise, the less likely it is that an investment contract will be found to exist. Thus, if the investor's efforts are significant to the enterprise's success, an investment contract will not be found to exist.

Under this definition, the term *investment contract* is broad enough to cover obscure, deceitful, new, uncommon, or irregular devices. Thus, some of the less obvious types of investments that are recognized as securities fall under the catch-all category of an investment contract.

Many fraudulent schemes involving exotic investments can be argued to constitute the offer or sale of investment contracts. The following are types of investments that frequently qualify as investment contracts:

- Ponzi schemes
- Illegal pyramid schemes
- Prime-bank note schemes
- Investment schemes involving precious metals or stones
- Viatical settlements
- Partnerships
- Joint ventures
- Oil, gas, and mineral interests
- Hedge funds
- Promissory notes

Ponzi Schemes

Ponzi schemes refer to illegal operations that use financial instruments of some sort to extract money from victims, and these schemes constitute securities fraud. In countries like the United States, in which the term *security* includes investment contracts, Ponzi schemes fall under securities laws and regulations because they qualify as investment contracts.

A Ponzi scheme is generally defined as an illegal business practice in which new investors' money is used to make payments to earlier investors. In a Ponzi scheme, there are few or no actual investments being made, just funds passing up a ladder.

The term *Ponzi scheme* is named after Charles Ponzi who, in the early 1920s, persuaded tens of thousands of Bostonians to invest over \$10 million. He created an entity, aptly named the Securities and Exchange Company, and issued investors a promissory note guaranteeing a 50% return in 90 days on every \$1,000 invested.

Illegal Pyramid Schemes

An *illegal pyramid* is a scheme in which buyers or participants are promised a payment for each additional buyer or participant that they recruit. Typically, these schemes involve a strategy whereby the fees or dues a member pays to join the organization are paid to another member, and in many cases, these schemes contain a provision for increasing membership through a process of new members bringing in other new members.

In these schemes, the members make money not by earning a commission on the bona fide retail sale of a legitimate product, but by recruiting new people. Illegal pyramids pay participants commissions for recruiting new members, and the schemes generate revenue by recruiting new members.

Illegal pyramids have unsustainable organizational structures that, like Ponzi schemes, rely on bringing in new people. Although illegal pyramid schemes are fraudulent, not all pyramid schemes are investment contracts.

Prime-Bank Note Schemes

Prime-bank note schemes involve the issuance and purported trading of so-called prime bank notes or other high-yield investment opportunities. In these schemes, investors are often told that they can obtain returns exceeding a percentage of several hundred per year when their funds are placed in an offshore trading program.

These programs are generally characterized by a number of factors. They are often excessively complex and secret. Investors are usually told that the investment opportunity is only available to a select few and the signing of nondisclosure agreements is mandatory. Typically, the explanation of how the program actually works is full of obscure terminology, and it makes reference to legitimate banks or organizations, such as the International Monetary Fund (IMF), to lend credibility. Often, to promote these schemes, investors are told that there is little or no risk of losing their principal.

While prime-bank note schemes were once an effective type of fraud, these schemes have died out for three key reasons. First, consumers are better informed. Second, investigative agencies have effectively prosecuted these schemes. Third, fraudsters have moved on to faster and more productive opportunities to commit fraud.

Schemes Involving Precious Stones and Metals

Often, investment schemes involve precious metals or stones. Scams involving precious stones and metals usually commence with an offer to purchase assets of a long-term nature that is made by a high-pressure salesperson over the phone or on the internet. Consumers respond to questions that enable the salesperson to determine their financial potential to make substantial investments. These investments are often promoted as low risk with a high rate of return. Typically, these involve the purchase of interests in gold or silver coins, bullion, diamonds, and other precious or semi-precious stones.

Viatical Settlements

Insurance companies have historically offered policies with an accelerated death benefit option. This option allows the insured to receive up to 80% of the death benefit or face value of the policy within the last year of the insured's projected life. The remaining 20% is paid upon death to the insured's estate.

In a *viatical settlement*, a terminally ill policy holder sells the death benefit under their insurance policy at a discount to a third party. In this type of settlement, the owner of the insurance policy receives cash, and the buyer becomes the new owner, or beneficiary, of the life insurance policy. The new owner pays all future premiums on the policy and receives the entire death benefit upon the insured's death. If the new owner does not pay the insurance premiums, the insurance policy will be voided, and the end payment will not be paid out. Moreover, in a viatical settlement, the third party who purchases the policy can resell the policy—along with the insured's medical and personal history.

In and of itself, a viatical settlement does not constitute the offer or sale of a security. But an industry has evolved to buy these rights and then sell fractional interests in them to investors. Frequently, these policy rights are pooled, and the investors are sold an interest in the pool. Investor returns increase according to how deeply the policy is discounted and are inversely related to how long the beneficiary survives.

Whether viatical investments constitute securities is unclear and can vary in different jurisdictions.

Partnerships

A partnership is a business structure that is used to separate a business from its owners. According to *Barron's Dictionary of Finance*, a partnership is a “contract between two or more people in a joint business who agree to pool their funds and talent and share in the profits and losses of the enterprise.” Put differently, a partnership is an association of two or more persons acting as co-owners in a business for profit.

There are various partnership forms, including general partnerships (GPs) and limited partnerships (LPs). *GPs* are associations of two or more persons acting as co-owners in a business for profit. In a GP, each general partner can incur obligations on behalf of the partnership, and each partner assumes unlimited liability for the partnership's debts. Thus, a general partner has unlimited personal liability. Also, in a GP, the partners take an active role in the operation of the business (i.e., they have management responsibilities).

Typically, however, GPs are not considered securities because the profits derived from such structures are generated from the efforts of the investors, not from the efforts of others. Thus, because the partners take an active role in the operations of GPs, these arrangements do not qualify as securities.

Be warned, however, that some promoters will try to disguise an investment contract as a GP. Therefore, it is important to look beyond the surface and determine if the partners really take an active role in operating the entity.

The unlimited liability risk of GPs makes LPs an attractive alternative to GPs. An LP is similar to a GP, except that in addition to one or more general partners, LPs also have one or more limited partners. In contrast to a general partner, who has unlimited personal liability, a limited partner is a passive investor whose liability is limited to the amount of their

investment in the company. Thus, in an LP, the general partners manage the enterprise's activities, and the limited partners supply the funding. Limited partners do not manage the enterprise's activities. Simply put, LPs facilitate commercial investments by those who want a financial interest but do not want the responsibilities or liabilities of GPs.

Unlike GP interests, interests in LPs generally constitute investment contracts.

To determine if a partnership is an investment contract, determine if the partners truly take an active role in operating the entity.

Joint Ventures

Joint ventures are associations of two or more people or entities that form an alliance to pursue a common business objective. Interests in a joint venture will often be found to be securities. As with partnership interests, to determine if a joint venture is a security, pay careful attention to the extent to which the investor actively participates in the management or operation of the business.

Oil, Gas, and Mineral Interests

Usually, the sale of fractional ownership of oil and gas wells or mineral rights constitutes the sale of a security. The misrepresentations and omissions found in oil and gas scams are often repeated in other mineral mining schemes, such as gold or coal. Investors have a right to be advised of the risks inherent in a securities investment, and oil/gas opportunities are traditionally high-risk investments. A red flag should arise if investors have been assured or guaranteed of success in striking oil, gas, or mineral deposits. Naturally, when examining investments involving oil, gas, and mineral interests, examiners should look for discrepancies in promoters' credentials, business history, and commission.

The following types of misrepresentations and omissions are often encountered in these investments:

- *Inflated drilling and completion costs:* Costs are often inflated to bilk the investor.
- *Invalid lease:* Promoters frequently do not have a valid *mineral rights lease*—a lease conveying property rights to exploit an area for the minerals it holds.
- *Misinformation on discovery and production potential:* The investor might be misled regarding the likelihood of striking oil, gas, or mineral deposit and the amount produced. This information is usually contained in the geologist's report.

- *Exaggeration about the wells:* The promoter might exaggerate the number and depth of wells, thus inflating the operating costs paid by investors.
- *Self-dealing:* Often, promoters of such interests engage in self-dealing. The promoter might, for example, declare a good well dry to reap the benefits of a productive well later when the investors have given up.
- *Dry holes:* Often, the promoter completes *dry holes*—wells drilled for oil or gas but yielding none—solely to improve their completion record and collect completion funds from investors.
- *Disproportionate royalties:* Insiders might be assigned the majority of royalties while investors receive only a small portion.
- *Unreasonable number of partners:* Promoters are likely to oversell the well (e.g., 99/64ths).

Occasionally, an oil, gas, or mineral investment might be a complete fabrication. This is even more likely in overseas mineral investments. To carry out such schemes, the perpetrators might falsify geologists' reports, or the promoters might rely on investors' reluctance to travel to remote spots to see their well or mine for themselves.

EXAMPLE

The Bre-X gold scandal, which occurred in the spring of 1997, provides a good example of a scheme involving international mineral investments.

In the 1990s, Bre-X, a Canadian mining company, announced that it had found a large gold deposit in Busang, Indonesia. As rumors of the tremendous discovery circulated, share prices of the penny-stock company skyrocketed.

Optimistic investors largely ignored the red flags that began to emerge. The initial concern with the announcement was that the mine was located in Indonesia, creating potential difficulties due to poor Canadian and U.S. relations with that country.

Undeterred by the red flags, investors continued to acquire stock in the mining company. Moreover, the company's geological reports claimed that there were as many as 5.68 grams of gold per ton of ore.

The rise in stock price, however, came to an end once a number of problems began to arise. Notably, the accuracy of the sampling came into question. Typically, when performing

geological samples, companies preserve part of the core samples for verification. Bre-X, however, did not preserve parts of the core samples; instead, the company allowed the core samples to be crushed.

Additionally, a fire destroyed the records of the Bre-X geologists, further casting the discovery into doubt. Accordingly, insiders began surreptitiously selling off large amounts of their shares.

Moreover, news that the Indonesian government had withheld key permits was concealed from investors.

Bre-X's exploration manager then suffered a mysterious death (he supposedly committed suicide by jumping out of a helicopter), and following his death, share prices plunged from approximately \$100 to around \$2. Ultimately, Bre-X's market value declined by 90%.

It was later revealed that the core samples had been "salted" (i.e., gold had been added to the ore samples to change the ore's value).

The most disturbing aspect of this case is the severe handicap investigators faced because of jurisdictional questions. "This could be a monumental scam that will be nearly impossible to prosecute," said a private investigator working on the case. "No one really has jurisdiction. The salting [of the gold samples] took place in Indonesia, but what laws were really broken in that country? The law against salting? There is none. The law against deceiving shareholders? That happened in Canada and the U.S. Most of the main suspects probably disappeared in the Philippines. But what law did they break in the Philippines? Are they fugitives? No. Can a prosecutor in Canada get a warrant for those guys in the Philippines for what they did in Indonesia? Very tricky."

In Indonesia, no extradition or law-enforcement cooperation agreements exist with Canada or the United States. Consequently, the criminal investigation was handled by the Indonesians themselves. Likewise, though Washington asked the U.S. Embassy in Jakarta to look into the fraud, the United States and Indonesia have a poor record of cooperating in criminal matters.

Investors in ventures like the one described in the Bre-X example can easily find themselves with no legal recourse if things go wrong. Obviously, different countries have varying laws regarding investor rights. Naturally, this makes it difficult to investigate such cases.

The principals of Bre-X claimed that they did not know about the sample salting. They portrayed themselves as victims and blamed the geologists for the fraudulent samples. The geologists, however, were Philippine nationals and retreated to their homeland, further complicating the investigation. The Philippine government suspected foul play in the death of the head geologist, Michael de Guzman, and was more concerned with its inquiry into his death than with turning over their countrymen for questioning.

When examining the case from a “follow the money” standpoint, the trail seems to lead to Bre-X insiders. Insiders concealed news of permits being withheld by the Indonesian government, and they secretly sold off huge amounts of stock at great profit. According to the *Wall Street Journal*, Bre-X Chairman David Walsh, Vice Chairman and Chief Geologist John Felderhof, and two other executives sold nearly CAD \$38 million of stock.

Hedge Funds

In general, *hedge funds* refer to private pooled investment vehicles managed by advisors who generally have a very large financial interest in the funds based on a management fee that includes a percentage of the fund’s performance. Put differently, hedge funds pool investors’ money and invest it in financial instruments with the goal of earning a positive return.

Hedge funds employ various speculative and aggressive strategies. For example, they often combine traditional investments with short sales, leveraging, and arbitrage strategies to maximize returns. In addition, hedge funds are often complex and lack transparency, and they are not as heavily regulated as other types of funds.

Certain factors make hedge funds vulnerable to fraud. For one thing, hedge funds have become an increasingly popular form of investment, causing some managers to become more aggressive and less meticulous in their transactions. For another thing, hedge fund managers typically charge a performance fee of 20% of a hedge fund’s profits, on top of an asset management fee of 1–2% of assets managed. Such lofty fees can motivate hedge fund managers to take greater risks with the hope of generating greater returns.

Typical hedge fund frauds committed by hedge fund managers include:

- Theft of investor assets
- Late trading
- Insider trading
- Overvaluation of portfolios

- Entering into inappropriate timing arrangements
- Exploitation of mutual fund investors for private gain
- Entering into inappropriate arrangements with mutual fund advisors in which the mutual fund advisors waive restrictions on market timing in exchange for placement of other assets by the hedge fund advisor in funds managed by a mutual fund advisor
- Conspiring with intermediaries to identify hedge fund from mutual fund personnel

Some red flags of improper hedge fund activities include:

- The fund's manager is resistant to due diligence or is resistant to provide the information necessary to conduct due diligence.
- The fund's manager is not willing to provide information upfront, including verification of employee birthdates, government identification numbers, employment history, education, professional licensing, professional credentials, corporate affiliations, and so on.
- The fund's manager is not willing to provide a signed release to allow the investigator to perform thorough checks.
- The fund's structure is not appropriate.
- The fund does not have verifiable and reputable independent service providers (e.g., independent accountants, attorneys, fund administrators, and prime brokers).
- The fund or its key employees have criminal records and civil litigation issues.
- There are misrepresentations (e.g., misrepresentations of education, employment history, or professional credentials).
- The fund has omitted significant background information (e.g., prior employment, employment terminations, or prior fund closures).
- The fund has experienced relevant or repeated regulatory issues.
- The fund lacks independent or experienced service providers.

Promissory Notes

A *promissory note* is a contract in which one party (the maker or issuer) makes an unconditional promise in writing to pay a sum of money to the other party (the payee), under specific terms, at a stated time, or on demand of the payee. Promissory notes are a form of debt similar to loans or IOUs, and they are investments that typically involve investors loaning money to a company in exchange for a fixed return over a stated period.

Private companies issue promissory notes to raise money and finance some aspect of their business, from launching new products to repaying expensive debt. In return for the loan, companies agree to pay investors a fixed return over a stated period.

A promissory note may be a security, but determining whether a promissory note actually is a security can be difficult. Under certain circumstances, promissory notes are not held to be securities. A note is presumed to be a security unless it bears a strong resemblance to a category of instruments that are not securities. Generally, longer-term commercial paper is similar in many respects to a bond and may be held to be a security unless it relates to such transactions as consumer finance or residential mortgages. For example, in the case of a residential mortgage, the note signed is simply a promise to repay, not a method to raise capital for some business venture.

To determine if a note is a security, it is often helpful to apply the resemblance test and look at three things: motive and expectation, plan of distribution, and regulation.

MOTIVE AND EXPECTATION

First, consider the issuer and buyer's primary motives. If the issuer's primary motive is to raise money for the general use of a business enterprise, then the note may be a security. Is the buyer motivated to make a loan or an investment-type transaction? What is a reasonable investor thinking? What are their expectations?

PLAN OF DISTRIBUTION

Second, consider the plan of distribution. If there is some form of common trading, a security probably exists.

REGULATION

Third, determine if there is some other regulatory system that significantly reduces the risk of the transaction, thereby rendering it unnecessary to apply the securities laws. If the transaction is deemed appropriately regulated in ways other than through the application of the securities laws, then it is less likely that securities laws will apply.

Securities Laws and Regulations

Securities regulation refers to laws, rules, and procedures enacted by a legislative body and administered by dedicated agencies that govern the way in which companies, consumers, and financial professionals behave when trading securities.

To be effective, securities regulation must balance the legitimate needs of businesses to raise capital against the need to protect investors. In addition to protecting investors, securities regulation serves other purposes, including:

- Fostering an active and competitive market
- Maintaining market confidence
- Reducing financial crime
- Discouraging behavior that might harm the market

The power to prescribe and enforce securities laws and regulations is territorial, and most securities markets, which are the markets in which securities are traded, are regulated by laws and regulations enacted and promulgated on a national basis. But because securities transactions have extraterritorial effects, national securities laws and regulations have some extraterritorial reach.

In some countries, however, the securities industry is governed by laws and regulations at different levels of government. For example, in the United States, the securities industry is regulated at both the federal and state levels. And although there is some commonality between federal and state laws, there are also some differences. Consequently, in the United States, there is a complex web of securities laws from the federal and state governments. Each state has its own securities laws, and even where the state law is similar to the federal law, the law's interpretation and rules might differ in state and federal courts.

Additionally, investors in securities face many challenges, especially in the globalized market. Different countries' exchanges have varying methods of regulating transactions. Some European countries, for instance, do not have restrictions against insider trading, while others do. Also, some countries do not have regulatory agencies to protect investor interests, and others make no stringent regulatory efforts to prevent market abuse.

For additional information regarding the regulation of securities in specific jurisdictions, such as the United States, see the content on "Securities Regulations" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

National Securities Regulators

To compete in the global securities market, a country must have a national regulatory authority to regulate all securities markets and administer securities laws under its jurisdiction.

Typically, such authorities supervise the exchanges and the main participants in the securities market (e.g., brokers, dealers, and investment advisors).

Below is a list of selected securities regulators:

- United States: U.S. Securities and Exchange Commission (SEC)
- Australia: Australian Securities and Investments Commission (ASIC)
- Canada: Canadian Securities Administrators (CSA)
- European Union: European Securities and Markets Authority (ESMA)
- Germany: Federal Financial Supervisory Authority (BaFIN)
- Japan: Financial Services Agency (FSA)
- Mexico: Comision Nacional Bancaria y de Valores (CNBV)
- United Kingdom: Financial Conduct Authority (FCA); Prudential Regulation Authority (PRA)

Exchanges

An *exchange* is a market in which securities, commodities, futures, or options are traded. Several types of exchanges exist, including securities exchanges, commodities exchanges, and futures exchanges.

Securities Exchanges

A *securities exchange* (or *stock exchange*) is a market in which stocks, bonds, and other securities are traded. Securities exchanges host markets where securities are traded. That is, a securities exchange is a market that provides services for brokers and traders to buy and sell stocks, bonds, and other securities. Securities exchanges do not buy or sell securities; they simply provide the location and services for brokers who buy and sell securities.

Securities exchanges provide many essential functions. They provide a mechanism for private enterprises to raise investment funds, supply investors with a forum to liquidate their holdings, help in the valuation of securities, and serve as indicators of economic trends.

Securities exchanges are largely self-regulatory, which means that they regulate themselves. That is, self-regulatory exchanges exercise some degree of authority to create and enforce industry regulations and standards in the markets they organize. Although exchanges have regulatory authority, they are also regulated entities to the extent that they are subject to national control and supervision.

To trade a security on a certain exchange, the security must be listed in the exchange, and securities must meet an exchange's requirements to be listed and traded there.

Some key securities exchanges include:

- New York Stock Exchange (NYSE)
- NASDAQ
- Australian Securities Exchange (ASX)
- Deutsche Boerse (DBG) (operator of the Frankfurt Stock Exchange)
- Hong Kong Stock Exchange (HKEX)
- London Stock Exchange (LSE)
- SIX Swiss Exchange
- Tel-Aviv Stock Exchange (TASE)
- Tokyo Stock Exchange (TYO)

Commodities Exchanges

A *commodities exchange* is an institution, organization, or association that serves as a market where various commodities and derivatives products are traded.

Futures Exchanges

A *futures exchange* is an institution, organization, or association that serves as a market where futures contracts can be bought and sold. But in practice, futures are usually traded at commodity exchanges.

International Securities Regulatory Institutions

Although securities are regulated on a national level, there are also numerous international bodies involved in the regulation or governance of international securities trading. The most important of these are the Basel Committee on Banking Supervision (BCBS), the International Organization of Securities Commissions (IOSCO), and the International Accounting Standards Board (IASB). Other international securities regulatory organizations include:

- The International Securities Association for Institutional Trade Communication (ISITC)
- The International Capital Market Association (ICMA)
- The World Federation of Exchanges (WFE)
- The International Council of Securities Associations (ICSA)
- International Swaps and Derivatives Association (ISDA)
- The European Securities and Markets Authority (ESMA)

Basel Committee on Banking Supervision

The BCBS provides a forum for regular cooperation on banking supervisory matters. Its objective is to enhance understanding of key supervisory issues and improve the quality of banking supervision worldwide.

The BCBS does not possess any formal supranational supervisory authority, and its conclusions do not, and were never intended to, have legal force. Rather, it formulates broad supervisory standards and guidelines and recommends statements of best practice in the expectation that individual authorities will take steps to implement them through detailed arrangements—statutory or otherwise—that are best suited to their own national systems. In this way, the committee encourages convergence toward common approaches and common standards without attempting detailed harmonization of member countries' supervisory techniques.

The International Organization of Securities Commissions¹

IOSCO is an international organization comprised of securities commissioners and administrators responsible for securities regulation and the administration of securities laws in their respective countries. IOSCO, which was created in 1983, is currently comprised of regulatory bodies from more than one hundred countries. IOSCO is recognized as the international standard-setter for securities markets, and the organization's members regulate more than 95% of the world's securities markets.

IOSCO's main objectives are to assist its members to:

- Cooperate to promote high standards of regulation in order to maintain just, efficient, and sound markets.
- Exchange information on their respective experiences in order to promote the development of domestic markets.
- Unite their efforts to establish standards and an effective surveillance of international securities transactions.
- Provide mutual assistance to promote the integrity of the markets through a rigorous application of the standards and effective enforcement against offenses.

¹ The material in this section is compiled from materials and resources issued by the OICV-IOSCO. For more information on this subject, please refer to their website at www.iosco.org.

IOSCO develops, implements, and promotes adherence to recognized standards for securities regulation, and while IOSCO's documents are not binding, IOSCO's work shapes securities regulation worldwide.

In 1998, IOSCO adopted a comprehensive set of principles called *Objectives and Principles of Securities Regulation* (IOSCO Principles), which is recognized as the international regulatory benchmark for all securities markets. Although members pledge to implement the IOSCO Principles in their home countries, the Principles are not binding.

In 2003, IOSCO endorsed a comprehensive methodology (IOSCO Principles Assessment Methodology) that enables an objective assessment of the level of implementation of the IOSCO Principles in the jurisdictions of its members and the development of practical action plans to correct identified deficiencies.

In 2002, IOSCO adopted a multilateral memorandum of understanding (IOSCO MOU), which is designed to facilitate cross-border enforcement and exchange of information among the international community of securities regulators.

In 2005, the organization endorsed the IOSCO MOU as the benchmark for international cooperation among securities regulators and set out clear strategic objectives to rapidly expand the network of IOSCO MOU signatories. It approved as an unambiguous operational priority the effective implementation—in particular within its wide membership—of the IOSCO Principles and of the IOSCO MOU, which are considered as primary instruments to facilitate cross-border cooperation, reduce global systemic risk, protect investors, and ensure fair and efficient securities markets. IOSCO also adopted a comprehensive consultation policy designed to facilitate its continuous interaction with the international financial community and in particular with the industry. As of May 2020, the IOSCO MOU has 124 signatories, with eight additional regulatory authorities seeking the legal authority necessary to enable them to become signatories. The growth of the IOSCO MOU has made it a significant document in combating violations of securities and derivatives laws.

OVERVIEW OF THE IOSCO PRINCIPLES OF SECURITIES REGULATION

The IOSCO Principles are based on the following three objectives:

- The protection of investors
- Ensuring that markets are fair, efficient, and transparent
- The reduction of systemic risk

There are local differences in market structures; however, these objectives form a basis for an effective system of securities regulation.

Although members pledge to implement IOSCO standards in their home countries, the principles are not binding.

THE PROTECTION OF INVESTORS

Investors should be protected from misleading, manipulative, or fraudulent practices, including insider trading, front running or trading ahead of customers, and the misuse of client assets.

Full disclosure of information material to investors' decisions is the most important means for ensuring investor protection. Investors are, therefore, better able to assess the potential risks and rewards of their investments and, as a result, to protect their own interests. As key components of disclosure requirements, accounting and auditing standards should be in place and they should be of a high and internationally acceptable quality.

Only duly licensed or authorized persons should be permitted to hold themselves out to the public as providing investment services, for example, as market intermediaries or the operators of exchanges. Initial and ongoing capital requirements imposed upon those license holders and authorized persons should be designed to achieve an environment in which a securities firm can meet the current demands of its counter parties and, if necessary, wind down its business without loss to its customers.

Supervision of market intermediaries should achieve investor protection by setting minimum standards for market participants. Investors should be treated in a just and equitable manner by market intermediaries according to standards, which should be set out in rules of business conduct. There should be a comprehensive system of inspection, surveillance, and compliance programs.

Investors in the securities markets are particularly vulnerable to misconduct by intermediaries and others, but the capacity of individual investors to take action may be limited. Further, the complex character of securities transactions and of fraudulent schemes requires strong enforcement of securities laws. Where a breach of law does occur, investors should be protected through the strong enforcement of the law.

Investors should have access to a neutral mechanism (such as courts or other mechanisms of dispute resolution) or means of redress and compensation for improper behavior.

Effective supervision and enforcement depend upon close cooperation between regulators at the domestic and international levels.

ENSURING THAT MARKETS ARE FAIR, EFFICIENT, AND TRANSPARENT

The regulator's approval of exchange and trading system operators and of trading rules helps to ensure fair markets.

The fairness of the markets is closely linked to investor protection and, in particular, to the prevention of improper trading practices. Market structures should not favor some market users over others. Regulation should detect, deter, and penalize market manipulation and other unfair trading practices.

Regulation should aim to ensure that investors are given fair access to market facilities and market or price information. Regulation should also promote market practices that ensure fair treatment of orders and a price formation process that is reliable.

In an efficient market, the dissemination of relevant information is timely and widespread and is reflected in the price formation process. Regulation should promote market efficiency.

Transparency may be defined as the degree to which information about trading (both for pre-trade and post-trade information) is made publicly available on a real-time basis. Pre-trade information concerns the posting of firm bids and offers as a means to enable investors to know, with some degree of certainty, whether and at what prices they can deal. Post-trade information is related to the prices and the volume of all individual transactions actually concluded. Regulation should ensure the highest levels of transparency.

THE REDUCTION OF SYSTEMIC RISK

Although regulators cannot be expected to prevent the financial failure of market intermediaries, regulation should aim to reduce the risk of failure (including through capital and internal control requirements). Where financial failure nonetheless does occur, regulation should seek to reduce the impact of that failure, and, in particular, attempt to isolate the risk to the failing institution.

Market intermediaries should, therefore, be subject to adequate and ongoing capital and other prudential requirements. If necessary, an intermediary should be able to wind down its business without loss to its customers and counterparties or systemic damage.

Risk taking is essential to an active market, and regulation should not unnecessarily stifle legitimate risk taking. Instead, regulators should promote and allow for the effective management of risk and ensure that capital and other prudential requirements are sufficient to address appropriate risk taking, allow the absorption of some losses, and check excessive risk taking. An efficient and accurate clearing and settlement process that is properly supervised and uses effective risk management tools is essential.

There must be effective and legally secure arrangements for default handling. This is a matter that extends beyond securities law to the insolvency provisions of a jurisdiction. Instability may result from events in another jurisdiction or occur across several jurisdictions, so regulators' responses to market disruptions should seek to facilitate stability domestically and globally through cooperation and information sharing.

THE REVISED PRINCIPLES FOR SECURITIES REGULATIONS

In response to the global financial crisis that began in 2008, IOSCO published a revised version of the IOSCO Principles in 2010. The purpose of the revision was to incorporate the lessons learned from the crisis and prevent future occurrences. Eight principles were added, bringing the total to 38. The latest principles address hedge funds, credit rating agencies, information service providers, and auditor independence. IOSCO also made minor revisions to the IOSCO Principles in 2017.

The IOSCO Principles need to be practically implemented under the relevant legal framework to achieve the objectives of regulation described above. They are grouped into nine categories.

A. Principles Relating to the Regulator

1. The responsibilities of the Regulator should be clear and objectively stated.
2. The Regulator should be operationally independent and accountable in the exercise of its functions and powers.
3. The Regulator should have adequate powers, proper resources, and the capacity to perform its functions and exercise its powers.
4. The Regulator should adopt clear and consistent regulatory processes.

5. The staff of the Regulator should observe the highest professional standards, including appropriate standards of confidentiality.
6. The Regulator should have or contribute to a process to identify, monitor, mitigate, and manage systemic risk, appropriate to its mandate.
7. The Regulator should have or contribute to a process to review the perimeter of regulation regularly.
8. The Regulator should seek to ensure that conflicts of interest and misalignment of incentives are avoided, eliminated, disclosed, or otherwise managed.

B. Principles for Self-Regulation

9. Where the regulatory system makes use of Self-Regulatory Organizations (SROs) that exercise some direct oversight responsibility for their respective areas of competence, such SROs should be subject to the oversight of the Regulator and should observe standards of fairness and confidentiality when exercising powers and delegated responsibilities.

C. Principles for the Enforcement of Securities Regulation

10. The Regulator should have comprehensive inspection, investigation, and surveillance powers.
11. The Regulator should have comprehensive enforcement powers.
12. The regulatory system should ensure an effective and credible use of inspection, investigation, surveillance, and enforcement powers and implementation of an effective compliance program.

D. Principles for Cooperation in Regulation

13. The Regulator should have authority to share both public and nonpublic information with domestic and foreign counterparts.
14. Regulators should establish information sharing mechanisms that set out when and how they will share both public and nonpublic information with their domestic and foreign counterparts.
15. The regulatory system should allow for assistance to be provided to foreign Regulators who need to make inquiries in the discharge of their functions and exercise of their powers.

E. Principles for Issuers

16. There should be full, accurate, and timely disclosure of financial results, risk, and other information which is material to investors' decisions.

17. Holders of securities in a company should be treated in a fair and equitable manner.
18. Accounting standards used by issuers to prepare financial statements should be of a high and internationally acceptable quality.

F. Principles for Auditors, Credit Ratings Agencies, and Other Information Service Providers

19. Auditors should be subject to adequate levels of oversight.
20. Auditors should be independent of the issuing entity that they audit.
21. Audit standards should be of a high and internationally acceptable quality.
22. Credit rating agencies should be subject to adequate levels of oversight. The regulatory system should ensure that credit rating agencies whose ratings are used for regulatory purposes are subject to registration and ongoing supervision.
23. Other entities that offer investors analytical or evaluative services should be subject to oversight and regulation appropriate to the impact their activities have on the market or the degree to which the regulatory system relies on them.

G. Principles for Collective Investment Schemes

24. The regulatory system should set standards for the eligibility, governance, organization, and operational conduct of those who wish to market or operate a collective investment scheme.
25. The regulatory system should provide for rules governing the legal form and structure of collective investment schemes and the segregation and protection of client assets.
26. Regulation should require disclosure, as set forth under the principles for issuers, which is necessary to evaluate the suitability of a collective investment scheme for a particular investor and the value of the investor's interest in the scheme.
27. Regulation should ensure that there is a proper and disclosed basis for asset valuation and the pricing and the redemption of units in a collective investment scheme.
28. Regulation should ensure that hedge funds and/or hedge funds managers/advisors are subject to appropriate oversight.

H. Principles for Market Intermediaries

29. Regulation should provide for minimum entry standards for market intermediaries.
30. There should be initial and ongoing capital and other prudential requirements for market intermediaries that reflect the risks that the intermediaries undertake.

31. Market intermediaries should be required to establish an internal function that delivers compliance with standards for internal organization and operational conduct, with the aim of protecting the interests of clients and their assets and ensuring proper management of risk, through which management of the intermediary accepts primary responsibility for these matters.
32. There should be procedures for dealing with the failure of a market intermediary in order to minimize damage and loss to investors and to contain systemic risk.

I. Principles for the Secondary Market

33. The establishment of trading systems including securities exchanges should be subject to regulatory authorization and oversight.
34. There should be ongoing regulatory supervision of exchanges and trading systems which should aim to ensure that the integrity of trading is maintained through fair and equitable rules that strike an appropriate balance between the demands of different market participants.
35. Regulation should promote transparency of trading.
36. Regulation should be designed to detect and deter manipulation and other unfair trading practices.
37. Regulation should aim to ensure the proper management of large exposures, default risk, and market disruption.

J. Principles Relating to Clearing and Settlement

38. Securities settlement systems, central securities depositories, trade repositories, and central counterparties should be subject to regulatory and supervisory requirements that are designed to ensure that they are fair, effective, and efficient and that they reduce systemic risk.

THE IOSCO FRAUD REPORT

In the late 1990s and early 2000s, the world witnessed a number of high-profile financial scandals involving large publicly traded companies. These scandals raised questions about the integrity of global capital markets, and the IOSCO Technical Committee decided to investigate the issues uncovered by these financial scandals and identify any broad trends. It also decided to make recommendations about whether securities regulators needed to undertake any specific actions to ensure that the regulatory framework remains robust and to help guarantee that the international financial system serves to protect the integrity of global capital markets, delivers investor confidence, and combats financial fraud.

Against this background, the Technical Committee published the report *Strengthening Capital Markets Against Financial Fraud* (the Fraud Report). This report identifies seven separate areas that have figured prominently in many high-profile financial scandals:

1. *Corporate governance*, including the role of independent directors on an issuer's corporate board, the protection of minority shareholders, the importance of independent auditor oversight committees, and mechanisms to protect against conflicts of interest presented by related-party transactions
2. *Auditors and audit standards*, including auditor independence, the effectiveness of audit standards and auditor oversight, and issues related to mandatory auditor rotation
3. *Issuer disclosure requirements*, including management's discussion and analysis of material events and factors likely to have an impact on the issuer
4. *Bond market regulation and transparency*, including the types of financial disclosures required of bond issuers and the transparency of bond market price-setting mechanisms
5. *The role and obligations of market intermediaries*, whether they contributed to recent financial scandals, and how these entities can mitigate reputational, legal, and operational risk through adequate controls and procedures, and ensure that material nonpublic information they acquire about an issuer is not misused
6. *The use of complex corporate structures and special purpose entities*, and the circumstances where they may pose particular regulatory issues
7. *The role of private-sector information analysts*, and the ways in which such individuals and entities can protect their analytical integrity and independence

For each of these seven areas the Fraud Report discussed what issues the recent financial scandals raised, and it included an action plan designed to tackle the biggest issues with high priority.

Much progress has been made in the implementation of the IOSCO MOU, and efforts in this field will continue. While much of the work that IOSCO has done can be derived from the seven issues identified in the Fraud Report, and while all this work has had important value, IOSCO drafted separate reports for the following initiatives: corporate governance, transparency and regulation of corporate bond markets, conflicts of interest in initial public offerings (IPOs), and special purpose entities. These reports are briefly discussed below.

CORPORATE GOVERNANCE

In the Fraud Report, IOSCO identified board independence, related-party transactions, and the protection of minority shareholders as crucial elements of corporate governance. These

issues have already been addressed by international principles such as those of the Organisation for Economic Cooperation and Development (OECD). However, as these are high-level principles designed to accommodate different legal and regulatory frameworks, IOSCO decided to carry out additional work on how to implement the OECD principles in practice. More specifically, IOSCO set out to undertake, in collaboration with the OECD, additional descriptive and thematic analyses of the definition and role of independent directors on the boards of issuers and the additional protections required in situations where issuers are controlled by a dominant shareholder.

An IOSCO task force carried out an extensive survey to explore these elements, resulting in a final report that was published in 2007. This report, titled *Board Independence of Listed Companies*, contains an overview of the legal and regulatory systems of technical committee jurisdictions regarding specific issues related to board independence and is a comprehensive analysis of current regulations worldwide. The report presents a unique and illustrating overview of existing rules and regulations on board independence in the jurisdiction of a large number of IOSCO members.

CONFLICTS OF INTEREST IN INITIAL PUBLIC OFFERINGS

Another element of the fraud report was the role of intermediaries in IPOs with conflicting interests. In 2006, IOSCO began examining this issue. This analysis was performed with the knowledge that the financial scandals involved accusations that underwriters and investment banks were performing substantial roles despite the existence of conflicts of interest. Because no international standards existed on this matter, IOSCO reviewed the role played by intermediaries in the financial standards. IOSCO focused specifically on conflicts of interest within intermediaries when they are involved in an IPO.

After informal discussions with market participants, the technical committee published a discussion paper titled *Market Intermediary Management of Conflicts That Arise in Securities Offerings*. IOSCO intended that the paper would facilitate a dialogue between the financial services industry and regulations on a cross-border basis regarding possible principles that may be used by market intermediaries to guide their management of some of the conflicts that arise from activities related to a securities offering. In November 2007, IOSCO published the final version of the report.

SPECIAL PURPOSE ENTITIES

Special purpose entities (SPEs) are separate legal entities that are corporate in structure and are established (or chartered by) the national, state, or a sub-unit form of government. Because multiple parties often interact with SPEs, it can be difficult to determine, for accounting purposes, which party should consolidate the SPE's assets and liabilities on its statement of financial position. Although SPEs are used for legitimate purposes, SPEs and complex corporate structures were used to perpetrate some major financial frauds. In certain instances, some sponsoring entities provided an incomplete picture of their financial position by not disclosing the transfer of their assets and liabilities to their unconsolidated SPEs.

Since the publication of the fraud report, several IOSCO members have implemented regulatory and legislative changes that are expected to address the concerns raised by the recent financial frauds. Specifically, some IOSCO members have adopted additional nonfinancial statement disclosure requirements to solicit information about unconsolidated SPEs, while others have looked to changes in the relevant accounting standards that were intended to make it more likely that SPEs would be consolidated. The results of the survey and limited review of filings indicate that IOSCO members have only recently taken different approaches in this area and have not yet had an opportunity to evaluate the effectiveness of their initiatives. As a result, the technical committee has concluded that it would be premature at this time to determine a global approach for addressing the reporting of information to investors regarding unconsolidated SPEs. However, IOSCO will continue to monitor developments with respect to off-statement of financial position financings, including unconsolidated SPEs, and may consider at a later date whether guidance from IOSCO on unconsolidated SPEs would be useful.

International Accounting Standards Board

The IASB is an independent body that sets accounting standard. The IASB has developed a single set of global accounting standards that have been adopted by the European Union (EU) and will likely be adopted in the future by other countries.

International Securities Association for Institutional Trade Communication

The ISITC is an industry association that collaborates to develop and promote standards and market practices designed to enhance efficiency, lower risk, and build shareholder value.

International Capital Market Association

The ICMA is a self-regulatory organization for participants in the capital markets, but it has a European focus. The ICMA aims to promote high standards of market practice, appropriate regulation, trade support, education, and communication.

World Federation of Exchanges

The WFE, formerly the Federation Internationale des Bourses de Valeurs (FIBV), is the trade association of regulated stock, futures, and options exchanges around the world. The WFE develops and promotes standards in markets, supporting reform in the regulation of over-the-counter (OTC) derivatives markets, international cooperation, and coordination among regulators.

International Council of Securities Associations

The ICSA, which is an association of a wide range of financial market self-regulatory and trade associations, aims to:

- Aid and encourage the sound growth of the international capital market by promoting and encouraging harmonization and, where appropriate, mutual recognition in the procedures and regulation of that market.
- Promote mutual understanding and the exchange of information among ICSA members.

International Swaps and Derivatives Association

The ISDA is a trade organization of participants in the market for OTC derivatives. The ISDA has pioneered efforts to identify and reduce the sources of risk in the derivatives and risk management business.

European Securities and Markets Authority

There has been a push in the EU to protect investors and provide confidence for investments by promoting common goals for securities regulators. The ESMA is a securities supervisory organization set up by the EU, and it is another product of efforts to remedy the financial oversight shortcomings that led to the economic crisis in 2008. The organization was created as an EU Authority in 2011.

THE ROLE OF ESMA

ESMA's role is to provide stability to the EU nations' financial system by ensuring integrity, transparency, efficiency, investor protection, and orderly functioning of the securities

markets. ESMA works toward the goal of a single set of regulations that apply to all EU members, so that buying and selling securities is a more stable and uniform process.

The powers of ESMA include:

- Drafting technical standards that are legally binding on EU members
- Resolving disputes between national securities authorities
- Prohibiting financial products that threaten financial stability
- Performing on-site inspections
- Monitoring systems risk of cross-border financial institutions
- Supervising credit rating agencies
- Entering into administrative agreements with supervisory authorities

MARKETS IN FINANCIAL INSTRUMENTS DIRECTIVE

The EU implemented the Markets in Financial Instruments Directive (MiFID) in 2007, which was intended to help integrate Europe's national security markets. In Europe, the legal relationships between the parties in securities transactions has historically been a matter of private law—handled under the same principles that would remedy a contract dispute or tort. MiFID played a part in transitioning securities laws in Europe from the private to public realm, meaning increased regulations and government oversight.

MiFID introduced new reporting requirements for equity markets to bolster pre- and post-trade transparency. Additionally, MiFID did away with previous requirements that stocks be traded only through local markets, and it promoted electronic securities trading. Another significant regulation under MiFID requires financial institutions that carry out transaction on their client's behalf must be able to prove that they provided the “best execution” of the transaction; the institutions must take into account the price, costs, speed, likelihood of execution and settlement, size, nature, or any other consideration relevant to the order.

Following the global financial crisis, ESMA reviewed MiFID and consulted with the European Commission in revising MiFID, and in October 2011, the European Commission published proposals for a revised MiFID. The revised proposals, commonly referred to as MiFID II, were intended to correct some of the problems of the original MiFID, as well as respond to lessons learned during the 2008 financial crisis. The revised proposals were approved in 2014 and took effect on January 3, 2018.

Self-Regulatory Organizations

In some jurisdictions, securities markets are regulated through a combination of self-regulation by self-regulatory organizations (SROs) and direct government regulation. An SRO is a nongovernmental entity that exercises some level of regulatory authority over the operations, standards of practice, and business conduct of an industry or profession.

Examples of SROs that regulate securities markets include the Investment Industry Regulatory Organization of Canada (IIROC), the Securities Association of China (SAC), the Association of Mutual Funds in India (AMFI), the Japan Securities Dealers Association (JSDA), and the U.S. Financial Industry Regulatory Authority (FINRA).

SROs can perform various regulatory functions in securities markets, but, in basic terms, they oversee the markets in which they operate and police the members and member firms participating in those markets. More specifically, the regulatory responsibilities of SROs might include matters such as:

- Creating rules to protect the integrity of the market in which they operate (e.g., rules that govern market conduct and that regulate exchange trading)
- Establishing the standards and rules under which their members operate (e.g., regulating their members' trading practices, member qualifications, and how members should relate to their clients)
- Offering professional training, testing, and licensing to individuals in their industry
- Monitoring compliance with and enforcing the rules of the markets in which they operate through market surveillance programs, trading analyses, and examinations of member firms' trading operations

In addition, many SROs play an important role in the resolution of disputes arising from market transactions. For instance, SROs might provide venues for hearing customer disputes.

There may be multiple SROs regulating a country's securities markets. For example, different SROs might regulate:

- The national exchanges that operate the markets where securities and futures are traded
- The companies that sell securities
- The bond market
- The commodities and futures industry

Some jurisdictions, such as the United Kingdom, do not rely on SROs to regulate their securities markets, however.

For additional information regarding SROs in specific jurisdictions, such as the United States, see the content on “Self-Regulatory Organizations” in the “Supplemental Regional Information” section of this chapter on [fraudexaminersmanual.com](https://www.fraudexaminersmanual.com).

Securities Fraud Schemes

In general, securities fraud schemes can be classified into two categories: schemes by registered persons and entities and schemes by unregistered persons. Both categories are discussed here.

For information regarding specific legal considerations relating to securities fraud schemes in jurisdictions such as the United States, see the content on “Securities Fraud Schemes” in the “Supplemental Regional Information” section of this chapter on [fraudexaminersmanual.com](https://www.fraudexaminersmanual.com).

Securities Fraud by Registered Persons and Entities

This discussion examines types of securities fraud and misconduct committed by registered individuals or firms.

Professional Misconduct

As it relates to the financial service provider, *professional misconduct* refers to acts that go against the profession. By serving as a trusted agent and representative, the financial service provider must, at all times, place the client’s wellbeing ahead of any self-serving interests.

Financial service providers are subject to certain standards of conduct, and most aspects of such standards are defined by statute and industry practice. But different jurisdictions apply different standards of conduct, and the standards might also vary depending on the type of financial services being offered by the provider. For example, brokers and investment advisors are generally subject to regulations requiring that they recommend suitable investments. Likewise, registered investment advisors are generally required to act in the best interest of their clients and are prohibited from seeking to advance personal interests to the detriment of their clients.

And although not all aspects of professional standards are defined by statute and industry practice, financial service providers are held to a high standard of care. Key elements of their duties include requirements that they must:

- Comply with industry rules and applicable regulations.
- Be well-informed consultants through continuing education.
- Use reasonable efforts to determine the needs and objectives of their customers.
- Only recommend investments consistent with customers' objectives and risk tolerance.
- Maintain fairness in transaction costs.
- Provide full disclosure to the relevant aspects of any recommendation.
- Refrain from taking advantage of the clients or firm.
- Be a respected member of the community.

There are several reliable and long-established rules of thumb that can be used to determine if an advisor has violated their professional standard of conduct. Some examples are:

- For most accounts, a financial advisor's annual commissions and fees in relation to the assets should be between 1–3%.
- Portfolio turnover (or the value of the assets bought and sold) in excess of 300% justifies close examination.
- Advisors should maintain due-diligence files, records related to client recommendations, and portfolio analyses.
- Regardless of complexity, advisors should be able to articulate the primary features of any recommendation and should have evidence that they have communicated that to their clients.
- Firm-sponsored technology, such as client-contact programs, should be regularly used.
- Advisors should demonstrate an effort to revise client profiles to match any lifestyle changes.

Churning (Excessive Trading)

Churning is the excessive trading of a customer account to generate commissions while disregarding the customer's interests. Specifically, churning occurs when an investment professional excessively trades an account for the purpose of increasing their commissions instead of furthering the customer's investment goals.

For securities and options, commissions are generally charged when the trade is entered and liquidated. Futures usually have a round-turn commission scheme, meaning that the commission covers both the purchase and sale. Commissions on futures are generally not charged until the trade is closed out.

There are two common methods to assess the excessiveness of trading in an account: turnover ratios and cost-to-equity ratios. *Turnover ratios* measure how often, on average, the securities in an account are traded in a year. *Cost-to-equity ratios* measure the annual cost of the trading as a percentage of the client's investments. That is, cost-to-equity ratios measure the percentage of the average equity in the client's account that is consumed by trading costs.

Often, two questions arise in churning cases:

- Who had trading authorization over the account?
- When did the account activity and commissions become excessive?

If customers are making their own trades, they cannot possibly accuse the broker of churning their accounts. But if brokers or some other people have trading authority (discretion) over the accounts and participate in the commissions, a conflict of interest exists and there might be a legitimate churning claim.

Many of the regulatory definitions of churning are inherently vague and offer little practical guidance. Customer trading objectives are simple: make profits and avoid losses. A good test for detecting churning is to calculate the amount of monthly gross commissions generated from the account as a percentage of the average account balance. For example, an active trading account with an average daily balance of \$10,000 might reasonably generate (on the high side) about \$500 dollars (5%) in gross commissions in an average month. Gross commissions would probably increase in months when the markets are experiencing greater price volatility and trading has been successful.

When investigating a suspected churning scheme, the fraud examiner should ask the following questions:

- Did the broker have trading authority (discretion) over the account?
- Have gross commissions increased during periods of decreasing market volatility?
- Are the gross commissions for the month in question substantially higher than the average monthly gross commissions for this account?
- Are gross commissions greater than 5% of the average account balance?

- Did commissions consume realized profits and/or aggravate losses?
- Were numerous trades entered into and exited over short time periods for small gains or losses?
- Was the trading unit (number of contracts per trade) too large for this account (overtrading)?
- Were the trades made for this account recommended by the research department of the brokerage and disseminated to other customers?
- Did unauthorized trading take place?

If the broker had discretionary authority to trade the account and any of these factors are true, further investigation for churning is warranted.

Finally, brokerage supervisors are required to perform due diligence to ensure that churning and other trading abuses do not occur.

Unsuitable Recommendations

In many countries, securities laws and regulations impose a suitability requirement on broker-dealers, which are persons or firms in the business of trading securities. Broker-dealers subject to a suitability requirement are prohibited from recommending investments or investment strategies that are unsuitable for their clients. Thus, making unsuitable recommendations (e.g., recommending high-risk options to an older individual with limited assets) is prohibited in countries with such suitability requirements. But typically, a suitability requirement only arises when broker-dealers make recommendations or provide advice to clients to purchase a product.

Suitability is a well-established regulatory concept for the financial services industry in many countries. The International Organization of Securities Commissions (IOSCO), which is an international organization comprised of securities commissioners and administrators responsible for securities regulation and the administration of securities laws in their respective countries, has addressed the issue of suitability in a report titled *Suitability Requirements with Respect to the Distribution of Complex Financial Products*. The report focuses on protecting consumers, and it sets out nine principles, including suitability obligations, to be used by securities regulators in addressing the risks relating to the distribution of financial products whose terms and features are unlikely to be understood by average retail customers.

In the United States, the concept of suitability is a part of specific rules established by securities self-regulatory organizations (SROs), such as the Financial Industry Regulatory

Authority (FINRA), and it is an obligation under the anti-fraud provisions of the federal securities laws. For example, FINRA Rule 2111 prohibits a broker-dealer from making a recommendation to a client if the broker does not have reasonable grounds for believing that the recommendation is suitable for the client.

The Markets in Financial Instruments Directive II (MiFID II), which governs financial markets in the European Union (EU), also contains suitability requirements.

Essentially, there are two rules relating to suitability: the know-your-customer rule and the suitability rule.

The *know-your-customer (KYC) rule* provides that securities broker-dealers must know their customer financially to effectively service the customer's account and minimize the risk of recommending an inappropriate investment. To comply with the KYC rule, broker-dealers must use due diligence to ascertain relevant personal and financial information about clients and potential clients in regard to opening and maintaining accounts. Thus, this form of suitability violation occurs when a broker recommends an investment or an investment strategy to a client without having conducted due diligence to ascertain relevant personal and financial information about the client.

In addition to the KYC rule, there are suitability requirements that broker-dealers must follow when making recommendations to a client. *Suitability rules* prohibit broker-dealers from making recommendations to clients if they do not have reasonable grounds for believing that the recommendations are suitable for the respective clients. That is, a suitability rule requires a broker-dealer to make a customer-specific determination of suitability and to tailor their recommendations to the customer's financial profile and investment objectives.

This form of suitability violation occurs when a broker recommends an investment, recommends an investment strategy, or makes an investment that is inconsistent with the client's objectives, and the broker knows or should know the investment is inappropriate.

The suitability of an investment should be based on a client's investment profile, which should include, but is not limited to, the following factors:

- Age
- Employment status
- Investment objectives (i.e., short-term and long-term financial goals)

- Prior investment experience
- Other investments
- Financial situation and needs
- Investment time horizon
- Tax status
- Net worth
- Liquidity needs
- Expenses
- Level of risk tolerance

Selling Away

Selling away is a securities fraud scheme that occurs when an investment professional (e.g., a registered representative, stock broker, or financial advisor) trades, or solicits the trade of, securities not held or offered by the brokerage firm with which they are affiliated.

Selling away violates rules that prohibit investment professionals from engaging in any private securities transactions that fall outside the scope of their employment, unless they have obtained written consent from their employer.

Selling away is a popular scheme committed by financial advisors. Often, selling away schemes target people who are older and might be financially inexperienced. And while selling away can be associated with traditional securities, it generally involves unregistered securities (e.g., partnerships, promissory notes, and programs).

Uncovering this type of fraud is difficult, but it is not impossible. Generally, examiners should start a selling-away investigation by asking investment professionals if they are aware of any colleagues who are engaged in such practices. In his *Securities Arbitration Procedure Manual*, David Robbins suggests making the following inquiries in a selling away case:

- Did the broker use the firm's marketing materials to market the investment?
- Were meetings for the investment at issue held at the firm's offices?
- Did the victim investors and the firm's management have contact about the investment?
- Were the funds for the investment made payable to the brokerage firm?
- Would it be reasonable to surmise that the investors should have known that the firm did not authorize the investment?²

²David Robbins, *Securities Arbitration Procedure Manual*, 3rd ed. (Charlottesville: Lexis Law Publishing, 1990).

Failure to Supervise

Broker-dealer firms must establish and maintain a system to supervise the activities of their registered representatives to ensure compliance with securities laws and regulations.

Failure to Report Client Complaints

In some jurisdictions, investment and advisory firms are required to report client complaints to government regulators.

Parking

Parking is the practice of selling a security to one party with the understanding that the seller will repurchase the security later at an agreed-upon price. This scheme allows circumvention of ownership reporting requirements and net capital rules.

Operating Without a License or Registration

True brokerages are required to register and meet certain financial thresholds, and broker-dealers must register with the appropriate regulatory authority. Thus, operating a security business without a license or acting as broker-dealer without proper registration violates the law. Also, the personnel at true brokerages must be registered, and often, the salespeople at such firms must pass certain tests. There might also be other licensing or registration requirements depending on the type of business in which the brokerage engages.

To determine whether an individual or firm is licensed or registered, and, therefore, legitimate, check with the relevant regulatory authority. Often, such checks can be performed by visiting the relevant authority's website.

Fraud examiners can also use the websites of financial regulatory authorities to research firms and individuals that operate in the securities industry. Often, fraud examiners can use such sites to check an entity's license status and search for complaints brought against them. If, however, a financial services firm or professional does not show up in the relevant authority's records, it is probably not legitimate.

The following red flags might indicate that an entity is operating a security business without the proper license or registration:

- Agents with criminal records
- Unexplained gaps in a promoter's work history
- Prior customer complaints

- A history of regulatory problems
- Questionable credentials
- Website lacks background information or contains generic contact information

Excessive Markups

Excessive markups involve selling securities at a marked-up price or buying securities at a marked-down price not reasonably related to the prevailing market price.

Misuse or Misappropriation of Customers' Securities

Financial advisors must observe high standards of commercial practice and equitable principles of trade. This means that advisors are prohibited from unauthorized use or borrowing of customers' funds or securities, and various other deceptions. Thus, this type of scheme might involve outright theft of securities or using securities in improper ways—for example, as collateral for loans or to conduct other securities transactions (e.g., margin trading).

Unauthorized Trading

A broker cannot trade on a customer account without authorizations from the customer, and unauthorized trading occurs when a dishonest broker sells, buys, or exchanges securities for a customer without the customer's permission or authorization. Dishonest brokers might commit unauthorized trading due to the pressures of meeting certain capital requirements, generating commission income, or meeting internal performance targets.

Any losses accruing to the customer account because of an unauthorized trade, whether made by mistake or intentionally, are the responsibility of the brokerage firm and must be reimbursed to the customer.

Likewise, gains from unauthorized trades also belong to the customer. This rule prevents brokers from executing unauthorized trades, claiming error, and taking any profits that might occur. And because of these rules, the only entries to the brokerage company error account, which is used to record its trading mistakes pending their rectification, should be losses; therefore, profits in an error account should be investigated.

Customers must report unauthorized trades the brokerage firm's management as soon as they are detected. Silence would imply ratification of the transaction.

Red flags of unauthorized trading include:

- A high incidence of failures to pay for trades
- Excessive trade cancellations
- Excessive corrections and credit extensions
- Numerous customer complaints against a broker
- A pattern of stock being sold to customers from a broker's inventory and then purchased back into the inventory by the broker close to settlement at a loss

Systematically Trading Accounts Against Each Other

Systematically trading accounts against each other is illegal, and it usually occurs between investment pools, which are funds from numerous investors that are combined for the purposes of investment (e.g., mutual funds, investment trusts, unit trusts, and other collective investment units). The scheme occurs when someone with trading authority simultaneously establishes opposite market positions in two separate investment pools that they control. A person who has trading authority and other controls over the pool might receive a monthly management fee of about 1.5% of the pool balance, a percentage of any of the pool's gains—perhaps 10% per quarter—and a portion or all of the commissions on trades. But in such a business arrangement, the pool operator has a conflict of interest. It is in the pool operator's interest to maintain account balances that are as high as possible, trade the accounts for commissions, and have at least some profits.

To further illustrate this scheme, consider a hypothetical example in which a pool operator establishes two limited partnerships (LPs) for trading commodities. The pool operator is a general partner in both partnerships, which means that they take an active role in each business's operations. Also, the pool operator will be compensated with a monthly management fee of 1.5% of the pool's balance, 10% of the pool's gains per quarter, and commissions on trades. The pool operator buys one hundred contracts of December Corn for Pool A, establishing a long market position, and at the same time, sells one hundred contracts of December Corn for Pool B, establishing a short market position. (If these transactions occurred in the same account, they would offset each other.)

Over time, one of the pools will suffer a loss while the other will enjoy a gain, but even when this occurs, things will not have changed much for the pool operator. The amount of equity in the two pools combined will be about the same with the loss in one pool being offset by the gain in the other pool. This preserves the basis for the general partner's management fee while the profitable pool will owe the pool operator a percentage of the gain.

In the end, one of the investment pools will dissolve because of trading losses while the other will enjoy handsome profits. Then, this scheme will take on some of the characteristics of a Ponzi scheme if the pool operator creates a new LP, advertises their success from the results of the profitable pool, and gets those who participated in the successful pool to provide positive word-of-mouth comments about their abilities. Thus, it is key to the success of such schemes that the participants in the original two pools don't know each other.

In this example, not only did the pool operator violate the laws and regulations that prohibit such conduct, they also committed a breach of contract. As the general partner, the pool operator breached the contract used to form the LP because they violated the fiduciary duties that they owed to the limited partners.

Supervisors and compliance managers of brokerages should be on the lookout for this type of activity. They can do little, however, if the general partner maintains the trading accounts at two separate brokerages.

When investigating these schemes, the fraud examiner will need to acquire the trading records of all pools run by a pool operator to establish if such a trading scheme has occurred. The comparison of market positions over time is simple and the information is easily obtainable from the brokerages once it is discovered who they are.

Block Order Schemes

A *block order* is an order placed for the sale or purchase of a significant number of securities. Often, a block order occurs when several different accounts are combined on the same order. For example, a broker might wish to execute the same buy order for ten of their customers. To accomplish this, they might write an order ticket such as: "For account 12345 and others, buy one hundred contracts of December cattle at the market." The justification for this type of order is that it is time sensitive. If the market is volatile, customers will need their order executed as quickly as possible. Writing ten separate order tickets for each account and calling the orders to the trading floor separately would take too much time. By combining all the orders on one ticket and providing one account number, the broker can save time. They will add the other account numbers and quantities to the order ticket when the executed order (fill) is reported back to them.

There is, however, potential for abuse with this type of transaction. Prices move rapidly in volatile markets, and with such block order transactions, the accounts that the order has been

executed for have not all been made known. The time from when the block order is placed and when the fill is reported back to the broker can take several minutes. On some busy days, it can take an hour or more before the fill is reported back to the broker. During this time, the market is moving and the executed order will either be in a loss or gain position by the time it is reported back. It is during this lag time when fraud can occur.

For example, assume that 100 contracts of December cattle were bought at 80.00 (cents per pound) and that when the fill is reported thirty minutes later the market is at 81.00. This favorable change in market price (100 points) is equivalent to \$400 profit per contract or \$40,000 profit for the entire order. After the fill is reported back to the broker, they give out the “other” account numbers to the floor clerk to complete the order, with 55 contracts going to a favored account and five contracts going to the other nine accounts. The broker then immediately sells 55 December cattle contracts for the favored account, realizing a \$22,000 profit. Of course, if the market had moved lower by the time the fill was reported, the favored account would not have been added to the order or the loss taken would have been minimal.

To prove such a scheme, the fraud examiner will need to obtain and analyze all of the following items:

- The monthly brokerage recap of the salesperson
- Copies of all order tickets written by the salesperson for the time period in question (brokerages must keep the hard copies for several years)
- A copy of the telephone audio recording of the placement of the order and reported fill from the trading floor (all calls to the trading floor are recorded and archived)
- Copies of the “daily equity statements” provided to the salesperson by the brokerage firm detailing account numbers, account names, open positions, and the cash value of all accounts represented by the salesperson

Market Manipulation

Market manipulation is a type of securities fraud consisting of a series of transactions designed to artificially raise or lower price or to give the appearance of trading activity for the purpose of inducing others to buy or sell. Market manipulation is especially common with penny stocks or micro-cap stocks. *Penny stocks* are low-priced (usually less than \$5), speculative securities that are registered but do not meet the listing requirements of an exchange. *Micro-cap stocks* are the stocks of companies with very small market capitalization. In market manipulation schemes, the stock is sold to unsuspecting victims once the price has been artificially inflated.

Insider Trading

Insider trading occurs when an *insider*—someone who possesses inside information about a security—buys or sells securities on the basis of material information about the security that is not available to the public. *Inside information* is any material, nonpublic information about a security that is not generally available to the public and that could affect the security's price.

Examples of insider trading include:

- Corporate officers, directors, and employees who traded their corporation's securities after learning of significant, confidential business developments
- Friends, business associates, and family members of corporate officers, directors, and employees who traded the corporation's securities after learning of significant, confidential business developments
- Employees of law, banking, and accounting firms who were given inside information to provide services to the corporation whose securities they traded
- Government employees who traded a corporation's securities after learning of inside information about the corporation because of their employment with the government

Most jurisdictions have rules that forbid investors from buying or selling securities where the decision to buy or sell is based on material, nonpublic information, but the rules and efforts to enforce them vary widely. Some countries are strengthening their existing insider trading laws, some countries are only beginning to establish insider trading laws, and others do not enforce their laws already in place.

There are two basic arguments for prohibiting insider trading. The first argument posits that insiders should not be permitted to earn profits based on an informational advantage not held by the investing public. The second argument contends that insider trading undermines public confidence in the securities markets. That is, if investors fear that insiders will regularly reap profits based on unfair advantages, investors will not be as willing to invest. A lower number of investors will lead to a lower demand for securities, which in turn will lead to lower stock values and a deflated market.

Often, insider trading is an abuse of confidentiality, and securities markets are prime targets for such abuses because successful security transactions often require the astute use of confidential information. Frequently, insider trading involves trading by those in a position to use confidential information about factors affecting the market value of securities before such information is made known to the public.

Moreover, under the legal theory of misappropriation, an insider's use of nonpublic information to profit from the purchase or sale of securities may violate the insiders' fiduciary duty to their company or shareholders, although not all courts accept this argument.

Front Running—Dual Trading

Front running is a type of insider trading. Although it usually will not cause a direct loss to the customer, front running violates the rules of many exchanges. *Front running* involves the use of the privileged knowledge of a customer's order to buy or sell a large amount of a commodity, option, or security that, because of its size, is likely to move the market. Back office personnel could have knowledge of such an order and buy or sell for their own account ahead of the customer. Because order fillers on the exchange floor are allowed to trade for their own account and fill orders for customers (dual trading) they also have an opportunity to engage in front running.

Consider the following scenario: An order is received from a hedger to sell five hundred December cattle futures contracts at the market. If the order filler knows that current market conditions are such that this order will move the market significantly lower, it would be very tempting to sell a few contracts for themselves and profit from the market decline when they execute the customer order. Order fillers are required to operate in the best interest of the customer and "work" the order to get the best price. However, once the trader has established their short position, it is really in their own interest to drive the market as far down as possible when executing the five hundred contract sell order. In this situation, the order filler might not give their best efforts and could hurt the customer.

In today's markets, which contain sophisticated surveillance technologies, exchange investigative personnel actively guards against this type of activity. The time stamps on the customer order, time and sales reports from the exchange, and the account activity of the trader would have to be obtained and examined to substantiate any front running allegations. This information is easily obtainable. Brokerage compliance personnel should easily detect front running by back office personnel by periodically checking their account activity or prohibiting them from opening trading accounts at all.

Material Misrepresentations and Omissions

Securities laws require that the investor receive full and fair disclosure of all material information, and they make it unlawful for anyone to obtain money or property by using a material misstatement or omission in the offer or sale of any securities.

Accordingly, *misrepresentation* occurs when an advisor gives an investor or prospective investor false or misleading information in an investment suggestion or a trading strategy they suggest a client undertake. An *omission* occurs when the issuer, in connection with the offer or sale of securities, omits a material fact, or when the professional fails to inform the investor of material facts.

Making misrepresentations to the investor or failing to inform the investor of certain facts (omissions) is a violation of law only if the misrepresentation or omission is material. That is, for a misstatement or omission to be fraudulent, it must be material. A fact is *material* if there is a substantial likelihood that a reasonable investor would consider it important in making an investment decision.

As a general rule, to determine materiality, the fraud examiner needs to answer the following question: “Would a reasonable investor wish to know this information to make an informed decision?” If the answer is “yes,” then this information, or the lack thereof, has a high likelihood of being deemed material. (If an actual investor acted based on the misrepresentation, then that clearly strengthens the case, but it is not essential that the false or misleading statement influenced an investor, merely that a reasonable investor could have been so influenced.)

For example, if the issuer of a biotechnology stock falsely claims that the government agency responsible for reviewing and approving drugs has approved the entity’s new cancer drug, the statement would be a misrepresentation that is material to any prospective investor. Similarly, if the chairman of a company had recently been released from prison after serving time for securities fraud, this information would be material and therefore should be included in any offering document. Failure to disclose this fact would constitute an omission of a material fact.

Securities Fraud by Unregistered Persons

Often, individuals who are not registered with securities regulators will engage in securities-related misconduct. When conducting examinations relating to alleged violations of securities laws, the fraud examiner should always begin by seeking the answer to these crucial questions:

- Is the security registered? If not, does it meet an exemption?
- Is the person offering or selling the security registered? If not, is the transaction exempt?
- Are there indicators of fraud present?

Those involved in the securities industry might be regulated by several agencies. In the United States, for example, securities broker-dealers must register with the U.S. Securities and Exchange Commission (SEC), and they must register in those states where they plan to do business. If they plan to do business with the public, they must also become associated with FINRA. Many regulatory agencies and exchanges throughout Europe also have registration and reporting requirements.

Fraud Involving Unregistered Securities

Securities can be either registered or unregistered. *Registered securities* are required to meet standards established by the appropriate government regulator or SRO. Conversely, *unregistered securities* are securities that are not registered with the appropriate government regulator or SRO.

Again, when conducting examinations relating to alleged violations of the securities laws, the fraud examiner should determine whether the security is registered as required, and, if not, whether it meets an exemption to filing a registration.

Backdating Stock Options

Backdating refers to the practice of marking a document with a date that precedes the actual date.

As a supplement to salary, companies frequently offer employees stock options, which grant the recipient the privilege to purchase a share of the company's stock at a future date for a specific price, called the strike price. A *strike price* is the value of a share at a particular date. Generally, the strike price is set at the price of the underlying stock on the day the option is granted; therefore, the option becomes valuable only with future increases in the stock price.

Companies grant stock options as an incentive for employees to boost company performance and thus raise the stock price, but the practice of backdating stock options gives the employee a chance to profit by purchasing stock at past low prices, providing an immediate payoff. Backdating stock options occurs when a company alters the date of the grant to a time when the stock was trading at a lower price in the interest of making the option instantly valuable and further increasing the employee's gain if the stock price continues to rise.

EXAMPLE

On June 1, 2019, Company XYZ grants its chief executive officer (CEO) a stock option that provides the executive the right to purchase 100 shares of XYZ stock on January 1, 2020, for the strike price. Per its usual policy, the strike price is set at the price of the company stock on the date of the option grant. On June 1, 2019 (the grant date), XYZ stock was trading at \$40 per share. Therefore, if the stock price increases to \$45 per share by January 1, 2020, the CEO could exercise the option and purchase the shares for \$40 per share, and then sell them immediately on the market for \$45 per share, resulting in a gain of \$5 per share.

However, the company has recently experienced a dramatic increase in its share price. On May 24, 2019, the stock was trading for \$15 per share. To provide the CEO with an opportunity to exploit the increase in share price, even though it has already occurred, the company chooses to backdate the stock options to make it appear as if the options were granted on May 24, 2019. Because the strike price is set at the price of the stock on the option grant date, the strike price is effectively changed to \$15 per share. As a result, the CEO now has the option to buy 100 shares of XYZ stock on January 1, 2020, for \$15 per share. Thus, the CEO has immediately gained \$25 per share (the difference between the stock price on the actual grant date of June 1 and the stated grant date of May 24) based solely on the manipulation of the grant date used.

Investigative Tips

When investigating allegations of securities fraud, the fraud examiner should examine the prospectus, sales literature, contracts, and any correspondence.

Usually, when investigating allegations of securities fraud, the fraud examiner will discover that various types of solicitation materials have been provided to investors and potential investors. Solicitation disclosure is often in the form of documents titled “prospectus,” “offering memorandum,” or “private placement offering memorandum.” These documents can sometimes provide conclusive evidence and should therefore be examined in detail, especially in cases involving misrepresentations or omissions of material facts.

Additionally, fraud examiners should examine the information in advertising media that is designed to persuade the public to invest. The fraud examiner should ask: How did the investor hear of this opportunity? Through cold calls, direct mail, newspapers, magazines, television, or the internet?

A properly prepared prospectus (which usually indicates that the issuer claims the security is registered) or a private placement memorandum (the issuer claims the security is exempt from registration requirements) would normally be expected to contain detailed information concerning the issuer and the security being offered.

Solicitation information should include various types of information. It should describe the type of security, the initial price, and the amount being offered for sale. The issuing company, its business, products, background, and the qualifications of its officers and directors should also be described. Any legal problems involving the company or its officers should be disclosed. The financial condition of the issuer should be discussed with audited financial statements where applicable. Frequently, there will be projections or forecasts of expected future growth and development (see “safe harbor” provisions discussed earlier). Usually, there will be risk disclosures of various kinds in bold font stating that, for example, “these securities have not been registered” or “purchase of these securities involves a high degree of risk.”

These documents should be examined thoroughly for misrepresentations and omissions. Look closely at the background of principals. If in doubt, conduct a detailed background investigation of the principal officers of the corporation. Look for any previous criminal or regulatory action relating to securities fraud or offenses involving dishonesty. Also check for lawsuits, bankruptcies, or other civil or administrative action against the entity or its principals. If there is evidence of legal action, look for the disposition of the action and for potential evidence gathered during the course of the suit. Also, verify any claimed experience in the relevant industry or academic qualifications.

Once the background investigation is complete, compare the background information with the information, if any, disclosed in advertisements and the offering document.

Also, when investigating an entity’s background, the fraud examiner should seek to answer the following questions:

- What promises are made regarding the viability of the product or service? Is a patent claimed? Does it exist?

- Is there a functioning business that can be checked out or is it in the developmental stage? Ascertain when and where the corporation was legally incorporated, or in the case of a partnership, where it was legally filed.
- Are investors promised guaranteed returns?
- Can financial statements concerning assets, liabilities, and income be verified?
- How will investor funds be used? Follow the money trail. Were the proceeds invested as represented or used for other purposes? Is the issue potentially oversubscribed?
- Are sales commissions paid to unregistered persons? Usually this is illegal. Also check to see if commissions paid are unusually high or are concealed from investors.
- Are the insiders retaining a majority of the stock while the investors fund the company?
- Are there any other undisclosed benefits to insiders?
- Is there adequate risk disclosure? Investors might not have been made fully aware of a high percentage of failure, the degree of competition, or inexperience on the part of the principals.

For additional investigative tips for fraud examiners practicing in specific jurisdictions, such as the United States, see the content on “Investigative Tips” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

MONEY LAUNDERING

Money laundering is the disguising of the existence, nature, source, control, beneficial ownership, location, and disposition of property derived from criminal activity. Put differently, money laundering is the process by which criminals attempt to disguise illicit assets as legitimate assets that they have a right to possess and spend. In this context, the term *assets* assumes the wider definition of that which is physical, intangible, or represented in the form of rights or obligations, such as a pension or trust fund.

Money laundering operations are designed to take the proceeds of illegal activity, such as profits from drug trafficking, and cause them to appear to come from a legitimate source. Once illegal money has been laundered, the perpetrator is able to spend or invest the illicit income in legitimate assets.

Money laundering is a big business, although estimates of how big differ greatly. Because it is illegal and thereby falls outside the realm of official economic statistics, any estimate of global money laundering is derived from a combination of experience, extrapolation, and intuition. The United Nations (UN) estimates that the aggregate level of money laundering is between 2 to 5% of the world's gross domestic product, which amounts to trillions of dollars.

The laundering of money occurs in the context of all forms of illegal activities. Often, criminals seek to launder money by conducting transactions in cash (currency) in such a way as to conceal their true nature. Problems can, however, occur regarding large volumes of cash—transporting it, converting small currency denominations to larger denominations, and converting cash into assets that can be invested or spent.

The Money Laundering Process

There are many ways that criminals can launder funds, but the process itself is generally divided into three stages: (1) placement, (2) layering, and (3) integration.

Placement

Placement is the first stage of the money laundering process. In this stage, the launderer introduces their illegal profits into the financial system. It is at this stage that legislation has been developed to prevent launderers from depositing or converting large amounts of cash at financial institutions or taking cash out of the country.

Placement can take any number of forms. If the money launderer has a large amount of cash, they can physically move the money to a foreign location or carry it out of the country in a suitcase and deposit it in an offshore bank. Another choice is to *structure* transactions, where a deposit or other transfer is made using a method that is specifically designed to avoid regulatory reporting requirements or an institution's internal controls. Many countries require financial institutions to report all currency transactions above a certain threshold (e.g., more than \$10,000) to the government. As a result, the most common type of illegal structuring scheme in the money laundering context occurs when the launderer breaks up the illicit money into smaller amounts and deposits it into bank accounts or purchases cashier's checks, traveler's checks, or money orders. This type of scheme is sometimes known as *smurfing*, especially in cases where the launderer uses runners (i.e., smurfs) to perform multiple transactions. A red flag of a structuring scheme is a customer who attempts to make many deposits just under the reporting threshold.

Money laundering schemes are most often detected at the placement stage. It is the most dangerous stage for the criminal because the placement process creates a direct connection between the profits and the crime; at this stage, the launderer is still associated with the crime's physical evidence.

Layering

If the placement of the initial funds goes undetected, the launderer can design numerous financial transactions in complex patterns to prevent detection. This stage of the money laundering process is referred to as *layering*, and it represents the most difficult area of detection. Once the funds have been deposited into a financial institution, a launderer can move them around by using layers of financial transactions designed to confuse the audit trail. For example, the launderer can move funds between bank accounts, transfer funds from one form of currency to another, or transfer money between businesses. The money can even be transported out of the country. Often, launderers take advantage of jurisdictions known for their lack of cooperation with foreign courts, investigators, and law enforcement agencies. If a launderer moves funds through several such jurisdictions, tracing the final destination can be burdensome.

Historically, layering primarily involved smuggling cash or running funds through traditional financial institutions, both domestic and foreign. While these practices are still very common, several types of transactions outside of traditional institutions are increasing in volume, such as alternative remittance systems, trade-based laundering, and digital currencies.

Integration

Integration is the final stage in the laundering process. In this stage, the money is integrated back into the economy in a way that makes it appear to be part of a legitimate business transaction. This stage of the process is also difficult to detect; however, if the integration process creates a paper trail—such as deeds for real estate, invoices, loan documents, transaction reports at financial institutions, or checks—and if there is cooperation from informants or foreign entities, then the chances of detection are improved.

A money laundering scheme cannot be successful until the paper trail is eliminated or made so complex that the flow of illegal income cannot be easily traced. The number of steps used to launder funds depends on how much distance the money launderer wishes to put between the illegally earned cash and the laundered asset into which it is converted. A greater number of steps increases the complexity of tracing the funds, but it also increases the length of the paper trail and the chance that the transaction will be reported.

The objective of money laundering is not only to disguise the source of illegal funds, but also to convert large stores of currency into other assets. In some cases, illegal funds are spent on personal assets, such as homes, cars, jewelry, and furniture. But the typical money launderer will not dispose of all their illegal currency in this manner; they will want to have a certain amount of liquid reserves for spending. Keeping large bundles of cash is inefficient because they are difficult to hide and transport. Therefore, money launderers will often convert substantial portions of their currency into negotiable instruments such as cashier's checks and money orders, which are routinely issued by financial institutions. Criminals prefer these negotiable instruments for two reasons. First, cashier's checks and money orders are bearer instruments, and the holder can use them or deposit them without having to prove the source of the funds. Second, they are "liquid" assets because the holder can use them immediately.

The following is an example of how a large money laundering scheme operated in the United States.

EXAMPLE

Alberto Barrera ran a rather sophisticated structuring operation that involved bank accounts in cities all over the United States. Barrera and his accomplices would fly to different U.S. cities, traveling to various banks and purchasing cashier's checks and money

orders in amounts less than \$10,000 (to avoid U.S. federal reporting requirements). They would then travel to banks in other cities, where they would deposit some of the purchased checks and money orders into accounts controlled by Barrera. Once the money was converted or deposited, it was transferred to banks in other countries.

Money Laundering Methods

There are many money laundering methods, and new techniques arise continuously. This makes keeping up with regulations and learning how to investigate such crimes an ongoing task for anti-money laundering (AML) professionals. There are many common and emerging schemes of which fraud examiners should be aware.

Using a Front Business to Launder Funds

One of the most common methods of laundering funds is to filter the money through a seemingly legitimate business, known as a *front business*. A front business can be a very effective way to launder money for a number of reasons. Front businesses provide a safe place for organizing and managing criminal activity, where the comings and goings of large numbers of people will not arouse undue suspicion. In addition, a front that conducts legitimate business provides cover for delivery and transportation related to illegal activity. The expenses from illegal activity can be attributed to the legitimate enterprise, and the illegal revenues can be easily placed into the enterprise.

The two methods most commonly used to hide assets or launder money through a front business are:

- Overstating reported revenues and expenses
- Depositing but not recording revenue

Overstating Reported Revenues and Expenses

Overstating revenues occurs when the money launderer records more income on a business's books than the business actually generates. The fictitious revenue accounts for the illegal funds that are secretly inserted into the company.

The following example shows how the owner of Luxury Antiques uses overstatement of reported revenue to disguise money earned from other sources.

EXAMPLE

Luxury Antiques is a chain of antique stores with several locations within and around a major metropolitan center. It is locally owned. The bulk of its activity is in the sale of antique figurines. Luxury Antiques sells an average of two hundred pieces per month.

Customers are encouraged to pay in cash and, when they do so, are usually pleased when they receive a “special discount” (which can be as high as 25%) off of the “official invoice price.” The invoice the customer receives shows the full price rather than the discounted price. If a customer questions this practice, the store owner explains it is done for “competitive reasons.”

Over the course of a year, Luxury Antiques sells 2,400 total figurines for an average “official invoice price” of \$4,000. This yields \$9,600,000 of recorded revenues. Actual cash received from customers falls short of that figure by 20%, for a total of \$7,680,000. The difference—\$1,920,000—is now available for laundering purposes. To take advantage of this situation, the owner simply deposits cash receipts of \$1,920,000 from his illicit sources as legitimate business income. The result is that \$1,920,000 has been successfully laundered.

Another way for Luxury Antiques to overstate reported revenues is to create fictitious sales with all the normal paperwork. If 50 fictitious sales are created each month at the average “official price” of \$4,000, an additional \$2,400,000 of laundered receipts are produced each year. The result is that \$2,400,000 of illicit funds can be disguised as legitimate business income. (Note that this method involves potentially more risk than the first because it involves completely fabricating all the elements of a sale rather than merely modifying one part of a normal sale.)

Overstating reported expenses will help counteract the key disadvantage of overstating revenues—that taxes will be due on the reported income. But because business expenses are tax deductible, additional tax liability incurred by inflated revenues can be reduced with fictitious business expenses. Therefore, if a company overstates its revenue, it will also want to overstate its expenses to offset its tax liability.

Another reason for overstating expenses is to siphon money out of the business to make payoffs, buy illegal goods, or invest in other criminal ventures. In practical terms, this method

strongly resembles the more familiar practice of padding expense accounts. Among some of the commonly used schemes are payments for supplies never received, fees to fictitious consultants, and salaries for nonexistent employees. The possibilities for fraudulent payments are limited only by the imagination.

Overstating expenses can be accomplished using various methods. Return to the hypothetical business, Luxury Antiques, and look at three strategies employed by the store's owner to inflate expenses and make the laundered cash available for criminal activity:

- Fictitious employees
- Fictitious fees
- Inflated invoices

In the following example, the owner of Luxury Antiques uses fictitious employees to inflate expenses.

EXAMPLE

Luxury Antiques has six salespeople and two assistant sales managers on the payroll. All eight employees are fictitious. Their pay, as well as sales commissions paid to the fictitious sales managers, represents an annual expense inflation of \$500,000. Luxury Antiques' owner does not have to pay taxes on this \$500,000 and can take that amount of cash out of the business and put it into his own pocket.

In the following example, the owner of Luxury Antiques uses fictitious fees to inflate expenses.

EXAMPLE

Luxury Antiques has lawyers and consultants on "retainer" for a total of \$600,000 per year. They perform little or no business work, but they do submit invoices for fees on expensive stationery and with suitably vague descriptions of their activities. Once again, the money paid out is not taxed and can be put to illicit purposes.

In the following examples, the owner of Luxury Antiques uses inflated invoices to amplify expenses.

EXAMPLE

Luxury Antiques makes purchases from a supplier, who agrees to inflate invoices by 25%. The supplier then gives back four-fifths of the inflated amount, keeping the other one-fifth. On \$500,000 of actual purchases per year, Luxury Antiques reports expenses of \$625,000—an inflation of \$125,000.

EXAMPLE

A Luxury Antiques supplier, Import Associates, which provides 40% of the antiques sold by Luxury Antiques, sells figurines to Luxury Antiques in lots consisting of 150–200 pieces. The individual prices and the exact number of figurines in each lot are vaguely described in these “wholesale” bills of sale. As a result of its long association with Import, Luxury Antiques is able to arrange for the invoices to be inflated by an average of 30%. This gains Luxury Antiques about \$580,000 per year in inflated expenses (assuming 960 figurines at an average real cost of \$2,000 = \$1,920,000). By inflating the invoice by 30%, the invoice price will reflect a price of about \$2,500,000, the difference representing laundered expenses.

It can be difficult to detect money laundering that includes both overstated revenues and expenses. When artificial price inflation is applied in moderate percentages to goods and services whose market value is difficult to establish (e.g., artwork, used cars, consulting fees, advertising expenses), detection is exceedingly difficult without inside information. Conversely, complete fabrication of transactions or ghost employees is somewhat easier to spot.

Depositing But Not Recording Revenue

In one of the most common schemes at the local level, launderers deposit illicit cash into the front company’s bank account rather than disguising it as revenue. These funds are not recorded like the money that flows into and out of a business as revenues and expenses. Like a loan, this excess cash represents the proceeds of a transaction that is handled outside of the front business’s daily activity. Also, like a loan, it appears on the company’s balance sheet, which includes both assets and liabilities.

EXAMPLE

Each month, an extra \$360,000 is deposited into Luxury Antiques’ bank account. To offset the entry, sales are credited for the laundered cash by either being fictitious or marked up.

This type of scheme can be detected by examining the business's revenue records. Every legitimate asset in a company's possession must come from somewhere—if not from revenues then from a limited number of other credible alternatives. The basic alternative sources include loans, proceeds from the sale of property or equipment, and capital investments from shareholders. All of these transactions require significant documentary evidence, which the fraud examiner should seek out to explain any suspicious infusion of cash into a suspect business.

Favorite Businesses for Hiding or Laundering Money

In general terms, the businesses chosen for money laundering possess one or more of the following characteristics:

- **Revenue**—Often, businesses chosen for money laundering are ones with a revenue base that is difficult to measure. Generally, revenue is difficult to measure in businesses with revenue from cash transactions with a highly variable amount per customer. In such businesses, extra money can be brought into the business and disguised as revenue.
- **Expense**—Front businesses often have variable expenses that are difficult to measure. With such businesses, launderers can extract money without raising undue suspicion.
- **History**—Many businesses used to launder money have historical ties either with the ethnic base of a particular criminal group or with other parts of an industry—either suppliers or customers.

BARS, RESTAURANTS, AND NIGHTCLUBS

Bars, restaurants, and nightclubs are commonly used to front money laundering operations for a number of reasons. These businesses charge relatively high prices, and customers vary widely in their purchases. Sales are generally in cash, and it is difficult to match the cost of providing food, liquor, and entertainment with the revenues they produce. Moreover, the range of goods and services these types of businesses provide is relatively broad.

Fast food restaurants are also frequently used as a front for money laundering operations. Although they tend to charge lower prices than other types of restaurants, most of their sales are made in cash, and expenses can be easily inflated. As a result, a red flag of front businesses is observing a low amount of business, despite the business's books showing a relatively high income for that period.

VENDING MACHINE OPERATIONS

Vending machine operations also possess many characteristics favorable to a money laundering operation. They have a highly variable and difficult to measure volume of cash receipts, and in large operations, there is a fair amount of flexibility with various transportation, installation, and promotion expenses, providing cover for the withdrawal of laundered funds.

WHOLESALE DISTRIBUTION BUSINESSES

Wholesale distribution businesses have historically been a prominent part of money laundering. Depending on the competitive environment, wholesale distributions do not normally require the same managerial skills necessary to operate a high-volume retail business. Wholesale distribution is attractive for money laundering because it is well embedded in a community's economic fabric.

From the revenue perspective, wholesale operations are somewhat less ideal for launderers because invoicing, rather than cash transactions, are typical. Even so, a diverse product line and falsified invoices will provide a substantial amount of flexibility. More important, the industry is ideal for money laundering from the standpoint of expenses. The activities required to run this kind of business are so diverse and difficult to measure that expenses are easy to inflate. A wholesale business's buildings, warehouses, transportation fleet, and contact with retail establishments are all attractive factors.

The Real Estate Industry

Money launderers often use the real estate industry to launder illicitly obtained money. Generally, the real estate industry is attractive to money launderers for various reasons. For example, the vast array of financial transactions linked to real estate provides money launderers an exceptional range of options for abusing these procedures to launder and use illegally obtained funds. In addition, real estate transactions often involve multiple parties (such as brokers, agents, and appraisers), which can obscure the source of investment funds and the identity of the true owner. Finally, money launderers might earn additional profits from introducing illicit funds into the real estate industry, especially in vibrant real estate markets.

Although there is a vast number of methods to launder money in the real estate industry, there are a few common schemes that warrant identification and discussion, including:

- Loan-back schemes
- Back-to-back loan schemes
- Shell entities

- Appraisal fraud
- Monetary instruments
- Mortgage schemes
- Indirect investments in the real estate industry

Loan-Back Schemes

Money launderers often use loan-back schemes to finance the purchase of properties directly or indirectly through purchasing shares in property investment funds. In a typical loan-back scheme, money launderers will deposit illicit funds in an overseas entity that they own, and then the entity lends the funds back to the launderers. The purpose of the loan is to make the money source appear legitimate and to conceal the parties' identities or the nature of the financial transactions associated with the loans.

Back-to-Back Loan Schemes

As with loan-back schemes, money launderers often use back-to-back loan schemes to purchase real property using illicit assets (or receive real property as a result of fraud). In a back-to-back loan scheme, a money launderer obtains a loan by presenting collateral, which originated from illicit funds, to a financial institution. Like the loan-back scheme, this technique gives the loaned money the appearance of a genuine loan.

Shell Entities

Money launderers often use shell entities to purchase real estate with illicit funds. Generally defined, *shell entities* are organizations without active business or significant assets, and they can take the form of limited liability companies, trusts, business trusts, corporations, and other legal entities. Because there is a lack of transparency in the formation of shell entities, money launderers often use them to hide the identity of the true owner, the source of the money, or the destination of the money.

Appraisal Fraud

Appraisal fraud is often associated with money laundering schemes. Money launderers might purchase properties to launder money or might use illicit funds to service the interest on the debts. Such schemes can conceal the true identity of the property owners and the true origin of the funds used in the transaction.

Appraisal fraud occurs where appraisers fail to accurately evaluate the property, or when the appraiser deliberately becomes party to a scheme to defraud the lender, the borrower, or

both. A common technique is the over- or under-valuation of property, which consists of buying/selling property at a price above/below its market value. In addition to manipulating appraisals, money launderers also over-value property through a series of subsequent sales, each time at a higher price, which tend to conceal the true purposes of the transactions.

Monetary Instruments

In many instances, money launderers purchase, build, or renovate property with cash, wire transfers, or other payable-through accounts. This allows the integration of large sums of illicit money into legal financial systems. If sold at a later time, it is difficult to relate the transaction to any criminal activity and therefore successfully conceals the true origin of the illicit funds and their ownership.

Mortgage Schemes

Often, money launderers will use illicit funds to pay the interest or repay the principal on mortgage loans, and in so doing, the illicit income is converted into seemingly legitimate profits when the property is sold. Mortgage schemes also involve under- and over-valuation of property. For example, in a common under-valuation scheme, a money launderer will under-value the purchase price of property, obtain a mortgage loan for the under-valued amount, use the loan to pay for the under-valued price, and pay the excess amount under the table with illicit funds.

Indirect Investments in the Real Estate Industry

Indirect investments in the real estate industry, which are those in which the investor has no direct control over the assets or investment vehicle, offer opportunities to conceal an investor's identification and monetary sources primarily because multiple parties are involved with the process.

Emerging Payment Methods and Schemes

The technological landscape behind conducting transactions is constantly changing, in large part to make payments faster and more convenient. This discussion examines some emerging payment technologies used to launder money, and it includes discussion of methods that have existed for a while but are in the process of becoming prominent concerns.

Automated Teller Machines

Often, launderers use automated teller machines (ATMs) to launder money. ATMs are relatively inexpensive, and money launderers purchase the machines and place them either in

establishments they control or in legitimate businesses. The machines work the same as any other ATM, and all transactions are legitimate. The money launderer simply fills the machine with cash from illegal activities. The customer uses the machine and never realizes the cash's source.

The ATM banking system debits the cardholder's account and credits the ATM owner's bank account. At the end of the month, the launderer receives a bank statement showing funds being deposited from a legitimate financial institution.

This option is attractive for money launderers because there are currently few jurisdictions that regulate the use and operation of privately-owned ATMs. There is usually no requirement to check the backgrounds of purchasers of the machines, and there are no mandatory reporting procedures and no rules for maintaining ATM sales records.

Prepaid Access Items

Broadly speaking, prepaid items are goods and services that are paid in advance of their actual purchase. Many businesses offer customers the ability to prepay for products and services, and this practice is beneficial to customers because it gives them the ability to give these items as gifts and also provides convenience. Moreover, prepaid items are great for businesses. They generate cash flow for items that have not been purchased yet, and some prepaid purchases are never redeemed, resulting in a windfall. Perhaps most important for large companies, prepaid items can open up international markets.

CATEGORIES OF PREPAID ITEMS

Prepaid items can be broken down into three categories: open loop, closed loop, and semi-open loop.

OPEN LOOP

Open-loop items are the most versatile form of prepaid item, meaning the funds on these items can be used for any type of purchase where the seller accepts that type of payment. For instance, prepaid debit cards are generally open-loop items and can be used virtually anywhere credit cards are accepted. They are usually associated with a credit card company (e.g., MasterCard or Visa) to facilitate the transaction. And with many open-loop items, users can withdraw cash from ATMs around the world.

While in some ways they function similarly to checking accounts, open-loop items do not allow for negative balances; the user can only spend the amount on the card. Additionally, the user information that the issuer of the prepaid card collects is usually less than what a bank would collect for a person opening a checking or savings account. The prepaid issuers usually charge the user for each transaction, issue charges gradually over time, or institute some other type of fee.

While not as common as prepaid debit cards, other items could be considered open loop if they allow for “paid” funds to be withdrawn. For instance, mobile phone accounts that allow for withdrawal and transfer can be open loop.

CLOSED LOOP

Closed-loop prepaid systems are those where the user may only use the stored value to purchase items from the issuing organization or its affiliates, making them less versatile than open-loop items. Furthermore, closed-loop items generally may not be redeemed for cash, even at the issuing organization.

SEMI-OPEN LOOP

Also called *semi-closed loop items*, *semi-open loop items* can be used to purchase goods and services wherever sellers accept that form of payment. In the case of prepaid cards, they are also generally associated with a credit card company. However, as with closed-loop items, semi-open loop items are not redeemable for cash.

VULNERABILITIES OF PREPAID ITEMS

While mainly used for legitimate business, prepaid items can also be used by money launderers to hide and transfer assets. Some examples of prepaid items with potential for money laundering include:

- Merchant gift cards
- Prepaid debit cards (as opposed to a standard check/debit account)
- Payroll cards
- Prepaid mobile phones
- Mass transit cards
- Gaming and lottery cards

The most attractive aspect of prepaid items to money launderers is that issuers of these items and the people who use them are under relatively fewer regulatory restrictions than traditional financial institutions and banking customers. For instance, AML regulations do not always cover prepaid items.

Additionally, traditional financial institutions are required to perform a certain minimum of due diligence on their customers, but for prepaid issuers, this burden is currently substantially less.

Prepaid items also offer a greater degree of potential anonymity than basic credit or debit cards. A person is rarely required to have a face-to-face transaction during any part of the process of obtaining and using a prepaid item. Moreover, the use of stolen IDs and fake addresses makes it possible for launderers to avoid attaching an obvious identity to the prepaid item.

Furthermore, prepaid items can be transported abroad with relative ease; thus, they can be used to move funds internationally and purchase goods or services almost anywhere.

Given the vulnerabilities of prepaid items, there are various ways in which criminals can use them in laundering schemes.

As a means of placing illicit proceeds, launderers could initially load the funds in prepaid items like open-loop cards and gift cards, which are fairly easy to obtain. Although there are maximum limits to the amount that a person can load onto a rechargeable prepaid item each day, as well as total maximum account values imposed by the issuer, criminals could obtain multiple prepaid cards and add funds to them over time. The benefit of this use would be a less bulky, less suspicious, and more transportable type of asset.

Once the illicit funds are placed on prepaid cards, launderers can easily move them around for additional layering. And because prepaid items can be transported abroad with relative ease, criminal organizations often use prepaid items to transfer funds out of the country. Moreover, because prepaid items offer some level of anonymity, the transactions a suspect makes using prepaid items will not appear on the suspect's personal account statements.

Mobile Payments

Mobile payments, also known as *mobile banking*, involve using an account associated with a mobile phone—as opposed to cash, credit cards, and debit cards—to facilitate transactions. Similar to the way in which credit and debit cards significantly cut into the use of checks and cash for consumer transactions, mobile payments are likely to grow in popularity.

As compared to other transaction methods, mobile payments are vulnerable to money laundering schemes in a few key ways. For one thing, given that mobile payments are still in the process of growing and developing definition, regulations are not as sophisticated or complete as they are for older payment systems. Also, many developing countries lack functional AML and anti-terrorism laws, making mobile payments outside of the jurisdiction even more difficult to prevent and trace. Also, a user can send mobile payments to almost anywhere in the world, making them a tool that launderers often use to move funds to foreign jurisdictions.

In addition, the use of prepaid phones causes substantial money laundering issues because the owner of a prepaid phone can be virtually anonymous. Prepaid phones can be purchased with cash, and the user typically does not need to provide personal information to open or add funds to an account associated with the phone. Anonymity is a strong attraction for launderers because it helps to obscure the paper/digital trail leading back to them.

Digital Currencies

In response to market demand, online payment services, which accept funds in a variety of ways to transfer payment either to an individual or a merchant, are emerging. In addition, the increasing demand for new payment methods has led a growing number of online markets to embrace online payment systems, which set their own clearing and settlement terms and offer no consumer protection or financial regulation. Since most transactions through these service providers are considered final and provide no recourse to individuals who believe they have been defrauded, law enforcement agencies suggest that they have become a popular payment system for individuals perpetrating online fraud.

Digital currencies are a type of online payment method that has emerged as a money laundering concern. Broadly defined, *digital currencies* are currencies that exist and are traded in a digital format. The term typically excludes government-backed currencies, despite the fact that they can also exist and be traded digitally. Digital currencies can come in several forms

and can have limited or broad uses. Among the most popular digital currencies is *bitcoin*, a cryptocurrency that features a peer-to-peer network that allows users to send units of the currency to each other online without the use of a traditional financial institution.

Digital currencies are often vulnerable to money laundering because many of them function as international person-to-person (P2P) payment systems that cross jurisdictional boundaries, creating difficulties for authorities pursuing enforcement or legal actions. Money launderers can complicate fund-tracing efforts by distributing digital currencies among many *addresses*—unique identifiers that represent the destination where cryptocurrency can be sent—or digital wallets in complex transactions.

As is typical with developing payment systems, digital currencies generally face less strict regulations than payments made through traditional financial institutions. However, many jurisdictions now require service providers who exchange or otherwise deal with digital currencies to have effective customer identification or recordkeeping practices. Therefore, digital currencies do not provide complete anonymity, so very few service providers actively promote anonymous digital currency ownership and payments.

One of the most difficult aspects of investigating and preventing laundering through digital currencies is the sheer number of them available. For instance, in May 2013, an international law enforcement effort led to the shutdown of Liberty Reserve, a popular digital currency service based in Costa Rica. Prosecutors alleged that the Liberty Reserve was operating as an unlicensed financial transaction service and that its lax processes allowed upwards of \$6 billion in illicit assets to be laundered since its inception in the early 2000s.

However, soon after this shutdown, it was apparent that launderers had already found alternatives to Liberty Reserve, such as Perfect Money. Because these service providers operate online, they can set up in countries with lenient financial regulations in a short period of time. Additionally, many of the most popular digital currencies, including bitcoin, are practically impossible to shut down from a law enforcement standpoint because they operate using a decentralized, peer-to-peer network.

After the rise in popularity of bitcoin, many similar alternative digital currencies also began to appear. Many have different features, so the money laundering potential varies between them. Generally, digital currencies give parties the ability to:

- Send and accept payments from any user in the world with an internet connection for little or no transaction fee.
- Send or accept payments without the need for any identifying information (other than the users' randomly generated "addresses").
- Conduct transactions in unlimited volume (assuming funds are available).
- Confirm transactions within minutes or less.
- Distribute digital currencies among many addresses or digital wallets to create complex transactions that are difficult to trace.

For more information on illicit transactions involving digital currencies such as bitcoin, see the "Tracing Illicit Transactions" chapter in the Investigation section of the *Fraud Examiners Manual*.

Virtual Assets

Virtual assets are similar to digital currencies but are generally intangible assets tied to a particular service or online community. For instance, a gambling website might offer its own mock-currency, or an online game might distribute virtual assets that users can purchase.

Often, virtual assets gain value outside of their original context (i.e., they gain real-world value) because they are scarce and can be sold to other people through online markets. The laundering process using virtual assets often resembles some variation of the following:

1. Illicit assets are used to purchase virtual currency or items from third parties. Alternatively, a criminal organization hires people to gather the virtual resources themselves.
2. If the virtual assets are bought from third parties, the seller transfers the virtual items to an account controlled by the criminal.
3. The criminal could either sell the virtual assets for actual money or give the virtual account information to another criminal as a means of transferring the value.

The actual sale price of virtual currency or items is usually not very high—a small proportion of transactions exceed a few thousand dollars. However, professional laundering organizations can break up sales and transfers and eventually pass large amounts through the cycle.

EXAMPLE

The Seoul Metropolitan Police uncovered a money laundering ring that moved \$38 million from South Korea to China during the course of 18 months. The group purchased in-game gold of an online video game “farmed” by low-cost laborers in China, and then sold it to exchangers in South Korea. The criminals placed the money into accounts opened under fake or stolen identities, and then disguised wire transfers to a Hong Kong–based paper company as product purchases. To avoid detection, group members used technology to spoof their IP address and make it look like they were operating out of an internet café in South Korea.

Bulk-Cash Smuggling

Bulk-cash smuggling, which is the smuggling of cash out of the country where it was earned for deposit in foreign jurisdictions with lax financial institutions or to fund criminal enterprises, is also on the rise. The rise in bulk-cash smuggling is due to the increasingly effective AML policies and procedures at financial institutions. In typical bulk-cash smuggling operations, smugglers hide cash in vehicles, luggage, express packages, commercial shipments, private aircrafts, or private boats.

For example, in 2012, an investigation into a major international bank, HSBC, revealed that criminals were using the bank to funnel large amounts of cash through its branches in Mexico. Much of this currency originated in the United States as drug proceeds before being smuggled into Mexico. An AML official of the bank estimated that at one point as much as 70% of the illicit currency deposited in financial institutions in Mexico was going through HSBC.

Trade-Based Money Laundering

Trade-based money laundering is one of the most complex methods of laundering money. The Financial Action Task Force (FATF) defines *trade-based money laundering* as “the process of disguising the proceeds of crime and moving value through the use of trade transactions in an attempt to legitimize their illicit origins.” Trade-based money laundering schemes generally involve importers and exporters who collude to misrepresent the price, quantity, or quality of imported or exported goods or services. These schemes can be used to create artificial profits for the purpose of laundering money between countries; to create a complex paper trail; and to avoid taxes, customs duties, and capital controls.

TYPES OF TRADE-BASED MONEY LAUNDERING SCHEMES

OVER- AND UNDER-INVOICING SCHEMES

In over- and under-invoicing schemes, importers and exporters conspire to misrepresent the price of the goods or services being traded, thus transferring additional value between the importer and exporter. These schemes can be used to create a complex paper trail for the colluding parties to launder illicit funds. The amount available to launder is the difference between the market value of the goods and the invoiced amount.

In an *under-invoicing scheme*, the exporter invoices goods or services to the importer at a price below their market value. This scheme transfers value to the importer because the amount the importer pays for the goods or services is less than the amount they can be sold for on the open market. For example, Company A sends a shipment of widgets worth \$200,000 to Company B but only invoices Company B for \$100,000. Company B then sells the widgets on the open market for \$200,000 and deposits the extra \$100,000 into an account controlled by Company A.

In an *over-invoicing scheme*, the exporter invoices goods or services to the importer at a price above their market value. This scheme transfers value to the exporter because the exporter collects the amount of the higher price that was invoiced, which is more than the goods or services can be sold for on the open market. For example, Company A sends a shipment of widgets worth \$100,000 to Company B but invoices Company B for \$200,000. Company A then deposits the extra \$100,000 into an account controlled by Company B.

OVER- AND UNDER-SHIPMENT SCHEMES

Like over- and under invoicing schemes, over- and under-shipment schemes can be used to create a complex paper trail for the colluding parties to launder money.

In an *over-shipment scheme*, money launderers understate the quantity of goods that are shipped. More goods are shipped than the company invoices for. For example, Company A invoices 100,000 widgets to Company B at a price of one dollar per widget. However, Company A ships 200,000 widgets to Company B. Company B then sells the widgets on the open market for \$200,000 and deposits the extra \$100,000 into an account controlled by Company A.

In contrast, the quantity of goods that are shipped is overstated in an *under-shipment scheme*. The company invoices for more goods than it actually ships.

In a *phantom shipping scheme*, no goods are actually shipped.

DUPLICATE INVOICING SCHEME

In a *duplicate invoicing scheme*, the exporter issues more than one invoice for the same trade transaction. By issuing duplicate invoices, a money launderer can justify multiple payments for the same goods or services.

FALSE DESCRIPTIONS IN INVOICES

Money launderers can conceal their illicit funds by misrepresenting the quality or type of goods or services provided. For example, an exporter can substitute products or materials of lesser quality than specified in the invoice; use lower quality staff than specified; use counterfeit, defective, or used parts to produce goods; or make any other deliberate departures specified in the invoice.

BLACK MARKET PESO EXCHANGE

Among the most notorious of trade-based money laundering operations is the Black Market Peso Exchange, a scheme where brokers purchase proceeds from narcotics in the United States from cartels and exchange them for clean pesos in Colombia.

RED FLAGS OF TRADE-BASED MONEY LAUNDERING

Some red flags of trade-based money laundering schemes include:

- The goods or services traded seem unrelated to the usual business of the importer or exporter.
- The shipping route is unusual, passing through one or more countries for no apparent reason.
- The goods or services do not match the description, value, quantity, or quality stated in invoices or other documents.
- The same goods are repeatedly imported and exported.
- The transaction involves shell companies or offshore accounts.

Banks and Other Depository Financial Institutions

Unfortunately, a significant portion of money laundering occurs through financial institutions when employees intentionally—or at least knowingly—aid criminals. While there is risk of enforcement actions for violations, banks can generate a large volume of transaction fees from launderers' activities. Individual employees sometimes directly help launderers to earn a commission or to advance their careers. Moreover, management might turn a blind eye to known violations because the upshot is higher profits.

There are several ways that collusion occurs. On the individual level, it generally involves an agent of the bank or institution manipulating a control or other procedure to prevent detection of a crime. For example, a launderer who wants to structure cash deposits could bribe a person responsible for reporting suspicious transactions or collude to provide false information in a new account application.

At the higher level, upper management could implement policies that it knows or should know are ineffective at preventing money laundering. Intent is difficult to prove in this instance but might be demonstrated through evidence of management ignoring warnings, failing to keep up with industry standards, and implementing policies that do not provide a direct chain of responsibility to an organization's leadership.

Some banks—especially privately-owned banks in low-regulatory zones—operate as front organizations for money launderers. This method can be used by large organizations to create transactions that are not likely to be reviewed by any regulatory authority (e.g., disguised bribe payments). Since the bank is essentially a front, the controlling organization can simply refuse to place controls that would stop money laundering.

Additionally, some jurisdictions have low capital requirements to start up a bank. This allows individual criminals with relatively fewer assets to also use this method.

Money Services Businesses

Money services business (MSB) is a term used with growing frequency to define a regulatory class of non-depository financial service providers that transmit or convert money. Although an MSB has particular meanings in different jurisdictions, it generally includes any business that operates in one or more of the following capacities:

- Currency exchangers
- Check cashers
- Issuers, sellers, or redeemers of traveler's checks, money orders, or stored value
- Money transmitters
- Prepaid access providers or sellers

MSBs offer an alternative to depository institutions for both financial services and money laundering. For this reason, an individual unable to transfer illegal funds into the traditional depository banking system might turn to an MSB. In addition, most MSBs operate under less strict regulations than traditional financial institutions. For example, an MSB might not check

a customer's credit report before opening an account, or it might require less rigorous proof of a customer's identity than a traditional bank. These overall less stringent requirements tend to raise the money laundering risk in certain transactions involving users of MSBs. However, there is a regulatory trend to expand certain requirements, such as customer due diligence (CDD) programs, to MSBs.

Insurance Companies

Insurance policies are designed to protect assets (as well as life and health), but they are also assets in their own right. As is the case with most assets, they can become part of a money laundering scheme. Due to the recent growth in the financial products offered by insurance agents and brokers (including savings products, investment products, and tax planning services), the insurance industry has become increasingly attractive to money launderers. One of the causes for this increase is that insurance agents and brokers offer many savings, investment, and tax planning services that might be used to launder funds. Generally, the independent brokers and agents who often sell insurance products do not work directly for the insurance companies. As a result, these intermediaries might lack the knowledge or incentive to screen clients or to question payment methods, and it is this factor that money launderers often exploit.

Redemption Schemes

A person can redeem some insurance policies, such as life insurance, before the event that triggers the insurance occurs. In other words, the insurer agrees to pay the beneficiary of the policy an amount less than what the payout on a claim occurrence (in the case of life insurance, the death of the insured) would be.

Using illicit assets, launderers can purchase life insurance or other redeemable contracts for themselves or their associates. If the investigator did not know that the launderer bought the insurance policy with illicit assets, the redemption payout would appear legitimate.

Prepayment Schemes

Insurance policies sometimes allow for premiums to be paid in advance. Some launderers make advance payments on insurance premiums. For instance, if a health insurer allowed \$10,000 in advance premium payments, then the launderer could use the illicit assets to "store" those funds. Perhaps the launderer was going to buy that health insurance anyway; now illicit assets have taken care of that bill.

Moreover, some insurance policies are very expensive, such as a large company's general liability insurance, allowing for higher laundered amounts.

Canceled Policy Schemes

Launderers do not always need to keep or redeem the insurance policies they purchase. Many policies have cancellation provisions that, for a certain amount of time, allow the launderer to cancel the policy and have any unused premiums returned. This technique can be used to temporarily store illicit assets and confuse the money trail by having the cancellation paid out to a different account.

Casinos

Casinos operate in a high-volume cash-intensive industry and provide a broad range of financial services (such as deposit and credit accounts, funds transfers, check cashing, and currency exchange services) outside the traditional financial services system. As a result, casinos are susceptible to money laundering.

There are several ways that criminals use casino chips to launder funds, including:

- Holding the chips for a period of time and later cashing them in for a casino check or having the casino wire the money elsewhere
- Using the chips as currency to purchase narcotics, with the drug dealer later cashing in the chips
- Using the chips to gamble in the hope of generating certifiable winnings

Additionally, law enforcement authorities have become increasingly concerned about the potential to use the growing internet gaming industry to launder funds. Generally created in jurisdictions without gambling restrictions, online casinos require little capital to set up. They offer virtual anonymity and many of the same features of a brick-and-mortar casino, such as standing accounts through which a patron may transfer funds via check, credit or debit cards, or wire transfers. For the most part, internet casinos figure in the layering and integration stages. In essence, these cyber-casinos function as unregulated banks, providing virtually anonymous accounts to bettors.

Shell Companies

Shell companies are business entities that generally do not have any physical presence other than a mailing address and generate little to no independent economic value. In most situations, individuals and businesses form shell companies for legitimate reasons, such as holding the

stock or intellectual property rights of another business entity, facilitating domestic and cross-border currency and asset transfers, or fostering domestic and cross-border currency corporate mergers. However, shell companies have become common tools for money laundering primarily because they have the ability to hide ownership and mask financial details, and because money launderers can create them with minimal public disclosure of personal information regarding controlling interests and ownership. This lack of transparency prevents the discovery of suspicious transactions and impedes investigations and prosecutions.

Charities and Nonprofit Organizations

Charities and nonprofit organizations are often used in fraud and other financial crimes, including money laundering. These organizations rely on gifts, and therefore can be used to disguise illicit assets. Typically, the launderer or an associate controls the organization, and can direct donated funds outside of actual charitable purposes.

EXAMPLE

In 2012, an orthodox rabbi from New York was sentenced to four years in prison for his involvement in a widespread money laundering and corruption scheme. The case was part of the FBI's "Bid Rig III" crackdown that involved the arrests of more than forty people, including politicians and other religious leaders. The rabbi ran a collection of community charities known as gmachs. An undercover informant approached the rabbi and sought his assistance in laundering money through the charities. The rabbi deposited check donations of almost \$1 million into accounts owned by the charities. He then used an underground financial network that operated between the United States and Israel to convert the funds into cash. After taking a 10% commission, he physically delivered the cash to the undercover informant.

With online donations available through non-traditional transfers (such as digital currencies), it is easier than ever for launderers to make virtually anonymous payments to corrupt charities and nonprofits.

Calling in a Specialist

Converting ill-gotten gains into cashier's checks or money orders is not particularly difficult for even the most unsophisticated criminal. However, because many launderers fear detection, they often engage others to help them launder funds.

Fraudsters may use *couriers* who arrange for the transportation of money to a site where it is converted into another form of currency. For instance, drug traffickers will physically

transport money to a foreign jurisdiction, where it is deposited into a bank account or converted directly to checks or money orders. Since the courier has no apparent connection with the true owner of the funds, the money launderer retains their anonymity.

In addition, fraudsters may employ gatekeepers who facilitate access to financial services. A gatekeeper may be an individual or an institution, and frequently, gatekeepers are bankers, trust companies, lawyers, accountants, realtors, insurance brokers, stockbrokers, or other entities with access to financial services. Through investments, trust accounts, fund transfers, and tax avoidance schemes, these professionals can manipulate the financial, commercial, and legal systems to conceal the origin and ownership of assets.

Most gatekeepers are legitimate, but they offer products and services that both legitimate customers and fraudsters find attractive.

Gatekeepers often facilitate the following:

- Disguising the subject's involvement in a commercial transaction (e.g., disguising an individual's ownership in a limited partnership)
- Layering criminal property (e.g., transferring the property through a company to conceal the property's criminal source)
- Disguising the ownership of property owned by the subject

Alternative Remittance Systems

Alternative remittance systems (also called *parallel banking systems*) are methods of transferring funds from a party at one location to another party (whether domestic or foreign) without the use of formal banking institutions. These systems are characterized by the lack of direct physical or digital transfer of currency from the sender to the receiver. Instead, in the typical alternative remittance system, the payer transfers funds to a local broker who has a connection to another broker in the region where the payee is located. The latter broker then distributes the funds to the payee.

How They Work

The parties involved in alternative remittance systems form a network and track their exchanges on an informal ledger. Unlike formal financial institutions, these ledgers will generally not list specific information about the payers and payees (such as bank account numbers and names) but will keep track of amounts owed. When the first broker requests that another broker in the network distribute funds, the debt is recorded in the ledgers. These debts between brokers

could be paid back by offsetting transactions (i.e., the first broker pays someone locally at the request of the second broker). Alternatively, the parties could meet to settle all outstanding debts at a later time. Below is an example of an alternative remittance system.

EXAMPLE

1. *Ana in London contacts and gives \$50,000 in cash to Broker A in London to get \$48,000 to Bob in Dubai. Broker A takes a commission of \$2,000.*
2. *Broker A contacts Broker B in Dubai and arranges the transfer; a code is exchanged.*
3. *Broker A gives Ana a code to be communicated to Bob.*
4. *Ana communicates the code to Bob.*
5. *Broker B and Bob make contact in Dubai.*
6. *Bob relays code to Broker B and is given the money.*
7. *Broker A owes Broker B \$48,000 worth of t-shirts. Broker A sends the merchandise from London to Broker B in Dubai, plus \$1,000 in extra merchandise as a share of the commission.*
8. *Transaction is complete.*

Often, brokers in the alternative remittance system are business partners who do legitimate business with each other on a regular basis. Because it can be difficult to transfer large amounts of money between countries, a debt might be paid with merchandise or a favor (e.g., Broker B owes Broker A money from a past transaction, and in a new transaction, pays the recipient, thereby relinquishing their debt to Broker A from the former transaction).

Alternative remittance systems are more than a thousand years old, tracing their origins to merchants wanting to avoid transferring currency through dangerous territory. Moreover, transferring funds in this manner is not necessarily illegal (although some jurisdictions require brokers to register with the government). If available, using such systems can be beneficial because the commission that the networked brokers take might be lower than a banking fee for international transactions. Additionally, the payers and payees do not need to have bank accounts to perform the transactions.

Typically, the network of parties in an alternative remittance system works on the basis of trust. There are often family connections between the parties. While there is little legal enforcement available to guarantee that the networked parties will live up to their agreements with the payers and payees, many people across the world rely on this system to send and

receive funds. For instance, many migrant workers rely on some form of alternative remittance system to send funds to their families in their native countries.

Alternative Remittance Systems and Money Launderers

The relative anonymity and lack of a paper trail afforded by alternative remittance systems make them attractive to money launderers, as well as to people involved in terrorist financing. For instance, a criminal who came upon illegal profits in the form of cash could transfer those funds out of the country through an alternative remittance system without the risk of a digital paper trail or arousing suspicion from a large, international currency transfer. Such transfers that are designed to hide assets might violate AML regulations.

Alternative remittance systems are largely regional. Each system has unique features and goes by a certain name, including the following:

- Hawala (Middle East, North Africa, Horn of Africa)
- Hundi (Indian subcontinent)
- Fei chien (China)
- Poey kuan (Thailand)

EXAMPLE

In the case of United States v. Omian,¹ the defendants pleaded guilty to owning and managing an unlicensed hawala transmittance system. To avoid filing Currency Transaction Reports with the federal government (mandatory in the United States for currency transactions of \$10,000 or more), the defendants structured the payments. Prosecutors found that the defendants caused \$9.7 million in payments to be disbursed in Yemen to unknown recipients. The original senders included individuals, businesses, and mosques.

An alternative remittance system is a tempting opportunity for launderers because it:

- Doesn't require formal identification
- Takes hours rather than days to transfer the money overseas
- Is cheaper than paying bank and shipping fees because brokers generally take a very small commission
- Does not require currency conversion
- Lacks a coherent paper trail

¹ Grand jury indictment available at www.documentcloud.org/documents/229339-nasser-indictment.html.

The very essence of alternative remittance systems bypasses regulation, such that money can be transferred without government and financial institution oversight. While many such networks are free of criminal intent, the system lends itself to abuse.

For brokers who operate storefront retail or service businesses in addition to their side exchanges, bank deposits rarely trigger investigation by a financial institution unless they are exceedingly high for the particular business. As always, such money can go undetected by putting it toward personal and business expenses.

Red flags of money laundering could also indicate an alternative remittance system scheme. The following transactions might indicate money laundering:

- Use of cash as payment for a transaction that is typically handled by checks or other forms of payment
- Lump-sum payments made by wire transfer or with foreign currency
- Reluctance to provide normal information when setting up a policy or account, or providing minimal information
- Purchase of investments in amounts considered beyond the customer's apparent means
- Use of a letter of credit or other methods of trade finance to move money between countries where such trade is inconsistent with a customer's usual pattern
- Establishment of a large investment policy and then, within a short time period, a customer requests cancellation of the policy and that the cash value be paid to a third party
- Use of wire transfers to move large amounts of money to or from a financial haven country such as the Cayman Islands, Colombia, Hong Kong, Liechtenstein, Luxembourg, Monaco, Panama, or Switzerland
- Services provided internationally but paid for locally
- Suspicious and seemingly related transactions involving a particular ethnic group or nationality

Combating Money Laundering in Alternative Remittance Systems

Alternative money movement systems have kept up with technology, which frustrates efforts to detect and prevent money laundering that uses these methods. Hawala systems based in Asia and the Black Market Peso Exchange based in Colombia have migrated to the use of instant messages, chat technology, and email to make discovery and tracing of communications even more difficult. The absence of a traditional paper trail has always been a challenge in working with these systems, but the advent of instant global communications has made them far more difficult to monitor.

The leading emerging threat in alternative remittance systems is identity theft. It has all but displaced the traditional fake identities used in fraud cases, especially money laundering. It is easier to assume the identity of a real person than it is to create a convincing fake identity. Considering that when a money launderer uses a stolen identity, it is not used to gain credit or exposed to loss, there is no reason for the identified person to ever learn that the accounts were opened using their name. Thus, the risk of discovery is low and the opportunity for misdirection is high. It's a near-perfect solution to the enhanced due diligence requirements being exercised by financial institutions.

Less savvy launderers, however, are still using straw men, both known and random, including family members, children, in-laws, and drifters, to play this role.

International Anti-Money Laundering Efforts

In the 1980s, the mounting global drug crisis led to the birth of international anti-money laundering (AML) efforts. As a result, international organizations began taking on initiatives to fight money laundering, while others were created for that same purpose. The principal organizations include the United Nations (UN), the Financial Action Task Force (FATF), and the Egmont Group. Following the events of September 11, 2001, however, the international community's AML focus shifted from anti-drugs to anti-terrorism, and many international organizations revised the AML framework to not only examine funds from illegal sources, but to also examine funds whose purposes were illegitimate.

For information regarding anti-money laundering laws in the United States, see the content on "Anti-Money Laundering Laws" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

The United Nations

The UN has steadily increased its role in fighting money laundering over time, particularly in the areas of illegal drugs and human trafficking. The UN provides informational resources such as statistical studies, expert advice to policymakers, red flags, and risk factors of money laundering. The UN also sets policies for its 193 member states to adopt, such as its requirement that members criminalize money laundering. While these policies generally lack an effective enforcement mechanism, many members take measures to comply with them.

The UN was the first international organization to undertake significant steps to combat money laundering, and it continues to play an important role in AML efforts.

United Nations Convention Against Illicit Traffic in Narcotic Drugs and Psychotropic Substances

In 1988, the UN adopted the United Nations Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances, a mandate to combat money laundering and organized crime. Then, in 1997, the UN established the Global Programme against Money Laundering (GPML), which provides member states with assistance to comply with international AML standards. In addition, the GPML, in participation with other international organizations, maintains the International Money Laundering Information Network (IMoLIN), a website that provides the international community with information and tools concerning AML.

Resolution 1373

The UN-adopted Resolution 1373 was created in September 2001 as a response to the 9/11 attacks in the United States. It called on countries to criminalize aiding terrorist groups, freeze funding to such groups, and cooperate with other countries to pursue them. It also marked an increased authority of international law. Historically, UN resolutions and requirements were voluntary; members might refuse to sign or enforce the resolution or rule. Resolution 1373, however, stated that all members *shall* pass its provisions, and a threat of sanctions looms for any country that does not comply.

United Nations Convention Against Transnational Organized Crime

The UN also created the United Nations Convention against Transnational Organized Crime, which requires members to:

- Criminalize participation in an organized criminal group, laundering of the proceeds of a crime, and corruption involving public officials.
- Regulate and supervise financial institutions and other industries vulnerable to facilitating laundering.
- Take measures to confiscate proceeds of crimes.
- Process requests of other members to enforce penalties for criminal offenses, confiscation, and so on; subject to approval.
- Afford member countries mutual legal assistance and law enforcement cooperation in transnational investigations.
- Train law enforcement personnel to prevent, detect, and control laundering and organized criminal offenses.

The Financial Action Task Force on Money Laundering

The FATF is an intergovernmental body that was established at the G-7 Summit in 1989. Its purpose is to develop and promote standards and policies to combat money laundering and terrorist financing at both the national and international levels. The FATF works in close cooperation with other international and regional bodies. Notably, the International Monetary Fund (IMF) and the World Bank provide assistance in monitoring countries' progress in implementing and adhering to the standards set forth by the FATF.

Originally composed of 16 members, the FATF has expanded continuously and is presently made up of 39 members (37 countries and territories and 2 regional organizations). The current members of the FATF are: Argentina, Australia, Austria, Belgium, Brazil, Canada, China, Denmark, European Commission, Finland, France, Germany, Greece, Gulf Cooperation Council, Hong Kong (China), Iceland, India, Ireland, Israel, Italy, Japan, Kingdom of the Netherlands, Luxembourg, Malaysia, Mexico, New Zealand, Norway, Portugal, Republic of Korea, Russian Federation, Saudi Arabia, Singapore, South Africa, Spain, Sweden, Switzerland, Turkey, the United Kingdom, and the United States. Almost every nation with active AML enforcement operations is a member of the FATF.

The FATF releases various model policies and data to help countries combat money laundering, the most influential of which is its International Standards on Combating Money Laundering and the Financing of Terrorism and Proliferation: the FATF Recommendations (referred to as the "FATF Recommendations").

The FATF Recommendations

The FATF Recommendations, revised in 2012, created the most comprehensive standard with which to measure a country's AML, counterterrorism, and nuclear proliferation laws and policies. They serve as a basic framework of laws that its members should have. While the FATF Recommendations are not required by the FATF's members, and the FATF acknowledges that following each rule might not be possible, members often adopt them.

The FATF also evaluates each member's compliance with the FATF Recommendations in its Mutual Evaluations.² These periodic publications detail members' deficiencies and recommend remedial measures. They are a good start to understanding a country's AML laws and procedures.

² Available at www.fatf-gafi.org/publications/mutualevaluations.

Some of the key measures in the FATF Recommendations provide that countries should:

- Use a risk-based approach when setting AML policy.
- Create policies that increase cooperation and coordination with other countries.
- Specifically criminalize money laundering and terrorist financing.
- Enable authorities to trace, freeze, and confiscate assets suspected in laundering and terrorist financing.
- Require financial institutions to:
 - Establish AML and counterterrorist financing programs.
 - Perform due diligence on customers.
 - Determine if customers are politically exposed persons.
 - Keep transactional records for at least five years.
 - Avoid correspondent banking with shell banks.
 - Continuously monitor wire transfers.
- Apply the above due diligence and recordkeeping requirements to designated nonfinancial businesses and persons, including:
 - Casinos
 - Real estate agents
 - Jewelry and precious metals dealers
 - Professionals who prepare business entities, buy real estate, and serve as a trustee
- Register money transmitters.
- Create financial intelligence units (FIUs) and require financial institutions and other high-risk industries to report suspicious activity to them.
- Ensure law enforcement has interdisciplinary personnel and the proper authority to investigate.
- Have detection methods for cash smugglers at borders and have a declaration system.
- Develop proportionate penalties for violations by individuals and entities.
- Cooperate to the fullest extent reasonably possible through legislative, judicial, and law enforcement efforts.

Revisions to the FATF Recommendations

The FATF originally had forty recommendations regarding money laundering. Shortly after the World Trade Center attack in 2001, the FATF mandate was expanded beyond money laundering to support the worldwide effort to combat terrorist financing (CTF). During an extraordinary plenary meeting in Washington, DC, in October 2001, the FATF adopted Eight Special Recommendations on Combating Terrorist Financing, which were revised in 2004 and expanded to the Nine Special Recommendations.

Money laundering techniques change in response to developing countermeasures. Launderers rely on increasingly sophisticated methods to achieve their objectives, including the assistance of professionals and the use of separate legal entities to mask ownership and control of funds. In light of this fact, the FATF made significant revisions to its recommendations to help national AML/CFT systems. The most important provisions set minimum standards for legal systems, sound practices for financial institutions and related professions, and guidelines for international cooperation.

In 2012, the FATF Recommendations were revised again, including a structural change that dropped the distinction between the original AML regulations and the special recommendations. The major changes included:

- A focus on a risk-based approach to combating money laundering and terrorist financing
- The inclusion of tax crimes as a predicate offense to money laundering violations
- Focused sanctions pursuant to the UN on parties that proliferate weapons
- A strengthened emphasis on anti-corruption measures, as corruption is often linked with money laundering

Provisions of the FATF Recommendations

There are several provisions of the FATF Recommendations that have helped to standardize the regulations and terminology in the international effort to stop money laundering.

LEGAL SYSTEMS

Under the FATF Recommendations, countries should adopt legislation that effectively criminalizes acts of money laundering and establishes the widest possible range of predicate offenses. In reference to money laundering, a predicate offense is a crime whose proceeds must be converted into a legitimate form. At a minimum, every serious offense should constitute a predicate offense, regardless of where it is committed. In addition, countries should implement laws and regulations that permit authorities to confiscate laundered money, the proceeds of predicate offenses, or property of a corresponding value.

FINANCIAL INSTITUTIONS AND RELATED PROFESSIONS

The FATF Recommendations were revised over time to set stricter guidelines for financial institutions and professionals who are routinely involved in substantial financial transactions. Such professionals specifically include casinos, real estate agents, lawyers, and dealers in precious metals and precious stones. The measures address customer due diligence, reporting suspicious transactions, deterring money laundering and terrorist financing, and regulation and supervision.

ANTI-MONEY LAUNDERING PROGRAMS

Under the FATF Recommendations, countries should require financial institutions to implement AML and terrorist financing programs. A financial institution's AML program is highly dependent on which jurisdictions it operates in, as well as the services that it offers. Generally, financial institutions should adopt the AML policies and procedures in the FATF Recommendations, but they need to tailor their programs to the requirements of the specific jurisdictions in which they operate. According to the FATF Recommendations, these programs should include:

- The development of internal procedures and controls, including adequate screening procedures to ensure high standards in employee hiring
- Ongoing employee training programs on money laundering risks
- An independent audit function to test the effectiveness of the programs
- The designation of a compliance officer at the management level

CUSTOMER DUE DILIGENCE

The FATF Recommendations set out the fundamental measures that financial institutions must take to identify and verify the identity of customers and beneficial owners. Although it is most important to conduct due diligence when a business relationship is first established, due diligence should be exercised on an ongoing basis. These requirements set firm, more detailed standards while also providing flexibility and allowing adaptation to new industry practices. In addition to the fundamental obligations, the FATF Recommendations also deal with other issues, such as the timing of verification, the measures to be taken with respect to existing customers and for legal persons or arrangements, and when simplified customer due diligence (CDD) measures may be appropriate.

According to the FATF Recommendations, the CDD measures to be taken by financial institutions and designated nonfinancial businesses and professions (DNFBPs) are:

- Identifying the customer and verifying the customer's identity through reliable, independent source documents or data
- Identifying the beneficial owner of the account or service, including the ownership and control structure of organization
- Obtaining information and understanding the purpose and intended nature of the business relationships involved in the account or service
- Conducting ongoing due diligence on the business relationship and transactions of the customer to ensure that they are consistent with the customer's profile

Some countries allow their financial institutions to rely on persons other than employees and agents to perform some of the required CDD measures. The FATF recognizes this as a common commercial practice and permits countries to allow their institutions to rely on third parties, provided that the conditions laid out in the FATF Recommendations are met. The ultimate responsibility remains with the financial institution that is relying on the third party.

Greater care must be exercised in CDD measures that involve politically exposed persons and their close relations. *Politically exposed persons* are individuals who hold prominent public positions in foreign countries, such as heads of state, senior politicians, high-ranking military officials, and members of the judiciary. Middle ranking or more junior members are not included in the definition.

DETERRING MONEY LAUNDERING AND TERRORIST FINANCING

Within certain limits, countries and institutions are free to determine the extent of measures appropriate to the specific risk of money laundering or terrorist financing they face. However, all countries are required to (1) establish a financial intelligence unit to receive reports regarding suspicious transactions, (2) designate law enforcement agencies for AML/CFT investigations, and (3) involve financial supervisors in AML/CFT initiatives. These authorities should have appropriate duties and powers, the necessary resources, and effective mechanisms to cooperate and coordinate during investigations. To ensure that systems are effective and subject to review, comprehensive AML/CFT statistics must be maintained.

The FATF has consistently found that the lack of transparency concerning the ownership and control of legal persons and arrangements is a problem for money laundering investigations. The measures required under commercial or other laws regarding obtaining or accessing such information vary widely from country to country. The FATF Recommendations, therefore, set out the key objective of ensuring that adequate, accurate, and timely information on the beneficial ownership and control of legal persons and arrangements is obtainable or accessible. In particular, countries must be able to show that companies issuing bearer shares cannot be misused for money laundering. Bearer shares are share certificates that can be issued without the name of the beneficial owner.

The FATF Recommendations dissuade countries from allowing the establishment of shell banks within their jurisdiction or engaging in transactions with such financial institutions. A shell bank is a bank that is incorporated in a jurisdiction in which it has no physical presence and that is unaffiliated with a regulated financial group.

REPORTING OF SUSPICIOUS TRANSACTIONS

Under the FATF's Recommendation 20, a financial institution should be required to file a report when it "suspects or has reasonable grounds to suspect that funds are the proceeds of a criminal activity, or are related to terrorist financing." Some jurisdictions also set additional requirements for reporting suspicious transactions, such as if a cash transaction surpasses a certain threshold amount. The name of these reports varies by jurisdiction, but they are generally called suspicious activity reports (SARs) or suspicious transaction reports (STRs).

The FATF Recommendations define *financial institutions* to include:

- Depository and lending institutions (i.e., traditional banks)
- Money services businesses (MSBs)
- Financial guarantors
- Securities brokers or traders, including those who trade in:
 - Money market instruments
 - Foreign exchanges
 - Exchange, interest rate, and index instruments
 - Transferable securities
 - Commodity futures
- Security issuing services
- Investment portfolio managers
- Parties that invest, administer, or manage funds or assets on behalf of others
- Insurance companies servicing life insurance and other investment-related insurance

Also, the parties that should file SARs or STRs have broadened to include DNFBPs, such as:

- Casinos (including internet- and ship-based casinos)
- Real estate agents
- Dealers in precious metals and stones
- Legal professionals at professional firms (not internal legal professionals)
- Trust and company service providers

REGULATION AND SUPERVISION

All countries need adequate measures to ensure that financial institutions and other businesses and professions are complying with their obligations. The required measures take into account the risks and the regulatory structures that already exist in the relevant sectors.

The required measures are:

- Financial institutions and casinos should not be owned or managed by criminals.
- The measures applicable to banks, insurance, and securities firms for prudential purposes also apply when combating money laundering.
- Currency exchange and money remittance businesses must, at a minimum, be licensed or registered and monitored for compliance.
- Other financial institutions should be regulated and subject to supervision or oversight to detect the risk of money laundering or terrorist financing.
- Casinos must be licensed and supervised.
- On a risk sensitive basis, other businesses and professions must have effective systems for monitoring and ensuring compliance, which could either be by a government authority or by a self-regulatory organization.
- Competent authorities must establish guidelines and provide feedback.

LARGE CASH TRANSACTIONS

Under the best practices provided in the FATF Recommendations, countries should implement a reporting requirement for financial institutions and DNFBPs that engage in cash transactions above the jurisdiction's designated threshold. The reports should cover domestic and international cash transactions. Many jurisdictions implement this reporting requirement.

CROSS-BORDER TRANSFER OF CURRENCY

Under the FATF's Recommendation 32, countries should implement disclosure requirements for individuals who are physically carrying currency or currency equivalents (i.e., bearer instruments) into or out of the country in amounts that are above the country's designated reporting threshold. Generally, individuals who are carrying currency or the equivalent above the reporting threshold while attempting to cross jurisdictional borders should be required to disclose the amount to authorities, and they will face penalties if they fail to do so.

INTERNATIONAL COOPERATION

The FATF Recommendations contain several provisions that address international cooperation. Notably, the Recommendation on mutual legal assistance covers several concepts that are in the 25 Non-Cooperative Countries and Territories Criteria discussed below. The most significant provisions deal with cooperation between administrative and law enforcement authorities concerned with combating money laundering and terrorist financing. This prescribes the need for the widest possible cooperation, and for clear and effective gateways.

Countries with Substantial Money Laundering Issues

The FATF maintains a list of countries that have strategic deficiencies which obstruct international efforts to curtail money laundering and the financing of terrorism. Furthermore, the FATF urges its members to protect the international financial system from money laundering and terrorist financing by applying counter-measures when dealing with these countries. In compiling this list, the FATF looks at factors such as a country's:

- Financial regulations
- Requirements for registration of business entities and identification of the owners of those entities
- Laws regarding the international exchange of information in money laundering investigations
- Strength of AML laws
- Allocation of sufficient resources to prevent and detect money laundering activity

As of this publication, the most recent FATF report found that the following jurisdictions to have substantial money laundering and terrorist financing risks:

- Iran
- North Korea

Additionally, the report found that the following jurisdictions have strategic deficiencies (as identified by the FATF) in their AML and counterterrorism efforts:

- Albania
- The Bahamas
- Barbados
- Botswana
- Cambodia
- Ghana
- Iceland
- Jamaica
- Mauritius
- Mongolia
- Myanmar
- Nicaragua
- Pakistan
- Panama
- Syria

- Uganda
- Yemen
- Zimbabwe

International Monetary Fund/World Bank

Created to revive international trade in the post-World War II era, the IMF and the World Bank were designed to enhance international commerce by creating a system supported by global monetary cooperation. Today, the IMF and the World Bank actively participate in global AML efforts through financial sector assessments, technical assistance in the financial sector, and policy development.

The Egmont Group

The Egmont Group is an informal international network of FIUs, which are national centers that collect information on suspicious or unusual financial activity, designed to fight money laundering by encouraging global cooperation and mutual exchange of information. The Egmont Group exists to increase the sharing of information and coordination between FIUs, and it offers training for FIU personnel.

European Union

The European Commission enforces several European Union (EU) policies that involve AML efforts. The most prevalent is the Anti-Money Laundering Directive (now in its fifth iteration and referred to as the Fifth Directive). The Fifth Directive applies to the financial sector as well as to lawyers, notaries, accountants, real estate agents, casinos, and company service providers. Its scope also encompasses all providers of goods when cash payments are made or received in excess of EUR 10,000. Those subject to the Fifth Directive are required to:

- Verify the identities of their customers and of their beneficial owners, and to monitor the transactions and business relationships of the customers.
- Report suspicions of money laundering or terrorist financing to the jurisdiction's financial intelligence unit or other proper authorities.
- Ensure proper training of personnel and establish appropriate internal controls.

The Fifth Directive entered into effect on July 9, 2018. Member states have 18 months from the effective date to incorporate the changes this iteration of the Anti-Money Laundering Directive introduces into their national laws. The Fifth Directive builds upon the Fourth Directive, which was enacted on June 25, 2015.

The Fifth Directive makes changes to address the risks posed by virtual currencies and prepaid cards; enhances the power of Financial Investigation Units and facilitates their transparency on who really owns companies and trusts by establishing beneficial owner registers; improves the safeguards for financial transactions to and from high-risk countries; and requires member states to maintain lists of what qualifies as prominent public functions to assist in identifying politically exposed persons (PEPs).

Other AML measures enforced by the European Commission include:

- Directive 2015/849 requires measures to guard against money laundering and corruption. This Directive repealed and replaced Directive 2005/60/EC and 2006/70/EC and entered into force on June 26, 2017. (<https://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:32015L0849&from=en>)
- Regulation 2015/847 requires information on the payer to accompany transfers of funds for the purposes of the preventing, investigating, and detecting of money laundering. On June 26, 2015, this regulation replaced Regulation 1781/2006, the former wire transfer regulation. (<https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:32015R0847&from=EN>)
- Regulation 1889/2005 requires persons entering or leaving the EU to declare currency sums of EUR 10,000 or more. (<https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2005:309:0009:0012:EN:PDF>)
- EU Council Decision 2000/642 lays out arrangements for cooperation among EU members' financial intelligence units. (<https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2000:271:0004:0006:EN:PDF>)

Enforcement and Prevention Strategies

Financial institutions, brokers, and insurance companies should be aware and should make their employees aware of situations that could indicate money laundering activity.

Anti-Money Laundering Compliance Programs

Most financial institutions are now required to have an anti-money laundering (AML) compliance program in place. However, every business that has the potential for transactions dealing with significant amounts of cash should institute a compliance program and a money laundering awareness program. All employees should be made aware of the money laundering laws and the serious implications of such laws on the institution and the employees.

Employees should be educated to be aware of transactions that might suggest possible laundering activity. Procedures should be implemented detailing what an employee should do if a customer or transaction appears suspicious.

Minimum Standards

At a minimum, a written AML compliance program should:

- Establish a system of internal policies, procedures, and controls to ensure ongoing compliance with the regulatory AML regime.
- Provide for independent testing of compliance by internal auditors and/or outside examiners.
- Designate a compliance officer(s) to ensure day-to-day compliance with AML laws and regulations.
- Provide training on an ongoing basis for all personnel.

Compliance Officer

A business should select a person or team responsible for the day-to-day monitoring of the compliance program. The compliance officer should be given broad authority to monitor all aspects of the institution's compliance, including the development and refinement of the program and the monitoring of employee training programs. Such an individual should also have the authority to conduct regular and ad hoc audits to ensure that the program is functioning effectively, and to hire outside consultants as necessary to investigate problems.

Policy Statement

All entities that have a potential for dealing with significant amounts of cash should have a written policy against handling the proceeds of drug trafficking or other criminal activity. The policy should provide that the institution requires its employees to operate with the highest moral and ethical principles. It should include a statement that the company refuses to do business with criminals and money launderers; a commitment to conduct business only with legitimate business organizations; a statement against doing business with organizations that refuse to provide proper documentation of their identity and purpose; clear directions for referring all suspicious transactions to the appropriate department; and a commitment to comply with the spirit and specific provisions of AML law.

Know-Your-Customer Programs

Financial institutions should implement know-your-customer (KYC) programs. Generally, there are two components to an effective KYC program. First, a financial institution should

identify and conduct background checks on all customers opening an account to prevent the creation of fictitious accounts. Second, financial institutions should monitor existing customers' activity to recognize when customers might be involved in suspicious activity.

More specifically, such programs should provide for effective customer identification, account monitoring, and appropriate action in suspicious circumstances.

To provide for effective customer identification, financial institutions and professionals should implement the following procedures:

- Identify the customer and verify the customer's identity through reliable, independent source documents or data.
- Identify the beneficial owner of the account or service, including the ownership and control structure of organizations.
- Obtain information and understand the purpose and intended nature of the business relationships involved in the account or service.
- Conduct ongoing due diligence on the customer's business relationship and transactions to ensure that they are consistent with the customer's profile.

Additionally, the following are particular areas of concern for KYC programs.

NEW DEPOSIT ACCOUNTS

For individual deposit accounts, minimum identification standards should be established. The information to be obtained should include:

- Name
- Address
- Date of birth
- Government-issued identification number
- Current employer
- Business and residence telephone numbers

The customer should be required to submit some form of identification that includes a photo, such as a driver's license or passport, and a copy should be made and kept in the customer's file. If there are any doubts or inconsistencies about the information provided, the employee should be instructed to notify the appropriate department.

Minimum standards for new business accounts should include:

- Business name and address
- Telephone number
- Taxpayer identification number
- Documents establishing the formation of the business entity (e.g., articles of incorporation, partnership agreement)
- Copies of all assumed name filings or doing business as (DBAs) filings
- A full description of the operations of the business
- Credit and banking references
- The identity of the officers, directors, or other principals

The account representative should also consider making a personal visit to the customer's place of business. Besides promoting good customer relations, a personal visit will help identify whether the business is legitimate or simply a front. The representative can also use this opportunity to get to know the principals of the business.

NEW LOAN ACCOUNTS

An institution should perform due diligence in establishing a new loan account because, if the customer is engaged in money laundering, there is a risk of forfeiture of collateral pledged on the loans. Real or personal property that is traceable to drug sales or that is purchased with laundered funds is subject to seizure by the government. If the property seized is pledged as collateral, the financial institution must prove that it was an innocent lienholder of the property and had no knowledge of the illegal activity.

Minimum standards regarding the information to be gathered should include:

- Reliable identifying information similar to that required for new deposit accounts
- Reliable financial information such as financial statements and copies of tax returns
- The purpose of the loan
- Credit history and prior banking references
- Verifiable, legitimate means of repayment
- Assurance that the loan amount is consistent with the purpose of the loan and the nature of the business

SERVICES FOR NON-ACCOUNT HOLDERS

Banks often issue cashier's checks, money orders, and traveler's checks and perform currency exchanges, wire transfers, or check cashing services for non-account holders. Strict

identification requirements should be established for transactions with persons who are not regular bank customers. In fact, regulations require that in some instances, banks keep a record of the identity of persons who are not established customers. Such regulations usually require at a minimum the person's name and address, official photo identification, and government or employer identification number.

MONITORING ACCOUNTS

While identification of customers is important, it is equally important to monitor the activity of accounts. The institution should identify unusual transactions that might not be consistent with the normal business of the customer. Unusual and dramatic changes in wire transfer, monetary instrument, and check transactions are important to identify. If unusual transactions or activities are noted, the institution should take some action to protect itself. The appropriate action in some cases might be to discuss the changes with the customer to find out the reasons for said inconsistencies. Increased transactions might be the result of an increase in sales or the result of a promotional activity. However, if the discussion leads to a reasonable suspicion that the transactions are illegitimate, the institution might be required to notify the appropriate government agency.

Special Problems for Insurance Companies

Although financial institutions, such as banks, are primarily associated with money laundering activities, insurance companies have become major targets of money laundering operations due to the variety of services and investment vehicles they offer that can be used to conceal the source of funds.

The most common form of money laundering that insurance companies face involves single premium contracts or policies. Examples include purchases of annuities, lump-sum top-ups to an existing life insurance contract, and lump-sum contributions to personal pension contracts.

Insurance companies, like other financial institutions, should educate their employees to look out for transactions that appear to be inconsistent with a customer's known legitimate business or personal activities, or the normal transactions for that type of account. To that end, insurance companies should institute know-your-customer (KYC) programs.

Red Flags

The following transactions might indicate money laundering is taking place. The list should be used to identify those transactions and customers that might require further investigation.

- Large purchase of a lump-sum contract when the customer typically purchases small, regular payment contracts
- Use of a third-party check to make a purchase or investment
- Lack of concern for the performance of an investment, but great concern for the early cancellation of the contract
- Use of cash as payment for a transaction that is typically handled with checks or other forms of payment
- Lump-sum payments made by wire transfer or with foreign currency
- Reluctance to provide normal information when setting up a policy or account, or providing minimal information
- Purchase of investments in amounts considered beyond the customer's apparent means
- Use of a letter of credit or other methods of trade finance to move money between countries where such trade is inconsistent with the customer's usual pattern
- Establishment of a large investment policy, and within a short time period, the customer requests cancellation of the policy and cash value paid to a third party
- Use of wire transfers to move large amounts of money to or from a financial haven country, such as the Cayman Islands, Colombia, Hong Kong, Liechtenstein, Luxembourg, Monaco, Panama, or Switzerland
- Request to borrow the maximum cash value of a single premium policy soon after paying for the policy

Detection

Most insurance companies must file reports of suspicious activity and comply with the requirements imposed by anti-money laundering (AML) legislation, including the implementation of an AML compliance program.

Accordingly, insurance companies should implement mechanisms to detect suspicious activity. *Incoming and outgoing wire transfer logs* can help companies identify possible patterns suggestive of money laundering. *Account activity reports* generally show weekly and/or monthly balances, deposits, and withdrawals. Review of these statements can identify those accounts with large increases in average balances and numbers of transactions. *Policy cancellation reports* should identify policies canceled within a specific time period. Report details should include the amount of the cash surrender value, the identity of the sales agent, and the actual term of the policy.

The “Tracing Illicit Transactions” chapter in the Investigation section of the *Fraud Examiners Manual* provides more information about techniques for detecting illicit income and payments. Included in that chapter are details on financial and behavioral profiles and analyzing financial records.

TAX FRAUD

Tax fraud refers to intentional actions that a taxpayer commits to defraud the government of owed tax dollars. It is a type of fraud committed against the government, typically involving false claims or concealed information.

Introduction

Most governments have laws prohibiting tax fraud, but these laws differ in substantive ways from country to country. Examining the tax fraud laws in every country is beyond the scope of this material, so fraud examiners dealing with tax fraud should consult with local legal counsel for guidance. Some additional country-specific information that might not pertain to a global audience can be found in the “Supplemental Regional Information” section of this chapter located on fraudexaminersmanual.com.

Tax Evasion

Tax evasion is a subset of tax fraud. The term *tax evasion* refers to any fraudulent actions that a taxpayer commits to avoid reporting or paying taxes.

Tax evasion, however, should not be confused with tax avoidance. *Tax avoidance* refers to a legal means of lowering one’s tax bill through legitimate deductions, credits, and shelters. The intent of the taxpayer to wrongly file a tax return or provide other false tax information will determine the difference between tax evasion and tax avoidance.

The primary distinguishing characteristic of tax evasion as compared to tax avoidance is that tax evasion is illegal, but tax avoidance is legal.

Intent

The most important distinction in determining whether an individual or company has committed tax evasion is whether the party acted with criminal intent. *Intent* is a mental attitude with which an individual acts. To establish criminal liability for tax evasion, most jurisdictions require a *willful* attempt to evade or defeat taxes in an unlawful manner.

In the context of tax evasion, a good faith or legitimate misunderstanding of the applicable law typically negates willfulness (the voluntary, intentional violation of a known legal duty). That is, honest mistakes, in contrast to willful evasion, do not constitute tax evasion.

However, a court might find that a defendant's claimed misunderstanding of the law is implausible given the evidence presented. Willfulness might be inferred from conduct such as:

- Keeping a double set of books (not to be confused with keeping separate books and tax records, which might require different recording techniques)
- Making false entries or alterations or creating false invoices or documents
- Destroying books or records
- Concealing assets
- Covering up sources of income
- Avoiding making records that are typical in transactions of the kind
- Moving taxable assets beyond the government's reach (e.g., into offshore accounts)
- Engaging in misleading or deceitful conduct

Also, keep in mind that the presence of willfulness is important for determining criminal liability for tax fraud, but violations of proper tax procedures can still result in fees and interest penalties. Honest mistakes and misinterpretations of the law typically do not prevent such fines.

Common Indicators of Tax Fraud

The following are some of the most common indicators of tax fraud:

- Misrepresentation of facts
- Artifice
- Efforts to hide income or assets
- Double set of books
- Secret bank accounts under false names
- Overstatement of deductions
- Fictitious transactions

Civil, Criminal, and Administrative Cases

In many jurisdictions, the government can file either civil or criminal charges against taxpayers. In some jurisdictions, the government can seek both civil and criminal sanctions for the same offense. Generally, the penalties are more severe in criminal cases; they might include imprisonment as well as substantial fines. In civil cases, the penalties are usually limited to monetary damages. In some jurisdictions, tax cases may be heard by administrative boards or tribunals, which generally operate like civil courts with similar penalties.

In addition to different penalties, civil, criminal, and administrative tax fraud cases might have different burdens of proof, statutes of limitations, and available defenses.

Burden of Proof

In most jurisdictions, the government has the burden of proving that a taxpayer violated the tax laws. In some jurisdictions, taxpayers might have the burden of proof under certain circumstances. The burden of proof can depend on whether the case is criminal, civil, or administrative. To determine which party has the burden of proof, fraud examiners should consult local counsel.

For additional information regarding how the burden of proof works in specific jurisdictions, see the content on “Burden of Proof” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

International Tax Avoidance and Evasion

Tax evasion often transcends national boundaries due to the investigative and jurisdictional limits of a country’s revenue authorities. Individuals frequently use tax shelters, tax havens, and secrecy jurisdictions to evade taxes. *Tax shelters* are investments that are designed to yield a tax benefit to the investor. Such investments are made to produce tax write-offs, generate deductions, or convert ordinary income into capital gains taxed at a lower rate. Tax shelters might be legal or illegal; they are generally aimed at avoidance, although they might, on occasion, cross the line into evasion if they take abusive forms. An illegal, abusive shelter is one that involves artificial transactions with little or no economic reality. For example, abusive tax shelters might artificially inflate the value of donations to charity; falsely identify an asset for business use that is mainly intended for pleasure; claim excess depreciation or depletion; or engage in the cross-leasing of luxury items such as automobiles, boats, vacation homes, and aircrafts.

In contrast, *tax havens* are countries that offer low rates of taxation to corporations and individuals. The use of tax havens might be legal or illegal, depending on the nationality and residence of the individual and the tax code of the country where the activity takes place. For example, a corporation that makes revenue in Country A but then moves that revenue to a shell company in Country B (which has a very low corporate tax rate) might be engaging in tax evasion under the laws of Country A.

Often, individuals try to avoid their tax responsibilities by hiding their assets abroad in secrecy jurisdictions. A *secrecy jurisdiction* is a country that has enacted laws that afford financial secrecy. Such jurisdictions may provide financial secrecy through domestic bank secrecy laws that bar insight by outsiders or through blocking statutes that prevent the disclosure, copying, inspection, or removal of documents located in the host country. Moreover, in some secrecy jurisdictions, legal depositions may not be taken on national territory in connection with judicial proceedings being undertaken abroad. Secrecy jurisdictions are often relatively small countries whose customers are largely foreigners.

Evidence of Tax Fraud

Evidence of tax fraud may be direct or circumstantial. *Direct evidence* includes testimony that tends to prove or disprove a fact in issue directly, such as eyewitness testimony or a confession. *Circumstantial evidence* is evidence that tends to prove or disprove facts in issue indirectly, by inference.

Direct Evidence

Certain circumstances constitute direct evidence of tax fraud, including:

- Unexplained bank deposits (e.g., using bank accounts in another person's name or a fictitious name)
- Submission of false documents (e.g., if a taxpayer claims medical deductions but cannot provide any evidence that they paid the associated medical bills)
- False explanations for prior conduct (e.g., the taxpayer destroyed their company's cash register tapes, which were the only records for the company's sales)
- Participation in an illegal business (e.g., over several years, a taxpayer who ran an illegal lottery substantially underreported their income)
- False claims of extra withholding exemptions (e.g., a taxpayer claimed fifty withholding exemptions but did not provide information to substantiate those exemptions)

Circumstantial Evidence

Certain circumstances constitute circumstantial evidence of tax fraud, including:

- Illicit income, which can be proved by showing that the subject's assets or expenditures for a given period exceed that which can be accounted for from admitted sources of income
- Income in excess of deposits

Types of Tax Evasion Schemes

There are many different types of tax evasion schemes, which will vary depending on the types of taxes that exist in a jurisdiction. Some common types of tax evasion schemes include:

- Income and wealth tax evasion
- Falsifying tax deductions
- Tax credit schemes
- Consumption tax schemes

Income and Wealth Tax Evasion

Taxes on periodic income or wealth (e.g., real property taxes) are a source of revenue for many governments, but fraudsters often commit tax evasion by falsifying or omitting material information. Common forms of criminal income and wealth tax evasion include:

- Failing to submit a report of one's taxable income, if such a report is required
- Intentionally misrepresenting one's income or wealth
- Pretending to transfer assets to another person or entity to lower tax liability
- Intentionally failing to withhold the taxable portion of an employee's income, if so required
- Failing to report foreign bank accounts or other taxable assets, if required
- Falsely claiming income was earned in another jurisdiction to lower tax liability

Falsifying Tax Deductions

In the context of income and wealth taxes, *tax deductions* are itemized expenses subtracted from gross income or assets to reduce the taxpayer's total liability. For instance, a company that is taxed by a percentage of its gross sales might be allowed to deduct the cost of making the goods (e.g., materials and employee costs) from its taxable income. Deductions are designed to make certain taxes fairer, but they can also be used inappropriately by tax evaders.

Examples of the fraudulent use of deductions include:

- Falsifying expenses, such as recording fictitious salaries to nonexistent employees
- Fraudulently inflating expenses, such as bribing a supplier to inflate an invoice
- Submitting false information to qualify for improper deductions, such as pretending to qualify for a tax deduction for having children living at home
- Misclassifying nondeductible expenses as deductible

Tax Credit Schemes

Similar to deductions, *tax credits* are an amount subtracted from a person's or entity's tax liability but are not necessarily tied to an expense. Additionally, some tax credits might result

in a tax refund if the credits are greater than the person's total tax liability. For instance, a government might give tax credits to individuals with low income to reduce their tax liability. Tax credits are often used to encourage certain behavior, such as making energy-efficient upgrades to homes. Taxpayers might attempt to evade taxes by misrepresenting their eligibility for a tax credit (e.g., an energy company underreporting its carbon emissions).

Consumption Tax Schemes

Consumption taxes are those collected from the proceeds of the sale of goods or services. Some of the common taxes include:

- *Sales tax*: a tax on goods or services, usually assessed at the consumer level and collected by the retailer or seller at the point of sale
- *Value-added tax (VAT)*: a system that imposes a tax on an item that is assessed incrementally based on its increase in value at each point along a supply chain, from manufacture, to wholesale, to retailer, to consumer; the tax is collected by the seller in each transaction, and only the difference between the price paid by the initial purchaser and the price paid by the subsequent purchaser is taxed
- *Excise tax*: a tax on a narrow class of goods or services (e.g., tobacco or gasoline), usually assessed one time (per jurisdiction) at the manufacturer or wholesaler level

As with any form of tax, there are common schemes by which fraudsters attempt to evade consumption taxes, including:

- Omitting transactions from tax records to evade consumption taxes
- Deflating the value of transactions in tax records (e.g., recording the portion of a transaction paid with a credit card, but not recording cash received for the same transaction)
- Disguising a transaction that should be subject to a domestic consumption tax as a tax-free foreign transaction
- *Missing trader schemes*, in which the culprit collects a VAT from a large transaction but, rather than paying the tax to the government, disappears with the proceeds
- Applying for a refund of a VAT that the subject or a co-conspirator in the transaction chain never paid to the government (called a *carousel scheme*, because the goods are often transferred among the co-conspirators several times)
- Smuggling goods into a jurisdiction to avoid paying excise taxes

Common Defenses to Allegations of Tax Evasion

A suspect or a criminal defendant might raise various defenses to accusations of tax evasion. Whether these defenses are legally recognized depends on the laws of the jurisdiction.

The following are common defenses to tax evasion.

No Tax Deficiency

The defendant can establish that there is no tax deficiency. If there is no deficiency, there is no tax liability. This is generally the best defense, if available, because several other defenses might negate willfulness but do not necessarily eliminate a tax liability with interest and penalties.

Lack of Willfulness

A lack of willfulness reduces the defendant's culpability for fraud. Again, a good faith belief that one is not violating the tax law, based on a misunderstanding caused by the law's complexity, negates willfulness. The rule might apply even if the defendant's interpretation of the law is irrational or unreasonable. Whether the defendant actually has such a belief is an issue for the jury or fact finder to decide.

Avoidance, Not Evasion

A taxpayer charged with tax crimes might argue that they engaged in legal means of lowering their tax bill through legitimate avoidance mechanisms, such as deductions, credits, and shelters. Thus, establishing that the taxpayer was engaging in tax avoidance and not evasion provides a defense to tax fraud.

Objectively Reasonable Position

A defendant might also claim that they took an "objectively reasonable" position with respect to their tax obligations.

Claim of Right Doctrine

In some jurisdictions, taxpayers must report income even if they do not have a fixed right to the income. For instance, a person could be given cash under a contract with the contingency that the cash will be taken back if the person fails to perform some task. Even so, as long as the taxpayer has control of the cash and can spend it, this contingency does not eliminate the requirement to report the income.

Thus, a taxpayer may seek to avoid a tax by claiming that they do not have an unrestricted right to the money at issue (or evade the tax by falsely claiming that their rights are restricted).

Mental Illness

Certain mental illnesses and incapacitating conditions negate criminal intent for tax crimes. This defense is applicable in regard to the time the return was prepared.

Reliance on an Attorney or Accountant

If a taxpayer properly relied on expert advice for the conduct in question, the jurisdiction might find no criminal liability. But generally, for this type of defense to succeed, the defendant must establish all of the following conditions:

- The taxpayer specifically relied on the advice from an expert.
- The expert is qualified, which is determined by a facts-and-circumstances test.
- The taxpayer gave full disclosure of the facts to the expert.

Ignorance of the Law

Generally, ignorance of the law is not a defense to criminal charges, but in some jurisdictions, this defense might succeed against allegations of tax fraud if the defendant can show that they had a good faith misunderstanding of the tax requirements.

Innocent Spouse

Innocent spouse relief permits a spouse to avoid tax liability in certain circumstances. Under this doctrine, a spouse may be excused from tax liability for tax penalties if a joint tax return was filed and the spouse can establish the following elements:

- The underpayment of tax is due to unreported income or disallowed deductions that are attributable to the other spouse.
- The spouse “did not know and did not have reason to know” of the facts surrounding the underpayment of tax.

Additionally, innocent spouses may obtain relief for “erroneous” income items.

Statutes of Limitations

Statutes of limitations set the maximum time after an event when legal proceedings may be initiated. In some jurisdictions, taxpayers can assert the statute of limitations as a defense to a tax fraud claim. In other jurisdictions, there is no statute of limitations for tax fraud.

For additional information on how statutes of limitations work in specific jurisdictions, see the content on “Statutes of Limitations” in the “Supplemental Regional Information” section of this chapter on [fraudexaminersmanual.com](https://www.fraudexaminersmanual.com).

Ineffective Defenses

Depending on the relevant jurisdiction, some defenses will be ineffective against charges for tax crimes. For example, the death of the taxpayer often cannot be used as a defense because taxes owed due to tax evasion typically survive the taxpayer’s death, meaning the deceased taxpayer’s estate will be held liable. Also, liabilities owed as a result of tax evasion may not be discharged in bankruptcy proceedings. If a person commits a tax fraud offense, amending fraudulent information held by the government will not generally relieve the taxpayer of criminal liability.

Fraud Schemes Targeting Taxpayers

Unlike tax evasion, which is perpetrated by taxpayers, some fraud schemes use the taxation system to target taxpayers. For example, in a *tax identity theft* scheme, a fraudster uses another person’s identity to file a tax return and obtain a refund from the government.

EXAMPLE

A fraudster uses Berta’s government identification number to file a fraudulent tax return in her name. The government accepts the fraudulent return and issues a tax refund to the fraudster. When Berta files her tax return months later, the government rejects it because a tax return has already been filed in her name.

As in the example, victims of tax identity theft often discover the fraud when they are notified that more than one tax return was filed using their government identification number. Another possible indication of tax identity theft is when the government’s tax records indicate that the taxpayer received wages from an employer for whom the taxpayer did not work.

In some countries, taxpayers can reduce their taxes by claiming their children or other family members as dependents. In those countries, fraudsters sometimes commit tax identity theft by using stolen government identity numbers to claim strangers as their dependents. In such cases, the victim generally discovers the fraud when notified by the government that the victim’s dependent has been listed on another tax return.

In other fraud schemes, fraudsters use email, text messages, the telephone, or the internet to impersonate government tax authorities and obtain money or information from taxpayers.

EXAMPLE

In the United States, fraudsters often impersonate the Internal Revenue Service (IRS), the government agency responsible for assessing and collecting federal taxes. By way of phishing emails or unsolicited telephone calls, fraudsters claim that they are IRS agents and demand immediate payment for delinquent taxes. The taxpayer thinks that they are making a payment to the IRS, but the money goes directly to the fraudster.

Instead of demanding payment, some fraudsters impersonate government tax authorities to obtain personal information, such as the taxpayer's government identification number, passwords, or banking information. The fraudsters then use this information to commit identity theft.

INDIVIDUAL RIGHTS DURING EXAMINATIONS

Because many fraud examinations might lead to legal action, fraud examiners should be familiar with the basic rights and freedoms of those involved in investigations, especially of those suspected of fraud. Being knowledgeable about individuals' basic rights and freedoms is particularly important for fraud examiners conducting investigations that could result in criminal action. The gathering of evidence, for instance, in violation of the law may result in the exclusion of that evidence later at a criminal trial. Accordingly, if the fraud examiner has any reason to believe that their investigation might ultimately result in legal action being taken against the subject of an examination, it is best to conduct the investigation in accordance with the rights guaranteed under the applicable laws.

This chapter presents some general concepts regarding individual rights that are common in many countries, particularly those operating under the common law and civil law systems, but it first examines employees' duties and rights during investigations.

Employees' Duties and Rights During Investigations

Employees involved in investigations of suspected fraud have certain duties and rights, whether they are merely bystanders who might have some information relevant to the investigation or are suspected of committing fraud.

Employee duties and rights vary among jurisdictions and from case to case, but generally, such duties and rights apply to employees who work in both government and private-sector workplaces. Thus, private and government employers can violate their employees' legal rights.

For additional information regarding employees' duties and rights during investigations in the United States, see the content on "Employees' Duties and Rights During Investigations" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

Employees' Duty to Cooperate

In most jurisdictions, a duty to cooperate exists in every employer-employee relationship, but such duties vary between jurisdictions. In the United States, for example, some states have statutes defining the scope of this duty; in others, the duty is found to be implied from the basic nature of the employment relationship.

Generally, the duty to cooperate extends to workplace investigations; therefore, employees have a duty to cooperate during an internal investigation as long as what is requested from them is reasonable.

What is *reasonable* is determined by the facts and circumstances of the particular case and by the duties for which the employee was hired. For example, if inventory items were missing, it would probably be reasonable to request that a warehouse supervisor review inventory records because this falls within the scope of their work duties. But under such facts, it might not be reasonable to ask the same supervisor to review detailed tapes from the company's cash registers, and it almost certainly would not be reasonable to ask the warehouse supervisor to let company investigators search their personal residence.

The issue of whether an employee has a duty to cooperate often comes up when investigators seek to interview employees about suspected workplace misconduct. In general, interviews should be considered reasonable if they address matters within the scope of the employees' actions or duties.

Duty to Preserve Information Relevant to Litigation

Employees may have a duty to preserve relevant information. Common law jurisdictions, in which litigants are usually obligated to disclose relevant information to the opposing side, impose a duty on litigants to take affirmative steps to preserve relevant evidence, and this duty might arise prior to the commencement of litigation. For litigation occurring in common law courts, the duty to preserve relevant evidence typically arises when litigation is reasonably anticipated or contemplated. When an organization is involved in litigation, this duty to preserve applies to the organization's management, and it extends to employees likely to have relevant information. A violation of the duty to preserve occurs when information that is relevant to anticipated or existing litigation is lost, destroyed, or otherwise made unavailable.

But in civil law systems, in which the primary responsibility of discovering evidence is placed on the presiding judge, there are no specific rules requiring litigants to preserve information for discovery because there is no common-law-style discovery in civil law systems. Consequently, civil law systems tend to have a more narrow view of what evidence is required for litigation, and the issue of when to take affirmative steps to preserve evidence is established by the court. Nonetheless, destruction of evidence is not permitted because parties must refrain from such procedural abuses.

Violating the duty to preserve relevant information can result in several adverse sanctions for the offending party, and such sanctions can arise from both intentional acts and accidental acts through negligence. The adverse consequences can include, but are not limited to, monetary penalties (e.g., paying the opposing party's legal fees and costs), the drawing of adverse inferences of fact, and criminal penalties. The theory behind such consequences is that the individual who makes evidence unavailable following the probable initiation of a lawsuit is aware of its detrimental effect upon a case.

Examples of situations that could give rise to sanctions for failing to preserve evidence include intentionally or accidentally:

- Erasing computer files (e.g., documents, images, databases) relevant to anticipated or existing litigation
- Losing or destroying physical evidence relevant to anticipated or existing litigation
- Losing, destroying, or altering documents or records relevant to anticipated or existing litigation
- Failing to suspend routine destruction of electronic data relevant to anticipated or existing litigation

Employees' Contractual Rights

Employees may have contractual rights that are enforceable against their employers. That is, employers and employees may enter into contracts that govern the employment relationship, and if the employer violates the contract, then the employee can sue for breach of contract. Such contractual rights can affect the employer-employee relationship and, in particular, they can limit the ability of the employer to compel full cooperation in a fraud examination.

Often, employee contractual rights at issue during investigations arise from a union contract, a collective bargaining agreement, or an employment contract. For example, if the employee is a member of a union, then the union contract or collective bargaining agreement might contain certain restrictions on the employer's investigatory procedures.

Additionally, employees might have a written employment agreement containing provisions concerning the employees' rights during an investigation. Generally, such contracts can be express or implied. Just because the employer does not have a written, signed, and formalized contract with an employee does not mean that there is no agreement in place. Many courts have held that company policies, employee manuals, and past practices can create "implied" contractual relationships between the employer and the employee.

Whistleblower Protections

Many jurisdictions have whistleblower laws designed to encourage individuals to bring forth complaints of wrongdoing by providing protections for those who report unlawful conduct. These laws shield employees who report their employers for misconduct by protecting them from any adverse employment action or retaliatory action from their employers.

Whistleblower laws do not, however, prevent individuals from being fired for engaging in unrelated fraudulent behavior.

Some countries have comprehensive whistleblower protection laws, and many others have adopted more limited protections for whistleblowers. In the United States, for example, there are numerous federal laws protecting whistleblowers from retaliation or illegal treatment and every state has some form of anti-retaliation legislation protecting whistleblowers.

Similarly, in the United Kingdom, the Public Interest Disclosure Act 1998 (PIDA) protects employees against being subjected to any retaliatory action on the ground that they made a protected disclosure—instances concerning criminal offenses, miscarriages of justice, environmental damage, etc.—about their employer or coworker.

Therefore, employers should not conduct investigations as a means to retaliate against employees, and they must be careful to conduct investigations in a way that avoids the appearance of retaliation. Likewise, management should consult counsel before discharging or taking action against any individuals to determine the applicability of any whistleblower protections.

Employees' Privacy Rights in the Workplace

Employees have certain privacy rights that can affect numerous aspects of the employer-employee relationship, such as conducting investigations, surveillance and monitoring, and workplace searches. An employee's privacy rights can arise from, and be protected by, various sources of law, including constitutional law, statutory law, common law, human rights law, labor law, data protection law, contract law, and other sources. In addition, different countries often have very different approaches to the issue of workplace privacy.

In Canada and the United States, for example, privacy laws generally prohibit unreasonable workplace searches and surveillance in areas where employees have a *reasonable expectation of privacy*. Depending on the circumstances, an employee might have a reasonable expectation of

privacy in a desk drawer, a file cabinet, a locker, or even an entire office. Reasonable expectations of privacy can also attach to communications, such as data stored on hard drives and other electronic communications like phone calls, emails, and text messages.

The key issue to consider when assessing the existence of a reasonable expectation of privacy is whether a reasonable person would expect the area or item to be free from intrusion. Employees tend to regard purses, briefcases, and other personal effects as personal items that they reasonably expect to be private. An employee does not need to have an ownership interest in, or legal custody over, the area or item to have a reasonable expectation of privacy in it. Thus, even if an employer owns the office where an employee works, the employee can still have a reasonable expectation of privacy in parts of the office.

Another important factor is the amount of control an individual exercises over an area or item. If an employee has exclusive control over an area or item, this tends to show that the employee has a reasonable expectation of privacy in it. Therefore, where employees have an office, private cubicle, locker, or other area assigned exclusively to them, they might have a reasonable expectation of privacy. Conversely, an employee probably cannot claim a privacy expectation in a work area that is open to the public and shared with other employees.

In terms of workplace surveillance, employees are likely to have reasonable privacy expectations in bathrooms, changing rooms, and other personal areas within the workplace.

In some jurisdictions, employers can reduce their potential liability for violations of employees' privacy rights by lowering the expectation of privacy in the workplace. If employers notify employees that their offices, desks, files, voice mail, computers, and so forth are subject to search and monitoring, then employees generally cannot assert that they have a reasonable expectation of privacy in those areas.

In jurisdictions where it is permissible, the best method employers can use to lower the expectation of privacy is to adopt a written privacy policy and require employees to sign it. Such policies should provide that, to maintain the security of operations, the company may monitor and search all work areas. Also, the policy should notify employees that computer systems (including the internet, email communications, hardware, and files) are solely for business use and that the company reserves the right to monitor, review, audit, and disclose all matters sent over the system or placed in storage. In some jurisdictions, such as Canada, it

is especially important that employees' consent to the policy is voluntary and that the workplace monitoring or searches are necessary to achieve a compelling business purpose.

Unlike Canada and the United States, privacy rights in most European countries are not based on the concept of a reasonable expectation of privacy. In such countries, privacy is considered a fundamental human right. For that reason, European countries tend to have robust privacy rights, even in the workplace, and workplace searches and employee monitoring are subject to greater legal restrictions. Those restrictions take the form of constitutional laws, data privacy laws, labor laws, European Union (EU) guidance, and collective bargaining agreements.

Most European countries are members of the EU, a coalition of member states linked by a series of treaties. The EU has the power to issue regulations, directives, recommendations, and opinions, which may be binding or nonbinding on member states. Some of these EU sources address issues of workplace privacy and employee monitoring, either expressly or implicitly. While the details of those sources are beyond the scope of this Manual, a number of common themes run through them. Based on those themes, employers in EU-member countries should adhere to the following principles before conducting a workplace search or crafting an employee monitoring policy:

- *Necessity*: The search or monitoring must be absolutely necessary to achieve a legitimate business purpose, such as protecting the business from significant threats.
- *Finality*: The data must be collected for a specific, explicit, and legitimate purpose and not used for any other purpose.
- *Transparency*: The employer must give employees clear and comprehensive notice of its search or monitoring policy.
- *Proportionality*: The intrusion upon employees' privacy should be no greater than is necessary to address the particular risk.
- *Legality*: The search or monitoring must comply with all applicable laws.
- *Accuracy and Retention of Data*: Any collected employee data must be updated as required to keep it accurate, and the data should be retained for no longer than necessary (generally no longer than three months).
- *Security*: The employer must implement appropriate technical and organizational measures to ensure that collected employee data is safe.¹

¹ Article 29 Data Protection Working Party, "Working Document on the Surveillance of Electronic Communications in the Workplace," WP 55 (adopted May 29, 2002); Miriam H. Wugmeister and Christine E. Lyon, *Global Employee Privacy and Data Security Law* (2nd ed.), ch. 10 (BNA Books, 2011).

The aforementioned principles should be viewed as minimum requirements; most European countries have adopted additional legal requirements for workplace searches and employee monitoring. For example, in some countries where employees are commonly represented by works councils, the relevant works council must be consulted or notified before an employee monitoring program is implemented. In addition, under data protection laws in most European countries, employees have the right to access and correct personal data collected by their employers. In some European countries, the right to search employees' computers depends on whether the employees were permitted to use their computers for personal tasks.

In Germany and Italy, employees must give voluntary written consent to any form of employee monitoring, and the consent may be challenged in court on the ground that it was not truly voluntary. In France, employers generally cannot access employee emails that are identified as "private" or "personal." Finland severely restricts the ability of employers to access any type of employee emails.

Outside of Europe, the laws are also varied. India and most Australian states have no laws restricting workplace monitoring, while China, Japan, and Singapore require notice of employee monitoring but not consent. In the United Arab Emirates, employee monitoring requires consent from all affected employees.

Nearly every country prohibits *covert* employee monitoring, unless a specific criminal activity has been identified. Therefore, nearly every employer is required to notify its employees before implementing an employee monitoring program. The notice should be clear and comprehensive, and it should be made in writing.

The laws governing workplace privacy are complex and vary by jurisdiction. Therefore, legal counsel should always be consulted before conducting a workplace search or implementing an employee monitoring program.

Employee Protection from Polygraph Examinations

Some jurisdictions have laws restricting the use of polygraph examinations during employee investigations. In the United States, for example, the Employee Polygraph Protection Act (EPPA) prohibits the use of polygraphs by most private employers, unless the employer is engaged in an ongoing investigation involving economic loss or injury to the employer in

the employer's business and there is a reasonable suspicion that the employee is involved in the incident. Employers subject to the law cannot use polygraphs to screen applicants for employment, and they cannot discharge an employee for refusing to take a polygraph exam.

Fraud examiners should consult legal counsel before asking any party to take a polygraph examination.

Rights and Obligations Under Criminal Law

Generally, individuals arrested or questioned by the police for suspected involvement in criminal activity have certain rights, such as the right to remain silent and the right to counsel. This discussion examines some of those rights.

For additional information regarding employees' constitutional rights in the United States, see the content on "Employees' Constitutional Rights in the United States" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

The Right to Remain Silent

A tenet of many legal systems is that a criminal suspect or person accused of a crime has the right to remain silent both at the investigative stage and at the trial stage of criminal cases.

The right to remain silent is centered on the right of those who are suspected of committing a crime to refuse to answer questions by the government when the questioning occurs under the threat of judicially imposed punishment. The right to remain silent applies to individuals being questioned by government authorities, but not someone who is being questioned by private party acting on its own accord. Accordingly, the right to remain silent generally does not apply in internal investigations by private employers.

These rights, however, differ in common law and civil law systems.

The Right to Silence in Common Law Systems

Common law systems generally recognize the right to remain silent. To review, common law systems are those in which court decisions have a precedential authority, and the judicial proceedings are typically adversarial in nature. Essentially, the right to remain silent in common law systems guarantees those suspected of a crime the right to refuse to answer questions or to provide certain personal information that might be incriminating. Thus, the

right to remain silent prevents government authorities from forcing criminal defendants to give testimony against themselves. Note, however, that the right does not protect a defendant from being ordered to provide other types of evidence, such as the weapon used in an alleged assault or a sample fingerprint.

Generally, if the subject has a right to remain silent, government authorities must warn the subject of this right before they can question them. In the United States, for example, police officers must give *Miranda* warnings to criminal suspects in a custodial interrogation. *Miranda* warnings, which advise suspects that they have the right not to answer questions and the right to legal counsel during interrogations, are required only if a person is being subjected to custodial interrogations. *Custodial interrogations* refer to guilt-seeking questioning initiated by law enforcement officers after a person is in custody. A person is in custody in two situations:

- When the suspect is under arrest
- When the suspect is not under arrest but has otherwise been deprived of freedom in any significant way

There are *Miranda* equivalents in other countries. For example, in Canada, individuals have similar rights pursuant to the Canadian Charter of Rights and Freedoms (Canadian Charter). Also, the European Union (EU) has published a directive on the right to information in criminal proceedings. Under the directive, suspects in the EU who are detained receive a letter listing their basic rights during criminal proceedings.

Again, the right to remain silent applies to individuals being questioned by government authorities or someone acting at the government's request, but not when someone is being questioned by private party acting on its own accord. Accordingly, the right to remain silent generally does not apply in internal investigations by private parties (e.g., a company). Therefore, non-government fraud examiners or investigators can usually interview a subject without informing them of the right to remain silent.

Also, because the right to remain silent does not apply in internal investigations by private companies, private employers generally can fire employees for refusing to answer questions that might incriminate them (i.e., for refusing to cooperate). Likewise, when a private employer is interviewing an employee who has no right to remain silent, the employer can use a threat of termination to coerce the employee to answer questions.

Although the right to remain silent does not apply in internal investigations by private employers acting on their own accord, it may apply if the private entity is acting in connection with government authorities. For example, if the examiner has been in touch with law enforcement before interviewing a suspect in an internal investigation, then the answer as to whether the suspect has a right to remain silent is not as clear. If police or other law enforcement personnel are involved, then the suspect may have certain legal rights, including the right to remain silent. The failure to follow certain precautions may invalidate any evidence obtained by the investigator.

While the right to silence is the general rule, some common law jurisdictions provide exceptions under certain circumstances. For instance, in England and Wales, the right does not apply to investigations conducted by the Serious Fraud Office (SFO), a UK government department that investigates and prosecutes complex fraud.

The Right to Silence in Civil Law Systems

The right to remain silent is not as uniform in civil law jurisdictions as it is in common law jurisdictions. Again, civil law systems are those in which all laws are codified and the judicial proceedings tend to be inquisitorial. While the right to silence usually exists in some form, civil law jurisdictions tend to place less value on the right to remain silent by creating various exceptions to the rule.

Several jurisdictions, for instance, provide a right to silence during the investigation of a crime, but at trial the defendant may be compelled to answer. Other jurisdictions allow for the defendant to remain silent but allow the prosecution to comment on the silence as indicative of guilt. Check the laws of the local jurisdiction to determine under what circumstances, if any, a defendant's right to remain silent may be curtailed.

Like in most common law systems, some civil law systems require government authorities to warn criminal subjects of their right to remain silent. For example, under German law, criminal suspects must be informed of their right to remain silent before any interrogation. However, not all civil law systems impose such requirements.

Right to Counsel

The right to counsel is the right of criminal defendants to have a lawyer assist in their defense, even if they cannot afford to pay for one. Thus, if an individual is the subject of a criminal

investigation by government authorities, they may have some type of right to consult an attorney or have an attorney appointed. This right is generally found in both civil and common law jurisdictions.

Generally, the right to counsel does not apply if there is no government action. Thus, in most cases, a private employer can interview an employee without the presence of the employee's attorney.

Police officers and other state agents who violate an accused's right to counsel do so at their own peril. Any evidence gathered in violation of an accused's rights may be inadmissible at trial.

Generally, a subject can waive their right to counsel, but to be valid, any waiver must be voluntary and premised on a true appreciation of the consequences of giving up that right. For example, if the detainee waives their right to counsel while drunk, the waiver will not likely stand because, under such circumstances, the subject cannot make a meaningful determination of whether or not to waive the right to retain counsel.

Many jurisdictions create exceptions to the right to counsel in criminal trials, the most typical being minor violations.

Right to a Trial by Jury

Some jurisdictions entitle defendants to the right to a trial by jury in criminal prosecutions. The right to a jury is a criminal defendant's option to have the facts of their trial decided by a jury (i.e., group of their peers sworn to give a verdict on the basis of evidence submitted in court). Juries are most common in jurisdictions with common law, adversarial systems. The right to a jury generally varies in common law and civil law jurisdictions.

In a trial by jury, the judge and jury serve important roles. In most common law jurisdictions, the jury is responsible for finding the facts of the case, while the judge applies the law, rules on evidence, and generally moderates the proceeding to ensure a fair trial.

Some jurisdictions with jury trials allow the defendant to waive their right to a jury trial. If a defendant waives this right, the judge decides both the facts and the law in what is called a *bench trial*.

Typically, jury trials are available only for serious criminal offenses. In fact, in civil law systems, juries are generally only used for the most serious cases. In some jurisdictions, jury trials are not available for civil cases.

There are, however, some democratic countries that have no criminal jury system. These include Chile, the Czech Republic, Hungary, India, Israel, Mexico, the Netherlands, and South Africa.

Right to a Trial by Jury in Common Law Systems

The right to a jury is paramount in many common law systems, and jury trials are available for most criminal trials (and even some civil trials). Typically, jurisdictions with jury trials allow defendants to waive their right to a jury trial.

In most common law jurisdictions, the jury is a group of citizens summoned at random, and it is responsible for deciding the facts of the case, while the judge makes the legal decisions. The number of people on a jury varies between jurisdictions, as does the number of people on the jury required to find a defendant guilty. This means that, in a criminal case, ordinary citizens will decide whether the accused is guilty or innocent of the charge against them.

Right to a Trial by Jury in Civil Law Systems

There is a common misconception that civil law systems do not provide for the right to juries, but that is only true in some jurisdictions. In civil law systems, trials are conducted by the judge or judges, who may sit alone or with jurors, also known as *lay judges*.

In civil law systems, juries are generally only used for serious cases. For example, in France, which is a civil law country, serious crimes are heard by criminal trial courts that sit with three judges and six or nine jurors. The role of jurors in civil law systems may not be as strong as it is in common law countries, and jury trials may not be as available in civil law systems, but they do exist.

Right to Be Free from Unreasonable Search and Seizure by Government Agents

Most countries have laws that provide the public with the right to be free from unreasonable search and seizure by government authorities. For example, in the United States, the Fourth Amendment to the U.S. Constitution guarantees the right of all citizens to be free from unreasonable searches and seizures. In Canada, Section Eight of the Canadian Charter protects all individuals from unreasonable search and seizure.

The right to be free from unreasonable searches and seizures protects individuals from actions by government authorities; it does not protect against actions by private parties acting on their own accord.

Limits on Using Confessions in Criminal Cases

A *confession* is an admission of misdeeds, and there may be laws limiting the use of suspects' confessions in criminal cases. In criminal cases, statements made by the accused to persons in authority are very frequently the primary, if not the only, evidence implicating the accused in the crime charged.

In some jurisdictions, confessions made out of court by the accused may only be admitted into evidence if the prosecution shows that the statement was made freely and voluntarily. In general, a confession is voluntary if it is not coerced by physical or psychological means, but determining whether a confession is voluntary will depend on the facts.

The rule requiring free and voluntary confessions has its origin in the fear that without such a rule, evidence would be obtained by torture, threats, or violence. In many jurisdictions, courts will admit a statement as long as it is voluntarily and freely made, even if it is obtained through deception.

Moreover, in jurisdictions limiting the admissibility of confessions, the law may require the government to establish the accuracy of the statement if it intends to use it against the accused. Courts generally give more credence to written statements than to oral statements. Therefore, law enforcement can avoid much difficulty by having a statement recorded.

Additionally, if a statement is to be admitted in such jurisdictions, the government may be required to show that the accused had the mental capacity to make such a statement.

The Law Relating to Government Search and Seizure

The law relating to search and seizure is extremely complex. In many countries, the state's power of search and seizure is derived from common law and statutory law, and rights providing search and seizure protections can even vary within a country based on the laws of a particular state or province.

For additional information regarding the law as it relates to search and seizure in the United States, see the content on “The Law Relating to Government Search and Seizure” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Search Warrants

Again, most countries have laws that provide the public with the right to be free from unreasonable search and seizure by government authorities, and though interpretation may vary, this right sometimes requires that the government obtain authorization (e.g., a search warrant) by a judicial officer or other authorized person before it conducts a search of a person, location, or vehicle for evidence of a crime.

A *search warrant* is a court order that grants government authorities the right to search a premises or property for information pertinent to a case. Search warrants were developed because, in most countries, governments do not have a general right to search a person’s home without permission. And even today, in common law jurisdictions, there is no common law authority to search someone’s home without the permission of the owner or occupier. These principles continue to guide us today so that if a court finds a search warrant invalid, a legal action can be brought against a person who searched the premises without consent or a valid warrant. Furthermore, the material seized under an invalid search warrant may not be admissible in court.

The requirements for search warrants or other similar authorization, however, do not apply to private parties acting on their own accord because the right to be free from unreasonable searches and seizures does not protect against actions by such parties. The right to be free from unreasonable searches and seizures only protects individuals from actions by government authorities. Thus, to determine whether a search warrant or similar authorization is required for a search to be conducted in an investigation, it is necessary to first determine whether government authorities are involved in the search.

Also, the right to be free from unreasonable search and seizure by government authorities can apply to searches in the workplace.

Warrants and similar legal devices are used in most countries, but the warrants range in importance. In the pattern of emphasizing defendants’ rights, common law countries tend to require that warrants be issued in more situations than civil law countries. Civil law

countries tend to curtail the need more often. For instance, some jurisdictions do not require warrants for flagrant offenses. Moreover, the threshold for obtaining a warrant is typically easier in civil law systems than in common law systems.

Reasonableness

In general, searches must be reasonable, and they must be conducted in a reasonable manner. Whether it is reasonable to conduct a search and whether the search was conducted in a reasonable manner is determined by the totality of the circumstances. What constitutes a reasonable search varies by country. In most common law countries, a reasonable search is one carried out pursuant to a search warrant issued on a showing of probable cause. *Probable cause* has been defined as those facts and circumstances sufficient to cause a person of reasonable caution to believe that a crime has been committed and that the accused committed it. Thus, authorities must have reason to believe that a crime has likely occurred. The determination of reasonableness depends on the individual's reasonable expectation of privacy and the degree of intrusiveness of the search compared to the interest advanced by it.

In civil law systems, the requirements for reasonableness of a search tends to be more relaxed, either because warrants are less often required or because something less than probable cause is required to conduct the search (or both).

Exceptions to the Warrant Requirement

Even if a warrant is technically required, there are a number of recognized exceptions to the warrant requirement. Two key exceptions are consent searches and evidence in plain view.

CONSENT SEARCHES

Consent is a recognized exception to the requirement that government agents must obtain a warrant before they search a person, location, or vehicle for evidence of a crime. Individuals are always free to consent to searches. If a suspect consents to a search or seizure by police or government agents, the consent eliminates the need for a search warrant. That is, the consent to search waives the person's right to be free from government searches. Thus, the government does not need a warrant to perform a search if a person with proper authority consents to a search.

Courts will closely scrutinize any such “consent” to make sure it was truly voluntary, particularly when it leads to the seizure of incriminating evidence. To be valid, an individual’s consent to a search or seizure must be voluntary.

Consents to searches or seizures by government agents obtained by force, duress, or bribery are generally held to be involuntary and invalid; therefore, such consent does not constitute a valid waiver of a person’s right to be free from unreasonable searches. Jurisdictions are mixed, however, as to whether consent obtained by deceit constitutes a valid waiver.

In the context of workplace searches, an individual’s consent might not be voluntary if it requires a choice between exercising legal rights and continued employment.

Also, there is generally no requirement that government agents warn suspects that they have a right to refuse consent.

Consent may be implied in circumstances where the individual can choose between entering an area and submitting to a search, or not entering, as when one enters a secured courthouse, boards an airplane, or crosses an international border.

Additionally, consent may be given by third parties to searches of property over which the third parties have authority, such as a co-tenant in a leased apartment.

EVIDENCE IN PLAIN VIEW

In many countries with a warrant requirement, the plain-view doctrine is an exception to the general rule that the government must obtain a search warrant before conducting a search of a person, location, or vehicle for evidence of a crime. Under this doctrine, evidence in plain view of a law enforcement officer who has a right to be in a position to observe it may be seized without a warrant. The plain-view doctrine applies when a government official inadvertently discovers contraband or evidence of another crime during a search or arrest, even if there was no prior authority to seize the evidence. Thus, the doctrine applies only if a police officer is legally authorized to search the premises in which they inadvertently discover the additional evidence in plain view.

The plain-view doctrine does not apply unless the police officer discovered the evidence inadvertently. Thus, if discovery of the evidence is anticipated, and no other exception

applies, the officer must first obtain a warrant. That is, if the officer knows in advance the location of certain evidence and relies on the plain-view doctrine to seize the evidence, the seizure will be considered illegal.

Also, evidence will not be admissible under the plain-view doctrine unless it is apparent to the police that the items observed were evidence of a crime or otherwise subject to search and seizure.

Investigations in Private Actions

The right to investigate, examine, or audit for fraud is implicit in most business, accounting, and legal systems. No special authority is required, although the activities of investigators and others may be regulated.

A fraud examiner may lawfully interview witnesses, collect evidence where lawfully available, collect and review documents, and examine public records, without fear of liability, if the examiner acts prudently and in good faith.

Of course, investigations in private actions are subject to certain legal limitations, some of which—such as the laws prohibiting unauthorized electronic surveillance—are enforced with criminal as well as civil penalties. Overzealous or imprudent acts by private parties (even if technically legal) can result in counterclaims, liability, and legal sideshows that can delay, disrupt, or even completely derail a meritorious case. Thus, fraud examiners must keep in mind the rights of those involved in any private investigation.

Below is a brief discussion of some legal issues that can arise as a result of an investigation, particularly one conducted in an irresponsible manner, carried out without predication, or conducted in a way that violates the rights of those involved. Each can be avoided if the fraud examiners are guided by common sense and professional standards and confine themselves to measures reasonably necessary to accomplish legitimate objectives. Fraud examiners should always pursue the facts (not people), ask rather than accuse, and prove rather than allege.

For additional information regarding the law as it relates to private investigations in the United States, see the content on “Legal Limits on Private Investigations” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

Defamation

Many countries have defamation laws that provide redress against harm to reputation. Generally speaking, *defamation* refers to the unprivileged publication of false statements about a person that causes harm to that person's reputation.

Defamation can be a crime or a civil violation, and the law varies by jurisdiction as to whether it is a criminal offense or a civil wrong. For example, defamation actions can be brought under the criminal and the civil law in most Southeast Asian countries. Also, in most civil law countries, defamation is dealt with first as a crime, rather than a civil wrong.

In most common law jurisdictions, the law of defamation comes in two forms: libel and slander. *Libel* refers to defamatory statements in writing, and *slander* refers to spoken statements, although the distinction often is blurred in cases involving electronic media. Thus, the key difference between libel and slander is the form in which the defamatory statement is made. In other jurisdictions, there is no distinction between libel and slander. For example, German law makes no distinction between libel and slander.

The threat of a defamation lawsuit is always present when allegations of wrongdoing are made against certain employees. For example, a claim of defamation might arise in the context of an interview as a result of unfounded accusations or statements made by the interviewer, where someone in addition to the employee and the interviewer is present.

If a plaintiff brings a successful claim for defamation, they may recover special damages (out of pocket losses), general damages to reputation, and (in some jurisdictions) punitive damages, which can be substantial.

Elements of Defamation

In general, the elements of libel and slander are the same, and to recover for defamation, the plaintiff must generally prove all of the following elements:

- The defendant made an untrue statement of fact.
- The statement was communicated (published) to third parties.
- The statement was made on an unprivileged occasion.
- The statement damaged the subject's reputation.

UNTRUE STATEMENT OF FACT

To be defamatory, a statement must be a statement of fact (not opinion) and be untrue. Thus, truth is an absolute defense to defamation.

COMMUNICATED TO THIRD PARTIES

To be defamatory, a statement must be published, either orally or in writing, to a third party. Defamation does not occur when one accuses another directly and in the presence of no other parties; to be defamatory, a statement must be heard or read by a third party.

ON AN UNPRIVILEGED OCCASION

Also, for a statement to qualify as defamatory, the occasion in which the statement is made must be an unprivileged one. If the statement is made on a privileged occasion, then no liability can attach to the declarant. Basically, the law recognizes that there are some circumstances in which the need to share information is so important that people will be allowed to make mistakes from time to time without having to worry about being sued for defamation. Statements that are made in these circumstances are said to be privileged.

Assuming that an employee can establish that defamatory statements were made and communicated to a third party, the most important defense privileges available include:

- Statements made during a judicial proceeding
- Statements made in preparation of judicial proceedings
- Statements made between a solicitor and their client
- Good faith statements made to protect a legitimate interest of the speaker or recipient—such as a communication between an employee and their employer regarding an important business matter or the results of an examination into suspected fraud

Accordingly, fraud examiners are protected by a number of recognized privileges in the law of defamation. In short, the fraud examiner who works in a prudent manner should not be concerned about liability for defamation.

DAMAGE THE SUBJECT'S REPUTATION

Additionally, to be actionable as defamatory, a statement must damage the reputation of a party.

Privacy Laws

Privacy laws are designed to protect the rights of individuals to be left alone.

The legal systems of different countries, however, perceive privacy issues differently. For example, U.S. notions of privacy are different than those held by people in other parts of the world. Specifically, in the United States, the right to privacy is perceived as part of the concept of liberty, but in most of the world, privacy is perceived as a central tenet of human dignity. Moreover, in Europe, privacy is considered a fundamental right. Consequently, the European legal system imposes greater legal restrictions on employers wanting to monitor or use surveillance in the workplace than the U.S. legal system.

Two Categories of Privacy Laws

There are two categories of privacy laws: general privacy laws and specific privacy laws. General privacy laws are designed to protect the general privacy of the personal information of individuals. Specific privacy laws regulate particular aspects of particular types of information. Common types of specific privacy laws are those that concern:

- Online information
- Financial information
- Health information
- Communications
- Privacy at home

Human Rights Legislation in the European Union

The European Convention on Human Rights (ECHR), which is the authoritative human rights instrument in Europe, provides that individuals have the right to respect for private and family life in Article 8. The Treaty Establishing the European Union, in recognizing Article 8, requires member states to respect the fundamental rights guaranteed therein.

Also, the Charter of Fundamental Rights of the European Union (CFR), which sets forth a binding list of rights for the European Union and its member states, affirms that “[e]veryone has the right to respect for his or her private and family life, home and communications.”

Civil Invasion of Privacy

Invasion of privacy laws concern a person’s right to keep their life private and free from intrusion, and in many common law countries, invasion of privacy is a civil wrong that can be addressed by a court through a lawsuit.

That is, some common law countries recognize a right to bring a civil action for damages for invading an individual’s personal privacy. In the United States, courts have recognized a cause

of action for invasion of privacy where there is a public disclosure of private facts, even if the private facts are otherwise true and accurate. In Canada, legislation has been enacted in several provinces making invasion of privacy a civil wrong, “actionable without proof of damage, for a person, willfully and without claim of right, to violate the privacy of another.” For example, Manitoba, British Columbia, Saskatchewan, and Newfoundland have all enacted such laws.

Some countries, like the United Kingdom, do not recognize invasion of privacy as a civil wrong. However, courts in the United Kingdom have used breach of confidence actions to address the misuse of private information.

In other countries, it is unclear whether there is a civil cause of action for invasion of privacy.

The two most common forms of invasion of privacy applicable to fraud examinations are intrusion into an individual’s private matters and publicity of private facts.

INTRUSION INTO AN INDIVIDUAL’S PRIVATE MATTERS

The civil wrong regarding intrusion into an individual’s private matters (often referred to as *intrusion upon seclusion*) occurs when an individual intentionally intrudes into another individual’s private matters and the intrusion would be highly offensive or objectionable to a reasonable person. The elements of this civil wrong include:

- An intentional intrusion
- Into an area where an individual has a reasonable expectation of privacy
- The intrusion would be highly offensive or objectionable to a reasonable person

There is no intrusion if the information at issue is open to public view or has been disclosed to others.

An intrusion claim can be based on physical intrusions, wiretapping, eavesdropping, and other forms of surveillance. Thus, liability for this civil wrong may arise from conducting an unwarranted search of another’s personal property, performing intensive physical surveillance, or obtaining private bank account information, absent legal authority. Also, questioning employees about activities not related to job performance might constitute an intrusion into seclusion.

PUBLIC DISCLOSURE OF PRIVATE FACTS

Public disclosure of private facts occurs when one party makes public statements about another party's private life that are not of public concern. For instance, disclosing information obtained in an interview conducted as part of a fraud investigation to individuals not involved in the investigation might constitute public disclosure of private facts.

To establish liability for public disclosure of private facts, the plaintiff must prove all of the following elements:

- The defendant made public statements about another party's private life.
- The statements were not of public concern.
- The statements would be highly offensive to a reasonable person.

The key to this cause of action is that the information must be private in nature and not a matter of public interest.

Also, unlike the requirements to establish a claim for defamation, liability for this cause of action can arise even if the statements at issue are true. Because giving unreasonable publicity to true, but private, information about an employee can give rise to a claim for public disclosure of private facts, the need to communicate information about the employee must be balanced against the intrusion into the employee's privacy. Thus, examiners must be careful when disclosing investigatory materials or conclusions.

The gist of this civil wrong is the unwarranted publicity of private facts, not the discovery of private facts. In the United States, courts have held that the publicity must be broad and pervasive for liability to attach. Thus, one case found no liability when a bank gave the account information of one of its customers to the customer's employer, and another court exonerated an investigator who reported credit information to an insurance company. The collection of such information can, however, violate the civil wrong for intrusion into seclusion.

Data Privacy

Most countries have data privacy laws (also known as *information privacy* or *data protection laws*) that protect personal information about individuals from disclosure, unauthorized access, and misuse. As innovations in technology make it easier to track, compile, and process individuals' personal information, fraud examiners who deal with such information must take steps to comply with local and international data privacy laws. These laws can significantly affect data collection, data use, and cross-border transfer.

Typically, these laws address:

- How personal information is handled
- How personal information is collected
- How personal information is used
- Who has access to personal information
- When personal information is amended, changed, and deleted

Also, data privacy laws focus on personal information, but they define personal information in different ways. Nevertheless, on a general basis, *personal information* refers to any identifiable information about an individual, such as:

- An individual's personal characteristics (e.g., name, gender, age, government identification number, household income, home address, telephone number, race and ethnicity, physical characteristics, familial status, marital status, and employment status)
- An individual's health information (e.g., health history, visitation history, health conditions, health services received)
- An individual's activities and views (e.g., religious affiliations, political views, personal opinions)

Data privacy laws are based on fair information practices (FIP), a set of standards for addressing the privacy of information about individuals. Different countries have their own standards for data privacy, and the Organisation for Economic Co-operation and Development (OECD) has published *Guidelines on the Protection of Privacy and Transborder Flows of Personal Data* (OECD Privacy Guidelines), which were developed to harmonize national privacy legislation and prevent interruptions in international flows of data.

The OECD Privacy Guidelines set out eight principles for the processing of data by private and public sectors that member countries should incorporate into national law. In terms of substance, the OECD Privacy Guidelines are very similar to other expressions of FIP.

Even though countries have their own requirements for the protection of data privacy, most countries impose requirements that converge around the principles that all personal information must be:

- Obtained fairly and lawfully
- Used only for the original specified purpose
- Adequate, relevant, and not excessive to the specified purpose
- Accurate and updated

- Accessible to the data subject
- Protected by reasonable security safeguards
- Destroyed after its purpose is completed

To illustrate, consider the applicable regulations in the EU, the United States, and Canada.

EUROPEAN UNION

The General Data Protection Regulation (GDPR) is a regulation designed to protect the personal data of EU residents and harmonize data protection laws throughout Europe. The Council of the EU adopted the GDPR in 2016, and it took effect on May 25, 2018. When it became effective, the GDPR replaced the EU Data Protection Directive of 1995 (also known as Directive 95/46/EC), which previously established the blueprint for data privacy laws across Europe.

The GDPR applies to EU-based organizations that collect or process the personal data of any person, regardless of where the person is located. The GDPR also applies to organizations that are not based in the EU if they collect or process the personal data of any person located in the EU for the purpose of:

- Offering goods or services to the person, regardless of whether payment is required
- Monitoring the person's behavior

Therefore, the GDPR applies to most companies that have customers in the EU, even if the companies have no physical presence in the EU.

The GDPR's major provisions are discussed below. Under the regulation, the term *data subject* refers to the person whose personal data are being collected or processed.

NOTICE

Before collecting or processing personal data, organizations must give the data subject notice of what information will be collected or processed, the purpose of the collection or processing, how long the data will be retained, the identity of the organization, the contact information for the organization and its data protection officer (if any), and any other relevant information.

CONSENT

Organizations must obtain the consent of data subjects before collecting or processing their personal data. Data subjects must give their consent via a statement or clear affirmative action. Silence, pre-ticked boxes, or inactivity are insufficient to grant consent, and organizations cannot use lengthy forms full of confusing legalese to request consent. In addition, data subjects must be informed that they can withdraw their consent at any time, and withdrawal of their consent must be as easy as providing consent.

The GDPR also requires organizations to obtain parental consent before collecting or processing the personal data of children under the age of 16. However, EU-member countries may pass legislation changing the age of consent to 13 or higher.

RIGHT TO ACCESS

Upon a data subject's request, an organization must confirm or deny that it possesses the data subject's personal data. The organization must also provide the data subject with a free copy of the personal data and any other specified information, such as the purpose of the data collection or the length of time that the information will be stored.

RIGHT TO DATA PORTABILITY

Under the GDPR, data subjects may request the transfer of their personal data from one organization to another. Organizations must store personal data in a structured, commonly used, and machine-readable format so that they can comply with such transfer requests.

RIGHT TO ERASURE

Under some circumstances, organizations can be compelled to delete personal data upon request. For example, a data subject may request the erasure of personal data if the data are no longer necessary in relation to the purpose for which they were collected, the data subject withdraws consent, the data were unlawfully collected or processed, or the data subject was a child when the data were collected. Organizations must respond to such requests without undue delay.

DATA SECURITY

The GDPR requires organizations to implement appropriate technical and organizational measures to ensure a level of data security that is appropriate to the risk, including the encryption and pseudonymization of personal data.

DATA PROTECTION OFFICERS

An organization must designate a data protection officer if its business involves the processing of sensitive personal data on a large scale or the regular and systematic monitoring of data subjects on a large scale. Data protection officers must have expert knowledge of data protection laws and practices.

PRIVACY BY DESIGN AND DEFAULT

The GDPR incorporates the concept of *privacy by design*, which requires organizations to take data protection into account when designing business processes. The regulation also adopts the concept of *privacy by default*, which means that organizations must set their default privacy settings at a high level. For example, organizations should not collect personal data unless absolutely necessary. In addition, organizations should limit access to personal data to those employees who need the data to do their jobs.

DATA BREACHES

An organization must report data breaches to its member country's designated supervisory authority within 72 hours after becoming aware of the breach. Also, the organization must notify all affected data subjects *without undue delay* if the breach is likely to result in a high risk to their rights and freedoms. However, the organization is not required to notify data subjects if the breach only involved encrypted or otherwise unintelligible data or if the organization took actions after the breach that substantially minimized the risk to data subjects.

RECORDKEEPING

The GDPR requires organizations to maintain electronic records of their data collection and processing activities. Upon request, such records must be made available to the designated supervisory authority of the organization's member country.

PENALTIES

For serious violations of the GDPR, organizations may be fined up to EUR 20 million or 4% of their global annual turnover, whichever amount is greater.

The GDPR is a lengthy and complex regulation; it contains many details that are not discussed here. Any organization that is subject to the regulation should seek expert legal advice to develop a GDPR compliance program.

UNITED STATES

The United States does not have a comprehensive federal data privacy law. Instead, the United States uses a sectoral approach in which different economic sectors operate under different legal requirements. This approach, which relies on a combination of legislation, regulation, and self-regulation, creates a system in which privacy standards emerge from a complex interplay of overlapping state and federal laws and regulations, as well as industry practices.

Recently, individual states have begun to enact their own data privacy laws. As of now, the most significant state data privacy law to emerge is the California Consumer Privacy Act (CCPA), which took effect on January 1, 2020. The CCPA applies to certain domestic and foreign businesses that collect the personal information of California residents. Although there are some important differences, the CCPA's requirements are similar to the GDPR provisions previously discussed. In addition to the California law, Maine and Nevada have recently enacted data privacy laws, and many other states are attempting to pass similar laws.

Privacy law in the United States is changing rapidly, so fraud examiners should consult with legal counsel before collecting the personal information of U.S. residents.

CANADA

Canada, like the United States, uses a sectoral approach to protect data. In Canada, an individual's private data may be protected by, among other things, the Constitution, common law, federal law, and provincial law. But even so, the overarching federal data protection law in Canada is the Personal Information Protection and Electronic Documents Act (PIPEDA). PIPEDA governs how management of private-sector organizations collect, use, and disclose personal information in the course of commercial business.

Among other requirements, PIPEDA sets out ten principles that establish ground rules for the collection, use, and disclosure of personal information. These ten principles state:

- Organizations are responsible for any personal information under their control.
- Organizations must identify why they collect, use, or disclose personal information, they must document why the information is collected, and they can only use the information for the stated purpose.
- Organizations must obtain an individual's consent to collect, use, or disclose that individual's personal information (except in certain situations).
- Organizations must limit the collection of personal information to that which is necessary for the purposes identified.

- Organizations can only use personal information for the purpose for which it was collected, except with the consent of the individual or as required by law.
- Organizations must keep all personal information accurate and up to date.
- Organizations must protect personal information with security measures that are appropriate to the sensitivity of the information.
- Organizations must make personal information readily available upon request, and they must disclose their personal information policies and practices.
- Individuals must have the right to access and correct personal information covered organizations have collected about them.
- Individuals should be able to challenge an organization's compliance with any PIPEDA privacy principle.

Beginning on November 1, 2018, new data breach notification requirements took effect under PIPEDA. The notification requirements apply when there is a breach of an organization's security safeguards involving personal information and the breach creates a real risk of significant harm to an individual. In such cases, the organization must notify all affected individuals, as well as the Office of the Privacy Commissioner of Canada, "as soon as feasible" after the breach is discovered. Also, the organization must create a record of every breach of its security safeguards involving personal information (even if the breach did not create a risk of significant harm), and these records must be maintained for at least 24 months.

International Data Transfers

Many countries have adopted legal restrictions on international data transfers. Thus, an important issue that arises in transnational investigations concerns the transmission of personal data to outside countries.

Data transfers cover any sharing, transferring, or disclosing, giving access to, or otherwise making available, information to third parties (e.g., corporate entities and government authorities).

Some countries, such as those within the EU, Hong Kong, and India, limit the transmission of personal data to other countries, whereas other countries, such as Thailand, do not.

Moreover, even where countries provide protection for cross-border data transfers, there are discrepancies in the implementation and application of such protections among the different countries. Some countries, such as Canada and Japan, have laws that do not distinguish

between cross-border and domestic transfers to third parties. Instead, they impose certain obligations on collecting entities to remain accountable for protecting personal information transferred to third parties.

Member states of the EU impose specific restrictions on cross-border transfers. In particular, member states of the EU have laws that prohibit the transfer of personal information to jurisdictions outside of the EU unless the country of final destination offers an adequate level of protection for data. The European Commission, which is the executive of the EU, is authorized to make an “adequacy” finding as to whether a country offers an adequate level of protection, and it has done so for some countries.

In contrast to the restrictions on cross-border transfers in the EU, Canada applies an organization-to-organization approach under PIPEDA, which governs how private-sector organizations collect, use, and disclose personal information in the course of commercial business. PIPEDA provides that organizations that collect data are responsible for protecting personal information transferred to other jurisdictions. And under PIPEDA, organizations that collect data must take all reasonable steps to protect personal information from unauthorized disclosures while it is in the custody of third parties. That is, under PIPEDA, organizations must be satisfied that a recipient of personal information has policies and processes in place to ensure that personal information in its custody is safeguarded.

Given the wide range of legislation and practices regarding cross-border transfer laws and restrictions, fraud examiners working in other countries must become familiar with laws governing privacy and must adapt their procedures according to local rules.

Nevertheless, there are three basic options by which management can legitimize cross-border transfers of personal information:

- Obtain the consent of the data subject.
- Establish a contract between the entities exchanging the information (i.e., between the transmitting entity and the receiving entity).
- If transmitting from the EU to non-EU countries, rely on adequacy decisions by the European Commission. That is, limit the transfer of data to countries that offer an adequate level of protection, as determined by the European Commission.

False Imprisonment

Many countries have false imprisonment laws that protect against unlawful confinement. *False imprisonment* is the unlawful restraint by one person of the physical liberty of another without consent or legal justification.

To recover for a claim of false imprisonment, the plaintiff generally must prove all of the following elements:

- The defendant used words or actions intended to restrain the plaintiff.
- The defendant's words or actions resulted in the restraint of the plaintiff without the plaintiff's consent (i.e., against the plaintiff's will) and without legal justification.
- The plaintiff was aware that they were being restrained.

A claim of false imprisonment might arise if an employee is detained in any way during a search or interview. Generally, an employer is entitled to question an employee at work about a violation of company policy without incurring liability as long as the employee submits to the questioning voluntarily—that is, not as a result of threats or force.

There are no precise rules as to when a false imprisonment occurs, but factors such as the length, nature, and manner of the interview might determine whether liability arises. Other factors used to determine if an individual has been falsely imprisoned include:

- Conducting an interview in a room that is small and confined in nature (e.g., small, windowless, not easily accessible)
- Conducting an interview in a room with severe lighting
- Requiring the employee's presence or continued presence by any amount of physical force (e.g., holding the employee's arm to escort them or pushing the employee into a chair)
- Using violent behavior of any kind during the interview, including yelling, pounding on desks, or kicking furniture or walls
- Using a physical barrier to restrain the employee (e.g., locking the door or standing in front of the exit)
- Making threats of immediate physical force to restrain the employee
- Conducting an interview in the presence of numerous people

Defenses to claims of false imprisonment include good faith and probable cause to believe the person restrained has committed an offense.

Malicious Prosecution

A *malicious prosecution* claim seeks recovery of damages for having to endure and defend a groundless lawsuit that the defendant filed, or caused to be filed, against the plaintiff. Thus, if a person files, or causes the government to file, a groundless criminal prosecution against an individual, the person against whom the charges were brought may retaliate by bringing a malicious prosecution lawsuit.

In general, to bring a successful malicious prosecution claim, the plaintiff must show evidence of a deliberate, groundless prosecution involving the following elements:

- The defendant instituted a criminal action against the plaintiff.
- Those proceedings ended favorably for the plaintiff (e.g., the charges are dismissed).
- There was a lack of reasonable and probable cause for the defendant's conduct (i.e., there was no just cause).
- There was an improper purpose underlying the defendant's conduct, not an honest belief in guilt (i.e., the defendant acted with malice).

Intentional Infliction of Emotional Distress

Intentional infliction of emotional distress refers to any unprivileged conduct that is so outrageous and egregious that it exceeds all bounds usually tolerated by civilized society and is intended to cause injury (or was committed with reckless disregard for the likelihood of its causing injury) to another. It is a civil action available mainly in common law countries.

To recover for intentional infliction of emotional distress, the plaintiff must prove all of the following elements:

- The defendant engaged in extreme and outrageous conduct.
- The defendant acted intentionally or recklessly (i.e., the defendant intended that their conduct would cause severe emotional distress, or they acted recklessly with regard to whether their actions would cause severe emotional distress).
- The victim actually did suffer emotional or mental distress as a result of the defendant's conduct.

For liability to attach, the offending conduct must "outrage the sensibilities of a reasonable man." Mere angry words or insults, or allegations or implications of wrongdoing (if based on reasonable grounds) are not enough. Also, it is not enough that the individual is merely "upset" by the conduct.

In addition, the cause of action is not actionable unless there is proof of actual physical harm; there must be a “visible and provable” illness resulting from the conduct of the defendant.

Wrongful Discharge

Wrongful discharge occurs when an employer discharges an employee for an improper reason (e.g., unlawful discrimination) in violation of actual or implied employment contract or company policies.

The scope for wrongful discharge, however, varies by jurisdiction.

Legal Protections Regarding Interviews

Interviews, and especially interviews of suspects, can expose the organizational powers administering the interview and the individual conducting the interview to certain legal risks. Thus, before engaging in an interview, the fraud examiner must understand the ramifications of their actions, which requires an understanding of certain legal issues and how they limit or affect the ways in which an interview may be conducted.

Of particular significance is the fact that most jurisdictions have restrictions concerning the ways in which employers can conduct interviews. Such restrictions might originate from employment contracts, collective labor laws, laws protecting labor rights, the common law, laws protecting fundamental rights, other applicable statutes, and so on.

Thus, it is in the organization’s best interest to have someone review all aspects of the employer-employee relationship—including company policies, contractual relationships, and prevailing law—before conducting interviews.

THE CRIMINAL JUSTICE SYSTEM

Criminal law deals with offenses of a public nature, whereas civil law is the body of law that provides remedies for violations of private rights. A criminal defendant has certain rights, but these rights vary substantially from jurisdiction to jurisdiction. This chapter describes several procedures and issues in criminal cases that fraud examiners should be aware of.

International Covenant on Civil and Political Rights

Most countries have signed and ratified the United Nations' (UN) International Covenant on Civil and Political Rights (ICCPR), which commits them to recognizing various rights of citizens. Part III of the ICCPR includes the rights of those accused of crimes. Members of the ICCPR adopt their own version of laws to uphold such rights, but do not always implement (or enforce) every provision. Despite inconsistencies, the ICCPR is useful in understanding the existence of rights throughout various jurisdictions.

The following are protections afforded by the ICCPR that are most relevant in fraud examinations. For information regarding defendants' constitutional rights in the United States, see the content on "Defendants' Rights in Criminal Cases" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

Freedom from Improper Arrests

Under the ICCPR, individuals have the right to liberty and shall not be subjected to arbitrary arrest or detention. Arrests must be done in accordance with procedures established by law. Once a person is arrested, the person is entitled to a proceeding before a court to decide without unnecessary delay the lawfulness of the detention and must be released if there is no lawful reason.

Most countries provide some degree of protection from unreasonable searches and arrests by the government. The two major types of issues concerning arrests are the conditions under which a person may be lawfully arrested and the rights that a person under arrest has (e.g., right to remain silent, right to legal counsel). A *custodial arrest* occurs whenever a government officer has a person in custody, meaning an officer has indicated that the person is not free to leave. It is important to determine when an arrest occurs to establish what rights the subject of the arrest had at a given time.

Generally, the government may not make an arrest unless there is a good reason to believe that the suspect committed an offense. Many countries require a warrant signed by a judge or magistrate to authorize an arrest. However, even where warrants are required, there are typically exceptions that allow law enforcement officials to make arrests without warrants.

Typical examples of such exceptions include:

- An offense that occurred in the presence of an officer
- The discovery of contraband in the suspect's possession
- Emergency situations

The location of a person might also be relevant to whether an arrest is lawful. For instance, detentions and arrests at airports or border checkpoints might require a lower threshold of suspicion. In contrast, arrests in a person's home are more likely to require an arrest warrant.

Right to Be Informed of Charges

Once a person is arrested, they have a right to be informed of the charges brought against them in a prompt manner. The charges must be presented in a language the suspect can understand.

Right to a Fair Hearing

The ICCPR states that all people accused of crimes are entitled to a fair hearing before a court or other tribunal and that the results of the trial should be made public to protect the transparency of the criminal justice system. This right includes:

- Adequate time to prepare a defense
- The ability to be represented by legal counsel of the defendant's choosing and to freely communicate with counsel
- The right to have accusations and the procedures explained through a translator for free, if necessary
- The right to be tried for charges without undue delay
- The right to examine or have examined the witnesses against the accused
- Freedom from testifying against oneself or compelled confessions

Presumption of Innocence

Under the ICCPR, everyone accused of a crime shall be presumed innocent until proven guilty according to the law.

Right to Appeal

The ICCPR states that every person convicted of a crime should have the right to have both the conviction and the sentence reviewed by a higher tribunal.

Right to Privacy

Under the ICCPR, no one should be subjected to arbitrary or unlawful interference with privacy, family, home, or correspondence or be subjected to defamation. Moreover, subjects should have the right to legal protection from such interference, whether from government or private parties.

The Charging Process

Once the government has arrested someone for a crime, the person under arrest must be formally charged with a crime by the filing of a charging document. Depending on the crime and the jurisdiction, the charging process will vary. But generally, if an accused is in custody, then there is usually a set time during which they must be presented to a judge or magistrate.

The judge will then decide whether to detain the accused or release them, and on what conditions. If an accused is released under the condition that they deposit money or other valuable security with the court, they are posting bail. *Bail* is a money bond to ensure that defendants will show up for trial. If a defendant who is out on bail fails to show up for trial, the bond is forfeited, and a warrant for the defendant's arrest is issued.

For information regarding how the charging process works in the United States, see the content on "The Charging Process" in the "Supplemental Regional Information" section of this chapter on fraudexaminersmanual.com.

Charging Documents

The criminal court process begins with the filing of a charging document, which contains a formal, written accusation of the crime.

Common Law Charging Documents

In some common law jurisdictions, there are two types of charging documents: the information and the indictment.

An information is sworn under oath by an informant, and an indictment is signed by the prosecuting counsel. In practice, informations are usually drafted by police officers, and indictments are prepared by prosecutors.

An *information* is an accusation made in writing and under oath before a justice in which the informant states that they have personal knowledge or that they believe on reasonable grounds that the accused person has committed an offense.

An *indictment* is an accusation in writing of a serious (that is, indictable) offense and is brought in the name of the government. Typically, it is a document used only after the accused has been admitted to stand trial following a preliminary inquiry, but it may also be used in the absence of a preliminary inquiry or where the accused has been discharged at a preliminary inquiry.

Civil Law Charging Documents

There are various types of charging documents used in civil law systems. Some call charging documents *indictments*, *petitions*, or something similar, but they are all functionally equivalent to indictments in common law countries in that they lay out criminal charges in writing.

However, some civil law systems have no such equivalent. In such cases, the closest thing to a charging document is most likely the defendant's arrest warrant, which should lay out the defendant's alleged violations. If a case goes to trial, the charges can also be found in the evidentiary report created during the examination phase of the criminal litigation process.

Prosecutorial Discretion and Bargaining Agreements

Whether criminal cases are actually brought to trial might depend on *prosecutorial discretion*, meaning that the decision to prosecute is left to the discretion of the appropriate jurisdictional authority. Prosecutors exercising this discretion consider issues like the potential for deterrence, the strength of the available evidence, and the resources (time, labor, money) incurred by going to trial.

All countries provide some measure of prosecutorial discretion; the prosecutor will not (theoretically) pursue cases for which there is no evidence. However, countries vary widely on how much discretion the government has to prosecute criminal cases. In the United States, for instance, the prosecutor has very wide discretion as to whether a person is prosecuted, and private citizens have little control over such decisions. In some

jurisdictions, victims of crimes may commence “private prosecutions” if the government declines to do so on its own. Other jurisdictions, like Germany, give prosecutors almost no discretion and require them to prosecute any crime where there is sufficient evidence.

Another method of disposing of cases in a growing number of countries is through *bargaining agreements*, which occur when a defendant makes an agreement with prosecutors to plead guilty or submit a recorded confession in exchange for lesser charges or a reduced sentence. It is usually within the prosecution’s discretion as to whether to offer a bargain. The goal behind bargaining agreements is to make the criminal justice process more efficient by reducing the need for trials. The practice has become more popular in the last few decades, and many countries that previously resisted using bargaining agreements have introduced them in various circumstances. The bargaining process works differently in common law and civil law countries.

In most common law countries, a criminal defendant enters a plea before the court in response to the charges. The most common pleas available are *guilty* and *not guilty*. A plea of not guilty results in a full trial, whereas a plea of guilty results in a truncated trial to formally record the evidence and sentence the defendant. When the prosecution has substantial evidence of wrongdoing, criminal defendants often enter into a *plea bargain* before trial where, in exchange for pleading guilty instead of not guilty, the charges or sentence sought are less than they legally could be.

Most civil law countries do not have pleas, per se (there is no option for the defendant to enter a guilty plea), but there can still be bargaining agreements. A defendant can enter a confession, but the confession is submitted as evidence in an otherwise standard proceeding. However, a confession in evidence clearly reduces the difficulty of prosecuting the case, so an agreement among the prosecution, the defendant, and the court can be made to reduce the sentence in exchange for a voluntary confession. Bargaining agreements are controversial in many countries and are not as widely used in civil law jurisdictions as in common law jurisdictions. Additionally, when they are allowed in civil law jurisdictions, the circumstances under which they are available are typically more limited.

Defenses

A *defense* is an assertion by a defendant that seeks to explain away guilt (or liability for damages in civil proceedings). Whether a defendant can raise a defense depends on the offense and the existence and availability of defenses in the relevant jurisdiction. Common defenses include:

- Alibi
- Consent
- Court's lack of jurisdiction
- Duress
- Entrapment
- Ignorance of facts
- Infancy
- Insanity
- Legal impossibility
- Mistake
- Necessity of the act
- Protection of others
- Protection of property
- Public duty
- Self-defense
- Statute of limitations (common law systems) or period of prescriptions (civil law systems)
- Triviality of the offense

In criminal fraud cases where intent is an element of the crime, defendants might advance a number of theories to excuse their guilt and hide the truth (e.g., by alleging some inhibiting factor that prevented the defendant from forming intent). For example, while ignorance of the law might not be an excuse, it can influence a fact finder at trial, particularly if the crime is complex and financial in nature (e.g., a tax evasion case in which the government used the net-worth method to prove the defendant's income). Some types of computerized embezzlements fit this category, too, as well as bank fraud, securities fraud, and price-fixing conspiracies. In short, while ignorance of the law might not be an excuse, it sometimes induces pity or sympathy.

Likewise, a defendant might attempt to use advanced age, sickness, or illiteracy to evoke sympathy. Such assertions are not generally considered proper legal defenses, but they might persuade the judge or jury to be lenient in sentencing.

The defenses that cause prosecutors the most headaches are assertions of poor investigative work (e.g., improper arrests, searches, seizures, and interrogations; improper handling and documentation of evidence; and privacy invasions). In fraud examinations, a defendant might make allegations of sloppy auditing and mishandling of work papers.

Also, the use of undercover operations in criminal investigations can lead to the use of entrapment defenses. *Entrapment* occurs when law enforcement officers or government agents induce a person to commit a crime that they are not previously disposed to commit. To make this defense, the defendant claims that the peace officer or undercover agent solicited, encouraged, or incited the criminal act, and without that incitement, the defendant claims that they would not have committed the act.

Additionally, defendants might raise collateral matters, accusing investigators of libeling, slandering, and defaming them during the investigation.

The Trial Process

This section discusses the components of what a trial generally entails—jury selection, the discovery process, the verdict, and how a trial is normally conducted—though elements might vary depending on the specific jurisdiction.

For information regarding how the trial process works in the United States, see the content on “The Trial Process” in the “Supplemental Regional Information” section of this chapter on fraudexaminersmanual.com.

The Burden of Proof in Criminal Trials

The *burden of proof* is the evidence one party must present to prove each element of a cause of action. In most jurisdictions, an accused person is presumed innocent until proven guilty according to law in a fair and public hearing of an independent tribunal, and in criminal trials, the government has the burden of proof with regard to the offense. The accused, theoretically, does not have to present any evidence. The burden is on the government to prove every element of the offense.

In criminal cases, the burden of proof is typically the highest level found in the jurisdiction, meaning it is as hard as or harder to prove a criminal case than an administrative or a civil proceeding. In most common law systems, the burden is phrased as *beyond a reasonable doubt*, and

therefore, the verdict must be based on assurance beyond a reasonable doubt. Plainly put, “beyond a reasonable doubt” requires the fact finder to be as sure as possible that the defendant committed the acts as charged to find them guilty. In purely philosophical terms, there might not ever be absolute certainty, but the reasonable doubt standard is lower than that.

Conversely, civil trials in common law systems typically only require a party to prove a case by a *preponderance of the evidence*, or “more likely than not,” to support a decision; therefore, proving criminal violations requires stronger evidence than civil actions.

However, beyond a reasonable doubt is not a universal burden of proof for criminal trials. Most civil law systems that use an inquisitorial court process apply a different standard, sometimes called the *conviction intime* or *inner conviction of the judge*. It means that the fact finder needs to be convinced on an inner, deep-seated level. While this standard is still quite high, it is generally thought to be somewhat less rigorous than beyond a reasonable doubt. Additionally, civil law systems typically have the same burden of proof for civil and criminal cases.

Fraud charges can be especially hard to prove because the evidence is by its nature overwhelmingly *circumstantial* (i.e., composed of documents and their interpretation versus the testimony of eyewitnesses).

The standard in criminal cases, whether the uniform civil law system standard or the heightened standard in common law jurisdictions, entails making an assured judgment based on the evidence as presented. The appeals process recognizes that more than one examination of the charge(s) might be necessary to ensure an accurate, fair-minded verdict.

Participants in the Trial Process

Witnesses

In most common law systems, accused individuals have the right to cross-examine any witness called by the government to give evidence, call their own witnesses, and testify themselves. In general, the judge or jury is to give a verdict based only on the sum of this evidence given during the trial. Note that in most civil law jurisdictions, there is no right to cross-examine a party.

Generally, witnesses are only allowed to testify to their personal experience or observations regarding the facts at issue. That is, witnesses generally cannot testify to their own opinions or testify about statements made by others.

Expert witnesses, however, are allowed to give opinion testimony. Experts are allowed to testify if the judge feels that there is some issue in the case that may be difficult for jurors to understand and that the expert testimony would aid the jury.

Additionally, in some common law jurisdictions, a defendant in a criminal trial is entitled to call character witnesses on their behalf who often have no knowledge of the charges or facts at issue but who are prepared to testify to the defendant's character. Such testimony must be given in the form of the witness's opinion or testimony as to the defendant's general good reputation; testimony as to specific incidents of good conduct is not permitted because such testimony would prove too confusing and time-consuming.

The Prosecutor

The prosecutor is the government's representative and advocate in criminal trials. The job of the prosecutor is not to win, but see that justice is done. This means that the prosecutor should see to it that all relevant evidence and witnesses' testimonies are presented, even if favorable to the accused. Moreover, the prosecutor should treat all witnesses, including the accused, with moderation and fairness. In some civil law systems, the prosecutor's role in investigating criminal cases is replaced or shared with a judge or magistrate.

Defense Counsel

The defense counsel is the representative of the accused. The job of the defense lawyer is to make sure that the accused is not convicted unless evidence that is fairly and legally obtained proves the case. If the prosecution cannot prove its case beyond the applicable burden of proof (possibly because there is simply not enough evidence, or because the evidence was obtained illegally by the police), then the accused person is entitled to be acquitted.

The Judge

In criminal trials, the judge serves to make sure that the trial is conducted fairly and impartially and according to the rule of law. If there is no jury, then the judge will decide the issues based on the evidence submitted. But if there is a jury, the judge will instruct the jury on whatever parts of the criminal law apply to the case and will make sure the jury knows that its decision must be made according to that law.

In common law jurisdictions, the judge presides while the prosecutor and defense attorney call witnesses and introduce evidence designed to prove the guilt or innocence of the accused. The judge's role is to be impartial and to serve as a referee over the parties.

In civil law systems, judges are more active participants, and are typically responsible for gathering evidence from the parties. Unless the civil law system allows for jury trials, the judge(s) also serves as the fact finder and decides matters of law.

Jury Selection

Both common law and civil law systems use juries to help decide cases, although the role of the juries and the methods in which they are selected usually vary from country to country.

Common Law System

Most juries in a common law criminal court consist of 12 or fewer jurors. The jurors are selected from the local population, often by a random lottery using voter registration records and the like. However, the jury that hears a criminal case is not required to reflect a cross-section of the community or contain individuals of the same race or age as the defendant.

While jury trials are typically used in criminal proceedings in common law jurisdictions, this is not always the case. For some cases, usually minor criminal offenses, a jury trial might not be available. In serious cases, however, jury trials are typically available. Additionally, many common law jurisdictions allow the defendant to waive the right to trial by jury. When no jury is present, the judge serves as the fact finder.

Potential jurors, however, may be dismissed, and there are three ways in which this may occur. First, a judge may exercise discretion and dismiss a juror upon their own initiative. This happens when a juror fails to meet the minimum qualifications or is otherwise unable to serve.

Second, a juror may be dismissed *for cause* (i.e., a request that a prospective juror be dismissed because their predispositions make them unfit to serve as a juror). A challenge *for cause* can generally be made on the following grounds:

- Name of the potential juror is not on its panel
- Juror is biased
- Juror has been convicted and sentenced to imprisonment
- Juror is unable to perform their duties
- Juror cannot speak the official language in which testimony would be given
- Juror is otherwise unqualified to serve under the laws of the jurisdiction

Third, in some common law jurisdictions, the prosecutor and the accused are each entitled to what are often called peremptory challenges. A *peremptory challenge* allows a litigant to remove

someone from the jury panel without comment or justification (i.e., without giving cause). The number of peremptory challenges, however, varies according to the charge against the accused. The prosecution may not use its peremptory challenges in a way solely influenced by racial factors. The United Kingdom no longer allows peremptory challenges.

Additionally, either the accused or the prosecutor may challenge the entire jury panel on the ground of partiality, fraud, or willful misconduct on the part of the officer by whom the panel was returned. The jury panel is the group of potential jurors. If a jury panel is challenged, the judge will determine whether the alleged ground of the challenge is true or not. If true, a new jury panel is returned.

Civil Law Systems
